A friend and confidant of Oliver Cromwell, whose deathbed he attended, he preached often before the house of commons. From 1650 until the Restoration, when he was deprived of the office, he was pres. of Magdalen Coll., Oxford. At his death, Feb. 23, 1680, he was pastor of the independent church, Fetter Lane, London.

Goodwin Sands. Dangerous sandbanks off the E. coast of Kent, England. They extend from N. to S. for 10 m., about 6 m. from the mainland. They form a natural protection to the anchorage of the Downs, but themselves have been the scene of many shipwrecks. At low water they rise some feet above sea level, whereas at high water they lie 15 ft. below the sea. The extreme limits of the shoals are marked by four light-vessels, whose flashing lights are visible at a distance of 12 m. The sands are named after Earl Godwin (q.v.).

Goodwood. Sussex residence of the duke of Richmond and Gordon. It is $3\frac{1}{2}$ m. N.E. of Chichester. The mansion was erected during the first half of the 18th century, and the grounds are celebrated for their magnificent cedars.

Goodwood Races. An English horse race meeting, held on the South Downs near Goodwood Park, Sussex. It takes place over four days beginning on Tues. at the end of July. The Stewards' Cup is the principal event. This meeting, inaugurated 1802, is a fashionable occasion. During the Second Great War the racecourse and buildings were used as an army and air force depot.

Good Words. English monthly illustrated religious magazine. Established in 1860 by Alexander

Goodwin Sands. Chart of the dangerous sandbanks off the east coast of Kent, England

Strahan, and published at 6d., its first editor was Norman Macleod, on whose death in 1872 Donald Macleod became editor. Its writers and illustrators included many eminent men and women. It later passed into the hands of Isbister and Co., from whom it was acquired by The Amalgamated Press, and issued as a penny weekly. In 1911 it was amalgamated with The Sunday Companion.

Goodyear, CHARLES (1800-60). American inventor. Born at New Haven, Conn., Dec. 29, 1800, the son of a hardware manufacturer,

Goodwood Races. The field towards the finish of the Stewards' Cup, 1946, which was won by Commissar

he devoted himself to experiments in the treatment of rubber which would make it impervious to extremes of temperature. By accident in 1839 he discovered the process of vulcanisation. He died in New York, July 1, 1860. The tire and rubber company founded by Goodyear later made balloons for the U.S. forces and, after acquiring Zeppelin rights in 1924, rigid airships and blimps. *See Airship.*

Goofah. Circular boat used on the Tigris and Euphrates rivers. Similar to the coracle (*q.v.*), the goofah is 6 ft. in diameter, woven from willow twigs and covered with bitumen to render it watertight. According to tradition, Moses was cradled in a goofah. *See Boat*; also illus. p. 1242.

Googly. In cricket, a ball which comes in towards a batsman (right-handed) from the off-side, but is delivered with a leg-break action. B. J. T. Bosanquet is credited with the invention, and South African bowlers became exponents of the googly before the First Great War.

Goole. Borough, market town, and seaport of the W. Riding of Yorkshire, England. It stands on the confluence of the Ouse and Don (here canalised and known as the Dutch River), on the E. edge of the Yorkshire coalfield. It is served by rlys. of the L.M. and N.E. regions, and has large docks, while canals link it with the industrial parts of the W. Riding. Boothferry Bridge, the principal crossing of the Ouse, stands at the N. boundary. Steamers go from Goole to many ports on the Continent, and it has an extensive coastal trade. Its industries include shipbuilding, flour milling, clothing, chemical works, and making fertilisers.

In a fine agricultural district, it serves as market town for a wide area of Yorks and Lincs. The principal building is the church of S. John; there are a free library and market hall. Pop. 20,239.

Goora Nut. Seed of an evergreen tree (*Cola acuminata*) of the family Sterculiaceae. It is a native of tropical Africa. The tree is about 40 ft. high and has large, leathery, oblong leaves, pointed at each end, and sprays of pale yellow flowers. The seeds, about the size of horse chestnuts, are contained in pod-like follicles. They are used as a condiment, a small piece also being chewed before a meal to improve the

Goora Nut. Foliage, flowers, and seeds (also in section) of an African tree

flavour of the viands. Goora is said to make half-putrid water drinkable.

Goosander (*Mergus merganser*). Diving duck. It visits the north of Scotland, and occasionally breeds there, feeding almost entirely on living fish. The male is black on the back and white beneath, with a greenish head, red beak, and pinkish breast, and is about 26 ins. long. In winter it migrates to Southern Europe and Asia. The

Goosander. Specimen of *Mergus merganser*, a diving duck

name is probably an abbreviation of goose-gander, as merganser of Lat. *mergus*, diver; *anser*, goose.

Goose. Name applied rather indefinitely to various genera of the order Anseriformes, which includes also ducks and swans. Some of these genera are so closely connected by intermediate forms with swans and ducks that it is difficult to indicate any clear line of demarcation. About 40 species are called geese; but the typical geese are usually restricted to eleven species. Broadly speaking, geese are smaller than swans, and, with certain exceptions, larger than ducks. Their necks are shorter than the body and their beaks are never longer than the head. They are heavy, strong birds, much less aquatic in habit than either ducks or swans. Of British wild geese, the grey lag (*Anser anser*) and the bean goose (*A. fabalis*) are the best known, the former breeding in the N. of Scotland and Ireland. But British wild geese are mostly winter visitors, retiring farther N. in spring for nesting.

The domestic goose is descended from the grey lag, with which it will interbreed, and was evidently domesticated at an early period, as some of the oldest Sanskrit writings mention it, and an ancient Egyptian painting represents the cramming of a goose by hand. In Great Britain it has long been bred on a large scale, the common land being utilised for the purpose. Before steel pens were invented, goose quills were in great demand. The down is still a valuable article of commerce.

The domestic goose has been greatly developed in size by selective breeding. Its ancestor, the grey lag, weighs about 8 lb., but a fine specimen of a good modern strain may scale 25 lb. As a producer of eggs the goose is unimportant, there being hardly any market for them. Of the various domestic strains, the Emden and Toulouse are those usually kept. The former is the Michaelmas

Goole, Yorkshire. View from the air of the extensive modern docks at this seaport, which lies just within the West Riding

goose, while the latter is the favourite bird for Christmas, as it attains great weight. A tailor's goose is a name given to the large flat iron used by tailors and so named from a resemblance of the handle to the neck of a goose. *See* Brent-goose; Poultry.

Gooseberry. Fruit of a shrub of the family Saxifragaceae and genus *Ribes*. *R. grossularia* is the parent species, but varieties are numerous.

No bush fruit is more profitable or easily grown than the gooseberry. The bushes will flourish in sunny or partially shaded places; planted in the spaces between young fruit trees, they will be remunerative for years. To do really well they must be grown in soil which has been dug about 20 ins. deep and manured. An annual top-dressing of stable manure, hop manure, or compost heap material on the soil in autumn or early spring is beneficial.

Bushes should be planted in autumn 5 ft. apart. The less severely they are pruned the better crops will they produce. In winter, branches and shoots that cause overcrowding should be cut out; in summer, long side shoots ought to be shortened. Cordon gooseberries with one, two, or three stems yield fine fruits; they are grown against a wire trellis or wall. Propagation is by cuttings 10-12 ins. long, inserted out of doors in autumn; the cuttings should be half covered with soil. All buds except the uppermost five must be removed. There are numerous varieties with white, green, red, or yellow fruits.

Gooseberries are liable to damage by caterpillars of the magpie moth and gooseberry saw-fly. *See* Gooseberry Caterpillar.

Goose. Bean goose, a British wild species. Top, Toulouse goose

magpie moth (*Abrazas grossulariata*) and a saw-fly (*Pteronusribesii*). Both feed on the leaves of the gooseberry and do great damage in spring and early summer.

The saw-fly larvae make their appearance soon after the leaves have expanded in the spring and, if not cleared off, soon destroy all the foliage. The caterpillars of the moth result from eggs laid in July or Aug., but as they go into hibernation before becoming full-grown, these also put in an early appearance. As both these insects are warningly coloured, in white, yellow, orange, and black, birds do not molest them. Sprays containing derris or lead arsenate are effective controls. If the latter be used, a month should elapse between dates of spraying and picking. With few bushes, hand picking of the caterpillars is the best method.

Goosefoot (*Chenopodium*). A genus of annual and perennial herbs. Of the family Chenopodiaceae, they are natives of all climates, mostly occurring on seashores or in cultivated land. Mostly weeds, some species are, or have been, used as pot-herbs, such as Good King Henry (*C. bonus-henricus*), formerly widely cultivated as a substitute for asparagus and spinach. *C. ambrosioides* of tropical America is the so-called Mexican-tea, whose essential oil causes it to be used as a tonic and anti-spasmodic medicine. *C. quinoa* is cultivated in Chile and Peru, its seeds being employed as food and medicinally.

Goose Grass. A common name for the weed described and illustrated under Cleavers.

Goose Land (Russ. Gusinaya Zemlya). S.W. division of Novaya Zemlya. Situated on the W. coast of the South island, it projects into the Arctic Ocean between N. and S. Goose capes. It is also known as Willoughby's Land.

Goose Step. Popular name of the German military exercise called the balance step, used on ceremonial occasions. The body is balanced upon one leg, while the other is advanced slowly without a jerk, the knee straight, the toe pointed outwards, and the shoulders square to the front. The advanced leg is then placed firmly on the ground and the weight of the body thrown upon it, while the other leg is advanced in the same fashion, both knees being kept quite straight. The march is in slow time, 75 paces to the minute. During the First and Second Great Wars, German infantry invariably goose-stepped into occupied towns.

In 1938 Mussolini introduced the step into the Italian army, re-

Goose Step. Nazi standard-bearers parading past Hitler at a party congress, Nuremberg

christening it the Roman step. Neither the goose step nor the Roman step should be confused with the ceremonial slow march practised by the British army and R.A.F. at funerals and when trooping the colour on the sovereign's birthday.

Goossens. Name of a family of British musicians. Eugène (1845-1906) was born at Bruges, Feb. 25, 1845, and coming to England in 1873, was conductor with the Carl Rosa opera company for ten years. He founded the Goossens male voice choir at Liverpool, where he died, Dec. 30, 1906. His son Eugène, born at Bruges, Jan. 28, 1867, likewise came to England in 1873, and was a violinist at Covent Garden and conductor of several opera

Gooseberry, the fruit and leaves

companies, notably Carl Rosa, 1899-1915, and the British National from 1926.

The third Eugene Goossens, born in London, May 26, 1893, was educated at Bruges conservatoire

and the London R.C.M. Violinist at Queen's Hall in 1911, he became associated with Sir T. Beecham (*q.v.*), conducting the London symphony, Philharmonic, and B.N.O.C.

Eugène Goossens III,
British conductor
and composer

orchestras. In the U.S.A. from 1923 he conducted the Rochester Philharmonic and directed the Cincinnati symphony orchestras. In 1947 he took up an appointment as conductor of the Sydney symphony orchestra. His compositions include chamber music, songs, and orchestral pieces. He wrote an opera, *Judith* (libretto by Arnold Bennett), in 1925. A brother Léon became a famous oboe performer, while of the women members of this family, Sidonie and Marie were celebrated harpists.

Gopeng Beds. Series of pale grey clays and boulder clays, developed in Kinta district, Malay Peninsula, and probably of Permo-Carboniferous age (*q.v.*). They contain tin ore, and are associated with granite, phyllite, quartzite, and crystalline limestone.

Gopher (*Geomys*). Genus of small rodents. They are sometimes regarded as belonging to the same group as rats and mice; others place them among the squirrels. The European gopher is known as the suslik, and is common in Central and E. Europe and Siberia. Its fossil remains have been found in the Thames valley. It somewhat resembles a squirrel without the tufted ears and long tail, and lives in burrows in which it hibernates during winter. It feeds on seeds and roots, and occasionally on birds and mammals.

Gopher Wood. Material of which, according to the Bible narrative, the ark built by Noah was constructed (Gen. 6). The weight of authority favours its identification with the cypress (*q.v.*).

Göppingen. Town of Germany, in Württemberg. Situated on the right bank of the Fils, it is 26 m. N.W. of Ulm. Most of the town was rebuilt after a disastrous fire in 1782, and it has woollen, paper, leather, chemical, and metal manufactures and a mineral

spring. The principal building is the old castle erected by Duke Christopher in the 16th century, possessing a fine spiral stone staircase. Pop. 23,314.

Gorakhpur. City, district, and division of the United Provinces, India. Area, div., 9,563 sq. m.; dist., 4,524 sq. m. About three-quarters is under cultivation; of the cultivated area almost half is devoted to rice. Leopold Amery was born in the city, which stands on the Rapti. Pop., div., 7,972,108; dist., 3,963,574; city, 98,977—a large majority in all being Hindus.

Goral. Ruminant mammal placed by zoologists between the goats and the antelopes. Found only in the Himalayas, it somewhat resembles a goat with very short horns and no beard. It stands about 27 ins. high at the shoulder, and is brown in colour

Goral. A Himalayan ruminant
resembling a goat

with black stripes down the back and on the front of the legs. It is usually found in small herds.

Gorbals. Suburb of Glasgow, Scotland. It is on the S. side of the Clyde, and is served by trams and buses from the centre of the city. The chief buildings are its parish church in Carlton Place, once a residential district, theatres, and the public library. The centre of the district is known as Gorbals Cross. Gorbals was a separate burgh until incorporated with Glasgow in 1846. One M.P. is elected. The ballet by Robert Helpmann, *Miracle in the Gorbals*, was first produced at the Princes Theatre, London, Oct. 26, 1944.

Gorboduc. Tragedy by Thomas Sackville (afterwards earl of Dorset) and Thomas Norton. It was first acted by the gentlemen of the Inner Temple before Queen Elizabeth, Jan. 18, 1562. It is the earliest example of English tragedy. Gorboduc, king of Britain, divides the kingdom between his sons, whose quarrels lead to a

wholesale killing off of the characters. *Gorboduc* was printed in 1570 as *Ferrex* and *Porrex*. There is a modern edition by L. Toulmin Smith, 1883.

Gordian. Name of three Roman emperors, father, son, and grandson. Antonius Gordianus Africanus (159-238), a kinsman of the emperor Marcus Aurelius, after holding the offices of aedile, praetor, and consul, in 232 became proconsul of Africa. Having gained the affection of the inhabitants, he was invited to assume the throne by a body of rebels who had revolted against Maximinus (*q.v.*). This he did with great reluctance in 238, being nearly 80 years of age. Duly recognized by the senate, he associated his son (192-238) with him as joint-emperor. The governor of Mauretania refused to recognize them, and in an engagement near Carthage the younger Gordian lost his life, whereupon the father committed suicide.

After the brief joint reign of Balbinus (*q.v.*) and Pupienus (*q.v.*) which ended in the murder of both, the son of the younger Gordian, a mere boy, was proclaimed emperor by the soldiery as Gordian III. He proved a capable general, but a succession of victories was cut short by his death. His successor in command, Marcus Julius Philippus, incited the soldiery against Gordian who was murdered in a mutiny, 244.

Gordian Knot. In Greek legend, a knot of bark made by Gordius, a Phrygian king, in fastening the pole to the yoke of a sacred wagon in the Acropolis of Gordium. An oracle declared that whoever should loose the knot would be ruler of Asia. Alexander the Great fulfilled the oracle by cutting the knot with his sword. "Cutting the Gordian knot" has become proverbial for prompt dealing with a baffling problem.

Gordium. Ancient city of Phrygia (now the N.W. of Asiatic Turkey). It stands on the road between Pessinus and Ancyra near the Sangarius river. It was named after Gordius, a peasant, who, according to tradition, became king of Phrygia. See Gordian Knot.

Gordon. Name of a Scottish family. Strictly speaking, its head is the marquess of Huntly, another branch being represented by the marquess of Aberdeen, while the duke of Richmond is a Gordon in the female line. Aberdeenshire is their special area, but there are many Gordons all over Scotland,

and many bearers of the name have distinguished themselves. It is perpetuated, moreover, by the Gordon Highlanders.

Gordon is supposed to be taken from Gordon, in Berwickshire, where a certain Norman settled in the 11th century, and took the name. His descendant, Adam Gordon, obtained from Robert Bruce, Strathbogie, in Aberdeenshire, the castle of which was long the family residence. He called this Huntly, after a place on his estate in Berwickshire. He was killed in battle in 1333. His lands in Berwickshire and Aberdeenshire passed down in the direct line until they came to Sir Adam Gordon, who had no sons. His daughter, Elizabeth, married Sir Alexander Seton, who then became lord of Gordon, their descendants taking the name of Gordon. From one of them, made earl of Huntly in 1450, come the earls and marquesses of Huntly.

A dukedom of Gordon was in existence from 1684 to 1836, being held by the marquesses of Huntly. The 4th marquess was created duke of Gordon in 1684; both he and his son, the 2nd duke, were Jacobites. The 3rd duke was the father of Lord George Gordon. Alexander, the 4th duke, was the husband of Jane Maxwell, the duchess of Gordon of whom many stories are told. Described as the greatest subject in the country, he was made earl of Norwich in 1784. His son George, the 3rd duke, who was known as a soldier, left no sons when he died in 1836, and the dukedom became extinct. His heiress, his sister, Charlotte, married the duke of Richmond, who took the additional name of Gordon, and in 1876 a later duke of Richmond was given the additional title of duke of Gordon.

Gordon Castle, near Fochabers, was the chief seat of the dukes of Gordon until their extinction. It is a large quadrangular building, built in the 18th century, and passed in 1836 to the duke of Richmond. An exhaustive account of the house of Gordon was edited by J. M. Bullock, 1903.

Gordon, ADAM LINDSAY (1833-70). Australian poet. Born at Fayal, in the Azores, and educated at Cheltenham and Merton College, Oxford, he left England in 1853 for S. Australia, where he became successively trooper in the mounted police, horse-

C. G. Gordon

breaker, livery-stable-keeper, and steeplechaser, and member of the House of Assembly.

In 1867 he published two volumes of poems, *Sea Spray* and *Smoke Drift*, and a dramatic lyric

Ashtaroth. *Bush Ballads and Galloping Rhymes* was published in 1870, and on June 24 of that year he shot himself at New Brighton, Melbourne, disappointment at failure to establish his claim to an estate in Scotland having aggravated a mental disturbance from which he had suffered throughout life. His collected poems epitomise the outlook of the Australian bushman. Gordon has a bust in Westminster Abbey. *Consuls Lives*, E. Humphris, 1933; D. Sladen, 1934.

Gordon, CHARLES GEORGE (1833-85). British soldier. Born at Woolwich, Jan. 28, 1833, he entered the Royal Engineers in 1852, served in the Crimean War in 1855, and took part in the Chinese expedition of 1860. After the peace, Gordon was allowed to assist the Chinese government in the suppression of the Taiping rebellion (1863-64), when his achievements won him the popular sobriquet of "Chinese" Gordon. In 1873 his services were lent to the khedive of

Charles George Gordon. The capture and murder of the general by the Mahdi's forces at Khartoum, Jan. 26, 1885. From the painting by Geo. W. Joy. By permission of Frost & Reed, Ltd., Art Publishers, Bristol & London, publishers of the etching

A. Lindsay Gordon, Australian poet

Egypt, Ismail, for the organization of the district known as the Egyptian Sudan. After a brief withdrawal, he returned thither in 1877 as governor, a position which he resigned in 1880.

Between 1880 and 1884 the Mahdi, a self-styled successor of the prophet, acquired a dangerous ascendancy over the fanatical Sudanese tribes. The Egyptian government was unable to re-establish its own authority, and the British government was not prepared to undertake the task of conquest. But the Egyptian garrisons at Suakin, Berber, Khartum, and elsewhere were not strong enough to maintain their positions unsupported, and the British government was induced to commission Gordon with the duty of withdrawing them, for which his unique knowledge of the Sudan and his immense personal influence marked him out. But when in 1884 he appeared on the scene, he at once formed the conclusion that it was the business of the Egyptian government to "smash the Mahdi" and recover the Sudan.

The Khartum Expedition

The result was that in March Gordon, without British troops, was shut up in Khartum, while the British government, believing that he could withdraw if he would, and feeling itself placed in a false position, resented demands for the dispatch of a relief expedition which it persisted in regarding as unnecessary. When the real need was realized it was still believed that the matter was not urgent, and months were wasted in the discussion of alternative routes before the expedition actually started in Oct. British troops advanced up the Nile; in Jan., 1885, the advance guard, after some sharp fighting, reached Metemneh, 100 m. below Khartum, where it halted for four days and then made its dash to bring Gordon out—too late. When it arrived at Khartum on Jan. 28 it found that the Mahdi had rushed the defences two days before, and that Gordon was dead.

So fell a soldier of true heroic type, a medieval warrior saint, a puritan mystic in the midst of 19th century materialism; fearing nothing and doubting nothing; one who, left to himself, had repeatedly accomplished the apparently impossible chiefly through his extraordinary power of influencing others. In China he had led his troops to battle, himself armed with nothing but a cane. Sudanese and Arabs had fallen under the spell of his personality.

As an administrator dealing with uncivilized or half-civilized peoples, unhampered by the complex organization of political systems, he had been incomparable, though he was an intractable subordinate. When the public services had not demanded his time and energies, he had devoted them not to his own advancement but to the redemption of the waifs and strays of humanity. A national monument was erected to his memory in Trafalgar Square in 1888 (removed in 1947 before a new site had been chosen), his family placed a cenotaph bearing a recumbent effigy of him in S. Paul's Cathedral, and an equestrian statue was raised in Khartum. Other memorials are at Chatham, Rochester Cathedral, and Westminster Abbey, and his character and work are fitly commemorated in the Gordon Boys' School (*q.v.*) for destitute lads.

Bibliography. Col. Gordon in Central Africa, G. B. Hill, 1881; The Story of Chinese Gordon, A. E. Hake, 7th ed. 1884; Letters from the Crimea, the Danube, and Armenia, ed. D. C. Boulger, 1888; Events of the Taeping Rebellion, with Monograph, Introduction, and Notes by A. E. Hake, 1891; Gordon at Khartoum, W. S. Blunt, 1911; Eminent Victorians, Lytton Strachey, 1918; Gordon and the Sudan, B. M. Allen, 1931; Gordon: an Intimate Study, H. E. Wortham, 1933; Gordon at Khartoum, J. Buchan, 1934.

Gordon, Lord George (1751-93). Third son of the third duke of Gordon. Born in London, Dec.

George Gordon.

From an old print

26, 1751, he became a lieutenant in the navy, but resigned on being refused a ship.

He entered Parliament in 1774 as member for Ludgershall, Wiltshire. In 1779 he was elected president of the Protestant association for the repeal of the Catholic Relief Act of 1778, and in 1780 marched from St. George's Fields to the house of commons at the head of an enormous mob to present a petition against the measure. (See Gordon Riots.)

Lord George was imprisoned in the Tower for eight months and tried for high treason, but was acquitted. In 1787, for libelling the British judiciary and Marie Antoinette, he was imprisoned in Newgate, where he spent the rest of his life, solacing himself with dinners, balls, and music, especially

the bagpipes. In his later years he was a zealous convert to the Jewish faith. He died in Newgate, "of a delirious fever," on Nov. 1, 1793.

Gordon, George Stuart (1881-1942). British scholar. Educated at Glasgow university, and Oriel College, Oxford, he became university lecturer in English, 1907-13, when he was appointed professor of English language and literature at Leeds university. He returned to Oxford in 1922 as Merton professor of English literature (until 1928). President of Magdalen College, 1928-42, he was vice-chancellor of the University, 1938-41. One of the most distinguished scholars of his day, he was Clark lecturer at Cambridge, 1933. He was also chairman of the B.B.C. spoken English committee. His publications included Charles Lamb, 1921; Trojans in Britain, 1924; Three Oxford Ironies 1927; Modern Biography, 1933; posthumously, in July, 1942, a collection of his other writings appeared, entitled Anglo-American Literary Relations. He died March 12, 1942.

Gordon, Lucie Duff (1821-69). British author and translator. Born in Westminster, June 24,

Lucie Duff Gordon
After H. W. Phillips

1821, the only child of John Austen the jurist, in 1840 she married Sir Alexander Cornwall Duff Gordon, Bart., and subsequently numbered among her friends Tennyson, Dickens, Thackeray, and Kinglake, her house in Queen Anne's Gate being famous as a centre of intellectual society. Later she lived in Egypt, dying at Cairo, July 14, 1869. Her chief works are Letters from Egypt, 1865, and trans. of Von Ranke's Ferdinand I, and Maximilian II of Austria, 1853.

Gordon, Patrick (1635-99). Scottish soldier. He was born March 31, 1635, at Auchleuchries,

Patrick Gordon,
Scottish soldier

in Aberdeenshire, the younger son of a poor laird. In 1651 he found his way to Poland, and for a few years fought for the Swedes, the Poles, and the

emperor, being always ready when taken prisoner to transfer his services to his last opponents. In 1661 he entered the service of Alexis, tsar of Russia.

On a visit to England in 1685 Gordon was requested by James II to settle permanently in England, but was unable to obtain permission to do so. Circumstances brought Gordon into contact with the young tsar, Peter the Great, who conceived a great affection for him. Gordon was responsible for defeating a conspiracy, as a result of which Peter was established more firmly on the throne; while in 1698 he crushed the formidable revolt of the Strelitzes or household troops. He died at Moscow, Nov. 29, 1699. Passages from Gordon's Diary were printed for the Spalding Club in 1859.

Gordon Bennett Cup. Name of various sporting trophies presented by the American newspaper proprietor, James Gordon Bennett (*q.v.*). The motor race for the Gordon Bennett Cup has not been held since 1905, nor did the aeroplane race continue; but the international balloon race, instituted in 1906 and held in Europe annually, was revived after the Second Great War in 1946. The Gordon Bennett Aeronautic Cup goes to the entrant who alights nearest his previously declared destination. A third trophy was offered after the first two had been won outright.

Gordon Boys' School. British institution under the patronage of King George VI for the training of boys. Founded in 1885 as the national memorial to General Gordon (*q.v.*), the school provides general education and vocational training for boys from 13 to 17. To qualify for admission a boy must on entry be under 15 years of age, of good character and physique, and in necessitous circumstances. Free admission is granted to boys whose parents or guardians are unable to pay anything. The school is non-denominational. Special facilities are available to boys wishing to enter the army; boys with musical gifts are trained for direct entry into army regimental bands. Suitable civil employment is found for others. The school is at West End, near Woking, Surrey.

Gordon Highlanders. Regiment of the British army. The regiment was raised in 1794 by the marquess of Huntly, afterwards fifth and last duke of Gordon, who was at that time a captain in the 3rd Foot Guards, now the Scots

Guards. Embodied as the 92nd Foot, the regiment was given the Gordon tartan with a distinguishing yellow stripe. The Gordons went to Holland in 1799 and gained their first battle honour at Egmont-op-Zee. The regiment served

Gordon Highlanders' badge

under Sir Ralph Abercrombie in Egypt, where they fought at Aboukir and at the siege of Alexandria; the Sphinx on their colours commemorates these victories.

The Gordons were with Sir John Moore at Corunna and served under Wellington in the Peninsula, gaining nine battle honours. Forming part of Wellington's army at Quatre Bras, they drove the French from their positions, and at Waterloo routed a column of French infantry, taking 2,000 prisoners. It was on that occasion that they made their famous charge hanging on to the Scots Greys' stirrups and shouting "Scotland for ever."

The Gordons served throughout the Indian Mutiny, and marched with Lord Roberts from Kabul to Kandahar. Four honours were gained in the Afghan campaign of 1878-1880. In 1881 the 92nd Foot was amalgamated with the 75th Foot, which had been raised by Colonel Robert Abercrombie in 1788. The 75th Foot had had a distinguished record of service in Holland and India, and became the 1st battalion when amalgamated with the 92nd as the Gordon Highlanders.

In 1882 the Gordon Highlanders went to Egypt, being the first British unit to cross the Egyptian trenches at Tel-el-Kebir. Following service on the Nile (1884-85), the Gordons participated in the Chitral campaign (*q.v.*) and helped to storm the Malakand Pass. It was during the Tirah expedition that piper Findlater of the Gordons won the V.C. for piping his regiment, despite serious wounds, in an attack on the Afridi stronghold at Dargai. The Gordons served all through the Boer War, and took part in the defence of Ladysmith and the battle of Paardeburg.

Twenty-one battalions of the Gordon Highlanders were raised for service in the First Great War, the regiment earning the following battle-honours: Mons, Le Cateau, Marne, 1914, '18, Loos, Somme, 1916, '18, Ancre, 1916, Arras, 1917, '18, Cambrai, 1917, '18, and Vittorio Veneto.

At the outbreak of the Second Great War the Gordons went to France, and fought in Belgium, in the retreat on Dunkirk, and in the desperate defence of St. Valéry-en-Caux, 1940. Reconstituted battalions of the Gordons fought in Africa with the 8th and 1st armies and took part in the Sicily landings. Battalions of the Gordons shared in the invasion of Normandy, 1944, fighting at Caen and in all the major engagements to the end of the fighting in Europe in May, 1945. Other battalions of the Gordons served with the 14th army in Burma. The regimental depot is at Aberdeen.

Gordon Riots. Disturbances which took place in London in June, 1780. In that year Sir George Savile introduced a bill to enable

Gordon Riots. Troops of the Honourable Artillery Company firing on rioters looting a house in the City of London, June 7, 1780. A surgeon, Sir William Blizard, is seen tending wounded in the foreground

From a picture by F. Wheatley

Roman Catholics who abjured the temporal sovereignty of the pope to purchase and inherit land; the bill also proposed to give a certain liberty to the priests. It became law as regards England, but a proposal to extend it to Scotland was violently opposed and was abandoned.

In England certain Protestants formed an association to work for the repeal of the Act. Lord George Gordon (*q.v.*) took the lead, and at the head of about 60,000 people marched with a petition to Westminster on June 2. They forced peers and members of Parliament to shout No Popery, and to wear blue cockades, made their way into the lobbies of the Houses of Parliament, and when the military arrived wrecked the chapels attached to the Bavarian and Sardinian embassies. On the 4th they renewed their attacks, and soon had a good part of London at their mercy. Prisons were broken open, numerous fires were started, and the Bank of England was attacked. On the 7th George III called a meeting of his ministers, and when they hesitated he himself ordered the military to act. The riots were suppressed, and the leaders brought to trial. Twenty-one were executed, but Gordon, who was tried for high treason, was acquitted. In Barnaby Rudge, Dickens gives a vivid picture of these riots.

Gore, CHARLES (1853-1932). British prelate. Born Jan. 22, 1853, he was a son of Hon. C. A. Gore and a nephew of the 4th earl of Arran. Educated at Harrow and Balliol College, Oxford, he was elected fellow of Trinity College, and was ordained. In 1880 he went to Cuddesdon

Charles Gore,
British prelate
Russell

as vice-principal of the college there, becoming in 1884 first head of Pusey House, Oxford.

For nine years he was an influential figure in Oxford, his main work being to permeate the High Church movement with the results of modern Biblical criticism. This led to certain difficulties and controversies, especially after the publication of *Lux Mundi*, 1890. In 1893 he left Oxford to become vicar of Radley, and in 1894 he was made canon of Westminster. In 1902 Gore was chosen bishop of Worcester, where he worked hard to found the new diocese of

Birmingham, of which in 1905 he became the first bishop. In 1911 he was translated to Oxford, where he remained until his resignation in 1919.

He founded the Community of the Resurrection at Mirfield; and wrote numerous theological and expository works on which rests his high reputation as a theologian. An able preacher, he was also distinguished for his active sympathy with socialistic and humanitarian ideas and movements. He died Jan. 17, 1932. *Consult* Lives by his nephew, John Gore, 1932; G. L. Prestige, 1938.

Gore, GEORGE (1826-1908). British physicist. Born at Bristol, Jan. 22, 1826, at an early age he became interested in electro-metallurgy and electro-chemistry. Elected F.R.S. in 1865, his discoveries established his reputation. His principal works are *The Arts of Scientific Discovery*, 1878; *The Scientific Basis of Morality*, 1882; and *The Art of Electro-Metallurgy*, 1877. He died Dec. 23, 1908.

Gorée. Small island off the French colony of Senegal. It is situated S.E. of Cape Verde, and forms with Dakar and Rufisque a territory called *circonscription de Dakar et dépendances*. It has a fortified harbour and exports wax, gold-dust, and ivory. Pop. 1,000.

Gorell, BARON. British title borne by the family of Barnes. John Gorell Barnes, 1st baron, born May 16, 1848, was called to the bar in 1876. He took silk in 1888, and became one of the foremost advocates of his time. Raised to the bench in 1892 as judge of the probate, divorce, and admiralty division, he became president of that court in 1905, and retired in 1908. Elevated to the peerage in 1909, he died April 22, 1913.

After his elder son Henry (1882-1917), who succeeded to the title, had been killed in the First Great War, another son, Ronald Gorell Barnes, became 3rd baron, 1917. Born April 16, 1884, he was educated at Winchester, Harrow, and Balliol College, Oxford. He was under-secretary of state for Air, 1921-22, and a partner in the publishing house of John Murray, editing the *Cornhill* magazine, 1933-39. Chairman of the Society of Authors, 1928-35, his many volumes of verse and fiction included *Days of Destiny*, 1917; *Plush*, 1924; *Gauntlet*, 1931; *Unheard Melodies*, 1934; *Last of the English* and other Poems, 1939; *Murder at Maving*, 1943; *Warrior's Way*, 1945.

Gorgas, WILLIAM CRAWFORD (1854-1920). American surgeon. Born Oct. 3, 1854, he studied medicine, and in 1880 was appointed an army surgeon. Rising to the rank of major-surgeon in 1898, he was sent as chief medical officer to Havana. Here he completely stamped out the yellow fever, and when chief sanitary officer for the Panama Canal, 1904-13, saved thousands of lives in the unhealthy districts. In recognition of this he was promoted surgeon-general 1914. On the entry of the U.S.A. into the First Great War he organized the army medical service, and visited France in 1918. He died in London, July 4, 1920.

Görgei or **GÖRGÉY, ARTHUR** (1818-1916). Hungarian soldier.

Born at Toporcz, Jan. 30, 1818, he came into prominence in the Hungarian rising against the Austrians in 1848. He achieved some signal successes, notably at Ozora (Oct. 7), where he forced the capitulation of 10,000 Croats, but found himself unable to work with Dembinski, the commander-in-chief, and was in fact accused of losing the battle of Kopolna by arriving late.

Subsequently Görgei himself was given the chief command, and almost cleared Hungary of the Austrians. Fatal delays were caused, however, by his dissensions with Kossuth, the dictator, and his government. A Russian army came to the help of the Austrians, and Görgei was compelled to surrender near Világos on Aug. 13, 1849. For this he was accused of treachery, a charge of which he was cleared in 1885. He died May 21, 1916.

Gorges, SIR FERDINANDO (*c.* 1566-1647). British adventurer. Born in Somerset, he became a soldier and saw a good deal of service. He fought against the Spanish armada and in France for Henry IV; went on an expedition with Essex, with whose rebellion he was associated, and served in Ireland. In 1596, having been knighted, Gorges was made governor of Plymouth, and there he shared in the early plans for settling colonists in America. A member of the Plymouth Company, he frequently sent out ships and colonists to the New World, in which he had obtained grants of land. The most considerable of

Arthur Görgei,
Hungarian soldier

these was one of 1639, making him lord of Maine, of which state he is regarded as the founder. In 1647, too old to serve the king in the Civil War, he died at Long Ashton, Somerset. *Pron. Gor-jez.*

Gorget (Fr. *gorge*, throat). In armour, a metal covering for the throat, protecting the gap between

Gorget: armour to protect the throat

the breastplate and helmet. In the ornate armour of the 16th century the gorget was often richly embossed. Reduced to a crescent-shaped ornament, it was long worn by officers to denote that they were on duty. The name is now applied to the patches or tabs worn on the collar by officers of the British army above the rank of lieutenant-colonel. These are relics of the hooks from which the original gorget was suspended. *See* Armour. *Pron. Gor-jet.*

Gorgias (c. 475-390 B.C.). A Greek philosopher and sophist. Born at Leontini, in Sicily, he came to Athens in 427 to plead the cause of his native town against Syracuse. Primarily a teacher of rhetoric, in which he introduced a number of innovations, unfamiliar words, and rhetorical figures, he also wrote a treatise *On Nature*, which is entirely lost. In this he maintained that nothing really existed; that if it did exist it could not be known; and that even if it could be known it could not be communicated. Gorgias is one of the chief interlocutors in the *Dialogue of Plato* which bears his name. The authenticity of two extant speeches—*An Apology for Palamedes* and *An Encomium of Helen*—attributed to him is disputed. *See* Sophists.

Gorgons. In Greek mythology, three monsters named Stheno, Euryalē, and Medusa, who dwelt in Libya. Instead of hair, their heads were covered with crawling serpents, and they had the property of turning into stone anyone who looked upon them. Medusa, who alone was mortal, was killed by Perseus, who struck off her head, looking at her reflection in a mirror while he did so, in order to avoid being turned into stone. Perseus presented the head to Athena, who set it in the middle of her shield. Similarly, the Chinese and other Oriental nations decorated their shields with frightful figures, to terrify the

Gorgons. Head of Medusa, alto-relief. Roman copy of a Greek original of the end of the 5th cent. B.C. Glyptothek, Munich

enemy. Later, the Gorgons were represented in art as beautiful maidens. Probably personifications of the flashing lightning, the rationalists explained them as a race of hideous women. Their sisters, the Graeae, personifying old age, had the forms of swans and only one eye and one tooth between them. *See* Perseus; Repoussé illus.

Gorgonzola. Town of Italy, in the prov. of Milan. It is 12 m. N.E. of Milan, with which it is connected by a steam tramway. It is engaged in the silk industry, but is best known for the cheese which takes its name from the town. Pop. 3,675.

Gorgonzola cheese is a member of the blue vein family, and is made by putting alternate layers of warm and cold curd into a surrounding thickness of warm curd. It matures in four or five months, but is usually kept for ten or twelve weeks longer to improve it. The cheeses are round and flat, and weigh about 16 lb.

Gorhambury. Hertfordshire seat of the earl of Verulam. It is 2 m. W. of St. Albans. The mansion, standing in a fine park, was built 1778-85, includes much later work, and is notable for its hall and pictures. In the ground are ruins of the house in which Francis Bacon lived in almost regal state. The manor originally belonged to

Gorhambury, Herts. Ruins of the house built in 1568, later occupied by Francis Bacon

the abbey of St. Albans, was granted by Henry VIII to Ralph Rowley and then to John Maynard. It was bought in 1550 by Nicholas Bacon and, after the death of his son Francis, 1626, descended to the latter's cousin Sir Thomas Meautys, whose widow married Sir Harbottle Grimston, speaker of the Restoration parl.

Gori. Town of the Georgian S.S.R. It stands on the river Kura and the Poti-Tbilisi rly., 48 m. N.W. of Tbilisi. The chief occupations are the cultivation of fruit and vines, cattle-rearing, and the manufacture of cotton and woollen goods. It is also a timber centre. Gori was formerly the residence of the princes of Karthli (Georgia). Pop. 10,000.

Gorilla. Largest of the anthropoid or manlike apes. It is found only in Western Equatorial Africa, where it inhabits the forests. A

Gorilla. The man-like ape of the African forests

fine male may attain a height of slightly over 6 ft., the female is rather shorter.

The gorilla is distinguished from the chimpanzee (*q.v.*) by its greater size, larger teeth, heavy brow ridges over the eyes, and great length of the arms—the hands reaching well below the knees when the animal stands erect. The adult animal has also a more savage look. In bulk and in length of limbs the full-grown gorilla much exceeds an average man. The colour is black, though some specimens show a slightly reddish tinge on the head and shoulders, and the body is covered with coarse hair.

The hands are wider and stouter than those of the chimpanzee, and the fingers are partly united by a strong web of skin, while the

thumb is short and not very useful as an opposable member. In contrast, the great toe is remarkably developed, and the foot is a powerful grasping instrument. Owing to the shyness and wariness of the gorilla, and its habitat in the densest forests, little is known as yet of its mode of life. The animals appear to have some kind of family life, the male and female being found with young ones of various ages, but it is doubtful whether they have any permanent home.

So far as is known, the gorilla in its wild state lives on fruit and roots, possibly varying its diet with eggs and young birds, and it has sometimes proved troublesome by robbing plantations.

The gorilla, like the chimpanzee and the orang-utan, does not habitually walk erect, but supports itself with its hands, which are usually partly closed so that the weight is borne on the knuckles. In the trees these animals move with surprising speed and agility, and can take long leaps that would appear impossible for such heavily built animals. Owing to its great muscular development and savage disposition, it is a very formidable opponent when brought to bay, but the stories of aggression on its part appear to be ill-founded. It rather avoids encounter with man, and makes off with great speed on his approach.

It is difficult to keep the gorilla in captivity. Young specimens exhibit some docility for a time, but soon mope and die. Adults can be tamed but unless expertly managed quickly die. Several gorillas have been kept in the London Zoological Gardens.

Gorinchem or **GORKUM**. Town of the Netherlands, in the prov. of S. Holland. It stands on the Merwede at the Linge inflow, 22 m. E.S.E. of Rotterdam. The town is picturesque, with 17th century gateways and brick and stone houses decorated with mosaic work. It has an excellent harbour, and carries on a trade in cattle, cereals, and hemp, while its salmon fisheries are important.

The Merwede canal communicates with Amsterdam. A few miles below Gorinchem begins the Biesbosch, a district 40 m. in area, which was overwhelmed by a flood in 1421, when over 70 market towns and villages were wiped out, with death-roll exceeding 100,000. The district has since been reclaimed. Gorinchem was the first city taken by the Water Geuzen (Beggars) from the Spaniards in 1572. Pop. 13,985.

Goring. Village and parish of Oxfordshire, England. It is on the Thames, opposite Streatley, on the Berkshire side of the river, 9 m. N.W. of Reading. For the two places there is a W. region rly. station. It is a boating centre, being also visited by anglers. There is a church with a Norman tower and formerly there was a nunnery here. It lies amid beautiful scenery and gives

its name to the gap between the Chilterns and the Marlborough Downs through which the Thames flows. Here Icknield Street (*q.v.*) crossed the river. Pop. 1,929. Goring Heath is a village $3\frac{1}{2}$ m. away.

Goring-by-Sea, in Sussex, England, is a coastal resort and residential area $2\frac{1}{2}$ m. W. of Worthing, of which bor. it forms part. Richard Jefferies died here in 1887. Pop. 4,417.

Goring, **GEORGE GORING**, LORD (1608-57). English royalist. Son of George Goring, earl of Norwich,

Lord George Goring, English royalist. After Van Dyck

he was born July 14, 1608. As a soldier, he gained his early experience in the Dutch service, before being made governor of Portsmouth in 1639. He served Charles I in the short wars against the Scots and was one of those who suggested to the king the idea of using the army to overawe the parliament. This army plot was betrayed by him, but when war began he was found on the side of the king.

Having surrendered Portsmouth he went to the Netherlands to raise soldiers, and then had a command in Yorkshire. He was taken prisoner at Wakefield, but was again free when Marston Moor was fought, and there commanded a wing. After this Goring held a command in the W. of England, where the plundering by his troops made him hated. He shared in the campaign that culminated in the defeat at Naseby, and was himself crushed at Langport in July, 1645. He passed the rest of his days in France and Spain. He died in Madrid.

Göring. Alternative spelling of the name of Hitler's associate, Hermann Wilhelm Goering (*q.v.*).

Goring, Oxfordshire. The Thames, with the village beyond, from Streatley

Gorizia. Town of Italy. Formerly capital of the Austro-Hungarian crownland of Görz and Gradisca, it was ceded to Italy in 1919. Gorizia is on the east bank of the Isonzo, 23 miles N.N.W. of Trieste, and is dominated by a hill surmounted by the ancient castle of the counts of Görz. The old part of the town is enclosed by triple walls. Noteworthy buildings are the 17th century cathedral, the municipal offices, the archbishop's palace, the Jesuit college, and the house of the provincial diet. The principal industries are cotton and silk weaving, and the manufacture of leather articles, liqueurs, pottery, paper, soap, and candles. There is also a considerable trade in fruit and wine. Pop. (pre-war) 46,640.

Gorizia was one of the strategic positions demanded from Austria by Italy in April, 1915, as the price of her continued neutrality in the First Great War and as

Gorizia, Italy. The old fortress of the counts of Gorz on the Castle Hill overlooking the town

compensation for the Austrian advantages gained in the attack on Serbia. Following their declaration of war on the Central Powers, the Italians opened an offensive on the Isonzo in July, 1915, but made little headway towards the town. General Cadorna launched a general attack along the Trentino front, and on Aug. 4 delivered a furious assault along an eight-mile line opposite Gorizia. The Austrian defences collapsed under an intensive artillery bombardment and the Italian infantry carried the heights on the W. bank of the Isonzo overlooking Gorizia. The following day the Italians stormed Monte San Michele, the key to the Gorizia positions, and after two days' fighting occupied Gorizia itself, holding it until Oct. 28, 1917, when they lost it to the Austrians as a result of their defeat at Caporetto (*q.v.*). The Italians reoccupied it in the autumn of 1918. At the end of the Second Great War, the New Zealand 2nd div. entered Gorizia, May 2, 1945, and held it despite Yugoslav claims to the town, which were not recognized by the Allies in drawing up the peace treaty with Italy.

Gorkum. Alternative form of name of the Dutch town of Gorinchem (*q.v.*).

Gorky (formerly Nijni Novgorod). Region and town of the Russian S.F.S.R. The chief river of the region is the Volga. The country generally is low-lying, swampy, and wooded, one-third of its area consisting of forest land. Agriculture is little developed, but cattle, horses, sheep, and pigs are bred. Lumbering, shipbuilding, and other occupations deriving from the forest occupy a large part of the pop. outside the town of Gorky. Its area is 19,789 sq. m.

The town of Gorky, capital of the region, stands at the confluence of the Volga and the Oka, and is connected by rly. with Moscow, which lies 250 m. W.S.W. The town is divided into three parts: the upper town on three hills, surmounted by a citadel, with the chief administrative and military buildings; the lower town, on the right bank of the Volga; and the Kunavino suburb, between the Oka and Volga, site from 1817 of the great annual fair (July 25 to Sept. 10) of Nijni Novgorod at which the products of the country for hundreds of miles around were sold and exchanged. The town was founded in 1221 by Yuri, prince of Suzdal-Vladimir, and after the downfall of the Kazan Tartars, in

1552, became the chief centre of exchange for Russian and Asiatic goods. Birthplace of Maxim Gorky (*v.i.*), it was given the name of Gorky in his honour by the Soviet government.

The town has a university. There is trade in cereals, metals, and fish; and for some years before the Second Great War, and still more during the war itself, Gorky was developed by the Soviet government as a centre of heavy industry, turning out motor cars, tanks, aeroplanes, etc. Pop. (1939) 644,116.

Gorky, MAXIM (1869–1936). A Russian author. He was born at Nijni Novgorod (renamed Gorky, *v.s.*, in his honour), March 14, 1869, his real name being Alexei Maximovitch Pyeshkov. His father died when he was four years of age, and his mother shortly after re-married. The boy was brought up by his maternal grandfather, but after a few months' schooling was apprenticed to a cobbler, and two months later to a draughtsman, from whom he ran away; then, after being assistant to an ironmaker, he became help to the cook on a Volga steamer, who inspired him with a liking for reading.

At the age of 16 Gorky, failing to secure education at Kazan university, entered a biscuit factory, afterwards working at anything that offered. In 1888 he tried to commit suicide, and on recovery resumed that vagabond life which later provided him with almost inexhaustible material for his pen. In 1892 his first story, *Makar Chudra*, appeared in a Tiflis journal. In 1893 V. G. Korolenko encouraged him to write. He rapidly produced *Chelkash*, 1893, and other short stories, becoming immediately popular. His stories began to appear in book form in 1898, many volumes of them later being translated into English. *Foma Gordeyev*, 1900 (Eng. trans. 1901), his first novel, though marked by fine descriptions of scenery of the Volga, and by remarkable character drawing, was on the whole disappointing. His play, *The Lower Depths*, was produced in London in 1903.

He was imprisoned in 1905 in connexion with the strikes of that year. After a visit to the U.S.A.

(1906), he settled in Capri, returning to Russia in 1914. On the outbreak of the First Great War he volunteered for service with the Russian Red Cross, and after the revolution became president of a committee for safeguarding artistic property. In 1922 his health compelled him to go abroad. He went first to Germany and then to Sorrento. He was given an enthusiastic reception when he visited Russia in 1928, and returned in 1932 to live there until his death, June 18, 1936.

His later works include *Fragments from my Diary*, 1924; *The Artamonoff Family*, 1926; *The Magnet*, 1931; *On Guard for the Soviet Union*, 1933. *Consult* Maxim Gorky, *His Life and Writings*, E. J. Dillon, 1902; Maxim Gorky and his Russia, Alex. Kaun, 1932.

Gorleston-on-Sea. Parish and watering place of Norfolk, England. It is part of the borough of Great Yarmouth, 122 m. N.E. of London, and is reached by rly. (E. region). Standing at the mouth of the Yare, it has good sands, in addition to a pier, swimming pool, golf course, and other attractions for visitors. Bus, river steamer, and train services connect it with Yarmouth proper. Pop. 18,929. *See* Yarmouth.

Görlitz (Pol. *Zgorzelec*). Town of Silesia near the Saxon border, mainly on the left bank of the Lausitzer Neisse. For seven centuries, Görlitz, seat of an old scientific society, and of the triennial Silesian music festivals, of many schools and colleges, was a political and strategic as well as economic outpost of importance, a centre of spinning and weaving, and in later times of rolling stock, engineering, timber, and glass industries. It received the privileges of a German city in A.D. 1220 and, in 1378, became capital of a duchy of the same name, granted by Emperor Charles IV to his son John; it defeated the Hussites in 1429 but lost most of its powers and wealth in 1547 in a struggle against Ferdinand I. It fell to Saxony in 1635, to Prussia in 1815. Many remarkable buildings witnessed to its proud history: watchtowers of the 15th century, such as the "Kaisertrutz," the Frauenturm, etc.; S. Peter and Paul (1423–57), the Trinity (13th century), and other churches; the chapel of the Cross (1465–98) with a copy of the holy sepulchre; the Gothic town hall (1534) etc. A theatre, a museum of natural history, a statue and tomb of the mystic Jacob Boehme, and a

Maxim Gorky,
Russian author

viaduct across the Neisse, 1,580 ft. long and 600 ft. high, a park and vineyards were among the attractions of Görlitz. Görlitz was within the area placed under Polish administration, 1945, and the bulk of its population was expelled. Its last registered figure (1935) was 94,182.

Gorlovka. Industrial town of the Ukraine S.S.R. It lies 35 m. N.N.E. of Stalino, and was one of 14 new towns of the great coalfield of the Donetz basin (Donbas) whose construction was decided on in 1930. During the Second Great War, it was overrun by the Germans in the autumn of 1941, and recaptured by the Russians, Sept. 4, 1943. Pop. (pre-war), 108,693.

Gornergrat. Rocky ridge of the Pennine Alps, Switzerland, in the canton of Valais. It forms part of the Riffelberg, 3½ m. S.E. of Zermatt, with which it is connected by a mountain rly. Alt. 10,289 ft. The summit commands a panorama of the Monte Rosa-Breithorn-Matterhorn group. At its base lies the Gorner Glacier.

Gorno-Badakshansk. Autonomous province of the Tadzhik S.S.R., also known as Badakshansk-Gorno (*q.v.*).

Görres, JOHANN JOSEF (1776–1848). German publicist. Born at Coblenz, Jan. 25, 1776, he graduated at Bonn. Teaching physics at Coblenz from 1800–06, he then moved to Heidelberg, returned to his native town in 1808, embroiled himself in revolutionary schemes, and was compelled to take refuge in Switzerland. In 1826 he returned to Germany and was appointed professor of history at Munich university, remaining there until his death, Jan. 27, 1848. *Die Kristliche Mystik*, 1836–42, was his chief work.

Gorse. Alternative name for the prickly evergreen shrub also known as furze (*q.v.*).

Gorsedd. Open-air bardic ceremony, said to be of ancient origin, included in the ritual of the Eisteddfod (*q.v.*), the national Welsh festival. At the Gorsedd the holding of the Eisteddfod is proclaimed a year and a day before it takes place. The word means assembly.

Gorst, SIR JOHN ELDON (1835–1916). British politician. Born at Preston, May 24, 1835, and educated at the grammar school and St. John's College, Cambridge, he went in 1859 to New Zealand, where he became civil commissioner in Wai-kato. Returning to England, he was called to the bar in 1865. He entered the house of commons in

*John Elford
Russell*

Gorst was knighted in 1885, was solicitor-general in 1885–86, under-secretary for India from 1886–91, financial secretary to the treasury, 1891–92, and vice-president of the committee of the council on education from 1895 to 1902. He took a keen interest in labour and social questions, and in 1890 was British plenipotentiary at the labour conference in Berlin. He died in London, April 4, 1916. His elder son, Sir Eldon Gorst (d. 1911), succeeded Lord Cromer in 1907 as British consul-general in Egypt.

Gort, OF HAMSTERLEY, SIR JOHN STANDISH SURTEES PRENDERGAST VEREKER, 1st VISCOUNT (1886–1946). British soldier. Born on July 10, 1886, he succeeded his father the 5th Viscount Gort, of Limerick, in 1902. He was created Viscount Gort, of Hamsterley, in the peerage of Great Britain, in 1945. Educated at Harrow and Sandhurst, he was commissioned in the Grenadier Guards, 1906, and at the outbreak of the First Great War was a captain. He had a distinguished career in France, gaining the M.C., 1915, the D.S.O. with two bars, 1917. In Sept., 1918, while in command of a battalion of the Grenadier Guards, he won the V.C. by leading a platoon to success in an assault upon machine-gun and artillery positions holding up the crossing of the Canal du Nord at Flesquières; he was wounded three times.

After the war Gort became an instructor at Camberley and at Sheerness; and director of military training in India, 1932. Promoted major-general, 1935, he was appointed commandant of the staff college, Camberley, 1936; military secretary at the war office, 1937, and three months later C.I.G.S. with the rank of full general. Gort immediately inaugurated a comprehensive pro-

gramme for modernising the equipment and training of the British army in the light of technical developments. War broke out before his plans were completed, and he went to France on Sept. 14, 1939, as c.-in-c., B.E.F. (Gen. Ironside replacing him as C.I.G.S.). His forces consisted of four British divisions and the French 51st division. The British divisions were short of armour, ammunition, artillery, equipment, and signals, and had scarcely any air support. During the winter and spring of 1939–40 Gort arranged with the French command for infantry brigades of the B.E.F. successively to complete short tours of duty on the Saar front to give them experience of actual contact with the enemy. The German offensive of May, 1940, and the three weeks' campaign which followed are described under British Expeditionary Force. Gort's dispatches, publ. Oct. 1941, shed much light on that campaign.

Gort returned to England on June 1, 1940, and in July was appointed inspector-general to the forces in training and inspector-general Home Guard. In 1941 he became governor and c.-in-c., Gibraltar, doing much to strengthen the defences of the "Rock." He was governor and c.-in-c., Malta, 1942–44, giving outstanding leadership there at a time when supplies of all kinds were dangerously low owing to the prolonged siege of the island from the air. Promoted field marshal in 1943, he went to Palestine in Oct., 1944, as high commissioner for Palestine and Transjordan, and c.-in-c., Palestine. His health broke down, and he resigned Nov., 1945. He died in London on March 31, 1946. He was succeeded by his brother, Robert Standish Gage Prendergast Vereker (b. 1888).

Gortchakov, PRINCE ALEXANDER MIKHAILOVITCH (1798–1883). Russian diplomatist. Born July

16, 1798, he entered the diplomatic service and became secretary at the embassy in London in 1824. After holding various posts he was appointed ambassador to the German Bundestag in 1850. Thence he was transferred to Vienna, 1854–56, in the latter year succeeding Nesselrode as foreign minister to

Alexander II, and in 1863 became chancellor of the empire. His policy was at first strongly pro-Prussian, but later he began to distrust Bismarck, a feeling increased by Germany's attitude of aloofness from Russia in the Turkish war of 1877-78. He then turned his attentions to France and worked for a Franco-Russian *rapprochement*. He resigned his portfolio as foreign minister in 1882, and died at Baden-Baden on March 11, 1883. See Berlin, Congress of.

Gortchakov, MIKHAIL DMITRIYEVICH (1795-1861). A Russian soldier. Of noble family, he became a soldier

M. D. Gortchakov,
Russian soldier

and saw service against the French in 1812-14. He fought against the Turks in 1828-29, against the Poles in 1831, and against the Hungarians in 1849. In 1846 he was made governor of Warsaw, and when the Crimean War began his reputation was sufficiently high for him to hold an independent command. His first operations were against the Turks in Moldavia and Wallachia, and an unsuccessful attack on the fortress of Silistria, but later he was entrusted with the command in the Crimea. There he won fame by his defence of Sevastopol. In 1856 he was made governor-general of Poland, and died at Warsaw, May 30, 1861.

Gorton. District of Manchester. It is an industrial area on the E. side of the city. It is served by railway, buses, and trolley-buses, and includes four eccles. districts. The chief industries are chemical works, engineering works, iron-works, and cotton mills. One member of parliament is elected. Pop. 50,127. See Manchester.

Gortonites. A religious sect founded in the U.S.A. about 1650 by Samuel Gorton (c. 1610-77). A native of Gorton, Lancashire, he fled to America on account of his religious opinions. At Warwick, Rhode Island, he made a settlement, mainly of those who shared his religious opinions. Named after him, the Gortonites, who disliked all forms and ceremonies, existed until about 1800.

Gortyna OR GORTYN. Ancient city of Crete, situated on the S. side of the island about 10 m. inland. It was second only to Cnossus (q.v.) in importance, and

the two cities from an early period were constantly at variance. In Roman times it became the capital of the island. Near Gortyna was discovered in 1884 the well-known inscription containing a code of laws dated about 400 B.C.

Gosau Beds. Series of limestones, marls, and sandstones in the north-eastern Alps of Austria. A local development of the Upper Cretaceous system, they contain fossil shells and banks of corals.

Goschen, GEORGE JOACHIM GOSCHEN, 1st VISCOUNT (1831-1907). British statesman. Born August 10, 1831, he was of German descent, his grandfather being a publisher of Leipzig. His own birth and education, however, were English, and after a fine career at Rugby and Oriel College, Oxford, he became a partner in the London firm of Fröhling and Goschen. In 1863 he entered parliament as Liberal member for the City of London, and in 1865 joined the ministry, entering Russell's cabinet the next year. From 1868-71 he was president of the poor law board, and from 1871-74 first lord of the admiralty under Gladstone. Declining to take office in 1880, he was sent as special ambassador to Turkey.

As a Liberal Unionist after 1884 Goschen was in more congenial company. He denounced Home

Goschen
Elliot & Fry

Rule with great spirit, and alone of his party took office under Salisbury in 1886. This was the occasion on which Lord Randolph Churchill, confident that his resignation would seriously embarrass the premier, "forgot Goschen," who remained chancellor of the exchequer until 1892. From 1895 to 1900 he was again first lord of the admiralty. He was M.P. for St. George's, Hanover Square, where he had found a seat when Liverpool rejected him in 1887. Previously he had represented Edinburgh, and earlier still Ripon. In 1900 he retired and was made a viscount. He was, however, active in his hostility to tariff reform, and spoke occasionally in the Lords until his death, Feb. 7, 1907.

Goschen was a man of many interests and sturdily independent. He wrote a standard book on the Foreign Exchanges, and in later

life edited the *Life and Times of his grandfather*. Short sight prevented him from being chosen Speaker, 1884. From 1903 to 1907 he was chancellor of Oxford University. *Consult* Life, Hon. A. Elliot, 1911; Lord Goschen and his Friends, ed. Percy Colson, 1946.

His son, George Joachim, 2nd viscount (b. 1866), was member for East Grinstead, 1895-1906, and was appointed joint parliamentary secretary to the board of agriculture, March, 1918. Governor of Madras, 1924-29, he was viceroy and acting governor-general of India, June-Nov., 1929.

Goschen, SIR WILLIAM EDWARD (1847-1924). British diplomatist. A son of W. H. Goschen, a London banker, and a younger brother of the 1st Viscount Goschen, he was born July 18, 1847. Educated at Rugby and Oxford, he entered the diplomatic service, and after passing some time as attaché at Madrid, Buenos Aires, and Paris, became secretary at Rio de Janeiro. From there he went to Constantinople, after which he acted as principal secretary at Peking, Copenhagen, Lisbon, Washington, and St. Petersburg. In 1898 he was British minister to Belgrade.

Sir William Goschen,
British diplomatist
Russell

From 1900 to 1905 he was minister at Copenhagen, and from 1905 to 1908 was ambassador at Vienna. In 1908 Goschen was transferred to Berlin, and it was his lot to conduct the negotiations immediately preceding the outbreak of the Great War and to leave the German capital on its declaration. In 1901 he was knighted, in 1905 was made a privy councillor, and in 1916 a baronet. He died May 20, 1924.

Gosforth. Urban district and residential town of Northumberland, England. It is 2 m. N. of Newcastle-upon-Tyne, with a rly. station (N.E. region). Near by is Gosforth Park, where race meetings are held, and there are three golf courses. Pop. 23,130. Another Gosforth is a village in Cumberland, on the edge of the Lake district, 12 m. S.E. of Whitehaven. It is noted for its ancient viking cross, a structure in the churchyard, 14½ ft. high.

Goshawk (*Accipiter gentilis*). Bird of prey, resembling a large sparrowhawk. It is found in many

Goshawk, a large bird of prey, formerly used for hawking

parts of Europe and Asia, but is now very rare in Great Britain. The species was formerly fairly common and was used in the sport of hawking. The plumage is brown on the back, and white barred with brown beneath.

Goshen. Land or district of ancient Egypt. It was given by Pharaoh to Joseph and his kinsmen as a dwelling place. It probably lay between the delta of the Nile and the isthmus of Suez. Its capital was the place now known as Kebir Fakkus.

Goslar. Th. of Lower Saxony. One of the best preserved of the ancient towns of Germany, it lies at the N. foot of the Harz mts., with the Rammelsberg (2,100 ft.) and the Steinberg (1,370 ft.) embracing the elliptical town. It is still surrounded by its old fortifications with watch-towers constructed in the 15th and 16th centuries. The Dome Chapel (1050), the Market Church (12th century), S. James's and the Frankenberg church (both 11th century), the former Augustine monastery Grauhof, the Kaiserhaus, founded in the 10th century, completed in the 11th by Henry III, the Gothic town hall (15th-16th century) and a guild hall (1494), a hospital of the 13th century, and many public and private buildings of the middle ages, make Goslar highly picturesque. Founded in

920 by Henry I, Goslar became wealthy from silver, copper, and lead mining in the Harz, was the seat of many Imperial parliaments, and, from 1281, was also a member of the Hanseatic League, a free city from 1400; ruined by the Thirty Years' War, it lost its independence in 1801, became Prussian 1802, Hanoverian 1815, and again Prussian in 1866. It has chemical, cigar, wood, stone, paper, and other industries, and had (pre-war) 20,854 inhabitants.

Gospel. An Anglo-Saxon compound word, god-spel, meaning good news, used as an equivalent of the Greek *evangelion*. The word is now used in various senses. It is the name of the biographies of Christ in the N.T.; signifies the message of redemption contained in those books; and is further used as a term for the entire Christian system of religion. Thus in the N.T., "to believe the Gospel" means not merely to accept the record of Christ as true, but to accept all that that record implies. See Bible; Gospels, The Four; New Testament.

Gospellers. A name formerly applied to the followers of Wycliffe and other pioneers of the Reformation in England, who laid stress on preaching the Gospel to the people. It was also given to a party of Antinomians who caused trouble during the Reformation period, and at a later date to the Puritans. In Church ritual, the gospeller is the deacon who reads the Gospel in the Mass.

Gospel Oak. Name of a short thoroughfare, or Grove, connecting Rochford Street and Haverstock Road, London, N.W. It is also the name of a rly. station, 6½ m. from Broad Street, lying between Kentish Town and Hampstead Heath. From an old oak tree at the boundary of Hampstead and St. Pancras parishes, at which a portion of the Gospel was read at the beating of the bounds, an

inn was named; and the name was later given to the surrounding fields, now built over, to a small village, to a chapel, to a school, and to the railway station.

Under one of the trees in Gospel Oak Fields, Whitefield is said to have preached; and here, down to 1857, was held a fair known as Gospel Oak Fair.

Gospels, THE FOUR. The name given to the first four books in the N.T., which are ascribed to Matthew, Mark, Luke, and John. The first three stand together and form a striking contrast to the fourth. They are called "the Synoptics," because they follow the same lines and deal with the narrative from a similar point of view. Mark is the earliest of the three and gives the story of the life of Jesus in its simplest form. Matthew adapts his narrative for Jewish readers, and his apologetic aim is manifest in his constant use of the argument from prophecy. Luke, on the other hand, being a Greek, strives to make his portrait of Jesus appeal to the Greek-speaking world.

The fourth Gospel was written thirty years later than the others, and is obviously an interpretation of Christ rather than a record of events. Its purpose is definitely stated in the words, "These (signs) are written that ye may believe that Jesus is the Christ and that believing ye may have life in His name" (20, v. 31).

The problem of the inter-relation of the Synoptic Gospels has been very widely discussed. It is no longer possible to regard them as independent writings. The immense amount of common material, the similar arrangement of events, the many verbal similarities put such a theory out of court.

It is inconceivable, for instance, that three independent writers in the narrative of the healing of the palsied man of Capernaum could have introduced at the same point in the story exactly the same parenthesis " (he saith to the sick of the palsy)." The hypothesis that the three evangelists embodied and reproduced the oral tradition of the Church has come to be regarded as inadequate. The most generally accepted theory is that the similarities in the three narratives can be accounted for only by assuming that the evangelists derived their materials from common sources. One of these sources is generally identified with the Gospel of Mark, perhaps not in its present form.

The justification for this assumption is ample. Practically the

Goslar, Germany. Market place with the fountain dating from about the 12th century

whole of Mark is embodied in Matthew and Luke, and even the order of Mark's narrative is followed by one or other of the later evangelists. It is only very rarely that Matthew and Luke agree in differing from the statements or arrangement, or phraseology of Mark. In addition to Mark it is known that the other two evangelists used another document, because their gospels contain much common material which is not derived from that source. This material is chiefly connected with the teaching of Jesus. It is, therefore, highly probable that the second documentary source employed by Matthew and Luke, was a collection of the Logia or Sayings of Jesus; and attempts have been made, notably by Harnack, to reconstruct it. Such a reconstruction, however, is bound to be hypothetical, since when Matthew and Luke diverge, there is no infallible criterion for deciding which of them represents the original.

Comparing the version of the teaching of Jesus in Matthew's Sermon on the Mount with the version of Luke, we find that about a third of the Sermon on the Mount appears in Luke's Sermon on the Plain; another third is found interspersed at many different parts in Luke, while the remaining third is absent altogether. Again, comparing the versions of the Lord's Prayer or the Beatitudes of the two Gospels, the most striking differences manifest themselves. It is almost impossible in these and many other cases to say whether Matthew or Luke is more likely to be a faithful representation of the original, and hence the character of the second source remains problematical as regards its details.

From the statement of Papias (c. 130), bishop of Hierapolis in Phrygia, "Matthew then composed the Logia in the Hebrew tongue and each one interpreted them as he was able," it has been argued that what Matthew wrote was not the present Gospel but the Logia source later embodied in it.

It follows that the Gospels represent three different strata of historical evidence. The first and most valuable is to be found in the sources of the synoptics—Mark and the Logia. It is from these that the earliest and best material for constructing the life of Jesus is to be obtained. Unfortunately the date at which these documents were written cannot be fixed with anything like certainty, but they cannot be much later than the

decade 50–60. They must certainly have been composed at a time when their statements might have been checked and challenged by the memory of living witnesses.

The secondary stratum is to be found in Matthew and Luke which probably belong to the period 60–80, though it is impossible to date them with anything like precision.

The tertiary stratum is the Gospel of S. John which cannot have come into existence much before 100. From an historical point of view its evidence is of much less value. The personal equation of the writer makes its presence felt especially in his version of the teaching of Jesus. There is much to be said for the position of Renan that "if Jesus spoke as Matthew makes him speak, he cannot have spoken as John makes him speak," not that this implies that the Johannine speeches are entirely fictitious, for, as Matthew Arnold puts it, "these speeches cannot in the main be the writer's, because in the main they are clearly beyond his reach." *See Bible; Criticism; Jesus Christ; New Testament.*

Gosport. A borough, seaport, holiday resort, and market town of Hampshire, England, originally

Gosport arms

two separate villages known as Gosport and Alverstoke. The seaside resort of Lee-on-the-Solent is included within the borough. Pop. est. 49,000. Standing on the W. side of Portsmouth Harbour, it is 86 m. by rly. from London. It joins with Fareham to elect one M.P. A ferry and floating bridge connect it with Portsmouth. The chief church is S. Mary's, Alverstoke. It has various naval establishments, the most notable being the immense Royal Clarence victualling yard, Fort Blockhouse submarine base, and Haslar Hospital (*q.v.*), while there are also barracks and notable shipyards. The town and beaches were one of the principal points of embarkation for the invasion of Normandy, 1944.

At the flying school established here during the First Great War,

and commanded by Lt.-Col. Smith-Barry, the Gosport system of flying instruction, basis of later R.A.F. methods, was evolved, and Gosport tubes—headphones, etc., for intercommunication between flying instructor and pupil—were invented.

Goss. Porcelain invented by William Henry Goss (1833–1906). It is remarkable for the delicate ivory of its body and the brilliance of the enamels employed in the heraldic decoration which was its earliest distinguishing feature. The ware is made at the Falcon potteries, Stoke-on-Trent. *See Pottery.*

Goss, Sir John (1800–80). A British organist and composer. Born at Fareham, Hampshire, Dec. 27, 1800, he became a chorister at the Chapel Royal in London. In 1838 he succeeded his master, Thomas Attwood, as organist of S. Paul's Cathedral, and he held that post until 1872, being knighted on his retirement. He composed many anthems, edited the Church Psalter and Hymnbook, and wrote *The Organist's Companion*. Goss died May 10, 1880.

Gossage, Sir (Ernest) Leslie (1891–1949). British air officer. Born Feb. 3, 1891, he went to Rugby and Trinity College, Cambridge. He received his first commission 1912, in the R.F.A., but in 1915 was seconded to the R.F.C., spending 3½ years in France. Squadron leader in the R.A.F., 1919, he rose to air marshal in 1940. He was air attaché at the British embassy, Berlin, 1930–31, served in Iraq (1934–35) and Aden (1935–36), commanded No. 11 (fighter) group (1936–April, 1940), and was air officer commanding Balloon Command (1941–44), and chief commandant and director general of the Air Training Corps (1944–46). He was created K.C.B. in 1941. He died July 8, 1949.

Gossamer. Fine filaments of cobweb, which may be seen in autumn floating in the air or entangled in the bushes. They are spun by the young of certain spiders, which are thus carried on the wind for considerable distances. The word is applied to a gauzy textile fabric.

Gossan. Geological term first used in Cornwall, England. Mineral deposits near the surface

Sir Ernest Gossage, British air officer

containing quartz and sulphides are frequently leached and oxidised, leaving an outcrop composed of a cellular mass of residual quartz and limonite (an iron oxide). This outcrop is known variously as gossan, ironstone (Australia), *colorados* (Spanish), *chapeau de fer* (French), *eisener Hut* (German).

Gosse, Sir Edmund William (1848–1928). A British man of letters. Son of P. H. Gosse (*v.i.*), he was born in London, Sept. 21, 1849. His mother was a Hebrew and Greek scholar. He was educated at private schools in Devon. Through the influence of Charles Kingsley, he became assistant librarian to the British Museum, 1867–75. Translator to the board of Trade, 1875–1904, and lecturer in English literature at Trinity College, Cambridge, 1884–90, he was librarian to the house of lords, 1904–14. He was knighted in 1925, and died May 16, 1928.

Edmund Gosse
Russell

Distinguished equally as poet, critic, translator, and biographer, Gosse's best remembered work is probably *Father and Son*, an autobiographical study, published anonymously in 1907, and crowned by the French Academy, 1913. His long series of critical biographies included Gray, 1832; Congreve, 1888; P. H. Gosse, 1890; Donne, 1899; Jeremy Taylor, 1904; Sir Thomas Browne, 1905; Patmore, 1905; Ibsen, 1908; Swinburne, 1917. His literary reviews in the Sunday Times were reprinted as *Books on the Table*, 1921, and his last book, *Leaves and Fruit*, appeared in 1927. His *Life and Letters* by E. Charteris was published in 1931.

Gosse, Philip Henry (1810–88). British naturalist. Born at Worcester, April 6, 1810, he spent his early years as a farmer in Canada and a schoolmaster in the U.S.A. Returning to England in 1839, he was sent to Jamaica to collect birds and insects for the British Museum. He then devoted his attention to marine zoology, and published and illustrated several books on the subject. He is the "father" in Edmund Gosse's *Father and Son*. He died at Torquay, Aug. 23, 1888.

Göta. River of S.W. Sweden. Issuing from Lake Wener, at its S. extremity, it flows S.S.E. to the Kattegat through two arms, the

southern one passing Gothenburg. About 65 m. long, it is navigable throughout its course. The cataract at Trollhättan is surmounted by locks constructed 1793–1800.

Göta Canal. Waterway of S. Sweden, connecting the Kattegat with the Baltic. Starting from Gothenburg, and utilising the Göta river and Lake Wener, the canal leads to Lake Wetter and then continues E. through small lakes to the Baltic at Mem, below Söderköping. Its total length is 240 m., the canalised portion being 55 m. It considerably reduces the sea journey between Gothenburg and Stockholm. The canal has 58 locks, a maximum alt. of 300 ft., and is 10 ft. deep. The work was begun in 1716, continued in 1753, and completed 1810–32. See Canal.

Göteborg. Swedish name for the town at the mouth of the Göta river. See Gothenburg.

Göteborg and Bohus. Län or government of Sweden. It is bounded on the W. by the Skagerrak and the Kattegat, area 1,989 sq. m. There are numerous coastal inlets and many islands. Fishing is an important industry. Pop. 502,445. The capital is Gothenburg (*q.v.*) or Göteborg.

Götenhafen. Name given by the Germans to the Polish port of Gdynia (*q.v.*) during their occupation of W. Poland, 1939–45. They made it a naval base.

Götha. A town of Thuringia. Formerly a residence of the ruling dukes of Saxe-Coburg-Götha, it lies 15 m. W.S.W. of Erfurt, in the foothills of the Thuringian forest. It developed round one of Charlemagne's farming estates, but was first mentioned as a town of the Thuringian landgraves in 1189. The Saxon dukes frequently resided there in Grimmenstein castle, replaced 1643–46 by the Friedenstein palace. There are also a summer palace (1711), a theatre (1774), a town hall (1547, reconstructed 1666), an Augustine church (13th) and S. Margaret's (12th–15th cents.), an art gallery, two observatories, and a museum. Rly. rolling stock, aircraft, pottery, rubber, and soap were among its manufactures. During the Second Great War it was captured by the U.S. 3rd army, April 4, 1945. Pop. (1935) 47,848. See Almanach de Götha.

Götha. German aeroplanes of the First Great War. It was used in raiding London, Paris, and other centres and had a speed of 70–80 m.p.h. A biplane fitted with twin engines, it had pusher or tractor airscrews. The firm of Götha pro-

duced several types of military aircraft during the Second Great War, notably the Go 242 transport glider.

Gotham. Parish of Nottinghamshire, England. It is associated with the phrases "wise men of Gotham" and "mad men of Gotham" once used as synonyms for rustic simpletons, much as Abderites was used in ancient Greece for the men of Abdera (*q.v.*). The men of Gotham figure in the jest books and plays of the 15th–16th centuries, notably in the Townley Mysteries and in the black letter collection entitled *Merry Tales of the Mad-Men of Gotam*.

The 20 tales or anecdotes in the collection referred to include the familiar jest of the men who hedged in a cuckoo to compel it to sing all the year, and the story of the man who, riding to market with two bushels of wheat, carried them

Gotham. Facsimile of the title page of an early edition of the old jest book

on his own neck so that his horse should not bear too heavy a burden.

Dekker, in *The Gull's Hornbook*, 1609, alludes to "the wise men of Gotham," as does the old rhyme:

Three wise men of Gotham
Went to sea in a bowl;
And if the bowl had been stronger
My song would have been longer.

Washington Irving, in *Salmagundi*, 1807, called New York Gotham. Pop. 1,344.

Gothenburg (Swed. Göteborg). Second largest city and chief exporting seaport of Sweden. It stands on the S.W. coast, 5 m. from the mouth of the river Göta, 285 m. by rly. S.W. of Stockholm. The old ramparts are replaced by boulevards adjoining the moat. The city is traversed by numerous

canals, has electric tramways, and is served by six railways. It has fine new quarters, handsome quays, and many parks, besides a cathedral, German and English churches, town hall, museum with pictures and statuary, city theatre, concert hall, and a university and library.

Its spacious harbour is generally ice free. Exports include timber, wood pulp, joinery, paper, cardboard, iron, glass, engineering products (ball bearings), matches, and fish. There are shipbuilding yards, flour mills, tanneries, sugar refineries, breweries, tobacco and margarine factories, and textile and other industries.

Founded by Gustavus Adolphus in 1619, it was at first settled by foreigners, chiefly Dutch, Scots, and English. During the Continental blockade of 1806 it was the chief British base in N. Europe. In 1802 the city suffered from a disastrous conflagration, and in Nov., 1920, the fishing harbour was seriously damaged by fire. During the Second Great War, sick and wounded German and British prisoners of war were sent here from Great Britain and Germany respectively for repatriation. Pop. 309,348.

Gothenburg System. Plan for dealing with the liquor traffic, introduced at Gothenburg, Sweden, about 1871. Adopted in Stockholm, in 1877, it spread to Norway and other countries, and was adapted in the United Kingdom by the Public House Trust (*q.v.*). Under the Gothenburg system a company may buy up existing licences and open in place of the old licensed houses a limited number of establishments for the sale of pure liquor, the salaried managers of which have no pecuniary interest in the sale of the liquor. Each company is under municipal control, and all profit beyond the realization of 5 p.c. on the capital expenditure is handed over to the civic authorities.

Gothic (late Lat. *Gothicus*). A term meaning connected with the Goths. Originally it was applied to certain distinguishing features of the middle ages as contrasted with those of classical times, and connoted rudeness or want of polish. The term is also applied to a certain phase of art and architecture; to type used for printing German black-faced and pointed letters formerly called black letter; and to the Mozarabic liturgy spoken by the Christians of Toledo, which was supposed to have been introduced into Spain by the Visigoths or Western Goths.

Gothenburg, Sweden. General view of the town from the Old Fort

The Gothic language is now generally assigned to the E. Germanic branch of the Teutonic group. Originally spoken by the Visigoths, who in the 4th century occupied Dacia and Moesia, it survived until the 16th century in the Crimea. The alphabet, the invention of which is attributed to Ulphilas (*q.v.*), consisted of 24 letters, based upon the Greek, but also contained some Latin characters and runic symbols (*see* Rune). Some idea of this Gothic, or, rather, Moeso-Gothic language, is furnished by the fragmentary remains of the translation of the Bible by Ulphilas, discovered in Germany and now in the library of the university of Uppsala, and of one or two other documents, together with a portion of a calendar, found in Italy. *See* Goths; Typography.

Gothic Architecture. Manner of building practised in western Europe, especially in France, during about 1150–1550. Before the earlier date a traditional use of Roman forms had lingered on in some degree. The styles of art then practised are, therefore, now usually called Romanesque. The word Gothic at first was applied to Romanesque art as well and was used in the sense of barbaric. In reality, however, Gothic architecture is one of the most remarkable and refined types of building art ever practised. Gothic art is also frequently called medieval, but this also applies only to western Europe; medieval art in Persia or India, for instance, is not Gothic.

About the middle of the 12th century, especially in Paris and its neighbourhood, all the inherited forms of building were gradually changed under the influence of great dominating principles. The leading ideas were freedom, energy, and delight. There was a great outburst of building fervour, especially in churches, and under this impulse the building art

became entirely experimental and organic.

The chief problem the medieval builders set themselves to solve was the erection of vast cathedral buildings having high stone vaults. Now, arches and vaults are active things always tending to push outwards and fall; thus these buildings came to be conceived as problems in equilibrium. The higher central vaults of the nave were usually sustained on either side by lower vaults over the aisles, and arched stone props, called flying buttresses, were built from the outer walls of these aisles to the upper part of the main building or clerestory. These arched props were placed only at intervals between the windows; at the outer ends they rose from strong buttress masses built out from the aisle walls. In some of the greater French cathedrals there are two aisles on each side of the central span, the outer ones being the lower. At the middle point of all, over the intersection of the nave and transepts, a tall lantern tower was frequently built. The whole plan and design of this "arcuated" architecture turned on this question of constructive balance.

In all the minor parts and details, a similar general idea of functional service was developed, pillars became very tall, and large windows interrupted the walls between the supporting points. Still further beyond the actual needs of structure, the expression of tense and active service was increased by breaking up the edges of arches and pillars into many deeply cut mouldings, but these and the many delightful forms of tracery and sculpture were means to what was thought to be proper finish, and do not belong to the structural system. It was these details, however, which caught the eyes of the older students of Gothic architec-

ture, so that it came to be thought of as a picturesque grouping of towers and traciced windows and pinnacles and parapets.

The great spring-time of Gothic art was the hundred years from 1150 to 1250; then came a century or so of strong maturity, and then a gradual decline. In England, Canterbury Cathedral was built by a French master-mason from about 1175, but a clear expression of the Gothic spirit hardly became general before 1200. In the middle of the 13th century, Westminster Abbey and Salisbury Cathedral were being built, and great works were in progress at other cathedrals, and at scores of abbeys.

The development of Gothic architecture from first to last was so regular that examples can be dated with fair accuracy at sight. In England the style of work which is most characteristic of the 13th century has been called Early English, the typical work of the 14th century is Decorated, and that of the 15th century is Perpendicular. Although the perfecting of the stone-vaulted cathedral was the great task of Gothic architecture, yet the problems of all other buildings, such as the castle, bridge, town hall, and house, were also dealt with. Gothic and the other style-names here mentioned are all modern; to those who executed it their work was merely good building.

Prior, 1900; Gothic Architecture in England, F. Bond, 1905; Medieval Architecture, A. C. Porter, 1909; Architecture for General Readers, H. H. Statham, 1909; Gothic Architecture in France, England, and Italy, 2 vols., 1915; Gothic England, J. Harvey, 1947.

GOTHIC REVIVAL. As the aristocratic Georgian influence was supplanted by that of the newly enriched middle classes, British architects, disliking the changing conditions, sought refuge in a return to past styles. The Gothic revival began in the 18th century, when Horace Walpole built Strawberry Hill, but did not develop fully until the 19th. At first the movement found expression only in small country houses and cottages. St. Luke's Church, Chelsea, by James Savage, first building in revived Gothic in London, was erected in the 1820s, and is in a formal, yet imaginative, style. As the century progressed, however,

the teachings of Ruskin and the tenets of the religious revival stimulated architects to design churches, railway stations, town halls, schools, and libraries in imitation of medieval castles and cathedrals. Gilbert Scott's churches of St. Giles, Camberwell, and St. Mary Abbots, Kensington, resemble his St. Mary's Cathedral, Edinburgh, and Glasgow University in their elaboration of detail. The Albert Memorial in Kensington Gardens, London, probably represents revived Gothic at its most grandiose. Other notable examples are St. Pancras station, the royal courts of justice, 1874-82 (one of the last attempts to apply Gothic to a large public building), and the Prudential building in Holborn. Liverpool Cathedral, begun in 1903, and built of red sandstone, has a simple dignity, and may be considered a climax to the revival. See Architecture; Cathedral.

Gothic Line. German defensive system of the Second Great War in Italy. It extended from Pisa through the N. Apennines over the Futa Pass to Rimini. The great natural difficulties of the terrain had been elaborately reinforced by concrete emplacements, strongpoints, and other fortifications built by forced labour. In July, 1944, the German commander Kesselring fell back to it before the Allied advance from the S. The Allies captured Pisa on Sept. 2, and on the same day breached the line in the Adriatic sector. The fall of Rimini on Sept. 21 turned it in the E., and with the occupation of the Futa Pass on Sept. 23, after a ten-day struggle, the Gothic Line ceased to be an effective defence.

Gothland (Swed. *Gotland*). Largest island in the Baltic Sea, belonging to Sweden. It lies about 58 m. off the S.E. coast of the Scandinavian peninsula, and is 76 m. long and 30 m. broad, with an area of 1,220 sq. m. A level limestone plateau, with an alt. of from 80 ft. to 100 ft., encircled by cliffs and broken by bays, its soil is fairly fertile and the climate comparatively mild. It is well wooded and the marshes have been drained. Cattle, ponies, and sheep are reared, and cereals, sugar beet, fish, lime, stone, and timber are produced. There are some 80 m. of rly. and several small towns.

In the Middle Ages Gothland was a member of the Hanseatic League, and since then it has had various owners, becoming Swedish

in 1645. From its form and situation it has been called the Eye of the Baltic. The capital is Visby. Pop. 59,275.

Gotland, GÖTALAND OR GÖTARIKE. Most southerly of the three old provs. of Sweden. It is subdivided into 12 läns or departments. Mountainous and forested in the N., and including lakes Wenner and Wetter, it also contains some of the most productive soil in the country. Gothenburg (*q.v.*) is the largest town.

Gotlandian. System of stratified rocks typically developed in the island of Gotland in the Baltic, whence they extend into Scandinavia. The name has been used by some authors instead of the equivalent and better known term Silurian (*q.v.*).

Goths. Teutonic people of the Scandinavian branch. In the 1st century A.D. they appear to have been dwelling in the neighbourhood of the Baltic and the river Vistula. In the 3rd century they had migrated southwards and were spreading along the N. of the Black Sea and the Lower Danube. In the second half of that century they annihilated the army of the emperor Decius, were heavily defeated later by Claudius, and were finally allowed by Aurelian to settle in Dacia. There they were known as the Visigoths or Western Goths, while the tribes which remained in the E. were called Ostrogoths.

They dwelt on friendly terms with the Roman Empire for the next hundred years, but towards the close of the 4th century the pressure of the Huns (*q.v.*), who subjugated the Ostrogoths, forced the Visigoths to push over the Danube, and the emperor Theodosius compromised with them by allowing their settlement in Thrace. They had already adopted the Arian form of Christianity, taught by the missionary Ulphilas (*q.v.*).

After the division of the empire between the two young sons of Theodosius, a new migratory movement began among the Goths. Gothic cohorts had been embodied in the Roman army; an injudicious reduction in their pay stirred the Visigoths to revolt under the leadership of Alaric the Amaling. Alaric was pacified by being made governor of Illyricum, but in 400 he led his Visigoths to invade the Western Empire by way of N. Italy. He was held back for a time by Stilicho, but in 408, when Stilicho was dead, Alaric renewed his invasion, swept through northern Italy, and in 410 captured and

GOthic ARCHITECTURE: ITS DEVELOPMENT IN ENGLAND FROM ANGLO-NORMAN TO TUDOR

sacked the city of Rome for the first time since its capture by the Gauls 800 years before. Though the Goths wrought much devastation they were distinguished as being by far the least cruel of barbarian conquerors; and the impressive majesty which still attached to the name Rome is emphasised by the strange fact that Alaric chose not to set himself on the imperial throne, but to act as lieutenant of the emperor.

Although the Goths might have taken possession of Italy, Ataulf, who succeeded Alaric, in 411 withdrew his Visigoths into southern Gaul. There the Gothic kingdom of Toulouse was set up, in nominal subordination to the Roman empire. In 451 its king, Theodoric, joined with the Roman general Aëtius in inflicting a decisive defeat upon Attila (*q.v.*) and the Huns, when Theodoric himself was killed.

Gothic Kingdom of Toulouse

The kingdom of Toulouse embraced Spain as well as southern Gaul. The Goths, in fact, were granted the sovereignty of this territory as an official recognition of their services to the Roman empire in Spain, which had been conquered by Ataulf's successor Wallia. The peninsula had just before been overrun by a kindred but infinitely more cruel race, the Vandals (*q.v.*). Wallia's conquest, nominally the recovery of Spain from the Vandals, drove that people into the southern portion of it, which still bears the name of Andalusia; later they migrated to Africa. At the beginning of the 6th century the kingdom of Toulouse was overthrown by the Franks (*q.v.*) under Clovis, whose career was checked by the Ostrogoth Theodoric (to be distinguished from Theodoric the Visigoth).

In Spain the Gothic dominion continued. By the middle of the century it had reverted to the form of an elective monarchy which had prevailed among the Goths under the old tribal system. In one of the revolutions which are the normal accompaniment of elective monarchies, a prince named Ermengild, who had relinquished Arianism for orthodox Christianity, earned the martyr's crown by refusing to revert to Arianism, but in the reign of his brother Recared, the Gothic people conformed to the prevailing creed of Western Europe and adopted orthodox Christianity.

The Church, hitherto hostile, now was friendly, but its friendship was more dangerous than its enmity, since the rulers fell

under the domination of Churchmen, who in their own interests hindered, instead of helping, all efforts to centralise the government. The Saracens invaded Spain, and the last Gothic king, Roderic, was overthrown in the great seven days' battle of the Guadalete in 711. The Moors overran the peninsula, and the surviving Goths were driven into the remote fastnesses.

The Ostrogoths had fallen under subjection to the Huns, but when the Hun empire broke up on the death of Attila they reappeared on the middle Danube. Thence about 470 they descended into the Balkan peninsula. Their young king Theodoric emulated the career of Alaric. Acting as lieutenant of the eastern emperor Zeno, he carried his Ostrogoths into Italy, overthrew Odoacer, the Teutonic chief who had deposed the last of the Roman emperors, and established himself as the viceregent of Zeno. He proved a soldier and legislator of exceptional ability; he died in 526.

The emperor Justinian resolved to make his dominion in Italy a reality; his general Belisarius (*q.v.*) temporarily wrested the supremacy from the Goths; after his departure they recovered their ascendancy under Totila, a worthy successor of Theodoric. Belisarius failed to overthrow him, but the task was finally accomplished by Narses. The Ostrogoths, their power completely shattered, retreated to the N., dispersed, and were never heard of again.

Bibliography. History of Latin Christianity, H. H. Milman, 4th ed. 1883; The Goths, H. Bradley, 1888; Decline and Fall, E. Gibbon, ed. J. B. Bury, 1909-14; Italy and her Invaders, T. Hodgkin, 2nd ed. 1916

Goto or Gotto. A group of islands off the S.W. extremity of Japan. They lie W. of Kyushu and 60 m. W. of Nagasaki. The largest are Fukai, Hisaka, and Nakadori. Fukai is 25 m. in length.

Götterdämmerung. German name for the Norse Ragnarök, or the Twilight of the Gods: the break-up of the power of the gods of Teutonic mythology which would result in a new cosmogony. This theme was adopted, and this name given to an opera in 3 acts with introduction, by Richard Wagner (*q.v.*). The fourth part of *Der Ring des Nibelungen*, the work was composed 1870-74, and first performed at Bayreuth, Aug. 17, 1876. *Götterdämmerung* contains the dramatic Death and Funeral March of Siegfried.

Gottfried von Strassburg (*f.* 1210). German poet. His unfinished epic *Tristan*, adapted from the French, is the only work that can with certainty be ascribed to him. In this poem, distinguished by style and beauty of expression, the author exhibits remarkable psychological insight.

Göttingen. Town in Lower Saxony, in the fertile valley of the Leine, 56 m. S. of Hanover, at the foot of the Hainberg (1,100 ft.). Though a picturesque town, with many buildings of the 14th to 16th century, Göttingen derives its international reputation exclusively from its university, founded by George II of England and Hanover in 1734-37; though young, compared with Prague, Heidelberg, and other seats of learning, it rapidly won fame for its historians, linguists, and jurists, and, from the 19th century, its physicists. Mentioned first in the 10th century as *Villa Gutingi*, Göttingen secured the privileges of a city c. 1200, became an important cloth-making centre, a member of the Hanseatic League, and between 1300 and 1500 attained considerable power. During the religious and the Thirty Years wars it declined and was partly destroyed, but it recovered under the Hanoverian dynasty. Many British scientists, statesmen, etc., studied at Göttingen, whose library (750,000 books, over 8,000 old MSS.) was one of the finest in Germany (some 200,000 volumes were destroyed by fire shortly after the Second Great War). S. John's church (12th and 14th century), S. James's (14th and 15th), the town hall (1369-71), the Junkernhaus (16th century), and the old goose-girl fountain were among buildings deserving mention. Its industries included the making of scientific instruments, pianos, and chemicals. Pop. (1935) 47,149.

In the Second Great War, Göttingen was overrun by infantry of the U.S. 1st army on April 8, 1945. It fell within the British zone of occupation. The university was reopened on Sept. 1, and, by the middle of 1946, had 4,800 students, among them men and women of the B.A.O.R., and nearly 250 professors and lecturers.

Gottsched, JOHANN CHRISTOPH (1700-66). German critic. Born at Judithenkirch, near Königsberg, he began early to lecture at Leipzig, where he became a professor in 1734. He sought to reform the German drama, and establish poetry as a matter of definite rule. For a time his influ-

ence was considerable, and he was regarded as a prophet of German culture. He died Dec. 12, 1766.

Gottwald, KLEMENT. Czechoslovak president, 1948. See N.V.

Gouda or **TER GOUW.** Town of the Netherlands, in the prov. of S. Holland. It stands on the Yssel at its junction with the Gouw, 12 m. N.E. of Rotterdam, and is intersected in all directions by a system of canals. Notable buildings are the Groote Kerk (S. Janskerk), founded in 1485 and rebuilt in 1552, and the Stadhuis, built 1449-59. During the Second Great War it remained in German occupation until the end of hostilities, May 6, 1945.

The principal industries are the manufacture of candles, cigars, twine, pottery, pipes, and the famous cheese (see Edam). A trade in cattle and cereals is carried on. Gouda canal connects Amsterdam with the Lek oil refineries. Pop. 32,703.

Gouge. As a geological term, it signifies a clayey attrition product, usually consisting of a fine-grained aggregate of minerals, and often occurring along the walls of a fault.

Gough, HUGH GOUGH, 1st Viscount (1779-1869). British soldier. Born at Woodstown, co. Limerick,

Nov. 3, 1779, he belonged to a family that had long lived in Ireland. In 1794 he entered the army, and took part in various expeditions against France and her allies. In 1809 he was in Portugal,

and in the Peninsular War made a reputation by his gallantry and also as a regimental leader. After 1819 he served in Ireland until 1826.

In 1837 he commanded a division in India, whence he went to China as commander-in-chief during the war of 1841-42. In 1843 he was made c.-in.-c. in India, and as such he took the field against the Maharrattas in 1843, and against the Sikhs in 1845. He crushed the Sikhs, his culminating victory

being at Sobraon, but in 1848 they rose again in arms. Gough met them at Chillianwalla, and, although that combat was not decisive, a victory at Gujarat, 1849, put an end to their resistance before the order for his recall reached him. In 1846, being already a baronet, he

was made a baron, and in 1849 a viscount. Promoted field marshal in 1862, he died March 2, 1869.

Gough, HERBERT JOHN (b. 1890). British metallurgist. Born April 26, 1890, he was educated at University College School and London university, and was apprenticed to Vickers, 1909-13. Superintendent, engineering dept., of the National Physical Laboratory, Teddington, 1930; director of scientific research, War office, 1938; director general, scientific research and development, the ministry of Supply, 1942, in 1945 he became engineer-in-chief of Lever Bros.

and Unilever Ltd. He was made F.R.S. in 1933. His publications included *Fatigue of Metals*, and numerous papers on engineering and allied subjects in scientific journals.

Gough, SIR HUBERT DE LA POER (b. 1870). British soldier. A member of a distinguished Irish military family, he was born Aug. 12, 1870, and was educated at Eton and Sandhurst. Commissioned in the 16th Lancers in 1889, he served in the Tirah expedition, 1897-98, and throughout the S. African war. Appointed to the command of the 16th Lancers in 1907, he was promoted

brig.-gen. 1911 and given command of the 3rd cavalry brigade at the Curragh, where his attitude in the political crisis arising from the Home Rule Act caused him to resign his commission rather than lead his troops against Ulster. The difficulty was adjusted, however, and at the outbreak of the First Great War he took his brigade to France. He was later given com-

mand of a division, and in 1916, of the 1st corps.

In July, 1916, he was created K.C.B. and put in command of the 5th army, which he had led during the battle of the Somme. In 1917 he was for some time in charge of the third Ypres offensive, where his tactics were criticised by some as unduly costly in casualties. When the final German offensive opened March 21, 1918, the 5th army bore the brunt of the enemy attacks. Although Gough did everything possible to stem the German advance, his troops fell back with heavy losses. He was held responsible for the disaster, recalled, and retired. The 5th army was disbanded. In his book *The Fifth Army* (1931) Gough vindicated his conduct of affairs in 1918, and this vindication was later supported by Lloyd George, who, as premier, had been instrumental in his recall, and given public expression in parliament. It was established that the tactical dispositions of the 5th army were the only ones possible in the circumstances, and that the failure was largely due to Haig's faulty dispositions of the reserves.

In 1919 Gough was appointed head of the British mission to the Baltic States. He retired from the army in 1922 with the rank of general. He joined the Home Guard as a private in 1940, and later became a zone commander, resigning in 1942.

Gough, JOHN BARTHOLOMEW (1817-86). American temperance lecturer. Born at Sandgate, Kent, England, Aug. 22, 1817, he went to America, and in 1831 became a bookbinder in New York. Drunkenness and a dissolute life, which hastened the death of his wife and child, brought him to destitution. Befriended by a Quaker, he took the pledge in 1842, and soon became a powerful and convincing lecturer on temperance, himself furnishing a useful illustration of his text. He died Feb. 18, 1886.

Gouin, FÉLIX (b. 1884). French lawyer and statesman. Gouin was born Oct. 4, 1884, at Peypin, Bouches-du-Rhône, studied law at Aix-en-Provence, and was admitted to the bar in 1907. A member of the S.P. from the age of 18, he became deputy for Aix in 1924. One of

Gouda. The Gothic Stadhuis, built in 1449-59, with a Renaissance staircase, 1803

1st Viscount Gough, British soldier. After J. Jackson, R.A.

Sir Hubert Gough, British soldier

Félix Gouin, French lawyer and statesman

the 80 deputies who voted against Pétain in 1940, Gouin defended Léon Blum at the Riom trial (*q.v.*). Appointed by the Socialist party as its representative on the French national committee in London, he escaped from France via Spain, where he was interned for three months, and reached London, Aug., 1942. A member of the provisional consultative council at Algiers, he was elected its president (speaker), became president of the constituent assembly in Paris, Nov., 1945, and succeeded Gen. de Gaulle as premier, Jan., 1946. Vice-premier in Bidault's ministry, June, 1946, he was minister of state in Blum's "caretaker" government, Dec., 1946, and in Ramadier's first 1947 government. He was criticised in connexion with the public management of certain wine transactions.

Goujon, JEAN (c. 1515-87). A French sculptor. A native of Normandy, probably born in Rouen, in 1541-42 he executed various sculptures for the cathedral and the church of S. Maclou in that city. Shortly afterwards he removed to Paris, where his connexion with the Louvre established and preserved his reputation. He took a prominent part in the decoration of the building—his four Caryatides being famous—and some of the finest examples of his genius have found a home there.

Goulard's Extract. Strong solution of lead subacetate. It is prepared by boiling lead oxide and lead acetate with water. It was discovered by Thomas Goulard (1720-90) of Montpellier, and in a diluted form is known as Goulard's lotion or water. Dilute solution of lead subacetate is used as an astringent lotion.

Goulash. Thick stew of Hungarian origin, made from beef and flavoured with paprika. At bridge, a goulash is a type of deal sometimes resorted to when all four players have passed a hand without bidding. Each hand is sorted into suits, the four hands are piled, and the cards are cut once, but not shuffled, before dealing. They are dealt five at a time, five at a time again, and then three to each player. The idea is that a freak deal may result; but if anyone objects to a goulash it cannot be played.

Goulburn. River of Victoria, Australia. It is 345 m. long, a tributary of the Murray, which it joins 9 m. E. of Echuca. It flows in a N.W. direction through good agricultural and gold-bearing

country, and is stocked with trout. It is navigable in its lower reaches.

Goulburn. Town of New South Wales. A rly. junction 137 m. S.W. of Sydney on the main line to Melbourne, it stands on the Wollondilly river, in an agricultural, pastoral, and dairying district. It possesses two cathedrals, Anglican and Roman Catholic, fine public buildings, and noteworthy educational facilities. Industries include woollen mills, brick, tile, and pottery works, tanneries, boot factories, breweries, and flour mills. Pop. 15,600.

Gould, SIR ALFRED PEARCE (1852-1922). British surgeon. Son of George Gould, a Baptist minister, he was educated at Amersham Hall School, Reading, and University College, London, where he graduated in medicine. In 1877 he joined the staff of the Westminster, in 1882 of the Middlesex Hospital. His reputation as a surgeon won for him the position of president of the Medical Society of London and other honours. He was also vice-chancellor of London university and president of the Röntgen Society. Knighted in 1911, Sir Alfred wrote several works on surgery, notably *The Elements of Surgical Diagnosis*, 5th ed. 1919. He died April 19, 1922.

Gould, SIR FRANCIS CARRUTHERS (1844-1925). British caricaturist. Born at Barnstable, Dec. 2, 1844, for many years he was a member of the London Stock Exchange, where his talent for producing clever sketches of a humorous and satirical order became well known. Having illustrated the Christmas numbers of *Truth* with remarkable acceptance, he formally

embarked upon the profession of caricaturist in 1887, working for the *Pall Mall Gazette*.

Later he transferred his services to the *Westminster Gazette*, of which his cartoons soon became an outstanding feature that made the initials F.C.G. famous. His favourite subjects for caricature were Balfour and Joseph Chamberlain, both of whom appeared in every conceivable form of zoological disguise. He also embellished with caricatures the parliamentary gossip of Sir Henry Lucy in the *Strand Magazine* during the 1890s. Many of his political pictures, always uncompromisingly in the interests of the Liberal party, appeared in volume form, and his other publications include *Froissart's Modern Chronicles*, 1902-03. He was knighted 1906; died Jan. 1, 1925.

His eldest son, Alec, born March 17, 1870, was a marine and landscape painter whose work is represented at S. Kensington and in other national collections.

Gould, BENJAMIN (1824-96). American astronomer. Born in Boston, Sept. 27, 1824, he was educated at Harvard and spent two years studying at European observatories. He took charge of the coast survey longitude work in 1852, and retired in 1867 to engage in his life work, the mapping of the southern heavens from the observatory he established at Córdoba,

E. H. Mills

Sir F. Carruthers Gould. A *Westminster Gazette* cartoon of 1903, "A Meeting of the Tariff Committee of the Birmingham Liberal Unionist Association," the joke being that each figure represents Joseph Chamberlain, one of "F.C.G.'s" favourite subjects

Argentina. He was a pioneer in using photography for measuring star positions. Founding the *Astronomical Journal* in 1849, he edited it, with interruptions caused by the Civil War and by his absence in S. America, until his death, Nov. 27, 1896.

Gould, GERALD (1885-1936). British poet, critic, and journalist. Educated at Norwich, University College, London, and Magdalen College, Oxford, Gould was a fellow of Merton, Oxford, 1906-16, leader writer of the *Herald*, 1915-19, associate editor of the *Daily Herald*, 1919-22. His *Collected Poems* were published 1929. His other publications included *The Helping Hand*, 1918; *The Coming Revolution*, 1920; *The Musical Glasses*, 1929. He was, however, best known as a reviewer of fiction in the *Observer*, the *Daily News*, and elsewhere. He created a new style in this field, introducing wit as well as judgement into his notices. He died Nov. 2, 1936.

Barbara Ayrton Gould, his wife, a daughter of Prof. W. E. Ayrton and Mrs. Hertha Ayrton, was an organizer and politician. She served on various commissions, including the royal commission on the civil service, 1929-31, and was a member of the executive committee of the Labour Party from 1930, being chairman, 1939-40. She sat as M.P. for Hendon North, 1945-50. Their son, born 1922, achieved a reputation as a painter and art critic under the name Michael Ayrton.

Gould, JAY (1836-92). American capitalist. Born at Roxbury, New York, May 27, 1836, he left his father's farm at the age of 16 and entered an ironmongery store. Here he remained until 1856, spending his spare time in the study of surveying.

Jay Gould,
American capitalist

After a venture in the lumber trade, he took advantage of the rly. panic of 1857 to buy a controlling interest in the Rutland (N.Y.) Washington rly. Two years later he opened a broker's business in New York.

In 1856 he became president of the Erie railroad, of which he had obtained the controlling interest, and manipulated rly. stock to enormous profit. The Union Pacific, Missouri Pacific, Wabash, Texas Pacific, St. Louis and Northern,

and St. Louis and San Francisco rlys. were all controlled by him, whilst in 1881 he formed the Western Union Telegraph System. He died Dec. 2, 1892.

Gounod, FRANÇOIS CHARLES (1818-93). French composer. He was born, the son of a painter, at

Ch. Gounod

Paris on June 17, 1818, and entered the conservatoire of Paris in 1836. After studying there under Fromental Halévy, he went to Italy as winner of the Prix de Rome, 1839.

On his return to Paris he became organist at the chapel of the Missions Étrangères. His name was brought into public notice by the production of his first opera, *Sappho*, in 1851. His next operatic success was in 1858 with a clever setting of Molière's *Le Médecin malgré Lui*. Gounod's version of Goethe's *Faust*, which set him in the forefront of operatic composers, was produced in Paris in 1859. Its first performance in London was in 1863.

Henceforth his work secured a ready hearing, and there came *Philémon et Baucis*, 1860, and *La Reine de Saba*, 1862, which has always met with more success abroad than in France. *Mireille*, on a libretto of the Provençal poet Mistral, appeared in 1864, and his fine rendering of the story of *Romeo and Juliet* in 1867. Meanwhile he had also been writing much other music, sacred and secular, notably the *Mass* of S. Cecilia, 1855. Among his other sacred music should be remembered two other *Masses*, 1876 and 1887, and the two oratorios *The Redemption* and *Mors et Vita*, produced at the Birmingham Festivals in 1882 and 1885 respectively. Gounod, who came to England during the Franco-Prussian War, composed a cantata, *Gallia*, for the opening of the Royal Albert Hall, 1871. He died at St. Cloud, Oct. 18, 1893.

Despite much severe criticism of his sometimes over-florid and over-sweet style, Gounod's work at its best has a permanent interest. His operas are untiringly welcomed in all countries, his *Masses* are frequently sung, some of his songs, e.g. the *Ave Maria*, a melody boldly superimposed on the first prelude of Bach, are universally familiar.

He exercised a great influence on the following generation of French composers. Gounod was personally a man of wide culture and deep religious feeling, both reflected in his work, and a volume of his autobiographical notes and reprinted articles was pub. 1896. *Pron.* goo-no.

Gourd (Lat. *cucurbita*). Half-hardy annual trailing plant of the family Cucurbitaceae, mostly natives of India. The edible varieties of gourd or pumpkin are grown in the same way as the vegetable marrow. They can be cooked as a vegetable while young and tender, or used to make pumpkin pie when ripe. The largest sort is the Hundredweight gourd. Ornamental gourds make a striking garden decoration when trained to cover arches or trellis-work; they are of various shapes, and brightly coloured. Among them are the apple, pear, orange, and egg-shaped, and the Turk's cap.

The best way to grow gourds is to sow the seeds singly in 3-in. pots

Gourd. Examples of some ordinary forms. The species shown include: 1. Vegetable Marrow; 2. Water Melon; 3. Winter Melon; 4. Great Yellow Gourd

in a greenhouse in April, planting the seedlings out of doors at the end of May in rich soil, and watering freely in dry weather.

The story of Jonah and the gourd (*Jonah* 4) is well known. The rind of several varieties of gourd, including the bottle-gourd (*q.v.*), is used by natives to form flasks or bottles for carrying liquids.

Gourgau, GASPARD, BARON (1783-1852). A French soldier. Born Sept. 14, 1783, at Versailles, he rose to the rank of general in the Napoleonic campaigns, and after the final overthrow of Napoleon accompanied his master to St. Helena, where he assisted him in the preparation of his *Memoirs*. He published an account of the campaign of 1815, and a vehement refutation of Scott's *Life of Napoleon*, but his most important book is his *Journal inédit de Ste.-Hélène*, first published in 1899. He died in Paris, July 25, 1852.

Gourko OR GURKO, JOSEPH VLADIMIROVICH (1828-1901). A Russian soldier. Scion of a noble

Joseph Gourko,
Russian soldier

Lithuanian family, he was born Nov. 15, 1828, and was appointed an officer of the Russian imperial guard. He rose rapidly in rank, and served in the Crimean War,

but his military reputation rests entirely upon his achievements against the Turks in 1877-78. He led a Russian detachment across the Danube and seized Timova; he then drove the Turks from the Shipka Pass, and pressed deeper into their empire. Falling back, he defended the Shipka against Turkish efforts at recapture, and had a large share in the operations that led to the fall of Plevna. One operation was an advance on Sofia, which he occupied, having previously driven the Turks from Orkhanie. Near Philippopolis he gained one of the few real victories of the war, and he had won other successes when the struggle ended. Gourko was afterwards governor of St. Petersburg and of Odessa, while from 1883 to 1894 he was governor-general of Poland. He died Jan. 29, 1901.

Gourmont, R  MY DE (1858-1915). French literary critic and scholar. Born April 4, 1858, at Bazoches, Orne dept., France, he came under the influence of Huysmans, G  rard de Nerval, and Mallarm  , and is remembered as a champion of the symbolist movement in modern French poetry, a scholar, and a writer who to a distinguished literary style added philosophic insight. From 1883 to 1891 he held an appointment at the Biblioth  que Nationale, Paris. Afterwards he became editor of *Le Mercure de France*. He wrote *Les Fran  ais au Canada*, 1888; *Proses Moroses*, 1896; *Le P  lerin du Silence*, 1896; *Le Livre des Masques*, 1896-98; *Esth  tique de la Langue Fran  aise*, 1899; *Promenades Litt  raires*, 1904-6; *Une Nuit au Luxembourg*, 1906; *Promenades Philosophiques*, 1906-8; *Le Probl  me du Style*, 1907; a volume of verse, *Divertissements*, 1912. Two of his works, *Lettres    l'Amazone* and *Pendant la Guerre*, were published posthumously, 1916. He died Sept. 27, 1915.

His brother, Jean de Gourmont (b. 1877), was also a writer, contrib-

uting to *Le Mercure de France*. He published poems, and a novel, *Le Toison d'Or*, 1908.

Gourock. A burgh, residential town, and holiday resort of Renfrewshire, Scotland. It stands on the S. side of the Firth of Clyde adjoining Greenock. It is connected with Glasgow by steamer, rly., and motor bus. Ashton is the holiday dist.

Gourock arms

The town has industries, connected with shipping and is itself a centre for local shipping, while its sheltered bay is much frequented by yachts. There are golf links here. Legendary and historical associations cling to a stone called *Granny Kempoch*. Gourock became a burgh in 1694. Pop. 8,844.

During the Second Great War, when the London docks became the target of concentrated attacks by the Luftwaffe, the Clyde anchorages emergency port was organized in the safe, enclosed waters off Gourock to handle ships which would normally have docked in London. Between Sept., 1940, and Aug., 1945, 1,855 ships discharged or loaded overside more than 2,000,000 tons of cargo.

Gout (Lat. *gutta*, drop, humour). Disorder of bodily chemistry. It is characterized by excess of uric acid in the blood, and deposit of urate of sodium in the joints and their vicinity. The changes in metabolism which cause the condition are not understood. Gout cannot occur without excess of uric acid, but the latter is not the cause of gout. Hereditary influences are an important predisposing cause; alcoholism and over-eating without sufficient exercise are frequent antecedents. Workers in lead are particularly liable to the disease. Males are more frequently affected than females, and the disease is exceptional in people who are under the age of 35.

Three forms are generally recognized: acute, chronic, and irregular gout. In the acute attack there may be premonitory symptoms, such as twinges of pain in the small joints of the hands and

feet, and indigestion. The attack most often begins in the early hours of the morning, with violent pain in the joints of the big toe, which rapidly become hot and swollen. Sometimes knee or finger joints are first to be affected, and several joints may be involved simultaneously, or in rapid succession. The temperature rises to 102   or 103  . The pain lessens in the course of a few hours, but recurs towards evening for two or three days, the severity of the symptoms gradually abating.

After the first attack, the joint affected appears to return to the normal condition, but repeated attacks result in more or less stiffness and swelling of the articulations. Ultimately the condition passes into the chronic form, the joints being permanently enlarged,

Gourock, Scotland. The town and bay on the south side of the Firth of Clyde

deformed, and irregular. So-called "chalk stones" are formed about the knuckles and elsewhere, and the skin over them is stretched and sometimes ulcerated. Deposits of sodium urate in the cartilages of the ear are common. Besides local signs the patient usually suffers from dyspepsia and more or less continuous ill-health. Irregular gout is a condition seen in persons who, while not suffering from definite attacks of gout, have a tendency to the disease often due to hereditary influences. The tendency may manifest itself in a number of ways, among which are liability to eczema, biliousness, thickening of the arteries, headache, neuralgia, diabetes, etc.

With proper care, gouty persons may live for many years, but long-continued attacks are likely to bring about Bright's disease, uraemia (*q.v.*), changes in the arteries, and affections of the heart. In an attack of acute gout, the affected limb should be raised, and the pain may be relieved by warm fomentations. Colchicum is the

sovereign, age-old remedy, and the administration of citrate of potash or lithium is useful. Chronic gout must be kept under control by carefully regulated living.

Meat should be taken sparingly, and substances like sweetbreads, liver, and kidney, as well as most soups and meat extracts, should be avoided. Fresh fish, eggs, milk, butter, and fresh vegetables are recommended. Red wines and champagne are more harmful than white wines and whisky. Regular sufficient daily exercise and attention to the bowels are important. Overwork and worry should be avoided.

Gout Fly (*Chlorops taeniopus*). Small fly whose larvae or grubs attack the young ears of spring barley, causing them to become much swollen and to fail to grow out of the ensheathing leaves.

Govan. Western suburb and parl. div. (returning one member) of Glasgow, until 1912 a separate municipality. It lies on the S. side of the Clyde opposite Glasgow proper, although part of the parish of Govan is N. of the river. It has its own railway station, and is also connected with Glasgow by buses and a rly. that goes under the Clyde. The chief industry is shipbuilding. Harland and Wolff having immense yards here. There are also docks, and steamers call at the pier. Also at Govan are engineering works and foundries. The principal buildings are the parish church, with some early Christian monuments in its churchyard, S. Mary's U.F. church, and the large Merryflats poorhouse. Here is Elder Park.

Governess-cart. Low-hung, small, two-wheeled, one-horse carriage holding four persons. It has two seats, facing inwards, and a small door at rear. Usually drawn by a pony or quiet cob, it is uncomfortable, but safe, and is named from its former common use as a children's conveyance.

Governess-cart. Low, two-wheeled vehicle used on country roads

GOVERNMENT: STATE ORGANIZATION

G. W. Keeton, LL.D., Dean of the Faculty of Laws, Univ. Coll., London

This outline of the purpose and forms by which countries are governed may be supplemented by reference to Democracy; Fascism; Feudalism; Monarchy; Tyranny, etc., and to such subjects as Cabinet; Commons, House of; President; Soviet, etc.

The term government (Lat. *gubernare*, to steer or direct) describes the work of those who guide the ship of state, and are ultimately responsible for its safety and well-being.

Historically, government has been of three kinds—monarchical, aristocratic, or democratic. In a monarchy, a single person exercised the main governmental functions; in an aristocracy, the functions were exercised by an order or class; and in a democracy, the government was ultimately responsible to the adult population as a whole. This classification is rooted in Greek political philosophy, and particularly in Aristotle, who separated three "good" types—monarchy, aristocracy, and constitutional government—from three perverted types—tyranny, oligarchy, and democracy. The line of differentiation was between government by the one, the few, or the many, and the good or bad term was applied as the rulers ruled in the public interest or for their own selfish ends. To Aristotle, however, an aristocracy was a government by an order specially qualified by abilities, training, and experience for the work of government. This ideal was sometimes achieved in ancient Athens, and, at its best, the rule of the Whigs in England in the 18th century approached it. When, however, the Whig rule degenerated to the promotion of the interests of their order, it was more accurately termed an oligarchy.

Possible Tyranny of Majorities

Aristotle used the term democracy, not for an ideal state, but for a debased condition in which political power was in the hands of the unreflecting and uneducated mob. Particularly since the French Revolution, however, the democratic form of government has been idealised, and there has been attributed to it what ought to be the characteristics of all good government, i.e. that under it all laws and political institutions promote the well-being of the community as a whole. The political philosophy of Western Europe in the 19th century assumed that this object could most certainly be achieved by letting government rest on the active consent of the adult population. It is obvious,

however, that, if pushed to extremes, such theories of government might lead (and in fact have led) to the tyranny of majorities over minorities, which becomes all the more acute where there is a difference of race, creed, or class between the dominant majority and the minority. Experience has shown that democratic government has worked well only in those countries which have possessed for long periods a strong feeling of unity, and in which majorities, in their period of dominance, are prepared to accept limits to their legal powers, and to use self-restraint in order that similar forbearance may be shown towards them when the positions are reversed.

Theories of Karl Marx

During the past century, the problem of government has been approached afresh in the light of the theories of Karl Marx (*q.v.*). From the Marxian point of view, government in western society was simply the domination of the community by a class in its own interests. The object of political endeavour should, therefore, be to establish the classless society in which government would then become the genuine instrument of the community as a whole. To achieve this end, Marx held that it would be necessary to pass through a transitional period in which the dictatorship of the proletariat would bring about the necessary social, economic, and political transformations by means of which all privileged orders would be abolished. These theories have formed the basis of government in the U.S.S.R. since 1917, though to the detached observer it might perhaps seem that while the old privileged orders have been swept away, a new governing class, the Communist party, has been introduced. Further, the claim of the new order to rule in the interests of the community as a whole can be assessed by precisely the same tests which are applicable to other political systems.

Besides the classification of governments recognized by Aristotle, there is a different classification into unitary and federal governments. In a unitary state, the central government possesses unlimited power, so that although local governments may exist

within the state, they are ultimately subordinate to the power of the central government, which can modify their powers as it chooses. In a federal state, on the other hand, sovereign power is divided between central and local governments, sometimes (as in the case of the U.S.A.) by a written constitution which prescribes the functions of each, and the central government can encroach upon the authority of the local government only to a defined limit. There are federal governments in the U.S.A., Canada, Australia, Switzerland, and various Latin-American states. In form, too, the Soviet Union is a federation.

Spheres of Government

In Western political thought, government is divided into three main spheres—legislative, judicial, and executive. The legislature is the organ which makes the laws, the judiciary interprets and applies them, and the executive enforces them. In the 18th century, Montesquieu traced the excellence of the English constitution to the fact that there had been a complete separation of these powers, so that no one department of government was able to override the other two. This was in contrast with France, where all power was concentrated in the hands of the monarch, with resulting impairment of individual liberty. The ideas of Montesquieu greatly influenced the political thought of the next half century, and in particular the constitution of the U.S.A., where the doctrine of separation of powers was pushed to its farthest limits. The result is that at times, when the president and congress are at variance, the execution of government policy may be held up or even abandoned altogether.

Even in origin, it is possible that the theory of Montesquieu is founded upon a misunderstanding of the English constitution, where full sovereignty resides in parliament, but the driving force is supplied by the cabinet, which contains the chief heads of executive departments. Today, moreover, the great extension of governmental activity into all aspects of social life has meant that, in practice, the theory of the separation of powers has had to be abandoned. It has also concentrated attention upon the vast growth in the powers of the great departments of state, upon which modern legislation increasingly confers wide legislative and judicial powers.

Governor. In mechanics, an apparatus for regulating the working speed of an engine under varying conditions of load. Most governors for steam and internal combustion engines follow the original ball governor of James Watt. The function of a governor is to adjust the mean driving torque of an engine or turbine to the mean resisting torque of the driven member (machine, generator, etc.) by increasing or decreasing as necessary the energy supplied. This can be accomplished either by altering the point of cut-

marine engines the governor is actuated by changes in the acceleration of the reciprocating parts (Aspinall governor).

Fig. 1 shows a loaded Watt governor (or Porter governor), which was in universal use for many years, but was found to be too sluggish in action for engines running at other than slow speeds. Moreover, it is unsuitable for any but stationary engines. But the spring-loaded governor, one type of which is illustrated in Fig. 2, does not depend upon gravity for its operation and can be adapted for high speeds of revolution, so that it can be used on moving vehicles and with the shaft horizontal if required.

In the case of Fig. 1, S is a vertical shaft rotated by the engine through a bevel gear. Four links LLLL connect two metal balls BB with the top of S and with a weight W grooved near the bottom at C. The weight is able to move freely up and down S. When the speed increases, the radius of action of the balls BB increases and the sleeve C, carrying the weight W and the end C of the forked lever D, lifts and partly closes the throttle, thus diminishing the supply of steam to the engine. When the speed decreases, C falls and the throttle opening is increased. The higher the normal speed of the engine, the greater W must be to obtain a reasonable movement of C for a small change of speed. If the load changes rapidly, the governor does not respond quickly enough and "hunting" (i.e. the exceeding by the engine of the designated speed) will occur.

off or by throttling the steam (steam engine or turbine), or by varying the supply of fuel to the cylinder (internal combustion engine). In small gas engines the governor operates by cutting out explosion strokes, but this leads to undesirable torque fluctuations and necessitates the fitting of very heavy flywheels. Most governors operate by changes in centrifugal force with changes of speed, but in the case of a number of

GOWNS AND HOODS OF LEADING BRITISH UNIVERSITIES AND DUBLIN UNIVERSITY
Specially drawn by J. F. Campbell from gowns lent by Ede and Ravenscroft, London.

In the spring-loaded governor (Fig. 2) the bell-crank lever ABC is pivoted at the pin B, which is fixed to the frame F, the whole revolving with the shaft R. At the working speed, the leverage of the centrifugal force on the balls A, taken about B, is just balanced by the leverage of the spring pressure on the sleeve, also about B. If the speed increases, the centrifugal force increases, partly due to the increased speed and partly to the increased radius of the ball path. As the sleeve lifts, the compression of the spring increases until the increased load on the sleeve just balances the increased centrifugal force. The stiffness and initial compression of the spring can be so adjusted that a small change of speed will move the sleeve to its extreme limit in either direction. Such a governor is known as an isochronous governor and a dash-pot is necessary, introducing fluid friction to slow up the movement of the sleeve and prevent the valve over-shooting its correct position for the new load, causing hunting.

In the case of steam turbines driving alternating current generators, where the speed must be regulated within very fine limits and the stop valve is comparatively heavy, the governor is made to operate a relay, admitting oil under pressure to either side of a cylinder which moves the valve the required distance. Such a governor can be quite small and comparatively free from solid friction. Since the governor is nearly isochronous a dash-pot is usually fitted and an auxiliary spring is used for fine adjustment.

For compression ignition oil engines the governor either changes the position of a sleeve or rotates the plunger of the fuel pump, thus releasing the oil pressure in the fuel pipe earlier or later as required. In hydraulic turbines of the impulse type the governor operates a relay which deflects the jet of water issuing from the nozzle. In the reaction type the angle of the guide vanes at entry is altered by a similar device. (See Hydraulic Turbine.)

For correct reproduction of speech or music a gramophone disk must run at the prescribed speed without perceptible fluctuation. To ensure this a spring-controlled governor is fitted to the driving motor which increases or decreases frictional resistance as the speed tends to alter. In other cases the governor can be made to apply a brake to an epicyclic gear. See Gear.

Governor (Lat. *gubernare*, to steer). Representative in a province or colony of the supreme authority of a state. Under the Roman Empire civil officials with proconsular power and rank governed the senatorial provinces, i.e. those in which legions were not maintained; the imperial provinces, requiring military forces for their security, were governed by *legati Augusti*, with full military power and wide jurisdiction.

In the British Commonwealth, governors are classified as governors-general and governors. A governor-general is appointed by the crown to represent its authority in each of the dominions and in certain of the colonies. Other colonies (e.g. Gambia, the Bahamas) have governors.

In the U.S.A. each state elects a governor as the chief official in the legislative and executive management of its own affairs.

Governor's Island. Fortified island in New York Bay S. of the Battery. It lies at the entrance to Brooklyn by the Buttermilk Channel. A station of the West India Company in 1621, the island is now the headquarters of the 2nd corps area or the eastern department of the U.S. army, which has jurisdiction over the area from New York to Virginia and includes Puerto Rico. By 1900, the island had dwindled from 170 to 70 acres through wave erosion. It was reclaimed in 1903 and now has an area of 173.35 acres. Bought from two Indians by Wouter van Twiller, second Dutch governor of New Amsterdam (as New York was formerly called) in 1637, the island has served at various times as a summer resort, racecourse site, sheep farm, and game preserve. It acquired its present name after the New York assembly in 1698 set it aside as a country seat for the colony's English governors. First fortified in 1794 when there were rumours of war with France, the island is the site of Fort Jay and Castle Williams, a circular fort used as a barracks, South Battery, overlooking the channel, the Chapel of S. Cornelius the Centurion, of Trinity Parish, a nine-hole golf course, polo grounds, target ranges, and the homes of the area commandant and of other army officers.

Gow, NIEL (1727-1807). Scottish violinist. Born at Inver, near Dunkeld, March 22, 1727, his skill in playing reels made him famous. In London he was in great request at fashionable gatherings, and he

also did most useful work in preserving old Scottish melodies. Gow, who died March 1, 1807, had four sons, all musicians, and his and their compositions are found in The Gow Collection of old Scottish songs, a valuable work containing many old melodies which would otherwise have been lost.

Gowbarrow Park. Estate in the Lake District of England, now public property. It is on the N. side of Ullswater, on the slopes of Gowbarrow Fell. The original park was about 2,000 acres in extent, but additions have been made to it. It contains a shooting lodge called Lyluph's Tower, and the beautiful waterfall of Aira Force. Gowbarrow was bought by the National Trust and opened in 1906.

Gower. Peninsula of Glamorganshire. It lies between the rivers Tawe and Loughor, being about 27 m. long and 7 m. across. It contains Swansea and Oystermouth, is almost surrounded by the waters of the Bristol Channel, and retains certain customs of its own. The Welsh call it Gwyr.

Gower was conquered by the Normans in the 12th century, and therein some of them settled, built castles, and introduced the feudal system. It had its own lord, who had the privileges of a lord of the marches; he held his court at Swansea and had his own sheriff and other officials. The lordship passed from the family of De Braose to John de Mowbray, duke of Norfolk. The earl of Pembroke was a later lord, and from that family it passed by marriage to the Somersets, now represented by the duke of Beaufort. In 1535, however, Gower was included in Glamorganshire (q.v.).

Gower, JOHN (c. 1325-1408). English poet, contemporary and friend of Chaucer, who calls him "moral Gower." He lived

largely at his country seat in Kent, but details of his life are obscure. He became blind shortly before his death, and was buried in S. Saviour's Church at Southwark.

Niel Gow,
Scottish violinist
After Raeburn

John Gower,
English poet

Gower's chief works are *Speculum Meditantis*, written in French, which was lost for centuries and discovered at Cambridge in 1895; *Vox Clamantis*, in Latin, which deals with the rising of Wat Tyler; and *Confessio Amantis*, in English, a collection of tales after the model of Chaucer's *Canterbury Tales*. Gower is unconscionably prolix and somewhat dull. The *Vox Clamantis*, which runs to 30,000 lines, is redeemed by the author's gift for story-telling and a certain quaintness of fancy. The standard edition of his works is that by G. C. Macaulay, 1899-1902.

Gown. Word meaning an outer garment of loose shape. It is now used in two senses, for the robe worn by graduate and undergraduate members of universities, and of learned societies generally, and as a synonym for a full-length dress worn by a lady. There are also dressing gowns, etc. See Hood; and plates facing pp. 3864-5.

Gowrie, ALEXANDER GORE ARKWRIGHT HORB-RUTHVEN, 1ST EARL OF (b. 1872). Born at Windsor, he was descended from the Scottish family of Ruthven who became earls of Gowrie, 1591-1600. He was educated at Eton, and commissioned to the Highland Light Infantry in 1891. Attached to the Egyptian army, he fought in the Sudan, and won the V.C. at Osmanieh, 1899. He served in France and Gallipoli, 1914-18; awarded the D.S.O. and bar and the C.B., he became temporary brig.-gen. He retired with that rank in 1924, and after terms as governor of S. Australia and of New South Wales became governor-general of Australia, 1936-44. He was created a baron in 1935 and an earl in 1944. In 1945 he was appointed deputy constable and lieutenant-governor of Windsor Castle. See Ruthven.

Gowrie Conspiracy, THE. Plot against the person of James VI of Scotland, attempted by John, earl of Gowrie, and his brother Alexander, known as the master of Ruthven. On Aug. 5, 1600, the king was mounting his horse at Falkland Palace for a day's buck hunting when Alexander Ruthven approached and told him that a countryman had found near Perth a wide pot full of coined gold in great pieces, and that the man was detained in Gowrie Castle, where the king was prayed to come and examine him.

About 7 o'clock the king accordingly rode there with a few attendants, Ruthven spurring forward to warn his brother of the king's approach. James's sus-

John Gower. Effigy and tomb of the poet in S. Saviour's Church, Southwark

picious had been aroused by Ruthven's strange manner, and also by Gowrie's appearance with an escort of fourscore armed retainers to meet his royal visitor, and he was further angered by the sorry cheer provided for his refreshment. After dinner Alexander led him to a remote part of the castle, up a winding stair, and through several rooms, the doors of which he locked behind him, into a gallery chamber where a man was waiting with a dagger in his girdle. Seizing this dagger, Ruthven held it to the king's breast, and threatened to stab him if he uttered a sound. James pleaded with him, and by promise of pardon and silence on the subject, prevailed on him not

to strike. Ruthven left the room to consult his brother, leaving the king in the custody of the servant.

Ruthven returning told the king he must die, and a desperate struggle followed, during which James managed to drag Ruthven to a window whence he called for help to his attendants, whom Gowrie had vainly tried to induce to leave, alleging that the king had already departed by another door. Sir John Ramsey was the first to find his way upstairs, and stabbed Ruthven, who was dispatched on the stairs by Sir Thomas Erskine and Sir Hugh Harries also rushing to the rescue. The earl of Gowrie, hurrying in, was stabbed to the heart by Ramsey.

What lay behind the facts remains uncertain. An investigation was held, but even at the time popular feeling ran high against James, whom the people believed to be "a doer and not a sufferer." It was alleged that he desired to extirpate the Ruthven family, who made some pretensions to the throne, and the pro. ed forgery of letters produced by a notary, George Sprot, which purported to have been written by Sir Robert Logan of Restalrig to Gowrie, has strengthened this opinion, further confirmed by the ruthless treatment meted out to the surviving Ruthvens. On the other hand, it has been suggested that the Ruthvens were actuated by desire to avenge their father's execution, and also that the conspiracy originated in the English court with the connivance of Elizabeth. See *The Tragedy of Gowrie House*, L. A. Barbé, 1887; *James VI and the Gowrie Mystery*, Andrew Lang, 1902.

parents at Fuendetodos, in Aragon, he studied art under José Martínez at Saragossa. Having become embroiled with the authorities, he was obliged to flee to Madrid, and a few years later had

to seek refuge in Italy. Returning to Madrid in 1775, he married the sister of Bayeu, the court painter, through whose interest he was commissioned to design the famous tapestries now in the Prado. In 1785 he became deputy director of the San Fernando Academy, in 1789 painter of the chamber to Charles IV, and in 1814 court painter to King Ferdinand. He was in Seville, 1817, at Paris, 1824, and at Bordeaux, 1825, where he died April 16, 1828.

A revolutionary in life as well as in art, Goya delighted in offending conventional susceptibilities. His three most famous sets of etchings, *Los Caprichos*, the *Tauromaquia*, and *Los Desastres de la Guerra*—the last inspired by Napoleon's invasion—express his mordantly satirical genius almost better than any of his paintings; but his portraits and subject paintings, with their uncompromising realism, are hardly less characteristic. The best of his work is at Madrid, but there are four examples in the National Gallery, London. *Consult* Goya: an Impression of Spain, Lord Derwent, 1930; Goya, C. Poore, 1938.

Goyaz. Central state of Brazil. It is bounded on the W. by Matto Grosso, and on the E. by Minas Geraes and Bahia. Area, 288,462 sq. m. Several mt. ranges traverse the state, mostly running from N. to S. and of no great elevation. The principal rivers are the Tocantins, which rises as the Maranhão in the S. of the state and flows due N. through the centre; the Araguaia on the W. boundary; and the Paranaíba. Several other streams are unnavigable because

of cataracts and currents. Extensive forests fringe most of the rivers, and a large portion of territory in the northern districts of the state is unexplored.

The S. part of the state contains the principal centres of the civilized population. Formerly gold was extensively worked, but the output has declined considerably. Silver, copper, marble, and iron exist, but are unworked. Diamonds and quartz crystals, called Brazilian pebbles and used in optical work, are found. The chief occupation is stock-raising, but the cultivation of coffee, sugar, tobacco, and cacao is carried on. Goyaz is the most backward of the Brazilian states, transport facilities are almost non-existent, and rlys. are only just beginning to be laid down. The site for the Federal capital has been selected from this state, on a plateau between Formosa, Pyrinopolis and Santa Lúgia. The climate is agreeable on the whole. Pop. (est.) 907,800.

Joyania (*q.v.*), the capital of the state, was formerly known as Goyaz or Villa Boa de Goyaz.

Goyen, **JAN VAN** (1596–1665). Dutch painter. Born at Leiden, Jan. 13, 1596, he worked for a while in France, and on his return to Holland took finishing lessons from Esaias van de Velde. After a short sojourn in Haarlem he resided in his native city for several

years, removing in 1631 to The Hague, where he died in April, 1665. He painted the river, canal, and coastal scenery of the Netherlands.

Gozo or **Gozzo**. British island of the Maltese group. It lies 4 m. N.W. of Malta, is 8 m. long and 4 m. broad, and has an area of 26 sq. m. Composed of coralline limestone, the surface is diversified, fertile, and well cultivated, producing fruits and vegetables. Lace is

made. There are remains of cyclopean walls, and a tower and Roman monuments. The chief towns are Victoria, formerly Rabato, in the centre of the island, and Fort Chambray on the S.E. coast. Pop. 23,000.

Gozzi, **CARLO**, **COUNT** (1720–1806). Italian dramatist and memoir writer. He was a native of Venice, born Dec. 13, 1720, and dying there April 4, 1806. His farcical plays and fairy pieces in the Venetian patois enjoyed popularity for their satiric wit. They were written to ridicule his dramatic rivals, Carlo Goldoni and others, and their success contributed to drive Goldoni from Venice. Re Turandote was the basis of an opera by Puccini. Gozzi's Memoirs, 1797, were translated into English by J. A. Symonds, 1890.

Gozzoli, **BENOZZO** (1420–c.1498). Florentine painter whose real name was Benozzo di Lese. Born in Florence, he studied under Fra Angelico, whose assistant he afterwards became. Gozzoli, who was an industrious and painstaking fresco painter, betrays the influence of Fra Angelico in his early works. Among his famous works were a Virgin and Child and St. Thomas Receiving the Girdle from the Virgin, painted in 1459 for the church of San Fortunato at Montefalco (the latter now in the Lateran Museum, Rome); the decorations for the Riccardi (then the Medici) Palace in Florence, particularly the frescoes of The Journey of the Three Magi and Angels in Paradise; and the series of 24 frescoes of Biblical themes executed for the Campo Santo, Pisa (ruined by shell fire, July 27, 1944). The National Gallery, London, contains his Virgin and Child with

Gozo, Malta. Wall in the Gran Castello containing Norman archways. Top, left, interior of the cathedral looking eastward

Gozzoli. This Florentine artist's spirited and highly Italianate conception of the abduction of Helen of Troy
National Gallery, London

Saints, painted at Florence, 1461, and a rendering of Paris stealing Helen of Troy from her husband's house. Gozzoli died at Pistoja, Oct. 4, 1497 or 1498. *Pron.* Got-so-lee.

Graaf Reinet. Town of Cape Province, South Africa. It stands on the Sundays river, 185 m. by rly. N.N.W. of Port Elizabeth. Founded in 1784, it is situated in a district famous for its angora goats and ostriches. To the N. are the Sneeuwbergen, of which the Compassberg rises to a height of 8,208 ft. above sea level. The town possesses a college for Dutch students, and is noted for its fruit and wine. Pop. 11,984. The dist. named from Graaf Reinet has a pop. of 23,133.

Graben (Ger., grave). In geology a valley or depression produced by faulting. It is an alternative term for rift-valley (*q.v.*).

Gracchus. Name of two reformers in ancient Rome. They were the sons of Cornelia (*q.v.*), daughter of Scipio Africanus the Elder, by Tiberius Sempronius Gracchus, governor of higher Spain in 181 B.C., who made the province one of the most peaceable in the Roman dominions.

The elder, Tiberius Sempronius Gracchus (163-133 B.C.), was present at the siege of Carthage and served in Spain, and on his journeys to and from that country the deplorable condition of Italian agriculture first drew his attention. The public land, *i.e.* the conquered territory distributed among Ro-

man citizens, had largely and illegally passed into the hands of a comparatively small number of wealthy people, who cultivated their farms chiefly by slaves.

As tribune in 133, Tiberius brought forward a measure providing that the public lands should be distributed in small holdings among the poor, and that a certain proportion of free labourers should be employed on all large farms. This measure brought Tiberius into conflict with the senate and the wealthy; and another tribune, Octavius, was suborned to veto the proposed legislation.

Tiberius thereupon got the assembly of the people to deprive Octavius of his office, and the bill was passed. Threatened with impeachment at the end of his term of office for his illegal proceedings, Tiberius set himself to obtain the tribunate for another year. The elections were held, but the senate declared that they were illegal, and in the riots which ensued Tiberius and 300 of his followers were killed. Tiberius was a man of noble character, and his reforms were prompted by a genuine desire to improve the condition of his less fortunate fellow citizens. Nor was his work altogether in vain; much land was recovered, and during the next decade the census showed an increase of 70,000 citizens.

Ten years after the death of Tiberius, the agitation was renewed by his brother, Gaius Sempronius Gracchus (153-121 B.C.), who, after service in Spain and as quaestor

in Sardinia, was tribune in 123 and 122 B.C. His policy was to put his reforms on a much broader basis than that of his brother, and not to rely on the support of only one class in the community.

In addition to renewing the purely agrarian legislation of Tiberius, his measures included the establishment of colonies for settlement by the poor, army reforms, and a monthly dole of corn to all citizens at less than half the market price, while an endeavour was made to secure the support of capitalists of the equestrian order by giving them the privilege of acting as jurymen. These proposals met with opposition from the senate, which Gracchus sought to counter by reviving the constitutional legislative powers of the assembly of the people which had been usurped by the senate. His policy virtually amounted to a revolution, and the senate, thoroughly alarmed, put forward a tribune, M. Livius Drusus, to outbid Gracchus. An additional proposal of Gracchus to extend the franchise among the Italians alienated many of his purely Roman supporters. He was not elected for the tribunate of 121, and steps were taken by the senate to repeal his measures. The result was a riot, in which Gracchus perished, as his brother had done before him. Less disinterested, perhaps, than Tiberius, Gaius was undoubtedly the abler man. The democratic movement which he started was eventually the chief instrument in the overthrow of the senatorial ascendancy. The lives of the brothers were written by Plutarch. *See Agrarian Laws.*

Grace (Lat. *gratia*). Term used in theology to express the love of God manifesting itself in free and undeserved favour to mankind. This manifestation is threefold and progressive. First, there is the original and eternal love with which God views His creatures; hence He wills that all men shall be saved and sends forth His Son to accomplish that salvation by His death. This is the grace of undeserved favour. Secondly, this fact is brought to the knowledge of man by the preaching of Christ and His Apostles, and by the teaching of the Christian Church. This is the grace of outward instruction. Thirdly, the knowledge of salvation is made effectual in the soul and the life by the supernatural gift of the Holy Spirit, whereby man embraces the salvation freely provided and offered him. This is the grace of inward sanctification.

The first is often known as general grace, and the second and third combined as particular grace.

Persons are said to be in a state of grace when they are living in communion with God, are penitent for their sins, and are making use of the means of grace provided by Christ. The sacraments are the special channels of divine grace; but whether their efficacy depends on the faith of the recipient is one of the points of controversy between Catholics and Protestants. In regard to the relationship of the grace of God to the free will of man, S. Augustine and the Calvinists maintained that all good in man is due to the grace of God; while the Pelagians taught that grace merely guided and helped man's free will. The Church generally takes the view that the grace of God and the free will of man cooperate in all good works; though some hold that every good thing wrought by the will of man is due to the preventient or anticipatory grace of God. See Calvinism; Theology.

Grace (Lat. *gratia*). Word meaning a favour of some kind. It is thus used in law and politics. In England an Act of Grace is one passed at the opening of a new reign, granting a general pardon to certain classes of offenders, usually insolvent debtors. In Scotland the term is applied especially to an Act of 1696, which compelled every creditor who had caused a debtor to be imprisoned for debt, to be responsible for the debtor's maintenance while in prison. Favours granted by sovereigns were long known as graces, and the term survives at the universities, being used there for certain permissions, e.g. to take a degree. Days of grace are days allowed, beyond the appointed time, in which a bill of exchange must be met. The phrase Your Grace is used in Britain in addressing archbishops and dukes, the idea behind it being that persons of these high ranks granted favours.

Grace. Form of thanksgiving said or sung before or after meals. Something of the kind was in use among the Greeks and Romans, but the existing graces are of Christian, and mainly monastic, origin. They are said in the halls of public schools and colleges, at Oxford and Cambridge, the Inns of Court, and other learned societies, and frequently at public dinners. Some societies have their own graces, often a long one. A popular form is *Benedictus benedictus* (May the Blessed bless) used

before, and *Benedicto benedicatur* (May the blessed be blest) used after the meal.

Grace, HARVEY (1874-1944). A British organist and music critic. Born at Romsey, Jan. 25, 1874, he became a pupil of Madeley Richardson at Southwark cathedral, and organist at S. Mary Magdalene, Munster Sq., London. He directed the S. Cecilia festivals, 1925-33, and was organist and director of the choir at Chichester cathedral, 1931-38. Editor of *The Musical Times*, 1918-44, in which his regular comments on current musical affairs over the signature Feste commanded attention, he also wrote manuals for organists, transcribed Bach, and edited Rheinberger's sonatas. He died Feb. 15, 1944.

Grace, WILLIAM GILBERT (1848-1915). English cricketer. Born July 18, 1848, at Downend, Glos,

W. G. Grace
Russell

he was the son of a doctor, who was also an enthusiastic cricketer. W. G. had three brothers, of whom Edward Mills (1841-1911) and George Frederick (1850-80) also played cricket for Gloucestershire and England. W. G. became a doctor, but cricket was his real career.

In 1863 he began to play in first-class matches, and in 1870 became a member of the Gloucestershire team, which almost at once ranked as first-class. This he captained until 1899, and under him it was thrice champion county. Grace also captained the English team in test matches against Australia until 1899, and to that country he took teams in 1873-74 and 1891-92; he also visited the U.S.A. In 1899 he became manager of the new London county club. He died Oct. 23, 1915.

The Champion, the Doctor, the Old Man, or W. G., as he was variously called, was certainly the greatest cricketer who ever lived. Of massive frame, over 6 ft. in height, he was also devoted to other sports, being a fine runner. As a batsman he was superb, but he was also a notable fieldsman and a skilful bowler. He knew the game from end to end, and was as crafty as he was brilliant. Grace's performances with the

bat were the more marvellous because they were done on the rougher wickets of the past. By 1900, when his career as a first-class cricketer ended, he had scored over 54,000 runs. In 1871 he scored 2,739 at an average of 78. In 1895, aged 46, he made 1,000 in May. His tally of 126 centuries was not beaten until 1925, by J. B. Hobbs. His highest score in first-class cricket was 344, and on ten occasions he passed 200. As a bowler he took over 2,800 wickets, while in seven seasons he scored over 1,000 runs and took over 100 wickets. He played in a series of Gentlemen v. Players matches from 1865 to 1899. Grace wrote *Cricketing Reminiscences*, 1899. *Consult* Life, B. Darwin, 1934.

Gracechurch Street. London thoroughfare connecting Fish Street Hill with Cornhill and Leadenhall Street, E.C. Known in the 13th century as Garscherchesstrate (A.S. *gaers, gers, græs*, a blade of grass, herb, hay), from the grass or herb market held in the yard of S. Benet's Church, its present name dates from 1666. S. Benet's stood on the E. side, at the junction with Fenchurch Street, was burnt in the Great Fire, rebuilt by Wren 1685, and demolished 1867-68, when the street was widened. Tarlton the clown lived here, and at the Cross Keys Inn, No. 15, which existed down to the middle of the 19th century, Banks exhibited his horse Morocco. At No. 13 William Hone opened The Grasshopper coffee house. Some scenes of Heywood's comedy, *The Wise Women of Hogsdon*, are laid in this street.

Grace Note. In music, a note not essential to the harmony, added to give piquancy to melodies. Such notes are usually written smaller than the ordinary notes. See *Appoggiatura*; *Mordent*; *Shake*; *Trill*; *Turn*.

Graces. In classical mythology, the three deities of grace and beauty, originally goddesses of fertility, and called Charites by the Greeks and Gratiae by the Romans. See *Charites*.

Grackle or **GRACKLE** (Lat. *graculus*, jackdaw). Name given to a number of birds of different regions, e.g. the hill myna of Malaya and India. These birds belong to the starling family, and have glossy black plumage with yellow wattles on the sides of the

head. They live entirely on fruit, and are clever talkers and mimics.

Grader. Machine for shaping the surface of roads, airfields, and similar areas. It consists of a scraping and carrying blade somewhat like that of a bulldozer (*q.v.*); the type of bulldozer termed an angledozer is a form of grader. The heavy steel blade is adjustable at various angles in relation to the line of forward travel, and when the grader is towed, or moved by its own built-in motive unit, the soil of the road is scraped off and carried to one side of the track. The grader is adapted for shallow excavation of loose soil, the removal of sods, the shaping of road surfaces to a slope or a camber, etc. It can also be used for mixing and placing new material on top of the road bed. Besides the adjustment for angle of blade in relation to line of travel, the blade can be set at various angles. See Excavator.

Gradient (Lat. *gradus*, a step). Term applied to the degree of ascent or descent of the slope of a road or rly. from the horizontal. A gradient is measured as one part vertical rise in x parts of horizontal distance, and may be denoted in several ways. Thus a gradient of two degrees 52 minutes is equal to a gradient of 5 p.c. or of 1 in 20; the way rises 1 ft. vertically in every 20 ft. horizontally.

The ruling gradient is the greatest slope permitted on a road or rly. On high roads this is usually kept between 1 in 20 and 1 in 30 except for short distances. A gradient of 1 in 25, occasionally used on rlys. in mountainous districts, is generally regarded as the limit for locomotives which depend upon friction for their driving force.

In Great Britain, gradients are always measured by the ratio 1 in x . This has the advantage of giving the relation between the weight of a vehicle and the tractive effort which is always exerted in a direction parallel with the road; thus a vehicle weighing 4 tons requires a tractive effort of one ton when ascending a gradient of 1 in 4. In the U.S.A., gradients are expressed by a percentage; an incline which rises 1 ft. in 10 ft. is a ten per cent. grade. A 66 p.c. gradient is the steepest which a vehicle can climb; above that figure the force of gravity overcomes the tractive effort.

The gradient of a river or flow of water is known as its fall. In physics the term gradient is used

to denote the rate of change of any quantity with distance. Pressure gradient is a term employed in meteorology to denote the rate of change of barometric pressure with distance along the earth's surface measured perpendicularly to the isobars. Potential gradient is an electrical term denoting the space-rate of change of electrical pressure or voltage across a medium such as a gas, liquid, or a solid dielectric.

Gradual or **GRAYL** (Lat. *gradus*, a step). Ancient liturgical chant or antiphon. Also called the responsory, it is sung at High Mass after the reading of the Epistle. Called the gradual from being formerly sung on the altar steps or while the deacon ascended the steps of the ambo (*q.v.*) or reading desk to sing or read the Gospel, it is called the responsory because it answers the Epistle. It is followed by the Hallelujah or, in penitential seasons, by the Tract. The book containing these pieces of music, to which Haydn, Mozart, and Cherubini contributed, was known as the *Gradale* or *Graduale*, a term later extended to include other portions of the service.

Gradual Psalms. Title given to Psalms 120-134. The early Fathers regarded them as marking the steps by which the soul ascends to God. In the Roman Breviary they are divided into three sets of five each, formerly said before matins every day in Lent. The obligation of reciting them in choir was abolished by Pius X. The term Song of Degrees, applied in the A.V. to a number of these Psalms, is altered in the R.V. to Song of Ascents. Of the many theories of the title the most generally accepted is the explanation that these Psalms were sung during the "goings up" or pilgrimages of the Jews to Jerusalem for the great annual feasts. They are usually attributed to the early part of the post-exilic period.

Gräfe, KARL FERDINAND VON (1787-1840). A German surgeon. Born March 8, 1787; at Warsaw, he studied medicine at Halle and Leipzig, and in 1810 founded and directed a surgical clinic at Berlin. Superintendent of German military hospitals during the Napoleonic wars, he did much to reform army hospitals and improve the treatment of wounds; but he is chiefly remembered as the father of plastic surgery. Gräfe died at Hanover, July 4, 1840.

Graffiti (It. *graffiare*, to scratch, to engrave unskilfully). Term used

for ancient scribblings. Written or drawn upon walls, rocks, potsherds, and other surfaces, graffiti were scratched with sharp implements, drawn in charcoal or chalks, or painted. Universal in range, from Neolithic drawings on cave-walls at Gezer and rocks in the Nile valley, to scratchings by 2nd century Chinese pilgrims on Shantung tombs, and viking runes at Maeshowe, they survive in schoolboy, tourist, and other scrawls. In ancient Egypt they occur on pyramid walls at Medum and on potsherds; many thousands are recorded from Thebes. At Pompeii they included sporting tips, election notices, and amatory effusions. On Silchester potsherds they show the Romano-British populace habitually using Latin. They were numerous in ancient Rome; a caricature of the Crucifixion was found on the Palatine in Rome in 1857; Maruchi found in the St. Sebastian catacomb, in 1915, 4th century graffiti confirming its traditional association with the remains of SS. Peter and Paul. See Art, Primitive; Inscriptions.

Graf Spee. This German pocket battleship of the Second Great War is described under its full title Admiral Graf Spee. See also Plate, Battle of the.

Grafting. A method of transferring a branch or bud of a choice variety of tree to a foster-parent. This process depends for its success on the union of the cambium layer (the seat of active growth, which lies just beneath the bark) of the scion or graft with that of the stock. The scion is a piece taken from the tree it is desired to increase, and the stock is the tree on which it is placed. Grafting is carried out when the sap is rising, from the end of March to the end of April.

The scion is a portion of a sound, firm shoot containing buds of the previous year's growth. It may be 6-10 ins. in length and should be prepared for insertion on the stock with a sloping cut at the base. As scions must be in a less advanced state of growth than stocks, they are cut off the trees in winter and half buried in a shady border. Selection and planting of special stocks are best left to the commercial grower, but amateurs will find grafting useful for renovating old apple and pear trees.

The branches of the old tree are cut back in Jan. to within about 18 ins. of the base. Crown or rind grafting is most suitable for large branches; it is carried out by inserting two scions on each

branch. A slit about 2 ins. deep is made in the bark, which is then lightly prised away from the branch to allow of the scion being inserted immediately behind it to such a depth that the top of the sloping cut on the scion is level with the top of the shortened branch. The scions are tied firmly with raffia or soft string, and this is covered with grafting wax or clay.

When the stocks are small, whip or tongue grafting is practised. Sloping cuts are made on scion and stock; the former is placed on the latter and bound and covered as already described. A firmer junction is assured by making a slit on the stock and another on the scion so that the tongue thus formed on the latter will fit into the notch on the stock.

Grafting. Transference of portions of tissue from one area to another to replace structures destroyed by burn or injury. Skin grafting was introduced by Reverdin in 1869. His plan was to remove a number of small pieces of cuticle and cutis, the upper layers of the skin, from the healthy area, which were then dotted over the denuded area, thus serving as centres of repair. In Thiersch's method large strips of cuticle are applied to the raw surface. In the Wolfe graft the whole thickness of the skin is employed. Between the graft and the surface penicillin is now inserted, combating effectively the sepsis which once caused the failure of many operations. Bone-grafting has important uses in modern surgery.

Grafton. Town of New South Wales. It stands on the Clarence river, 45 m. from its mouth, and is the chief port of the Northern Rivers dist., 434 m. N. of Sydney. It has bacon factories, creameries, sawmills, and tanneries. The centre of a fertile district devoted to dairying and horse breeding, it produces also sugar, maize, oranges, and timber. It is the seat of Anglican and R.C. bishops. Electric power is supplied by the Nymboida hydro-electric scheme. Pop., with South Grafton, 10,540.

Grafton, Duke of. English title borne by the family of FitzRoy from 1675. Henry, son of Charles II by Barbara Villiers, duchess of Cleveland, was called FitzRoy and made duke of Grafton in 1675. He

Grafting. 1. Crown or rind grafting. 2. Splice. 3. Cleft. 4. Saddle. 5. Inarching. 6. Whip. 7. Notch

was killed in 1690 whilst fighting in Ireland for William of Orange. His descendant, Augustus Henry, the 3rd duke, figured in the politics of the 18th century, and from him the later dukes descend. Charles Alfred Euston FitzRoy (b. 1892) became 10th duke in 1936 in succession to a cousin. The duke's eldest son is known as earl of Euston, and his chief seat is Euston Hall, Thetford. His estates are in Suffolk and Northants.

Grafton, Augustus Henry FitzRoy, 3rd Duke of (1735-1811). English statesman. Born Oct. 1, 1735, he was educated at Westminster and Cambridge. He became duke in 1757 and was soon a prominent figure in politics. He opposed Bute, and in 1765 became secretary of state for the northern department. In 1766 he was made first lord of the treasury. He was head of the ministry during Pitt's illness, but resigned in 1770. He was made lord privy seal in 1771, and again in 1782. Grafton seldom let public affairs interfere with racing and other pleasures. He died March 14, 1811.

Graf Zeppelin. Name of two German airships and an aircraft carrier. The first airship (L.Z.127) was the most successful of all commercial lighter-than-air craft. Launched in 1928, it was 772 ft. long, 100 ft. in diam., and had a gas capacity of 3,710,000 cu. ft. The five engines (530 h.p. each) drove the ship at 80 m.p.h. Commissioned under Dr. Hugo Eckener (*q.v.*), the Graf Zeppelin made the first round-the-world flight (1929) and a visit to the North Pole (1931), but during 1932-36 was on a regular service from Ger-

many to S. America, making 148 Atlantic crossings without incident. It had carried over 13,000 passengers and covered a million miles when withdrawn from service.

A much larger Graf Zeppelin (L.Z. 130) was launched in 1938, as a sister ship to the ill-fated Hindenburg (*q.v.*), but the outbreak of war prevented its commercial use. The 19,250-ton aircraft carrier Graf Zeppelin—Germany's first modern carrier—was launched in 1938, but never completed. See Airship; Zeppelin.

Gragnano. Town of Italy, in the prov. of Naples. It is 20 m. by rly. S.E. of Naples, and 2 m. E. of Castellammare. It has macaroni factories and exports red wine.

Graham, Sir James Robert George (1792-1861). A British politician. He was born June 1, 1792, and went to Westminster School and Christ Church, Oxford. Entering parliament as a Whig in 1818, he made his mark as a Liberal with a pamphlet, *Corn and Currency*, 1826, and was first lord of the admiralty in Grey's reforming administration, 1830-34. Graham then moved to the Right, resigning over Irish Church policy. Home secretary under Peel, 1841-46, he became unpopular for having private letters opened by the post office. He went out of office with Peel over the abolition of the Corn Laws, succeeded him as party leader, and was again at the admiralty in Aberdeen's coalition, but resigned in 1855 when a committee was set up to discuss the conduct of his department in the Crimean War. He died Oct. 25, 1861. *Consult* Life, C. S. Parker, 1907.

Graham, Robert Bontine Cunningham (1852-1936). Scottish author and traveller. His ancestry was partly Spanish and he also claimed to be the heir of Robert II of Scotland. From Harrow School he went to S. America and was by turns a soldier in Uruguay, a rancher in Argentina, and a farmer in Mexico, where he

Sir James Graham, British politician

Augustus H. FitzRoy, 3rd Duke of Grafton

R. B. Cunningham Graham, Scottish author

met Buffalo Bill. As Radical M.P. for N. Lanarkshire, 1886-92, he had a stormy career, being suspended twice and injured in the Trafalgar Square riots. In the First Great War he bought horses and cattle in S. America for the British government. He helped to found a national party of Scotland, 1928. He died March 20, 1936, in S. America. In 1879 he had married a Chilean, Gabriela de la Balmondière, artist and writer.

Graham's Notes on the District of Menteith, 1895, made a remarkable guide book. Next year, with his wife, he wrote *Father Abraham of Scotland* and other essays. *Aurora*, la Cujijñi, 1898, sketched a bull fight and dance hall in Seville. In the same year Mogreb el Acksa described a Moroccan journey. *A Vanished Arcadia*, 1901, concerned Paraguay. Graham wrote lives of many S. American figures, e.g. de Soto, Diaz del Castillo, Valdivia, Paez; and romantic works entitled *Success*; *Progress*; *Faith*; *Hope*; *Charity*. Lavery painted him as Don Quixote and he is described in *A Modern Conquistador*, H. F. West, 1932.

Graham, STEPHEN (b. 1884). British author and traveller. Study of Russian literature attracted him to visit the country, where he tramped in the Caucasus, Crimea, and Far North, as well as Central Asia. Returning through Egypt, the Balkans, Norway, and Murmansk, 1914-16, he joined the Scots Guards in the First Great War, and wrote of his experiences in *A Private in the Guards*, 1919. In the 1920s he was exploring, mostly on foot, the new Russia and the Balkans. Beginning with *A Vagabond in the Caucasus*, 1911, he wrote a series of travel books, social studies, and biographies of tsars—Peter the Great, Ivan the Terrible, Boris Godunov. With these were interspersed studies like *London Nights*, 1925; *The Gentle Art of Tramping*, 1927; *Twice Round the London Clock*, 1933. Graham edited *The Tramp's Anthology*, 1928.

Graham, THOMAS (1805-69). Scottish chemist. A Glasgow boy, born Dec. 21, 1805, he attended

The Graham

the university. He was professor of chemistry at the Anderson Institution, Edinburgh, 1830, and at University College London, 1837, staying until

he became master of the mint in 1855. F.R.S. from 1836, he was a founder and first president of the Chemical Society, 1841. He died Sept. 11, 1869. His reputation rests on his investigations into the diffusion of gases and liquids, and observations which led to the concept of poly-basic acids.

Graham, WILLIAM (1887-1932). A Scottish politician. Born at Peebles, July 29, 1887, he went to George Heriot's School, studied economics and law at Edinburgh university, and became a journalist. A prominent Labour leader, he lectured at Ruskin College, Oxford, became a member of the Edinburgh town council in 1913, and entered parliament for Central Edinburgh in 1918. In the first Labour government, 1924, he was financial secretary to the Treasury; in the second, 1929-31, president of the board of trade. He lost his seat at the general election, and died Jan. 8, 1932.

Graham, KENNETH (1859-1932). Scottish author. The son of an advocate, he was born in Edinburgh. Educated at St. Edward's School, Oxford, he entered the Bank of England, of which he was secretary 1893-1908. A first work, *The Headswoman*, a short satirical tale, appeared in 1890. In 1895 *The Golden Age*, consisting of 18 sketches, won acceptance as a classic description of childhood. More famous was *The Wind in the Willows*, 1908—a story of animals written for children—dramatised by A. A. Milne in 1930 under the title of *Toad of Toad Hall*. Grahame died at Pangbourne, July 6, 1932. His *Life and Letters* by Chalmers appeared the following year.

Grahame-White, CLAUDE (b. 1879). First British aviator. Born Aug. 21, 1879, he was educated at Bedford grammar school and established a motor engineering business in London. He became interested in aeronautics in 1909, making

C. Grahame-White,

British aviator

his earliest flights at Pau, and was the first Englishman to be granted an aviator's certificate. There he started the first British flying school. Grahame-White made a gallant attempt to beat the Frenchman Paulhan in his flight from London to Manchester in a bid to win the Daily Mail's £10,000 prize. Paulhan reached

Manchester early on April 28, 1910, just ahead of Grahame-White, who had made the first night flight in history. In the U.S.A., also in 1910, the latter won the second Gordon Bennett race at 60 m.p.h. He formed the Grahame-White Aviation Co., which became proprietors of the aerodrome at Hendon. Popular flying displays were organized, and aircraft were built in his factories during the First Great War.

Grahamite. An asphaltite, the more lustrous varieties of which may be confused with gilsonite (g.v.), but it is differentiated from that mineral by a higher fixed carbon content (30 p.c.) and by not melting but intumescent when heated. Grahamite occurs in veins, exceptionally exceeding 30 ft. in thickness, and is found in W. Virginia, Oklahoma, Trinidad, Cuba, Argentina, Peru, etc. The ash of some grahamites contains a high proportion of vanadium.

Graham Land. Part of the Antarctic continent. It lies due S. of Tierra del Fuego, N. of Alexander I Land, and S. of Danco Land, and is a dependency of the Falkland Islands. It was discovered by John Biscoe, a British mariner, in 1832, the islands lying off its N. coast being named after him. It is a mountainous tract, desolate and ice-bound. Nordenskiöld remained two years here from 1901, and it was visited by Charcot in 1904-05. On the W. coast a meteorological station was erected by the Argentine republic. Ry-mill's 1934 expedition showed that Graham Land is not an archipelago but part of the continent. See Antarctic Exploration.

Graham Prize. Prize for naval history, founded in 1909 by Lady Graham in memory of her husband Admiral Sir W. Graham. It is given to the cadet of the 4th, 5th, or 6th term at the Royal Naval College, Dartmouth, who obtains highest place in a voluntary examination in a special period of naval history.

Grahamstown. City of South Africa. In the Cape prov., it is the capital of its E. portion, in the Albany district. Grahamstown stands on the slopes of the Zuurberg Mts., by rail 43 m. from the sea at Port Alfred and 106 m. N.E. of Port Elizabeth. The chief buildings are the Anglican and R.C. cathedrals, and the city hall, a Gothic building completed in 1882; there are a public library, art gallery, and museum. The Anglican cathedral in Church Square, partly designed by Sir Gilbert

Scott, has interesting decorations. There are several other churches, a synagogue, etc. The Albany Hall, the court house, and the botanic gardens covering 100 acres may be mentioned. At Grahams-town is the Settlers' Hospital. Educational institutions include

Grahamstown. The 1820 Settlers' memorial, the cathedral, and, on the left, the City Hall

the Rhodes university college, founded in 1904; and S. Andrew's College, a public school for boys.

Oatlands is a suburb, and near the town is a racecourse. Grahams-town has a trade in wool, and is also a health resort. Founded in 1812, it was for many years an important military station. It was named after Col. John Graham, a leader among the early settlers. European pop. (1946) 8,900.

Grahn, LUCILE (1819-1907). Danish dancer. She trained at the Royal Theatre ballet school, Copenhagen, making her début there in 1829, and became a pupil of Bournonville. She appeared as a ballerina in Paris in 1836, and was soon acclaimed one of the finest dancers of her time. Grahn achieved a European reputation and outstanding success in romantic ballets. She later taught and produced ballet at Munich, retiring in 1875.

Graian Alps. Section of the Western Alps, lying between S.E. France and N.W. Italy. Running from N. to S. from the valleys of the Isère and Dora Baltea in the N. to those of the Arc and Dora Riparia in the S., they culminate in the Gran Paradiso (13,324 ft.) and the Grivola (13,022 ft.).

Grail, THE HOLY. Name given in legend to the cup used by Christ at the Last Supper. Several versions of the story of this vessel exist, some saying that it came

into the hands of Joseph of Arimathea, who used it to collect the Blood which flowed from Christ on the Cross. By other authorities it is described as the sacred cup from which Christ drank while hanging on the Cross. It is sometimes called the San (Saint) Graal or Greal. Joseph is reported to have brought it to England, but later it is said to have been carried to India.

In the *Morte d'Arthur* of Sir Thomas Malory (15th century), the Siege (seat) Perilous at the Round Table is reserved for the perfect sinless knight who shall achieve the quest of the Grail: and there on the day on which that knight, Galahad, who was of king's lineage and of the kindred of Joseph of Arimathea, takes his seat it is told to Arthur: "This day the San Grail appeared in thy house, and fed thee and all thy fellowship of the Round Table." After the Holy Grail has appeared, the knights set off on that quest which but one can achieve, and which marks the breaking up of the fellowship.

In another form of the legend—that of which Perceval (*q.v.*) is the central figure—the Grail is seen in a chapel belonging to the castle of King Fisherman, and evil falls upon the king and his land because the knights to whom a sight of it is granted fail to say a certain word. In the Germanised form of the story, the Grail is not a dish or a cup, but a stone; while in the Welsh tale of *Peredur*, which some regard as the original, there is no Grail at all, but only the quest.

In the 12th century Robert de Borron treated the subject in his *Joseph of Arimathea*. About the same time Chrétien de Troyes wrote his poem, *Perceval le Gallois*, and about the end of the century came another version in the *Parzival* of Wolfram von Eschenbach, who said that he had received the substance of his story from a Provençal poet. In the early part of the 13th century an unknown author composed the romance of *Perceval le Gallois*, ou le Conte de Graal (Eng. trans. The High History of the Holy Grail, S. Evans, 1898). The etymology of the word grail (old Fr. *grail*, *greal*) is uncertain. It is suggested that it is a corruption of late Lat. *gradale* or *cratus* (*cf.* crater), both meaning bowl, dish. San Gréal was later corrupted into Sang Réal, the True Blood of Christ. See *Arthur*; *Morte d'Arthur*; consult also *The Legend of the Holy Grail*, A. Nutt, 1902.

Grain (Lat. *granum*). Literally a small, hard seed. From this it has become a synonym for corn, especially when used in a business sense. See *Barley*; *Oats*; *Wheat*.

Grain. Unit of weight. The average weight of a grain of corn taken from the middle of a ripe ear; the 1/7000 part of a pound avoirdupois. In Troy weight, 480 grains equal an ounce, while 24 grains are called a pennyweight.

Grain. Metallic crystal of irregular shape, as revealed under the microscope. When a molten pure metal is cooled, at its melting point it starts to solidify at various centres, which act as nuclei for the growth of crystals. As solidification proceeds, these crystallites grow, the atoms arranging themselves in a regular pattern. Ultimately they interfere with each other, so that none can attain a perfect crystal form as in quartz crystals. Although the grains appear quite irregular, X-ray examination shows the ordered internal arrangement of the atoms inside each grain, with an unsystematic and possibly amorphous layer at the boundaries between neighbouring grains. The size of the grains depends mainly on the speed of cooling, slow cooling resulting in large, coarse grains. Similar considerations apply to alloys.

The grain size of a metal can be changed in the solid state. If the metal is worked, the grains become deformed. Subsequent heating, called annealing, will then cause recrystallisation or the formation of new grains. Grain growth may follow, the new crystallites absorbing each other and so getting larger. In general, the larger the grains get, the softer and more ductile the metal itself becomes.

Grain boundaries are harder than grains themselves, because the finer grained metal, which must have more boundary material, is harder and less ductile. This theory led Sir H. C. H. Carpenter between 1915 and 1925 to attempt to make a metal test piece entirely of a single crystal. His success led to a better understanding of the behaviour of metals. His single crystals showed much greater ductility than the polycrystalline material, and a variation in ductility depending upon the orientation of the crystal. Test pieces composed of two crystals never broke at the grain boundary: proof of its superior strength.

Coarse structures are not always desirable and there are various

methods of grain refinement: by hot working, by recrystallisation at a change point, such as the eutectoid in steels, or by severe cold work and annealing at lower temperatures, which leads to heavy recrystallisation with a fine grain size. The grain size may be described by the number of grains per unit area, the dimension, or the average diameter. *See* Annealing.

Grain, ISLE OF, OR ST. JAMES. Parish and village of Kent, England. Standing at the junction of the Thames and the Medway, it was formerly an island, but has now roadway communication with the mainland. Here fortifications guard the approaches of the Thames and the Medway.

Grain, (RICHARD) CORNEY (1844-95). A British entertainer. Born Oct. 26, 1844, he was called

Corney Grain,
British entertainer
Elliott & Fry

to the bar in 1866, but four years later joined the German Reed Company, with which he was associated until his death, March 16, 1895. He wrote over fifty entertainments

for the company, and songs and sketches, being the pioneer entertainer at the piano. His autobiography appeared in 1888.

Grain Coast. Name formerly applied to a portion of the W. African littoral between the island of Sherbro and the Ivory Coast. The greater part is now under the control of the republic of Liberia. It was noted for melegueta pepper, or grain of Paradise (*v.i.*), hence its name. *See* Liberia.

Grainger, PERCY ALDRIDGE (b. 1882). Australian composer and pianist. Born at Melbourne, July 8, 1882, he studied under Busoni in Germany, and came to London in 1900, living there until in 1915 he settled in the U.S.A. A brilliant pianist, he gave many recitals and often played at concerts. Grainger was influenced by the style of Grieg in his collections and annotations of English, Welsh, and Irish folk songs, and his compositions owe much to the robust vernacular of folk idiom. His works include the Irish reel, Molly on the Shore; the clog dance, Handel in the Strand; Shepherd's Hey; Country Gardens.

Graining. The art of imitating woods such as oak, mahogany, walnut, etc., by means of paint.

Upon a ground colour is painted a coat of graining colour, and while this is still wet it is manipulated in such a manner as to remove part of it and expose the ground beneath. Oak graining is the most popular, probably because of the remarkable resemblance to nature which a skilled craftsman can produce. In old houses will often be found examples of graining in excellent condition after more than a quarter of a century. Ability to grain well was at one time the hallmark of the expert painter and decorator, but the teaching of Ruskin, who called graining a "sham," gave the art a great setback from which it recovered only slowly.

Grain of Paradise (*Amomum*).

Seed of two species of this genus, which is included in the family Zingiberaceae.

Both are perennial herbs, and natives of W. Africa. *A. gratum-paradisii* has lance-shaped leaves and whitish flowers; *A. melegueta* more slender leaves and pale pink flowers. The seeds are warm

to the taste and have a suggestion of camphor. They are illegally used by brewers and distillers to make the strength of their productions appear greater. *See* Cardamom.

Grain Ship. Steam, motor, or sailing ship designed for the bulk carriage of grain. Steam-propelled craft on the inland waterways of N. America transport grain from the prairies through the Great Lakes to the east coast ports of Canada. This type of vessel is in effect a barge, as it consists of a large hold. On the forecastle is a wheel house, and the engines are in the extreme stern. One such ship, the Lemoyno, displaces 10,000 tons on a length of 833 ft. and her engines develop 11,000 h.p. to give a speed of 13 knots. She is able to transport 550,000 bushels in a single load.

A fleet of sailing ships operated by the Finnish shipowner Erikson transports grain between Australia and Europe. Its most famous vessel was the Herzogin Cecilie, 3,111 tons, which in 1927 made the passage from Port Lincoln, S. Australia, to Cobh, Eire, in 88 days. She was wrecked off the S. Devon coast in 1936.

Grain of Paradise.
Left, plant with
flower; right, seed
pod and section

During the Second Great War, grain ship aircraft carriers were built for service in the N. Atlantic. They had a deadweight carrying capacity of 7,930 tons and a speed of 13 knots. The cargo was carried below the second deck, on which was hangar space for Swordfish aircraft. Above was a flight deck 440 ft. long and 60 ft. wide, electric lifts transporting the aircraft from hangar to flight deck. Defensively armed with two Bofors, four Orlicons, and one 12-pdr. gun, and known as a merchant aircraft carrier, this type of grain ship allowed of air cover for convoys during the battle of the Atlantic.

Gram OR GRAMME. Unit of weight in the metric system. To provide the desired link between size and weight, the gram was defined as the weight of 1 c.c. of water at 4° C. It is approximately equal to 15.4323 English grains. The kilogram, 1,000 grams, is the standard weight, and is 35.2734 oz. avdp., or roughly 2.2 lb. Thus 1,000 kilograms, a metric tonne, is 2204.6 lb. or 0.95421 tons.

Gram, GREEN (*Phaseolus mungo*). Herb of the family Leguminosae, a native of India. Commonly cultivated in India and the Nile Valley, it has a considerable number of varieties, some dwarf and erect, others climbing. It is a hairy plant, with the leaves divided into three oval leaflets. The small whitish flowers are succeeded by hairy, nearly cylindrical pods containing the small seeds which are used as food.

Gramineae. Large family of herbs of the grass family. It includes over 3,000 species, natives of all climates. They are mostly tufted, with cylindrical, jointed stems and narrow, alternate leaves. The flowers usually consist of two minute scales enclosed in a boat-shaped glume, together with three stamens and a single-celled ovary. The fruit is a membranous envelope, enclosing the single albuminous seed. Most of them produce nutritious herbage and seeds, which form the principal foods of man and his herds and flocks. The numerous meadow-grasses mainly consist of species with flat leaves that do not roll up in dry weather. The order contains all the valuable cereals—wheat, oats, rye, rice, etc.—sugar-cane, and bamboo.

Grammar (Gr. *grammatikē*, the science of letters, *grammata*). This term, originally meaning simply the art of reading, was extended to include the study of literature and all branches of learning generally.

In its more restricted sense, it is the study of the forms and syntax of a language, the art of speaking and writing correctly. But the rules of grammar are not unalterably fixed and final; they merely represent the practice followed in speaking and writing by educated persons at a certain time. Much of what is now bad grammar (e.g. I don't know nothing) was once correct. The best authors of the most flourishing period of a literature did not write according to rules; rather, their writings furnished the material on which the rules of the grammarians were based.

Grammar early interested the learned in both east and west. The founders of the science in the west were the Greeks. The sophists and Plato first directed attention to the formation and derivation of words, Aristotle discussed the parts of speech, and the Stoics invented names for cases. Alexandrian grammarians and critics drew up the rules of Greek grammar from the Homeric poems and other masterpieces of Greek literature, and their rules still find a place in modern school books.

In the 1st century B.C. Dionysius Thrax brought out the first complete Greek grammar, and Apollonius Dyscolus (2nd century A.D.) first definitely separated forms from syntax. The Romans made no appreciable contributions to the science, their chief merit being that they translated the Greek terminology and introduced it into Europe. The two most famous Roman grammarians were Aelius Donatus (4th century A.D.) and Priscian (6th century). In the Middle Ages, and even in the Renaissance period, little progress was made; but the discovery of Sanskrit in the 18th century led to a precise formulation of grammar. See Language; Phonetics.

Grammar School. Type of school for secondary education. Grammar schools were first established in medieval times, when a knowledge of Latin and its grammar was the foundation of education. The curriculum of these early schools comprised little besides Latin and Greek grammar, texts, and translations, and mathematics. Some were founded by monastic orders; many were endowed by merchants or merchant companies; some were organized as chantry and choristers' schools. Henry VIII, when dispossessing the monasteries, necessarily disendowed many of the schools associated with them. During the reign of Edward VI and of Eliza-

beth some restitution was made by the establishment of many new grammar schools. Some of these remain as famous day schools; others have developed boarding establishments. Many of the older grammar schools are now public schools, i.e. are represented at the headmasters' conference.

Slowly the concept of education broadened, and the curriculum of the grammar school was extended to include modern languages and history; but Latin, Greek, and mathematics remained the basis of the classroom work, though the larger grammar schools developed as well as their classics side a modern side in which pupils gave more attention to natural science, geography, modern languages, literature, and crafts, and sometimes omit the study of Latin.

The secondary schools set up under the Education Act, 1902, by local education authorities provided a curriculum basically of the grammar school type, i.e. it is, fundamentally a preparation for university study. The Education Act, 1944, retained the grammar schools, giving an academic form of education of the traditional type as one of the three types of secondary school to which every child was to go at the age of 11. See Modern School; Technical Education.

Gramme, ZÉNOBE THÉOPHILE (1826-1901). Belgian electrician, born April 4, 1826. In 1869 he perfected and introduced the method of ring-winding or armature which led to the first practical dynamo. Although discovered by Pacinotti in 1860, this became known as the Gramme winding or Gramme-ring. Gramme died near Paris, Jan. 20, 1901.

Grammichele. Town of Sicily, in the prov. of Catania. It stands on an eminence, 1,560 ft. above sea level, 55 m. by rly. (33 m. direct) S.W. of Catania. Clay, stone, and marble quarries are worked, and a trade is carried on in grain, cotton, oil, wine, fruit, and cattle. It was founded in 1693 to replace Occhiala, which had been utterly wrecked by an earthquake. Near by is a cave altar to Demeter. Pop. 23,500.

Grammont (Flem. *Geerardsbergen*). Town of Belgium, in the prov. of E. Flanders. Situated on the Dendre, 23 m. S.S.E. of Ghent, it has a Gothic 15th century town hall with four corner turrets and a fountain like that of the Mannikin at Brussels. In the church of S. Barthélemy are two paintings by de Crayer. The rly. line from Alost to Mons passes through Grammont. Pop. 12,664.

Gramont, PHILIBERT DE (1621-1707). French courtier, subject of the *Mémoires* written by Anthony Hamilton (q.v.). Of noble descent, Gramont was educated for the Church, but, turning to the army, served with distinction under Condé and Turenne in Flanders and Spain. Banished from the French court on account of an intrigue with one of the mistresses of Louis XIV, he came to London 1662, and mixed freely in the court of Charles II. There he married Elizabeth Hamilton, sister of Anthony. His exile ended in 1664, but he revisited England on diplomatic and court missions. He died in Paris, Jan. 10, 1707.

The *Mémoires de la Vie du Comte de Gramont*, published in 1713 as having been dictated by the subject himself, were actually written by his brother-in-law, and give not only a vivacious picture of Gramont, but also an intimate account of the more scandalous aspects of the court of Charles II. They were edited by Scott, 1811; C. Goodwin, 2 vols., 1903; new Eng. trans., P. Quennell, 1930.

Gramophone (Gr. *gramma*, letter; *phōnē*, sound). Machine for the reproduction of sound from records of wax or other composition. The original type invented by Edison in 1877 employed cylindrical records; but the introduction of the disk record type by Berliner in 1894 was really the forerunner of sound recording and reproduction for domestic purposes. The illustrations on page 3876 show the principal parts of a simple acoustic gramophone. The sound wave track on the record vibrates the needle, and the vibrations are conveyed by the stylus bar to a diaphragm stretched across the sound-box. The sound waves from the diaphragm are fed via the tone-arm to the horn, or tone chamber, which amplifies and distributes the sound.

To incorporate as large a horn as possible in a limited space, the actual tone chamber is often folded back upon itself as shown in the illustration. Although mica diaphragms are satisfactory, some of the best results have been achieved with a diaphragm of corrugated aluminium freely suspended round the periphery. The acoustic gramophone has had only a limited market since the introduction of electrical recording and reproduction in 1925.

In the latter system, the sound waves on the record are converted into electrical currents by a pick-up in which a small armature

attached to the needle holder vibrates between the pole pieces of a permanent magnet. Surrounding the armature is a coil of many turns of wire. The varying

Gramophone. Diagrams showing (above) the principles of construction in a simple acoustic gramophone and (right) details of the motor

magnetic flux due to the movement of the armature within the coil generates electrical currents which may be conveyed to an amplifier and loud-speaker for reproduction. In radiogramophones, the output from the pick-up is conveyed to the L.F. or output stages of a radio receiver chassis.

RECORD MANUFACTURE. For many years all gramophone records have been electrically recorded. Microphones collect the sound from artists or orchestra and the electrical output is fed into amplifiers. Fading and mixing control panels enable engineers to obtain a satisfactory tonal balance, and the final output is fed to the recording unit—a motor driving a turntable upon which is fixed the thick, soft wax disk. A recording head converts the electrical energy from the amplifiers into mechanical movements of the cutting stylus in a similar but reverse action to that of pick-ups which reproduce the recorded music in radiogramophones.

After the wax has been cut it is dusted with fine graphite powder; this forms a metallic film on which a negative shell is grown by an electro-plating process. From the negative is grown a positive disk exactly similar in its impressions to the original wax. This is used for obtaining negative working matrices from which the records are pressed after the matrices have been strengthened with a steel

backing plate. Material for records consists of shellac, resin, copal, etc., mixed and refined to a smooth powder. The material is heat-rolled into brittle sheets sufficient for either a 10-in. or a 12-in. record. These sheets, softened to a plastic condition, are placed in a press, where a pressure of some 100 tons to the sq. in., combined with steam heating behind two matrices, produces a double-sided record.

Grampian Hydro-Electric Scheme. Engineering work in the Grampians, Scotland, designed

to provide electricity for local consumers and for the grid. A dam 1,360 ft. long and 57 ft. high was constructed at Loch Erich, and the waters were led away by an aqueduct to the Rannoch power station at Tummel Bridge; this stage of the work was completed in 1934. In 1937 output was increased by the digging of a tunnel conveying the waters of Loch Garry to Loch Erich.

Grampians. Mt. range in Scotland. They dominate the centre of the country, their S. face serving as the barrier between the Highlands and the Lowlands. They stretch from the coast of Aberdeenshire in a S.W. direction to Dumbartonshire, touching also the counties of Banff, Inverness, Kincardine, Angus, Perth, Stirling, and Argyll. Their highest point is reached in Ben Nevis (4,406 ft.), but there are other peaks over 4,000 ft. high, and a number over 3,000. Among the most important are Ben Macdui, Ben Lawers, Ben Lomond, Cairngorm, Ben Alder, Ben Cruachan, and Cairntoul. Many rivers flow from the Grampians; e.g. the Forth and Tay, southwards; the Don and Dee, northwards. The mts. enclose some of the finest scenery

in Great Britain: the stretch along the Dee in Aberdeenshire, the wild country at the W. end of the Caledonian Canal, the wooded passes of Perthshire, and the mts. and lochs that beautify that co. and also Argyllshire. In general the N. parts of the range are wild and barren, and there are extensive deer forests.

Grampians. Mountain range in the W. of Victoria, Australia. It contains the source of the river Glenelg, and Mt. William (3,825 ft.) is its highest summit. The N.E. extension of the range is called the Pyrenees.

Grampound. Market town of Cornwall. It stands on the Fal, 9 m. E.N.E. of Truro, and has a railway station at Grampound Road, 2 m. away. Its old town hall still stands, and the place is mainly interesting on account of its past. It became a town in the Middle Ages, and in 1553 began to send two members to parliament. It had a mayor and corporation, and a small number of persons elected the two members. These men's votes were so easily and openly bought that the process became a scandal even in the 18th century. In 1818 an inquiry was held, and in 1821 the borough was disfranchised. A little later it lost its rights as a borough, and is now only a parish. Pop. 388.

Grampus. Popular name for either of two quite different animals. One is *Orcinus orca*, the killer whale (q.v.). The other is Risso's dolphin (*Grampus griseus*), grey, beakless, about 12 ft. long, and widely distributed. The name is said to be derived either from *gras poisson* or from *grand poisson*. The celebrated Pelorus Jack, which used to swim at the bows of ships between Nelson and Wellington, N.Z., was a Risso's dolphin.

Granada. Name of a Moorish kingdom in Spain that lasted from 1238 to 1492. The city of Granada and the district around it fell into the power of the Moors and was long ruled by the caliphs of Córdoba. It became a flourishing place, and was at one time the capital of an independent principality. The kingdom, however, was formed when a certain Moor began to rule over Granada, Málaga, and other places, making the former his capital.

Gradually the Christians won back Spain from the Moors, and later in the 15th century Granada alone remained to the latter. Ferdinand and Isabella at length turned their arms against it, and, owing to rivalries among the ruling

family, Granada fell an easy prey. The Moors were beaten in battle; their last ruler, Boabdil, formally resigned his kingdom to the Christians who, Jan. 2, 1492, entered the city of Granada. Thenceforward the kingdom formed part of Spain. See Alhambra; Moors; Spain; History.

Granada. Maritime prov. of Spain, in Andalusia. Bounded S. by the Mediterranean, it formed part of the old Moorish kingdom. The surface is mountainous, and it contains, in the Sierra Nevada, the highest points of Spain, one of the most picturesque regions in Europe. Well watered, chiefly by the Genil and its tributaries, it is extremely fertile.

Granada. Map of the southern Spanish province, which contains the loftiest peaks in Spain

Warm in the plains and cool in the hills, it has the products of alpine and sub-tropical regions. Sugar-canes, beetroots, cereals, fruit, cotton, and flax are grown, and silk, wine, and oil produced. There are textile factories, tanneries, and iron works, but sugar refining is the primary industry. There are various minerals and marble quarries, and precious stones are found. Area, 4,838 sq. m. Pop. 776,468.

Granada. City of Spain, capital of the prov. of Granada. It stands on the slopes of two hills and on the plain connecting them, 63 m. N.E. of Málaga. Abundantly supplied with water, and having a delightful climate, this old Moorish city, the last seat of the Muslim rulers of Spain, is peculiarly interesting. The Alhambra (q.v.) manifests Moorish power and art.

Granada arms

The old town, Albaicin, which stands on a neighbouring hill, although the poorest part of the city and the dwelling-place of gipsies, is most picturesque. There are remains of the Moorish walls and towers, the Alcázar, the Casa del Cabildo (or old university), the water conduits and other buildings which once made Granada a great

trading city and a famous seat of arts and learning. The more modern town contains the cathedral, public buildings, promenades,

Granada, Spain. The centre of the city and the cathedral

plazas, gardens, fountains, etc. It has many educational and philanthropic institutions, carries on a large trade in agricultural produce, and manufactures textiles, liqueurs, soap, and paper. In the *Capilla Real*, in the cathedral, is the sarcophagus of Ferdinand and Isabella, and in the convent of San Jeronimo lies Gonzalo de Córdoba, conqueror of Naples. Pop. 161,888.

On the invasion of the Iberian peninsula by the Saracens in the 8th century, some, mainly Syrians from Damascus, established themselves near the site of the ancient Illiberis. The settlement grew in importance, and during the Middle Ages became the wealthiest and most splendid city in Spain. As the capital of the Moorish kingdom of Granada it flourished for centuries until the Moors began to give ground during the wars with Alfonso XI and Pedro the Cruel.

In 1482 Ferdinand and Isabella began their task of expelling the Moors from Spain, and in 1492 Boabdil, the last king of the Moors, was compelled to abandon his capital. The city thereafter declined in prosperity and importance. It was taken by the French in 1810 and 1823. It suffered from seismic disturbances in 1884-85 and from a disastrous conflagration in 1890.

Granada. Fifth largest city of Nicaragua, capital of the dept. of Granada. It stands on Lake

Nicaragua, 28 m. by rly. S.E. of Managua. Founded in 1523, the city is well built, and has fine churches and public buildings. It trades in dye woods, indigo, sugar, coffee, cocoa, wool, and hides, and manufactures footwear and gold-wire chains. There are large cocoa plantations in the environs. The city was partly burned down in 1855. Pop. 35,250.

Granadilla. Edible fruits of several species of *Passiflora* (passion-flowers), though the name properly refers to the large greenish-yellow fruits of *P. quadrangularis*. These are about 6 ins. in diameter, with sweet, slightly acid, purple pulp. The plant is a native of Nicaragua, but is largely cultivated in the tropics. It has strongly scented white and red flowers.

Granary (Lat. pl., *granaria*). Place for storing grain in bulk. In modern times the granary has been largely supplemented by the elevator. See Barn; Elevator.

Granby. A city of Quebec, Canada. In Shefford co., on the Yamaska river, it is 47 m. by C.N.R. east of Montreal. The manufactures include rubber products, furniture, tobacco, and maple products. Pop. 14,500.

Granby, MARQUESS OF. Title borne by the eldest son of the duke of Rutland, Granby being a village in Notts, not far from Belvoir. Its most notable bearer was the English soldier John Manners. The eldest son of the third duke, he was born Aug. 2, 1721. Educated at Eton and Trinity College, Cambridge, he saw service with Cumberland's army in the Jacobite rising of 1745. During the Seven Years' War, in 1759 he became commander of the British

John Manners, Marquess of Granby
After Reynolds

contingent, in which capacity he did brilliant work, notably at Warburg, Brückermuhl, Gravenstein, and Wilhelmstahl. He returned home in 1763, and became commander-in-chief in 1766, his conduct in this position being attacked by Junius. For many years Granby was M.P. for Grantham, and he represented Cambridgeshire from 1754 until his death at Scarborough, Oct. 18, 1770. This was the marquess whose name is borne by many public houses.

Gran Chaco. This region of central S. America is entered as Chaco, El Gran; see Chaco War.

Grand. River of the U.S.A. Its headstreams rise in Iowa, and unite in Gantry co., Missouri, through which state the river flows S.E. to its junction with the Missouri river near Brunswick. Its length is about 300 m.

Grand. River of Colorado and Utah, U.S.A. A headstream of the Colorado river, it rises in the Rocky Mts., and flows 350 m. S.W. to the Green river, which it joins in the S.E. of Utah, and has cut deep and precipitous cañons.

Grand. A river of Michigan, U.S.A. Rising in Jackson co., in the S. part of the state, it flows W. and N. to Lansing, where it again follows a W. course, and enters Lake Michigan at Grand Haven. It is 280 m. long, and navigable for 40 m. up from its mouth.

Grand, SARAH (1855-1943). Pen-name of Frances Elizabeth M'Fall, British novelist (Irish by birth). She married at 16 Lieut.-Col. M'Fall, and was widowed in 1898. Her first novel, *Ideala*, was written at 26, but her reputation chiefly rests upon *The Heavenly Twins*, 1893.

Sarah Grand
Russell

memorable for its unconpromising handling of sex problems. The subject was skilfully developed in *The Beth Book*, 1897. A supporter of the woman's movement, she wrote the *Winged Victory*, 1916; *Variety*, 1922. Thrice mayoress of Bath, she died May 12, 1943.

Grand Alliance. Name given to the alliance of European Powers against France in 1701. Louis XIV of France refusing to recognize the treaties by which arrangements for a partition of the Spanish possessions had been made, accepted for his grandson the crown of Spain.

To counter this, William III formed the alliance between the Empire, England, and Holland, who signed a treaty agreeing to compensate the emperor for the loss of Spain, on Sept. 7, 1701. The alliance, joined in 1702 by Prussia, and in 1703 by Portugal and Savoy, carried on the War of the Spanish Succession (*q.v.*).

Grand Army of the Republic. Not a military body, but a civilian association in the U.S.A. of men who had fought on the side of the North in the Civil War. It was formed in 1866 to preserve the memory of fallen comrades and give aid to soldiers' widows and orphans and needy veterans. It became a powerful political force allied with the Republican party, exerting pressure on congress to secure legislation about pensions. At one time it reached a membership of over 400,000.

Grand Banks. Submarine elevation, extending about 200 m. to 300 m. S. by E. of Cape Race, Newfoundland. The area is about 500,000 sq. m.; the depth varies from 10 to 160 fathoms. The waters swarm with fish, especially cod, and fishing is free. The season lasts from June to mid-Nov. See Fisheries; Newfoundland.

Grand Bassam. Port in the French colony of the Ivory Coast. It stands on the Gulf of Guinea, at the entrance of a lagoon, which forms a well protected harbour. It is a leading port in the colony, but trade is somewhat hampered, owing to the fact that Abidjan, the coastal terminus of the main line of rly., is situated on the adjacent mainland. Grand Bassam was formerly the seat of the governor of the colony. Gold is found near. Pop. 5,743.

Grand Canal. Main waterway of Venice. It winds through the city in the shape of a letter S, and from it other canals branch in all directions. On its banks are most of the famous palaces of the city, and near it is the Piazza of

S. Mark. The Rialto bridge crosses it. (See Venice.)

Another Grand Canal extends from Dublin to Ballinasloe, Eire.

Grand Canal. Canal of China, stretching from Hangchow to Tientsin, a distance of 850 m. At Chinkiang, 280 m. from Hangchow, the Yang-tse divides the canal into two portions. The construction of the middle section, from the Yang-tse to the Yellow river, which was in use in 480 B.C., is attributed to the 6th century B.C. The S. section was added between A.D. 605 and 617, and the N. part, from the old bed of the Yellow river to Tientsin, during 1280-83.

Grand Cañon. Deep gorge in Arizona, U.S.A., cut by the Colorado river. It is the most remarkable of a series of cañons, extending for about 1,000 m. along the river's course, and presents a scene of unequalled natural grandeur and weirdness. The gorge extends for about 218 m., has a depth in places exceeding a mile, and a breadth of from 2 m. to 18 m. Geologically as well as in coloration it is one of the world's wonders. The first authenticated passage was accomplished by Major J. W. Powell in 1869. See Cañon; Colorado.

Grand' Combe, LA. Town of France. In the dept. of Gard, it is 31 m. N.W. of Nîmes. The municipality includes La Levade and La Pise, as well as La Grand' Combe proper. There are coal and other mines around the town, which is also known for glass making. Pop. 14,165.

Grand Cornier. Mt. of Switzerland, in the canton of Valais. Situated N. of the Dent Blanche, near the Matterhorn, it reaches an alt. of 13,020 ft. The ascent by the Col de Bricolla is difficult, but not dangerous; that from the Col du Grand Cornier (11,628 ft.) is longer and more difficult. See Alps.

Grand Coulee Dam. Irrigation and hydro-electric plant on the Columbia River, Washington, U.S.A., constructed by the U.S.

Grand Coulee Dam. This enormous concrete dam over the Columbia river. Washington, was put into operation in 1941.

Bureau of Reclamation. The dam, which started working March 22, 1941, is built of concrete and is 550 ft. high. It impounds a reservoir with an area of 82,000 acres and 151 m. long. The dam is the key structure of the Columbia Basin irrigation project, and serving 1,200,000 acres is estimated to be capable of supporting 350,000 persons. The spillway discharges 1,500,000 galls. per sec. and creates a waterfall as great as Niagara. Hydro-electric plants at the base of the dam have a potential capacity of 1,964,000 kilowatts. The total cost of dam and generating plants was \$26,000,000.

Grand Duke. Title ranking above that of duke. It first appeared in 1557, when Pius V gave it to the duke of Tuscany. It was held by the Medici family and later by the Hapsburgs, who retained it after they had been deprived of Tuscany in 1859. The other grand dukes mainly date from the reorganization of Europe in 1815. There were several in Germany before 1918—Saxe-Weimar, Baden, Oldenburg, the two Mecklenburgs, and Hesse-Darmstadt. The present ruler of Luxemburg is called grand duchess. Grand duke was used to translate the title borne by members of the imperial family of Russia before 1918. *See* Duke.

Grand Duke, THE. Thirteenth and last of the so-called Gilbert and Sullivan operas, i.e. with libretto by W. S. Gilbert, music by Arthur Sullivan. The alternative title was *The Statutory Duel*. Produced at the Savoy Theatre, London, March 7, 1896, it was considered inferior to any of its predecessors, ran for only 123 performances, and was never revived.

Grandee (Span. *grande*). Spanish title. Borne by the highest nobles, it carried many privileges. Grandees were exempt from taxes, and from arrest except by special warrant from the king, and could even join the service of the king's enemies. They were allowed to remain covered in the king's presence. Their privileges were gradually curtailed, and Joseph Bonaparte abolished the title. It was revived 1834, shorn of privileges.

Grande-terre. Eastern of two islands which make up the French territory of Guadeloupe (*q.v.*).

Grand Falls. Cataract of Labrador. It is on the Grand or Hamilton river, about 252 m. W. by S. of Hamilton Inlet. It descends over 315 ft., has a breadth of 200 ft., and is one of the finest cataracts in N. America.

Grand Falls. Town of Newfoundland, on the Exploits River, about 22 m. from its mouth. It is connected by rly. with the port of Botwood. It takes its name from the falls, and owes its origin to the development of water power there by the Anglo-Newfoundland Development Company, Limited, whose pulp and paper mills, begun in 1906, and completed three years later, are among the largest in the world. Pop. 6,500.

Grand Falls. Town of New Brunswick, Canada, capital of Victoria co. It stands on the St.

Grand Falls, New Brunswick. The falls of the St. John River

John river, near its falls, 202 m. N.W. of St. John, and is served by C.P.R. and C.N.R. Some 80,000 h.p. from the falls have been developed by the International Paper Co. of New York. The town lies in farming country. Pop. 1,806.

Grandfather Clock. Popular term for a domestic clock in a tall case made to stand on the floor. Usually it is 5 ft. 10 ins. and over; if much below that height, it is referred to as a grandmother clock, and recently a clock standing 4 ft. 10 ins. and less has been introduced and called a granddaughter clock. The grandfather clock first appeared c. 1675. Previously a similar type of clock hung on the wall with weights and pendulum exposed.

With the introduction of the anchor escapement in 1675, the swing of the pendulum was reduced and it was possible to case in the pendulum and weights. Clock cases generally were in advance of the prevailing fashion in furniture. The earliest cases are of oak with walnut veneer; then followed marquetry; ebonised work; lacquer work; oak; and finally mahogany, approximately

in that order. The first grandfather dials were square, made of brass with a silvered hour circle or zone and of simple design, eventually developing into an arched dial with elaborate decorations. Some dials, principally of country make, are painted with a rocking ship or a rising or setting moon, etc. Rarely, Battersea enamel is used. Country-made grandfather clocks are as a rule not as well proportioned as the London models; hence the London makers are much sought after for their superior craftsmanship.

Among the old masters is Thomas Tompion (1639-1713), who is buried in Westminster Abbey. One of Tompion's clocks has changed hands for £8,000. Others whose work is prized by collectors are Edward East, Daniel Quare, Joseph Knibb, Daniel Delander, and George Graham.

Grand Fleet. Name given to Great Britain's principal naval force during the First Great War. Numbering about 400 ships, it was based upon Scapa Flow in the Orkneys; Invergordon in Cromarty Firth; and Rosyth in the Firth of Forth. The Harwich force, but not the Dover Patrol, came under it. During the last year of the war an American battle squadron of five ships formed part of it. Just before the war the Grand Fleet was commanded by Sir G. A. Callaghan, who was replaced by Sir John Jellicoe immediately war was declared. Upon the latter becoming first sea lord in Nov., 1916, Sir David Beatty was appointed commander-in-chief of the Grand Fleet, and he retained that post until the end of the war, when the Grand Fleet was dispersed. *See* Royal Navy.

Grand Forks. Second largest city of North Dakota, U.S.A., the co. seat of Grand Forks co. It stands at the union of the Red Lake river with the Red river of the North, 82 m. N. of Fargo, and is served by rly. It contains Wesley and the Lutheran Bible Colleges; and about 2 m. from the city is the suburb of University, the seat of the state university. Grand Forks is a distributing centre for the agricultural district, and has flour mills, meat packing plants, beet sugar factories, printing plants, and fox fur farms near by. Settled in 1871, it received a city charter in 1881. Pop. 20,228.

Grand Guignol (Fr.). Type of horrific theatrical entertainment. Guignol is the name of the chief personage in French marionettes. France is the home of Grand

Guignol, with its special interest in blood, horror, sex, and death. It was popular in Montmartre at the end of the 19th and beginning of the 20th centuries. The Grand Guignol Theatre was originally an artist's studio, surviving characteristics of which were arched windows, rafted roof, and carved decorations. Les Trois Messieurs du Havre was an outstanding thriller in the Grand Guignol repertoire on its first London appearance in 1908 at the Shaftesbury Theatre. In this piece a rich banker was represented as being hanged from a curtain pole in view of the audience. In 1920 José G. Levy inaugurated a Grand Guignol season at the Little Theatre, London.

Grandi, Dino, Count (b. 1895). Italian politician. Educated at Bologna university, he entered journalism. He became one of the original members of the fascist party, taking part as a staff officer in the march on Rome in 1922. After holding cabinet appointments, Grandi became ambassador to Great Britain in 1932. Upon Italy's entry into the Second Great War, he became minister of justice. When Italy sued for an armistice in 1943, Grandi was one of the leading fascists to oppose Mussolini, and fled to Portugal. In 1947 a Rome assize court acquitted him on all charges of fascist activity.

Grand Island. City of Nebraska, U.S.A., the co. seat of Hall co. Near the Platte river, 155 m. W. by S. of Omaha, it is served by rlys. It has an R.C. cathedral and the U.S. central monitoring station of the federal communications commission. The surrounding region produces cereals and livestock. The city has stockyards, a horse and mule market, rly. shops, pack-

ing plants, flour mills, and canneries. Laid out in 1866, the city took its name from a narrow strip 42 m. long between the river's two channels. Pop. 19,130.

Grandison, Sir Charles. Hero of The History of Sir Charles Grandison, a novel by Samuel Richardson, told in letters, first pub. anon. 1753-54. Intended to be a character of ideal human goodness, Sir Charles is a prig rather than a hero.

Grand Junction Canal. Former name of part of the Grand Union Canal (*q.v.*).

Grand Jury. In English law, a body of men who, at assizes or quarter sessions, decided whether or not there was a *prima facie* case against an accused. If they held there was such a case they found a true bill and the accused was then tried before a petty jury. Grand juries were abolished in 1933 except in a few cases in London and Middlesex. See Jury.

Grand' Mère. City of Quebec, Canada, in Champlain co. On the St. Maurice, 90 m. N.E. of Montreal and 95 m. W. of Quebec, it is served by C.P.R. and C.N.R. An important industrial centre, the city is administered under the council-manager plan. Pop. 8,608.

Grand Mufti. Turkish title used during the sultanate and given to the supreme head of the Ulemas (servants of religion and laws). A mufti is a consulting canon lawyer in Islam. The office of grand mufti was abolished in Turkey in 1924, but that title was assumed by Haj Mohammed Emin el Husseini, spiritual head of the Arabs in Palestine. See Husseini.

Grand National, THE. Principal British cross-country horse-race. Inaugurated in 1839, it takes place annually at Aintree, normally on the Friday of the Liver-

pool Spring Meeting. The course is 4 m. 856 yds., and includes 30 jumps. The water jump is 15 ft. broad, and two other difficult obstacles, both taken twice, are Becher's and Valentine's Brooks. The race was suspended in 1916-18, substitute events being held at Gatwick; it was again suspended in 1941-45. Five horses have won twice: Abd-el-Kader, 1850 and 1851; The

Lamb, 1868 and 1871; The Colonel, 1869 and 1870; Manifesto, 1897 and 1899; Reynoldstown, 1935 and 1936. Poethlyn won it in 1919, having been successful in the substitute race in 1918. The highest weight carried to victory is 12 st. 7 lb., this being achieved by Cloister, 1893; Manifesto, 1899; Jerry M., 1912; Poethlyn, 1919. Record time is credited to Golden Miller, 9 mins. 20.4 secs., in 1934. Winners since 1901 are listed in the table.

Grand Period. Physiological term for the time which elapses between the beginning and cessation of growth of an organism or its part. The rate of growth is at first slow, but accelerates with the passage of time to a maximum. Then deceleration sets in and is progressive till growth ceases.

Grand Popo. Seaport of the French West African colony of Dahomé. In the extreme W., it lies 25 m. W. of Whydah. A rly. along the Togoland border links it with Lokossa.

Grand Pré. Village in King's co., Nova Scotia, Canada. Situated on the shores of the basin of

Grand Pré, Nova Scotia. The Evangeline statue unveiled in 1920

GRAND NATIONAL WINNERS FROM 1901

1901 Grudon	1923 Sergeant Murphy
1902 Shannon Lass	1924 Master Robert
1903 Drumcree	1925 Double Chance
1904 Moifaa	1926 Jack Horner
1905 Kirkland	1927 Sprig
1906 Ascetic's Silver	1928 Tipperary Tim
1907 Eremon	1929 Gregalach
1908 Rubio	1930 Shaun Gollin
1909 Lutteur III	1931 Grakle
1910 Jenkinstown	1932 Forbra
1911 Glenside	1933 Kellsboro Jack
1912 Jerry M.	1934 Golden Miller
1913 Covertcoat	1935 Reynoldstown
1914 Sunloch	1936 Reynoldstown
1915 Ally Sloper	1937 Royal Mail
(1916 Vermouth)	1938 Battleship
(1917 Ballymacad)	1939 Workman
(1918 Poethlyn)	1940 Bogskar
1919 Poethlyn	1946 Lovely Cottage
1920 Troytown	1947 Caughoo
1921 Shaun Spadah	1948 Sheila's Cottage
1922 Music Hall	1949 Russian Hero
	1950 Freebooter

Minas, 46 m. N.W. of Halifax, it was the scene of the surprise, defeat, and capture of Col. Noble's Massachusetts regiment by the French in 1747, and of the expulsion of the Acadians by the British in 1755, which forms the theme of the first part of Longfellow's poem *Evangeline* (*q.v.*). By a purchase the C.P.R. secured control of the well beside the willows on the farm that tradition associates with Evangeline's story,

and here in 1920 Lady Burnham unveiled a statue of Evangeline. The statue, in bronze, by Henri Hébert, was cast in Paris.

Grand Prix (Fr., great prize). Name of several sporting events. The Grand Prix de Paris, a horse-race for three-year-olds, is held at Longchamps over 1 m. 7 fur. An English horse named Ranger won the first race in 1863. Grand Prix motor races, held in several Continental countries, are for specially designed cars, weight and/or engine size being the only limiting factors. (See Motor Racing.) Annual motor cycling Grand Prix races are held over the Isle of Man circuit.

Grand Prix de Rome. State prize for composition at the Paris conservatoire which is competed for annually in July, the result being announced in Nov. The successful candidate is crowned with laurel, proclaimed *lauréat*, and sent to Rome to study for four years, during which time he receives an income from the French government. The *proxime accessit* receives a gold medal. A similar Prix de Rome at the Brussels conservatoire is awarded at intervals of two years. See Prix de Rome.

Grand Rapids. City of Michigan, U.S.A., the co. seat of Kent co. On the Grand river, at the head of navigation, it is 65 m. W.N.W. of Lansing, and is served by the Michigan Central and other rlys. and an airport. It contains a Roman Catholic cathedral, an art gallery, and a unique museum devoted to furniture. It is one of the world's greatest furniture manufacturing centres, and also turns out motor bodies and parts, sheet metal goods, musical instruments, plumbing fixtures, springs and bedding, paints and varnish, and paper products. Gypsum is mined. Grand Rapids has the largest Dutch colony in the U.S.A. Founded in 1833, it was incorporated five years later, and granted a city charter in 1850. In 1905 it was reincorporated. Pop. 164,292.

Another city, in Wisconsin, formerly bearing this name, is now called Wisconsin Rapids.

Grand Remonstrance. THE. In English history, the statement of the case of the commons against Charles I. It was drawn up by the Long Parliament in 1641, immediately before the outbreak of the Civil War. The first part detailed the acts of misgovernment committed by the king after his accession; subsequent sections dealt chiefly with suggested remedial measures, such as the adoption

of safeguards against Roman Catholicism, guarantees for the better administration of justice, and the prevention of the employment as ministers of worthless persons. After acrimonious debate the Grand Remonstrance was passed by 159 votes to 148, Nov. 22, and presented to the king, Dec. 1, 1641.

Grands Mulets. Rocky ridge on the N. slope of Mont Blanc, France. It lies at an alt. of 10,030 ft. on the track from Chamonix to Mont Blanc (*q.v.*).

Grandson OR **GRANSON.** Town of Switzerland, in the canton of Vaud. It stands on the lake of Neuchâtel, 3 m. by rly. N. of Yverdon. It has an ancient Romanesque church, recently restored, and a fine castle dating from the 11th century, long the seat of the baronial family of Grandson. Captured by the Bernese in 1475, it was taken in Feb., 1476, by Charles the Bold, duke of Burgundy, whose massacre of the garrison led to the famous battle of March 3, 1476, near the town, in which Charles was disastrously defeated by the Swiss.

Grand Union Canal. Largest British artificial waterway, formed in 1929 by an amalgamation of the following canal companies: Regent's Canal and Limehouse Dock, Grand Junction, Warwick and Napton, Warwick and Birmingham, Birmingham and Warwick Junction. In 1932 it was extended by taking over the Leicester Navigation, Loughborough Navigation, Erewash, and Hertford Union Canals. With other canals it was nationalised 1948.

Except for a stretch of some 5 m. W. from Braunston, Northants, which forms part of the Oxford Canal, the canal covers the 147 m. route from London to Birmingham. Numerous branches bring its total length to 240 m. The route extends via Brentford Lock to Norton Junction, at which point the canal bifurcates. One section continues 48 m. to Birmingham, the other 42 m. to Leicester, thence to Loughborough and Langley Mill. There are 6 tunnels, the longest being the Blisworth tunnel of just over 3,000 yds. Between Brentford and Birmingham there are 159 locks. Some sections have recently been enlarged, and the canal can take craft up to 72 ft. in length, 7 ft. beam, 3 ft. 9 ins. draught, and 7 ft. 6 ins. head room. See Canals map facing p. 1704.

Grange (late Lat. *granea*, barn). Term now used for a country house with farm attached, and also for a

better-class farm. It has been applied to a granary, a barn, a farm, occasionally to a collection of farms, and hence a village or hamlet, and especially, in the Middle Ages, to outlying farm buildings belonging to a religious house or lay lord where crops for tithe or rent were stored.

Grange OR **GRANGE-OVER-SANDS.** Urban district and watering-place of Lancashire, England. It stands on Morecambe Bay, 9 m. N.W. of Carnforth, and has a rly. station (L.M. region). On the fringe of Lakeland, 7 m. S. of Windermere, it has a mild climate and is surrounded by beautiful country. There are a hydropathic establishment, a golf course, a swimming pool, and public gardens. Pop. 2,650. Near Grange are the Witherslack nature reserve, Cartmel, with its 12th-century priory, and Humphrey Head, where water from the holy well is said to have curative powers and where the last wolf in England was killed.

Grangemouth. A burgh and seaport of Stirlingshire, Scotland, on the right bank of the Forth, 3 m. N.E. of Falkirk. Here the Grange and Carron rivers run into the Forth. Mainly a modern town, it arose at the terminus of the Forth and Clyde canal, and has extensive docks and a rly. station. Coal and iron are shipped, and ore is landed for the Falkirk ironworks. There is a shipbuilding industry, an oil refinery, and chemicals and soap are manufactured. The burgh is included in the burgh constituency of Stirling and Falkirk burghs Pop. 15,000.

Grange Party OR **GRANGERS.** An economic organization in the U.S.A., in full the Society of Patrons of Husbandry. It was founded in 1867, the prime mover being O. H. Kelley, a farmer from Minnesota, and its main object was to foster the agricultural interest. A secret society, it restricted membership to those engaged in agriculture; women were eligible with men. Until 1873 its influence was marked and to it much legislation was due, the railways being of interest to the Grangers. From 1890 the movement was a social and educational organization. As a political force it was superseded by the Farmers' Alliance.

Granger, JAMES (1723-76). An English writer and print collector. Born at Shaftesbury and educated at Christ Church, Oxford, he became vicar of Shiplake, where he died April 4, 1776. He wrote a Biographical History of England, from Egbert to the Revolution,

1769, which he lavishly illustrated with the engraved portraits he had collected. This history was added to by other hands, one copy containing 3,000 portraits.

The process of extra-illustrating a book with pictures relating to all that the book contains has been known since as grangerising. The grangeriser, having made his collection, takes his book to pieces, inserts the extra illustrations in the most appropriate places, and has the whole bound anew. Notable examples of this kind of work are the Crowle copy of 'Pennant's History of London, in the British Museum; and Sutherland's Clarendon and Burnet, in the Bodleian.

Granicus. Ancient name of the modern Bigha Chai, a river of the Troad, Asia Minor. It flows into the Propontis or Sea of Marmara, and is famous as the scene of the battle in which Alexander the Great defeated the Persians in 334 B.C.

Granite (Ital. *granito*, grained, speckled). Coarsely crystalline rock generally considered to be of igneous origin, composed essentially of quartz and alkali feldspar, with lesser quantities of muscovite or biotite mica, hornblende, tourmaline, etc., any of which may be present to the exclusion of the others. Minor accessory minerals—zircon, apatite, magnetite—are usually present. Granites occur in the earth's crust in large irregular masses which may cover thousands of sq. m. Such large bodies are referred to as batholiths; smaller masses are termed stocks or bosses.

Some granites have consolidated from a liquid melt of much the same composition as the present rock, and have been injected (squirting) into place. Others were perhaps formed by reconstitution of the original country rocks by chemical reaction with heated solutions from depth, which converted the older rocks, more or less *in situ*, into granite. This process of conversion of solid rock into granite without its passing through a fluid stage is known as granitisation.

Granite is a rock which was formed at considerable depth below the surface, and is found typically where mountain building movements occurred in the past. That now exposed at the surface has been uncovered by erosion stripping away the overlying roof-rocks. Ore deposits are often found near and at the margins of granites, e.g. the Cornish tin veins, and lodes of copper and tungsten, etc.

Granites are normally grey or pink. Their strength and light

colour make them desirable building stones, but their hardness makes them expensive to work. Fine grained granites are used for road metal, but coarser varieties cannot stand up to modern traffic. Granite is found in Scotland, the Lake District, N. Wales, Cornwall, and Devon. Aberdeen granite is grey; Peterhead, red; Dalbeattie and Ballachulish, grey. Most Cornish varieties are grey, and Shap (Westmorland) is pinkish with characteristic flesh-coloured feldspar crystals. Graphic granite is a variety in which the quartz and feldspar have crystallised together; it is found, among other localities, on Mt. Sinai. See Geology; Petrology.

Granite. Variety of granite in which the mica constituent is represented by biotite alone.

Granodiorite. Coarsely crystalline rock, intermediate between granite and diorite in composition and appearance. It is composed of quartz, orthoclase, and plagioclase feldspar, biotite mica, and/or hornblende. Its mode of occurrence and origins are similar to those of granite (*q.v.*), and many masses originally mapped as granite are now recognized as being granodiorite. Most of the continental areas of the earth's crust is granodiorite.

Gran Sasso d'Italia (Great Rock of Italy). Mt. mass of the Apennines (*q.v.*). It lies between the provs. of Teramo and Aquila. The highest peak is Monte Corno (9,580 ft.), the loftiest point of the range. Other peaks are Corno Piccolo, 8,650 ft.; Pizzo d'Intermesole, 8,680 ft.; Pizzo Cefalone, 8,307 ft.; and Monte della Portella, 7,835 ft. Generally snow-capped, it commands an extensive view, including the Dalmatian Mts. Summer and autumn are the best seasons for making the ascent, from Aquila or Teramo. It was first ascended by Orazio Delfico in 1794. There is an Italian Alpine Club hut near the summit.

After his resignation, July 25, 1943, Mussolini was confined by the Badoglio government in a former hotel on the Gran Sasso, from which he was rescued on Sept. 12 by Nazi parachutists and

flown to Germany in an aircraft which landed on a narrow plateau in front of the building.

Grant (Lat. *credentare*, to entrust). Literally, permission and thus a gift, the implication being that such a gift carries with it a privilege of some kind. It is thus used especially in law, where it means the conveyance of property from one person to another by deed. A deed of grant is now the proper method of conveying freehold property; but it is used in many other cases also, whether the property be real or personal. A grant-in-aid is money allowed by parliament to local authorities in aid of local services.

Grant, DUNCAN JAMES CORBOWE (b. 1885). A Scottish painter. Born at Rothiemurchus, Inverness-shire, he was educated at S. Paul's School, and became a pupil of J. E. Blanche in Paris in 1909. Noticeably influenced by Cézanne and van Gogh, his decora-

Duncan Grant. Girl at the Piano, an example of this artist's work in the Tate Gallery, London

tive panels and designs for applied art, no less than his easel pictures, reflected his inventiveness in colour and outstanding draughtsmanship, as well as a constant appreciation of the beauty of pigment. A member of the London Group, he exhibited at the leading galleries. In 1941 one of his pictures was purchased by the Chantrey Bequest, and he is represented in the Tate Gallery.

Grant, JAMES (1802-79). Scottish journalist. Born at Elgin, he helped to found, and for a time edited, the Elgin Courier, and, after serving on the Morning Chronicle, London, was editor of the Morning Advertiser, 1850-71. He was author of a history of The Newspaper Press, 3 vols., 1871-72, and wrote extensively on theological subjects from a Calvinistic standpoint. He died at Bayswater, May 23, 1879.

Grant, JAMES (1822-87). Scottish novelist. Born at Edinburgh, Aug. 1, 1822, related through his mother to Sir Walter Scott, he served, 1840-43, as an ensign in the 62nd Foot, studied for a time in an architect's office, and then devoted himself to literary work. Of his 56 novels, most of which deal with military life or Scottish history, the most notable is *The Romance of War*, 1845, largely based on his father's stories of the Peninsular War. He was author of *Old and New Edinburgh*, 1880; *Memoirs of Montrose*, 1858; *Scottish Soldiers of Fortune*, 1839; *Histories of British Battles*, 1873 and 1884; *The Tartans of the Clans of Scotland*, 1886. A pioneer of the volunteer movement, he died in London, May 5, 1887.

Grant, JAMES AUGUSTUS (1827-92). British soldier and explorer. Born at Nairn, April 11, 1827, and educated at Marischal College, Aberdeen, he received a commission in the 8th Native Bengal Infantry, 1846. He took part in the sieges of Multan and Gujarat, 1849, and was attached to the 78th Highlanders at the relief of Lucknow, 1857, when he was wounded. In 1862-63 he accompanied J. H. Speke (*q.v.*) in exploring the sources of the Nile, and published *A Walk Across Africa*, 1864. In 1868 he accompanied the Abyssinian expedition under Napier as intelligence officer. He left the army with the rank of lieutenant-col., and died at Nairn, Feb. 11, 1892. His collection of dried plants is in the herbarium at Kew Gardens.

Grant, ULYSSES SIMPSON (1822-85). American soldier and president of the U.S.A. Born April 27, 1822, near Clermont, Ohio, the son of a tanner of Scottish ancestry, he was educated at West Point. He fought with distinction in the Mexican War (1845-

U. S. Grant

48), but in 1854 resigned from the army and was engaged for some years in farming and in real estate dealing at St. Louis. His first command in the Civil War was the colonelcy of an infantry regiment of volunteers, and shortly afterwards he was made a brigadier-general. But the event which brought him into prominence was his capture of Fort Donelson, in Feb., 1862.

Less successful at Shiloh in April, he began as commander of

the 13th army the series of movements which culminated in July, 1863, in the surrender to him, of Vicksburg with some 30,000 men. This brilliant piece of work brought Grant the command of the military division of the Tennessee, and the rank of major-general in the regular army, followed by promotion to the rank of lieutenant-general after the victory at Chattanooga, Nov. 23-25.

In March, 1864, Grant, now recognized by Lincoln as the one man capable of finishing the war, was made commander-in-chief and established his headquarters with the army of the Potomac, operating in Virginia. The main strength of the Confederates was there, and Grant announced that he would fight it out on this line, though it took him all the summer. The battles of this campaign, The Wilderness, Spottsylvania, Cold Harbor, were among the most terrible of the war. Grant's losses were greater than those of his opponent Lee, but Grant could always reinforce his depleted ranks, whereas Lee could not. Eventually the policy of attrition began to tell. Petersburg and Richmond, the Confederate capital, fell on April 2 and 3, 1865, and with the surrender of Lee's shrunken remnant at Appomattox Court House on April 9, the war was virtually finished.

In 1869 Grant became president of the U.S.A. and held office for two terms. During his presidency the Alabama claims against Great Britain were settled. In 1880 there was a movement to put Grant forward for a third term, but the project aroused opposition as being unconstitutional and was accordingly dropped. In 1884 the banking house in which Grant had become a partner failed, and he was reduced to poverty. In order to provide for his wife and family he began to write his *Personal Memoirs*, which enjoyed great popularity. He died of cancer of the throat at Mt. MacGregor, near Saratoga, July 23, 1885. His tomb in Riverside Drive, New York, is a famous monument. See *American Civil War*.

Bibliography. *Military History of Grant*, 1861-65, A. Badeau, 1881; *From Tanyard to White House*, W. M. Thayer, 1885; *The Generalship of U.S.G.*, J. F. C. Fuller, 1929; *U.S.G.—The Great Soldier of America*, R. R. McCormick, 1934.

Granta. Name of the headwaters of the river Cam, England. Up to the 12th century the whole river was called Granta, and Cam-

bridge is referred to in Domesday Book as *Grantebrige*. The Granta rises in Essex between Saffron Walden and Bishop's Stortford, and flows N.W. to a point just above Grantham, being joined by the Bourne river, the Rhee, and the Bourn Brook. At its confluence with the last it turns N.E. and thence is called the Cam. A long-established undergraduate publication of Cambridge university is called *The Granta*.

Grantham. Village of Cambridgeshire, England, 2 m. S.S.W. of Cambridge. Of great beauty, it is the subject of a famous poem by Rupert Brooke, who had rooms in the vicarage. Tennyson lived here for a time; Byron gave his name to a pool in the river Cam just above the village; and this pool was almost certainly that of the mill at Trumpington in the *Reeve's Tale of Chaucer*. A mill stood on the site until 1928, when it was destroyed by fire. There are Roman and Saxon remains in the village, including an earthwork near the church. The approach from Trumpington is preserved by the Cambridgeshire Preservation Society. Pop. 1,200.

Grantham. Mun. borough and market town of Lincolnshire. It stands on the Witham, 25 m. S.S.E.

Grantham arms

of Lincoln, and is an important rly. junction of the E. region; it is also served by a canal which connects with Nottingham and the Trent. The chief building is the church of S. Wulfram; mainly 13th century work, it has a massive tower with spire, and is noted for its window tracery, crypt, and chained library. Sir Isaac Newton, to whom a statue was erected, 1858, was educated at the grammar school here; it is of early foundation, endowed anew in the time of Edward VI. There are a modern guildhall, an exchange, and several churches. The ancient market cross, demolished by Roundheads, was re-erected in the large marketplace in 1910.

The Angel Inn once belonged to the Templars, while the George is mentioned in Nicholas Nickleby. The chief industries are the manufacture of agricultural implements and engines, plastics, malting, basket making, wickerwork, etc. Grantham existed in the time of Domesday. Various charters were given to it, and it was represented in parliament until 1918, now giving its name to a parl. co. div.

Grantham, Lincolnshire. Parish church of S. Wulfram, showing the 14th century spire, 280 ft. high

It obtained a mayor and corporation in 1463, and is governed by a corporation reformed under the Act of 1835. During the Second Great War, Grantham became a training centre for the R.A.F., and schools of musketry and mines were established on the outskirts. An infantry training centre and depot was also opened for the R.A.F. Regiment. Several fairs are held in the town. Market day, Sat. Pop. est. 22,500.

Grant Land. Ice-bound tract within the Arctic Circle. It is the N. part of Ellesmere (q.v.) Island.

Grantley, FLETCHER NORTON, 1ST BARON (1716-39). English lawyer, born at Grantley, near Ripon, June 23, 1716. He was called to the bar in 1739, entered the house of commons for Appleby in 1756, and remained therein, sitting for various constituencies, until 1782. In 1782 he was made solicitor-general and in 1763 attorney-general. He was elected speaker of the house in 1770, but lost the position in 1780, largely owing to the way he had addressed the king about money matters in 1777. But he was raised to the peerage in 1782. An able but unscrupulous lawyer, he figured in the public prints as Sir Bull-face Doublefee. He died Jan. 1, 1789. Richard (b. 1892) succeeded to the title as 6th baron in 1943.

Granton. A seaport of Midlothian, Scotland. It stands on the Firth of Forth and within the

city of Edinburgh. It has a good harbour, with two breakwaters and facilities for coaling, and is the headquarters of several steamship lines and a landing place for the North Sea trawlers. Coal, cotton, etc., are exported, and timber, grain, tobacco, etc., imported. See Edinburgh.

Grantown. Police burgh and market town of Morayshire, Scotland. It stands on the Spey, 23 m. S. of Forres, on main and branch railway lines. The capital of Strathspey, Grantown is finely situated amid magnificent forests of pine and birch, and is frequented as a health resort. Distilling is carried on. The town was founded in 1776 by Sir James Grant, hence its name, and near it is Castle Grant, seat of the earls of Seafield. Pop. 1,519.

Granulation. Process used in metallurgy to obtain metals in such a state that they have a large surface area. The molten metals are poured into large vats of cold water and freeze rapidly into small granules. Lead, zinc, copper, etc., may be treated, either so that the metal is in a suitable form for some subsequent process or to obtain a sample for analysis. A similar process is used to obtain fine metal for use in powder metallurgy, the molten metal being passed through a fine sieve and so in thin streams into the water. See Powder Metallurgy.

Granulite (Lat. *granulum*, little grain). Metamorphic rock commonly derived from sandstones by alteration, but sometimes formed from igneous rocks. It consists mainly of quartz, feldspar, mica, and garnet. Common in Scotland in the Moine series of rocks, it is also found in other areas where ancient rocks are exposed. To French geologists *granulite* indicates a granite containing both muscovite and biotite micas.

Granville OR GRANVELLA, ANTOINE PERRINOT DE (1517-86). Spanish prelate and diplomatist, born Aug. 20, 1517, at Besançon. His father was chancellor to the emperor Charles V. Educated at the universities of Padua and Louvain, Antoine became a priest, and in 1540 was made bishop of

Arras. But his father's influence, no less than his own aptitude, led him into political life, and he attended some of the sittings of the council of Trent in the emperor's interest, and was responsible for the treaties between Charles and his German foes in 1547 and 1552. He helped to arrange the marriage between Mary and Philip II, and in 1559 settled in the Netherlands as chief adviser to the regent. During 1570-75 Granville was viceroy of Naples for Philip II, after which he held a controlling position in state circles at Madrid. He was made archbishop of Malines in 1560, archbishop of Besançon in 1584, and a cardinal in 1561. He died at Madrid, Sept. 21, 1586. His letters and papers have been valuable to historians.

Granville. Town and watering-place of France, in the dept. of Manche. Built on a promontory, where the river Bosq enters the English Channel, it is divided into the lower and the upper town, the latter being surrounded by fortifications and containing the citadel. The Gothic church of Notre Dame was restored in the 15th-16th centuries. The town has a good

Granville, France. The lower and upper towns, from the south

harbour and a shipping trade.

Granville was fortified by the English when they held France, but was taken from them in 1450. They possessed it again later, but, having fortified it in 1640, finally lost it in 1641. On July 31, 1944, U.S. armoured units captured Granville from the Germans, finding the town largely undamaged, though the harbour installations had been destroyed. A small German force, probably from the Channel Islands, raided the town on the night of March 8-9, 1945. Pop. 10,132.

Granville, GRANVILLE GEORGE LEYSON GOWER, 2ND EARL (1815-91). British statesman. The eldest son of the 1st earl, he was born May 11, 1815, and was

educated at Eton and Christ Church, Oxford. Related to the great Whig families, he entered parliament for Morpeth in 1836, and was an under-secretary under Melbourne. In 1846 he succeeded to his father's earldom, and a succession of offices fell to him in the cabinets of Russell, Aberdeen, and Palmerston. In 1851 he was foreign minister, in 1852 president of the council, in 1854 chancellor of the duchy of Lancaster, and in 1855 again president. He resigned with his colleagues in 1858.

In 1855 Granville became leader of the Liberals in the house of lords. During 1868-70 he was colonial secretary under Gladstone. He was foreign secretary 1870-74, and again 1880-85, but his performance was subjected to severe criticism. He followed Gladstone on Home Rule, and in 1886 was for a short time colonial secretary. A cultured man of gracious personality, and alive to the need for educational improvement, Granville was chancellor of the university of London, 1856-91. He died March 31, 1891. *Consult* Life, Lord Fitzmaurice, 1905.

Granville, WILLIAM SPENCER LEVESON GOWER, 4TH EARL (b. 1880). A British sailor and administrator. Commissioned in the Royal Navy, he served in the suppression of the slave trade in the Red Sea in 1902-03. In 1929 he became naval A.D.C. to the king; in 1931 he was promoted rear-admiral and appointed commanding officer coast of Scotland; he retired from the Royal Navy in 1935 with the rank of vice-admiral. In 1937 he was appointed lieutenant-governor of the Isle of Man, and in 1945 governor of Northern Ireland. Earl Granville, who succeeded his brother in this title in 1939, married in 1916 Lady Rose Bowes-Lyon, sister of Queen Elizabeth.

Granville-Barker, HARLEY GRANVILLE (1877-1946). British man of the theatre. Born in

H. Granville-Barker, British actor-manager

London, Nov. 25, 1877, he became an actor under Ben Greet, was associated with the Stage Society (founded 1899), and in 1904 entered with J. E. Vedrenne on the management of the Court Theatre and later the Savoy Theatre, London. This management marked an epoch in

the English stage; most of Shaw's and many of Ibsen's plays appeared under its aegis, and in 1912 there was an outstanding production of Twelfth Night.

Granville-Barker's own plays include *The Voysey Inheritance*, 1905; *Waste*, 1907; *The Madras House*, 1910; their dialogue shows the influence of Shaw. He made adaptations in collaboration with his second wife Helen Huntington-Gates (he was divorced by Lillah McCarthy in 1918) from the Spanish plays of Martinez Sierra and the Quintero brothers; translated Schnitzler's *Anatol* and Romain's *Dr. Knock*; wrote (with William Archer) *A National Theatre*, 1907; and his prefaces to Shakespeare were famous. He directed the British institute, Paris university, 1937-39, and was visiting professor at Yale, 1940-43. He died in Paris, Aug. 31, 1946.

Grape. Fruit of the vine (*Vitis vinifera*), a shrub of the family Vitaceae. The vine, a native of

Grape. Black Hamburg grapes, a fine variety for growing under glass

the Mediterranean region, was apparently introduced into Britain at the start of the Christian era.

A few of the small-berried grapes can be grown out of doors on a sunny wall in the S. and W. districts of Great Britain, but the finer varieties can be satisfactorily cultivated only under glass. Royal Muscadine, Miller's Burgundy, Black Cluster, and Brant are some of the best grapes to plant against a house or garden wall. The Strawberry grape, Royal Muscadine, and Grizzly Frontignan can be grown in an unheated greenhouse that is open to the sun; the berries are not large but are of delicious flavour. In a heated greenhouse

the large-berried black grape, e.g. Black Hamburg, Alicante, Gros Colmar, and the white-berried Foster's Seedling will thrive. A rather higher temperature is required to grow the Muscat grapes to perfection. Of these, Muscat of Alexandria and Cannon Hall (white) and Mrs. Pince and Madresfield Court (black) are very fine.

As grape vines will remain productive for generations, even for a century and more when grown in a large glasshouse (the famous vine at Hampton Court, which is still flourishing, was planted in 1768), it is of the first importance to prepare the sites thoroughly by making a border 2 ft. deep, 3 ft. wide, and 4 ft. long for each vine; the soil should consist of pieces of old turf with the addition of some well-decayed manure and a scattering of bone-meal. The border is made outside the greenhouse and the stem of the vine is brought inside through a hole in the greenhouse wall.

Pruning is an important detail of cultivation. Every winter the side shoots must be pruned to within one or two buds of the base of the past summer's growth, and in summer the tips of the green shoots must be shortened to prevent an excessive growth of leaves. *See* Vine.

Grape Fruit. Common name for the shaddock or pomelo, the globular or oblate fruit of the *Citrus decumana*, a tree closely related to the orange and lemon (*qq.v.*). The tree is an evergreen of the family Rutaceae, and is now unknown in a wild state. It has downy shoots and oval leaves, with winged leaf stalks, and bears a white flower. Its fruit, called grape fruit from their habit of growing in bunches, are usually from 4 ins. to 6 ins. in diameter, and have a yellow rind. The pulp, which has a slightly acid flavour, resembles that of a lemon.

The grape fruit is a native of the Malayan archipelago, but it was not cultivated until the 17th century, when some trees were transplanted to the W. Indies. The fruit was first imported into Europe in 1707 by a merchant in Amsterdam. It gained little popularity in Europe, but in the W. Indies and the United States was eaten as a breakfast food.

Early in the 20th century grape fruit was imported into Great Britain, at first on a small scale only. Between 1920 and 1938, however, imports increased from 1,700 to 87,000 tons. The principal

countries growing grape fruit for export are the U.S.A., Palestine, Cuba, S. Africa, and Jamaica.

Grape Hyacinth (*Muscari racemosum*). A bulbous herb of the family Liliaceae. A native of both

Grape Hyacinth. Leaves and flowers of this bulbous herb

Europe and S. Africa, it has long, slender, half-rounded leaves, and a short flower stem, bearing many round dark-blue flowers.

Grape Pear (*Amelanchier canadensis*). Small tree of the family Rosaceae. It is a native of N. America. It has oblong-elliptic, toothed leaves, and large white flowers in drooping sprays. The fruit is globular, of crimson or purplish colour, sweet, and agreeable.

Grape-shot (Fr. *grappe*, bunch of grapes). Obsolete projectile at one time much used for smooth-

Grape-shot, an obsolete projectile

bore guns. It consisted of a large number of cast-iron bullets packed in layers between thin iron plates, and then arranged in tiers (generally three), the whole being held together by an iron bolt passing through the centre of the plates, thus resembling a bunch of grapes. When fired the shot broke up and distributed the bullets in a shower in a somewhat similar manner to case-shot, but at a greater distance from the muzzle of the gun. It has been entirely replaced by shrapnel (*q.v.*). See Ammunition.

Grapes of Wrath, THE. Novel by John Steinbeck. Published in 1939, this best-seller depicted the adventures of a family who, evicted from the "dust-bowl" of Arizona, emigrate to the Cali-

fornian fruit-fields. The title was taken from the battle hymn of the Republic, wherein occurs this reference to the Lord: "He is trampling out the vintage where the grapes of wrath are stored." A film, based on the novel, and directed by John Ford for 20th Century Fox company, was released in 1940.

Grape Sugar. The solid form of glucose, which is described under Dextrose.

Graph (Gr. *graphein*, to write). Diagrammatic representation of quantitative facts, experimental results, etc. Graphical methods have principally two uses: (a) by appealing to the eye to impress on the mind changes in such quanti-

Grape Pear. Leaves, flowers, and fruit of this North American tree

ties as temperatures, sales, costs of production, population, etc., and (b) to help in the analysis of statistics, experimental results, etc. They are, therefore, a means of displaying quantitative facts,

and a mathematical tool for elucidating quantitative relationships.

Graphs are usually prepared on squared paper ruled in tenths of an inch or in millimetres. A suitable scale of distances is taken horizontally to represent the independent quantity, such as units of time, and a suitable scale of distances is taken at right angles to it to represent the dependent quantities, such as temperature, sales, etc. Thus: suppose the following are the details of the sales of a business during the twelve months of 1946: (£s) 6,374; 5,869; 5,267; 5,083; 5,547; 5,863; 6,174; 6,395; 6,728; 6,085; 5,741; 6,562. The scale of months should be taken horizontally, say, $\frac{1}{2}$ in. to a month. The scale of £s sales should be taken vertically. This scale should be such as to indicate the fluctuations clearly, so that they can be comprehended at a glance. The range of the sales is from £5,083 to £6,728, that is, about £1,700. A scale of 1 inch to £1,000 suggests itself. Since no item is less than £5,000, the scale can conveniently be broken as indicated in the accompanying figure—it is generally thought desirable to show the zero of the vertical sale. The monthly figures must first be "plotted." Above the point indicating a particular month, a small cross should be made at the appropriate distance indicated by the scale. Thus, the cross for the January item of £6,374 should be made above the point marked January at a distance of $13\frac{1}{2}$ small squares above the £5,000 line; the February item

Graph. This example serves to compare the fluctuations in sales over a period of two years, as explained in the text

of £5,869 should be "plotted" by making a cross exactly above the point marked February and at a distance of $8\frac{1}{2}$ small squares above the £5,000 line. The points thus indicated by crosses should be joined by straight lines. The resulting graph shows immediately the marked seasonal fluctuations. The value of the graph is increased if the corresponding graph for the preceding year is drawn either alongside or on the same space in distinctive ink or by a distinctive line, as shown on the diagram.

Such a graph shows the amount of fluctuation, and may be deceptive, for an increase of £1,000 on £5,000 may have a different effect from an increase of £1,000 on £10,000. It is often more necessary to show the ratio of the change than its amount. To graph the rate of change the logarithms of the quantities are graphed instead of the quantities themselves. Ordinary paper can be used, the vertical scale being a scale of logarithms; or semi-logarithmic paper, specially ruled for such ratio charts, can be purchased. The use of ratio charts has much increased of recent years. *Consult* Treatise on Graphs, G. A. Gibson, 1904; Charts and Graphs, K. Karsten, 1923.

Graphic Statics. Method used for obtaining the relations between forces, external and internal, acting on a body or framework in engineering. Forces are represented in magnitude and direction by straight lines, and by compounding them together according to the law of the polygon of forces, the forces in any part of a framework may quickly be obtained. The representation of these forces is called the stress diagram, and from it can be obtained by direct measurement the force in any particular member of a structure, as a bridge. *Consult* Graphical Statics, L. Cremona, Eng. trans. L. H. Beare, 1913; Theory of Structures, A. Morley, 1918.

Graphite. A form of carbon (C), popularly known as black-lead. A very soft, black, opaque mineral, it has the same composition as diamond, but a different crystalline structure. Graphite is found principally in metamorphic rocks, such as gneiss and schist (Madagascar, Germany, Korea), and in marbles (Canada), which have been subjected to heat and pressure by natural agencies: graphite occurs also in veins (Ceylon). The source of the carbon in gneisses and schists, limestones and veins is considered to be the

carbonaceous sedimentary material, mineral carbonates, and gaseous carbon compounds respectively. Graphite can also be made artificially by heating anthracite to a high temperature in an electric furnace.

Twelve p.c. of the world's graphite is baked in moulds with a special fireclay to form the "lead" in lead pencils. Sixty p.c. is used in foundries and in making graphite crucibles for metallurgical purposes. Moulds used for castings are coated with graphite (and sometimes talc) to prevent the casting from sticking and to give it a smooth surface.

Graphite crucibles are made by firing a mixture of graphite, clay, and sand.

Finely pulverised graphite, often mixed with grease, oil, or water, is used as a lubricant. Other uses are in graphite paints, stove-polish, electrodes, brushes for dynamos, dry batteries, and glazing powder. In the trade, very fine graphite is called "amorphous" and a slightly coarser type is termed "crystalline."

Graphitisation. An effect produced in cast irons by annealing, whereby the iron carbide, cementite, becomes converted into free or graphitic carbon. White cast iron is extremely hard and brittle, but this can be reduced to some extent by malleabilising, which gives malleable cast iron. Two processes are commonly used, the white-heart and the black-heart; in the former the carbide is converted to graphite and later partially oxidised and lost by packing in haematite ore and heating at over 900° C., whereas in the latter it is formed into nodules by heating to about 800° C. in a neutral atmosphere, giving greater malleability with slightly less strength. *See* Cast Iron; Iron.

Graphology (Gr. *graphein*, to write; *logos*, discourse). The art or science of interpreting human character from the handwriting. Graphology derives from the fact that between a person's character and the specific development of his, or her, writing independent of all teaching or material influences, there is a definite relationship. This individuality becomes visible from about the tenth year, and though handwriting is affected by the state of health, the emotions, the outward circumstances of the writer, yet it preserves a number of ineluctable characteristics even when—as e.g. in the case of Lord Nelson—the loss of the right arm suddenly enforces an awkward

writing with the left hand, or with the toes or the mouth after loss of both arms.

Graphology does not rely on particular curvatures or angles in a handwriting, but on the sum total of a person's handwriting, called the formative level. Nearly everybody reacts, when opening a letter, to an unknown handwriting, forming a judgement of the "character" of the writer. This intuitive reaction was first registered, and brought into a sort of system, by the Italian physician, Camillo Balbo, in 1622; the Swiss philosopher, J. K. Lavater, in 1775, wrote a short study linking handwriting with physiognomy; the Frenchman, J. H. Michon, 100 years later, published a *System of Graphology*, and his pupil Crépieux-Jamin set going the serious study of graphology in which psychologists and psychiatrists have cooperated.

The practical value of graphology lies in the expert analysis of documents and signatures whose authenticity is disputed; in the confirmation, or otherwise, of the psychiatric examination of a case, and in the initial sifting and later promotion, especially on the Continent and in the U.S.A., of applicants for employment.

Grapple (from Fr. *grappe*, a hook). Small anchor with four or more hooks radiating in a circle from a common stem. It is not used where any great holding strength is required, but only for anchoring small boats, and sometimes as a kedge in warping or hauling. Grapnels are used by cable ships to hook up submarine cables for repair, and by balloons to get a grip on the ground. In sailing-ship warfare, grapnels attached to ropes enabled one ship to seize and hold on to another. A special type recovers drills broken in boring oil or artesian wells. *See* Anchor.

Grappa. Mt. of Italy, the highest in a range between the valleys of the Brenta and the Piave. The Grappa region became prominent when fighting took place there between the Italian and Austro-German forces in 1917 and 1918.

Grapple-plant (*Harpagophytum procumbens*). Prostrate perennial herb of the family Pedalaneae, a native of S. Africa. The leaves are hand-shaped, the purple flowers funnel-shaped. The large fruits are armed with strong, sharp hooks which cling to the skins of animals, and so get transported from place to place, the numerous angular seeds being shaken out by the

Grapple-plant. Leaves, flower, and fruit of this S. African herb

movements of their carriers. When they come in contact with the lips of browsing animals they cause intolerable pain. Dr. Livingstone has told how an ox will stand and roar with the pain and sense of helplessness inflicted by these fruits attached to its mouth, which also prevent its feeding.

Graptolitoidea (Gr. *graptos*, lettered; *lithos*, stone; *eidos*, form, likeness). Extinct class of low organisms, remains of which are found in early sedimentary rocks. They are often to be seen on slates, forming a fossilised film, and looking rather like a flattened branch of seaweed or seafans. These organisms were tiny marine animals belonging to the order Hydrozoa.

Gras, Félix (1844–1901). Provençal novelist and poet. He was born May 3, 1844, at Malemort,

Félix Gras, Provençal author

Vaucluse. His first work, *Li Carboundé*, won him an immediate position among the *félibres*, an association for the revival of the Provençal language and literature. This was followed in 1882 by *Tolozæ*, an epic dealing with Simon de Montfort and the persecution of the Albigenes. Then came *Lou Roumançero Provençal*, a collection of traditions of the country in ballad form, 1887; *Li Papalino*, tales in prose dealing with days of the popes at Avignon, 1891; and three impressive novels of the French Revolution, all of which have been translated into English by C. A. Janvier, *The Reds of the Midi*, 1896; *The Terror*, 1898; and *The White Terror*, 1900. Gras, who succeeded to leadership of the *félibres* in 1891, died March 4, 1901.

Grasmere. Lake and village of Westmorland, England. The lake

is one mile long and about $\frac{1}{2}$ mile wide. It is beautifully situated in a valley in the centre of the Lake District, surrounded by the mountains. The village, which stands where the Rothay falls into the lake, is 4 m. N.W. of Ambleside and 12 m. S.S.E. of Keswick. It is noted for its associations with Wordsworth, whose early residence, Dove Cottage, is here. In it De Quincey also lived. In the churchyard are the tombs of Wordsworth and Hartley Coleridge. An annual festival, called the rushbearing, takes place here on the Sat. nearest S. Oswald's day, August 5. The place has also an athletic meeting in August. S. Oswald's Church is partly a 13th century building. Grasmere is a good centre for visitors to Keswick, Conistone and elsewhere, and there is boating on the lake. Pop. 988. See Lake District.

Grass. Term strictly applied to species of the family Gramineæ, but in farming language also used of clovers and other kinds of herbage growing together in a field. A distinction is drawn between temporary grass, or ley, intended to be ploughed up after a short interval, and permanent grass, which occupies the land continuously, either as pasture devoted to grazing, or as meadow yielding a hay crop at regular intervals. When first laying down land to grass, both careful cleaning and the preparation of a fine seed bed are necessary.

The mixture of seeds sown varies according to the object in view. For temporary leys those species of grass and clover are chosen which are short-lived but of rapid growth, while perennial types make up the mixtures used when permanent grass is to be established. The exact nature of the mixture will depend on the local soil and climate. Only seed of the highest quality should be used.

The management of established pastures calls for considerable skill. At the end of winter and beginning of spring chain harrowing and rolling are beneficial. By the former process dung is spread out, molehills levelled, and moss removed, while rolling consolidates the soil round the roots and encourages a thick growth of herbage.

Cattle must not be turned on too early, certainly not until late in April; sheep crop grass very closely, so that they can get a good living after the other kinds of stock have had their turn. Pastures devoted to fattening stock need little artificial manuring, but where lime is deficient this may be supplied, either in the form of quicklime or of ground lime. Poor pastures benefit from dressings of potash or phosphates; remarkable results have been obtained from the use of basic slag.

Meadows, after being grazed, need chain harrowing and rolling,

Grasmere, Westmorland. The lake and village seen from the south

and stones or the like should be removed when a hay crop is to be gathered later. Large dressings of manure are necessary, more especially if a hay crop is taken every year. Every three or four years farmyard manure, up to 10 tons per acre, can be applied with advantage, supplemented by a complete mixture of artificial fertilisers in years when the meadow has not been dunged.

The world's great natural grasslands are known by various names, prairies in Canada, steppes in Russia, pampas in S. America, veld in S. Africa, downs in Australia. On the desert edge the grasslands degenerate into scrublands; on the forest edge they become parklands or savannahs.

In Western Europe and in New Zealand the natural vegetation is forest, but the trees have been cleared and the land devoted to arable and pasture. In New Zealand, cleared land is sown, usually with English grass seed, and sheep and cattle are fed upon the resulting crop. Upon mt. ranges in medium latitudes the higher levels where trees do not grow usually become meadows during the summer months.

These summer pastures are the "Alps" and are used in Switzerland and similar countries for the summer feed of flocks and herds.

1. Yorkshire fog. 2 Meadow foxtail. 3. Short-headed foxtail. 4. Marram grass. 5. Timothy. 6. Matt grass. 7. Reed canary grass. 8. Sweet vernal. 9. Tufted hair grass. 10. Heath grass. 11. Crested dogtail. 12. Rough spiked dogtail. 13. Meadow fescue. 14. Quaking grass. 15. Smooth-stalk meadow grass. 16. Soft brome. 17. Sterile brome. 18. Italian rye grass

GRASSES FOUND IN MEADOW AND MOORLAND OF GREAT BRITAIN

Some natural grasslands, such as the pampas, are sown with alfalfa or lucerne, an excellent food for cattle, which thrives especially in a slightly alkaline soil and in a dry climate. Other grasslands have been turned to arable: e.g. the great wheatlands of N. America were originally prairie. See Ley Farming; Pasture.

Grass Cloth. Term commonly applied to fine fabrics woven from certain Oriental plants which are not grasses, especially to that made from China grass (*Boehmeria nivea*), which is a nettle-like plant. The inner fibres of Manila hemp, a plant of the banana family, produce good grass cloth, much used in Europe for articles of dress. The cloth made from true grasses, e.g. esparto, is coarse.

Grasse. Town of France. In the Alpes-Maritimes dept., it is 19 m. W.S.W. of Nice. On a mt. slope, 700-1,380 ft. above sea-level, sheltered from the cold winds of the N. and open to the S., it is a favourite winter resort and a centre for the manufacture of perfumes and essences, about 60,000 acres being devoted to the culti-

stitute the pasture and all the meadow plants that will convert into hay. The crops of his corn-fields, whether wheat, barley, or oats, he does not refer to as grass, though they, as well as the sugarcane and bamboos of the tropics, are equally grasses. These grain-bearing grasses, including maize and rice, constitute the staple food of the human race, while the fodder grasses supply indirectly the greater part of man's animal diet. Their great importance is due to the richness of their seeds in the matter of starch and the high percentage of protein. Certain grasses, such as esparto, yield fibres that are of value in the making of paper and cordage. Grasses are found in nearly every part of the world where there is a little soil, from the tropics to the Arctic regions, and from high-water mark up to the limits of vegetation on the mountains. See *illus.* page 3889.

Grassholm. Island 6 m. off the coast of Pembrokeshire, Wales. A small flat-topped island of Old Red Sandstone with a thin carpet of turf, it is one of the 23 places in the world where gannets are known to breed, and during the season the birds and their nests cover its surface. Cormorants and other sea-birds are also found. There are no human inhabitants. Bought and turned into a bird sanctuary by Malcolm Stewart in 1940, it was used as a bombing practice target by the R.A.F.

In 1947 the island was bought by the Royal Society for the Protection of Birds.

Grasshopper. Orthopterous (straight-winged) insects of the Acrididae and Tettigoniidae families. Remarkable for their long hind legs and jumping powers, they are common in fields during summer. They vary in colour from green to brown, and the species differ much in size. The Tettigoniidae are usually green in colour, with long antennae and an ovipositor in the female. The Acrididae have short antennae and a reduced ovipositor.

Locusts belong to the Acrididae. The familiar chirp is produced in the Tettigoniidae by rubbing the wings together, and in the Acrididae by drawing the edge of the wing

Grasshopper. Great green grasshopper, *Locusta viridissima*. Top, *Meconema thalassinum*

along the inner side of the femur. Most of the species feed upon plants, but some eat other insects. See Locust.

Grassman's Law. In philology, name given to the explanation of certain exceptions to the law of consonantal interchange known as Grimm's Law. It deals with the aspirated mutes (gh, kh, dh, th, bh, ph) and lays down the principle that, when an original Indo-European root began and ended with an aspirate, only one was allowed to stand in Sanskrit and Greek, e.g. Skt. *bhavami*, Gr. *phuo*, I become, but *babhwa*, *pephuka*, I became. See Philology; Phonetics.

Grassmarket. Thoroughfare of Edinburgh, Scotland, between West Port and the Cowgate. A weekly market has been held here since 1477. A stone cross marks the site of the ancient gallows, where many of the Covenanters were executed. During the riot of 1736 between the populace and city guard, Captain Porteous was dragged here from the Tolbooth and hanged from a dyer's pole.

Grass of Parnassus

(*Parnassia palustris*). Perennial herb of the family Saxifragaceae. It is a native of Europe, N. Africa, N. and W. Asia, and N. America. It is a plant of bogs and wet moors, with long-stalked heart-shaped leaves, and large solitary white

Grass of Parnassus. leaves and flowers

Grassholm. The small island off the Pembrokeshire coast preserved as a sanctuary for gannets and other sea-birds

vation of roses and orange flowers. The parish church, an old cathedral, dates from the 12th-13th centuries; the hôtel de ville, with a 12th century tower, the hospital, and the casino are notable features, and there is a public park. Fragonard, the painter, was a native. Grasse was liberated from the Germans by U.S. troops Aug. 24, 1944. Pop. 21,217.

Grasses. Name loosely applied to many plants of diverse nature, but more correctly indicating those of the family Gramineae (*q.v.*). Although both in genera and species they are outnumbered by the orchids, in individuals grasses predominate over all other green vegetation. When the farmer speaks of grass he is referring to all the fodder plants that con-

flowers on tall stems. The petals are thick and veined. The large ovary bears four stigmas. Five of the ten stamens have been transformed into scales bearing nectar glands, and fringed with hairs ending in yellow knobs.

Grass Snake (*Natrix natrix*). One of the commonest non-poisonous snakes of Europe, part of Asia, N. Africa, and England,

Grass Snake. Specimen of this harmless snake, common in England

being unknown in Scotland and Ireland. Greenish-grey to brown above, with black bands, which give it the alternative name of ringed snake, it is black and white underneath. It has two white or yellowish-white spots behind its head which distinguish it some distance away. Growing to 3 or 4 ft., the grass snake feeds chiefly on frogs, toads, and fish, and is usually found in damp places. The eggs, varying from 15 to 30, the size of a dove's egg, are laid in rich damp mould, manure heaps, and similar places. See Snake; Water Snake.

Grass Tree (*Xanthorrhoea*). A genus of perennials of the family Liliaceae, natives of Australia. They are also known as black-boy and grass gum-tree. They have short, thick trunks like those of palms, rough with the bases of former leaves, consolidated by red or yellow gum produced by the plant. The long, wiry leaves are like those of the rushes, and form a great tuft. The central flower-stem may be 15 ft. to 20 ft. long, its upper end a dense spike of small flowers. *X. arborea*, the Botany Bay gum, and *X. hastilis*, when denuded of leaves, have frequently been mistaken for men (black-boys). Cattle eat the leaves, and the natives the middle of the top of the stem. The fragrant resin exuded is known to commerce as Botany Bay resin and black-boy gum.

Grass-wrack (*Zostera marina*). A perennial marine plant of the family Naiadaceae. It is a native of most temperate coasts, where it grows submerged about low water. Its slender, grass-like, bright green

leaves are from 1 ft. to 3 ft. long. The green flowers are devoid of sepals or petals, consisting only of an ovary and one or two anthers. The dried leaves are used for packing, and for stuffing upholstery, under the name of *Ulvamarina*.

Grate (Lat. *cratis*, hurdle). Grille of cast iron used to support solid fuels during combustion.

The dimensions of the bars and of the spaces between them accord with the nature and size of fuel and methods of draught and firing. Basket-shaped grates designed to burn low volatile anthracite or gas coke in domestic fireplaces have high curved fronts and tapered spaces narrowing downwards from the top. Hollow water-cooled firebars, and solid grates arranged to rock for ash removal, are both used in central heating. Grates of cast iron, in steam boilers, withstand high temperatures and delay growth and wastage. Steam generators are often fitted with moving chain grates resembling endless belts; these carry burning fuel continuously towards the back of the combustion chamber, and reject remaining ash as each bar turns round the rear roller. Fire-bars are commonly cooled by jets of steam or sprays of atomised water under the grate.

Gratian (A.D. 359-383). Roman emperor. Flavius Gratianus Augustus in 375 succeeded his father, Valentinian I, with whom he had already been associated in the government of the western empire since 367, but a section of the army insisted on his four-year-old half-brother, Valentinian II, sharing the throne. Gratian was an unwarlike youth, quite unfitted to deal with the barbarian peril.

Grass Tree. An Australian tree with long flower-stems, a head of which is shown inset

Pressed from the east by the Huns, the Goths crossed the N.E. frontier, and in 378 won the battle of Adrianople (*q.v.*).

Valens, the emperor of the east, having fallen in the battle, Gratian invited Theodosius I to succeed him. Both rulers were under the domination of S. Ambrose, which led to the prohibition, enforced with great severity, of pagan and heretical worship throughout the empire. In 383 Maximus was proclaimed emperor by the troops in Britain, and Gratian was murdered by his own soldiery, at Lyons, Aug. 25 in the same year.

Gratian OR GRATIANUS, FRANCISCUS (c. 1100-c. 1150). Italian jurist. He entered a Benedictine monastery and as a monk spent his life. He is known solely for his legal work, the *Decretum Gratiani*, regarded as the foundation of canon law. According to some accounts, he was at the time of his death, bishop of Chiusi. See Canon Law.

Graticule. Scale or design etched or photographed on to a glass or other plate for use in an optical instrument for purposes of measurement.

Grattan, HENRY (1746-1820). Irish orator and statesman. Born in Dublin, July 3, 1746, the son of the recorder, he was educated at Trinity College. He was a student of the Middle Temple, London, but spent most of his time listening to speeches in the houses of parliament and practising oratory. In 1772 he was called to the Irish bar, and in 1775 was nominated to represent Charlemont in the Irish parliament by the owner of the borough, Lord Charlemont.

Grattan soon became the leader of the popular or patriot party. Supported by the Irish volunteers, he procured, in 1782, the passing of legislation which made the Irish parliament independent. A rupture between Grattan and Flood (*q.v.*) then occurred, the former believing that England had given sufficient evidence of her recognition of Irish legislative independence, and that there was no longer a need for the retention of the Volunteers; Flood, on the other hand, continued to clamour for more complete renunciation of English authority.

After F. Wheatley, R.A.

Grattan won, but his success, coupled with his failure to procure Catholic emancipation, saw the beginning of the decline of his popularity. He continued with unabated vigour to speak for the popular cause, attacking the pension list, the sale of peerages, and the purchase of seats in the house of commons, pleading for the amelioration of the lot of the peasants, and for commercial equality between England and Ireland, and opposing vehemently the constant suggestions of a union. In 1794 he supported the government on the question of the war with France, but in 1797 protested strongly against Gen. Lake's proclamation of martial law for Ulster.

Though so ardently devoted to the side of liberty, Grattan showed no sympathy with the movement of the United Irishmen, and in 1798, when their rebellion broke out, he went over to England. From 1806 until his death he represented Malton and Dublin in the British parliament, his chief interest being to secure emancipation for Roman Catholics. He died in London, June 4, 1820, and was buried in Westminster Abbey. Grattan was a man of fine character, disinterested and patriotic, but his reputation is chiefly that of the greatest Irish orator. Fox called him the Irish Demosthenes. His speeches were published in 1822, and there are biographies by his son Henry, 1839-46, and J. G. McCarthy, 1886.

Gratuity (late Lat. *gratuitas*, a free gift). Sum of money given without demand for services rendered, but for which the recipient has no legal claim: a present or donation. Examples are the tip given to a servant or attendant, or the bonus awarded by a firm to its employees.

Every man and woman who served in the British armed forces or civil defence during the First and Second Great Wars was granted a gratuity according to length of service and rank. Women's gratuities were two-thirds of the corresponding male rate. Gratuities were additional to any service or disability pension. In the event of death on active service the appropriate gratuity, up to the time of death, was paid to the next of kin.

Grätz, HEINRICH (1817-91). A German historian. Born of Jewish parents at Xions, Posen, Oct. 31, 1817, he resolved to champion the cause of orthodox Judaism, studied at Breslau university, and in 1870 became professor. His reputation had been established

with the first volumes of his *History of the Jews*, 1853-75, Eng. trans. 1889-95. In this celebrated work he expressed radical views on Biblical history, but its 11 vols. are recognized as the standard treatment of the subject. Grätz died at Munich, Sept. 7, 1891.

Graudenz or GRUDZIADZ. A town of Poland. Once a strongly fortified German town in W. Prussia, it lies on the right bank of the Vistula, 45 m. N. of Thorn (Torun), and is commanded by a citadel built by Frederick the Great. The principal manufactures include machinery, flour, and tobacco. Graudenz fell to Poland in 1486, and to Prussia in 1772. Early in the First Great War it was threatened by the Russians in their advance on the Vistula, but was saved by troops hastily sent across Germany from the W. In the Second Great War, Graudenz was captured by the Germans early in Sept., 1939, and by them converted into a "hedghog" position. It was taken by the Russians on March 6, 1945, after a siege lasting a fortnight. Pop., pre-war, 54,000.

Graun, KARL HEINRICH (1701-59). German composer. Born at Wahrenbrück, in Prussian Saxony, May 7, 1701, he began his career in opera at Dresden. About 1735 he made the acquaintance of Frederick the Great, then crown prince, and was attached to the court until his death in Berlin, Aug. 9, 1759. For his patron he composed operas and cantatas and a Te Deum to celebrate the battle of Prague. He is best known by his cantata, *The Death of Jesus*, 1755, which for over 100 years was performed throughout Germany during Passion Week.

Grauwacke. Alternative spelling of the name of the coarse sandstone Greywacke (*q.v.*).

Grave. Name for a place of burial. It comes from an Anglo-Saxon word, and from it have come the compounds gravestone, graveyard, gravedigger, etc. See Archaeology; Burial; Burial Acts; Burial Customs; Cemetery; War Graves.

Gravel. Accumulation of worn rock fragments, formed by the action of the sea, by rivers, or by glaciers. The constituents of gravel, which may be formed from nearly every type of rock, vary in size from a walnut to a pea. Larger fragments are known as shingle, smaller as sand. By infiltration of silica, lime, or iron oxides the gravel fragments may become cemented together and are known as conglomerate (*q.v.*). The

chief use of gravel is for the construction of roads and paths, that which is rich in oxide of iron being preferred for its warm colour. Gravel also makes concrete aggregates. Shell gravel, as its name implies, consists chiefly of shell fragments, and is extensively used for pathways. Artificial gravels are used in road-making on account of the scarcity of good binding natural gravel, and are made by crushing granite, quartz, slag, etc., to the required size.

Gravel. Popular name for the small stones or calculi which may form in the renal tract, gall bladder, etc., and which are small enough to find their way through the ducts of the organs in which they occur.

Gravelines. Town and seaport of France, in the dept. of Nord. It stands on the Aa, about 1 m. from its mouth and 15 m. W.S.W. of Dunkirk. The port has a harbour on the river, but the accumulation of sand therein is a drawback to it. It is a fishing centre, many of the fisherfolk living in Les Huttes, a part of the town almost reserved for them, and has a trade in timber, coal, etc. There are several other industries, including sugar refining, while fish and food preserving are carried on. Gravelines retains its old walls. About 1250 a count of Flanders canalised the river Aa, and here the town grew up. *Pron.* Grav-leen.

Gravelines, BATTLE OF. Fought July 13, 1558, between the French on the one side and the Spaniards and English on the other. Philip II of Spain had persuaded his wife Mary of England to join him in making war on France. Two small armies met outside Gravelines, the Spanish having English help in the shape of a fleet, under Lord Clinton, cruising along the coast. The French were charged by the Flemish cavalry under the count of Egmont, while the guns of the ships assisted in their discomfiture. The result was their defeat and the consequent treaty of Cateau Cambresis.

Gravelotte. Village of Lorraine, now in the French dept. of Moselle, 6 m. W. of Metz. It was the scene of a battle in the Franco-Prussian War on Aug. 18, 1870, between the Germans under von Moltke and the French under Bazaine. As the French army of 100,000 was driven by the German force of 150,000 into Metz, this was a strategical victory for the latter, who turned the French right flank and prevented a movement W. on Verdun.

The Germans suffered 20,000 casualties and the French 13,000.

Graves. Name of wine produced in the Graves district of Gironde, France. It is generally dry, light, and more alcoholised than claret, with a distinctive flavour imparted by the gravelly soil. Graves is either white or red, but in England the name is usually associated with the white variety. *Pron.* Grahv.

Graves, THOMAS GRAVES, BARON (c. 1725–1802). A British sailor. He entered the navy young, served in the expedition to Cartagena (1741), and was present at the battle off Toulon (1744). In 1758, after service in Africa and the English Channel, he fought under Rodney at the

1st Baron Graves,
British sailor
After Northcote

bombardment of Havre de Grâce. Promoted rear-admiral in 1779, in 1780 he sailed to America and in 1781 took part in the action of the Chesapeake, and became commander-in-chief of the station.

His actions, especially his failure to relieve Cornwallis when besieged at Yorktown, caused much discussion, but he was promoted vice-admiral in 1787 and in 1788 was made commander-in-chief of Plymouth. In 1794 he became admiral, and for his conduct in the battle of June 1 was made an Irish peer and granted a pension of £1,000. He died Feb. 9, 1802.

Graves, ALFRED PERCEVAL (1846–1931). Irish author. Born in Dublin, July 22, 1846, a son of the bishop of Limerick, after graduating at Dublin he entered the home office, and was an inspector of schools, 1875–1910. He began his literary career at 14, with a Christmas Ode in a Liverpool

A. Perceval Graves,
Irish author
Elliott & Fry

paper. Father O'Flynn, the poem by which he was first known, appeared in *The Spectator* in 1872, but was not published as a song until 1882, when it came out in a collection of Irish songs arranged by Stanford. Other works by Graves are *The Irish Song Book*, 1894; *The Book of Irish Poetry*, 1915; and an autobiography, *To Return to All That*. He was a

founder of the Irish Literary Society, of which he was twice president, and of the Folk Song Society, and a leader of the Celtic revival in Ireland. He died Dec. 27, 1931.

Graves, CHARLES LARCOM (1856–1944). Irish writer. Younger brother of the above A. P. Graves, he was born Dec. 15, 1856, and educated at Marlborough and Christ Church, Oxford. After association with *The Globe* and *The Cornhill Magazine*, he became assistant editor of *The Spectator*, 1899–1917. He was from 1902 a regular contributor to *Punch*, of which he became assistant editor in 1928. He collaborated often with E. V. Lucas in the writing of humorous squibs and burlesques. He also edited Mr. Punch's *History of Modern England* and Mr. Punch's *History of the Great War*. Apart from humorous verses, e.g. *The Blarney Ballads*, 1889, he wrote biographies of musicians, e.g. *Grove*, 1903, and *Parry*, 1926. Graves died April 17, 1944.

Graves, CLOTILDE INEZ MARY (1864–1932). Irish author. Born at Buttevant, co. Cork, June 3, 1864, she studied art, and then turning to the drama and literature won popularity under the name of Richard Dehan, in 1910, with *The Dop Doctor*, a realistic story of life in S. Africa during the Boer War. This success was followed up by *Between Two Thieves*, 1912; *The Man of Iron* (Bismarck), 1914; *The Sower of the Wind*, 1927. Her plays include *St. Martin's Summer*. She died April 2, 1932.

Graves, GEORGE (1876–1949). British comedian. He was born in London, Jan. 1, 1876, made his professional début in 1896, and two years later first appeared in London. His reputation as a leading musical comedy "funny man" was first established in the provinces when he toured in *The Runaway Girl*, *The Geisha*, and *Florodora*. In London his first big success was in *The School Girl*, 1903, but his outstanding performance was as Popoff

George Graves,
British comedian

in *The Merry Widow*, 1907. For years he was chief comedian in Drury Lane pantomimes. He appeared in *Me and My Girl*, 1937, and a revival of *The Merry Widow*, 1943. His reminiscences, *Gaieties and Gravities*, appeared in 1931. He died April 2, 1949.

Graves, ROBERT RANKE (b. 1895). A British writer. A Londoner, son of A. P. Graves, and great-nephew of Ranke, he was educated at Charterhouse and S. John's College, Oxford. In his autobiographical *Goodbye to All That*, 1929 (relating to the

Robert Ranke Graves,
British writer

First Great War), he established his reputation. I. Claudius, an historical reconstruction, won the Hawthornden and James Tait Black prizes in 1934, and had an immediate sequel, *Claudius the God*. Count Belisarius received the Stock prize in 1939. Other publications included *Sergeant Lamb of the Ninth*, 1940; *Wife to Mr. Milton*, 1943; *The Golden Fleece*, 1944; *The Power of the Dog*, 1945; *King Jesus*, 1947; and collections of poems.

Graves, SIR THOMAS (c. 1747–1814). British sailor. Entering the navy, he served in the Seven Years' War, and in 1773 sailed to the Arctic seas under Captain Phipps. The following year he went to America, where he was employed in the prevention of smuggling. In 1779 he commanded a sloop, and was in the action of the Chesapeake, 1781, that of St. Kitts, 1782, and of Dominica in the same year. In 1800 he was given a command under Lord St. Vincent, and the next year was promoted rear-admiral, sailing to the Baltic under Sir Hyde Parker. He was Nelson's second in command at the battle of Copenhagen and was knighted for his services. From 1812 he was an admiral.

Sir Thomas Graves,
British sailor
After Northcote

Graves' Disease. Alternative name for the disease known as Exophthalmic Goitre (q.v.).

Gravesend. Municipal borough, river port, and market town of Kent, England. On the right

Gravesend, Kent. The works of the Imperial Paper Mills, Ltd.

bank of the Thames estuary, 24 m. by rly. E. of London, it is opposite Tilbury, with which there is ferry communication, and is a Green Line terminus. It is a customs and pilot station, and a port under the Port of London Authority. The market,

Gravesend arms

owned by the corporation, has existed since the close of the 13th century. Gravesend is the home of many river pilots and boatmen. There are two piers. The frontage of the Imperial Paper Mills is directly on the river, and there is a jetty opposite the main entrance, so that ocean steamers can unload their cargoes of wood pulp within a few feet of the paper-making plant. The Fort House was destroyed in the Second Great War.

Gravesend has a history going back to pre-Norman times. In 1380 the town was partly burnt by the French, and it shared in the Wat Tyler rebellion. George I was welcomed here on his accession to the throne, and Edward VII, when prince of Wales, landed here with his young bride, Alexandra. Gravesend's first charter is dated 1632, but various deeds and royal grants are older. In the parish church of S. George are memorials of the Indian princess Pocahontas (*q.v.*), who saved the life of Captain John Smith (*q.v.*). Rosherville Gardens, 1 m. to the W., were at one time a popular resort for Londoners.

Bargebuilding, brewing, and shrimp fishing are among the industries, while vegetables and fruit are grown in the surrounding districts. Gravesend gives its name to a county constituency. Market day, Sat. Pop. est. 40,000.

Gravimetric Analysis. Method of obtaining the constituents of any substance by weighing, as distinct from volumetric analysis, which obtains them by consideration of the cubical contents.

Gravina. City of Italy, in the prov. of Bari. It stands on an eminence on the left bank of the

Gravina, 29 m. direct and 63 m. by rly. S.W. of Bari. Over 1,000 ft. above sea level, it possesses a 15th century cathedral, a castle of the Emperor Frederick II, afterwards belonging to the Orsini, Dukes of Gravina, and medieval walls and gateways rise above the town. Besides Santa Sofia, there is a rock-hewn church, with ancient paintings. In the vicinity are prehistoric tumuli, and a castle of the Hohenstaufen. Pop. 18,950.

Gravina, FREDERICO CARLOS (1756–1806). Spanish naval officer. Born at Palermo, Sicily, Sept. 12, 1756, he was educated at the Clementine College, Rome, and in 1775 became an officer in the Spanish navy. He served in a frigate at the siege of Gibraltar (1779) and against the British in the W. Indies and S. America. He was in command of the Spanish squadron of the fleet defeated by Nelson at Trafalgar. Severely wounded in the action, he managed to return to Spain, dying at Cadiz, March 2, 1806.

GRAVITATION: A PROPERTY OF SPACE

Hyman Levy, D.Sc., Prof. of Mathematics, Imp. Coll. of Science

An explanation of the Newtonian law of gravitation, and of the modification of it due to deductions by Einstein, by which it was made to harmonise with physical facts previously unexplained.

See also Einstein; Matter; Newton; Relativity, etc.

Gravitation (Lat. *gravitas*, weight) may be explained in the following manner: If a piece of material, say a mass of lead, be suspended from the end of a spring, the latter is stretched just as if a pull or force had been exerted on it. Therefore the mass transmits this force to the spring. If the lead is released, it falls to earth with a definite acceleration just as if a force were pulling it downwards. This force, equal to the pull on the spring, is called the gravitational attraction between the earth and the mass of lead.

Irrespective of the nature of the material, equal masses would be those that stretched the spring by the same amount. Two such masses together would therefore stretch a spring by double the amount, and so the total gravitational pull would also be doubled. This is one part of the general law of gravitation which says that the attraction between two bodies is proportional to the number of units of mass in each of the attracting bodies.

The other part of the law can be seen in this way. If the spring, with lead attached, be carried to a point more remote from the earth, say to the top of a moun-

tain, the extension of the spring is decreased, showing, therefore, that the gravitational attraction between earth and lead has also diminished. According to what rule is the attraction between two bodies reduced as they are drawn farther and farther apart? Evidence on this is found in a study of the motion of the planets round the sun. These bodies move in ovals (ellipses) with the sun at the focus. By mathematical means Newton showed that the orbit or route of a planet will be such an ellipse only when the attraction between the two bodies falls off inversely as the square of the distance. This means that if the distance between them be doubled, the gravitational force will be reduced to one quarter; if trebled it will be reduced to one-ninth; and so on. The Newtonian Law of Gravitation states that the force of attraction between two bodies is along the line joining them and is proportional to the product of the masses and inversely as the square of the distance apart.

The discovery of this law brought together a whole variety of diverse phenomena in nature into a single rational picture. Not only did it simplify the complex

motions of the planetary system into one scheme; it made it possible to predict the presence of a previously undetected planet, in the effort to explain the fact that deviations from the simple ellipse were occurring in the orbit of Uranus. The discovery of Neptune revealed the source of disturbance. Here is illustrated a principle of scientific method whereby an induction or generalisation drawn from past experience is used to deduce or predict a new occurrence and so to stimulate experiment in the effort to verify the deduction.

Again, the explanation of tidal phenomena followed at once from the law of gravitation, for under the attraction of the sun and the moon the waters on the earth would tend to be heaped up or drawn out from the surface, so that, as the earth rotated, high tides would appear at these points of heaping. When the sun and moon were so situated that they combined their attractive effects on the waters of the earth, spring tides would result, and when they tended to neutralise each other, neap tides would occur.

Problems of Gravitation

Firmly established as the law of gravitation was, it nevertheless stood in peculiar isolation from all corresponding phenomena. In some mysterious way it operated across the empty space between bodies, and seemed to require no medium for its transmission. It did not have a "speed of action" like the speed of light or of electromagnetic waves; it acted instantaneously. It could not be deflected or shielded by any barrier, though one could erect a shield or insulator against electrical or magnetic force. The law, moreover, was deficient in certain respects; for example, the planet Mercury showed a progressive change in its orbit which defied all explanation in terms of gravitation. In spite of its success the law was basically unsatisfactory.

The solution of the mystery came almost as a by-product of another branch of physical science. Early in the 20th century scientists were faced with the inescapable fact that the speed of light, as measured by an observer on the earth's surface, is always the same whether the earth is moving towards the light source or away from it. This contradicted the most elementary preconceived notions of time and space. It was as if the speed with which a train appeared to approach an observer was independent of whether he

were approaching or receding from the train. Preconceived notions assumed that time and space were independent features of nature, and that the geometrical properties of bodies in this physical space were consistent with Euclid's propositions.

Newton's and Einstein's Laws

Einstein, in two important pronouncements in 1905 and in 1920, broke away from these assumptions, and, starting with the experimental fact that the speed of light was constant to all observers irrespective of their motion, showed that one was led to a linked space-time unity with such geometrical properties that bodies moving freely in each other's presence followed natural paths corresponding to the actual paths of the planets. Thus the geometry of physical space was such that masses moved as if they were attracted to each other according to a law closely akin to Newton's. Einstein's modified gravitational law satisfied all the known experimental facts, resolved the difficulties associated with Mercury, and enabled scientists to make other predictions concerning the behaviour of light which have since been verified. He removed the law of gravitation from its anomalous position, reducing it virtually to a property of physical space. In Feb., 1950, he published a further generalisation of his theory of gravitation to take in also the electro-magnetic forces covered by his unified field theory of 1929.

Gray, DAVID (1838-61). Scottish poet. Born near Kirkintilloch, Dumbartonshire, Jan. 29, 1838, the son of a hand-loom weaver, he was educated at Glasgow university. In 1860 he came to London with Robert Buchanan. He died Dec. 3, 1861, of consumption, developed from a cold caught from spending his first London night in Hyde Park. His best work is his sonnet sequence, *In the Shadows*.

Gray, ELISHA (1835-1901). An American inventor, born at Barnesville, Ohio, Aug. 2, 1835. In 1867 he brought out a patent for an improved telegraph apparatus, and nine years later filed specifications for the telephone, which he claimed as his own invention. The U.S. supreme court, however, awarded the patent to A. G. Bell. Gray died Jan. 21, 1901.

Gray, THOMAS (1716-71). English poet. Born in London, Dec. 26, 1716, the fifth child and only survivor of twelve, he was educated at Eton, where he was a school friend of Horace Walpole.

After four years at Peterhouse, Cambridge, where he went in 1734, Gray accompanied Walpole on a three years' tour of the Continent. The scenes of travel made a deep and lasting impression on Gray's mind, though the end of the tour was marred by a quarrel between the two friends, each returning home alone. Shortly afterwards, in 1742, Gray went back to Cambridge to resume the classical studies he loved, and in Cambridge, first at Peterhouse and afterwards at Pembroke, he made his home for the rest of his life, save for brief periods, as, for instance, when he visited Scotland in 1765.

After J. G. Eccard in the Nat. Portrait Gallery

In 1757 he was offered but declined the poet laureateship, and in 1768 became professor of modern history at Cambridge.

Apart from translations from the classics, Gray's first poem was the *Ode to Spring*, followed by the *Ode on a Distant Prospect of Eton College* and the *Hymn to Adversity*; all these appeared in 1742. In 1747 appeared the *Ode on the Death of a Favourite Cat*, an earnest of his renewed friendship with Walpole, to whom the cat belonged. Three years later came the *Elegy Written in a Country Churchyard*. The inspiration came from the churchyard at Stoke Poges (*q.v.*), and the poem, made familiar by many quotations, is one of the most beautiful and exquisitely finished ever written. Other well-known poems are *The Progress of Poesy*, 1754, a magnificent piece of work written in the so-called Pindaric metre; *The Bard*, 1757; *The Fatal Sisters*, 1768; *The Descent of Odin*, 1768. The two last were the fruits of the Norse and Icelandic studies which occupied his later years.

Very small in bulk, all Gray's work is that of a consummate artist. Though influenced by the prevailing 18th century conventionalism, he shows a depth of thought and feeling notably absent from most contemporary poetry. Temperamentally shy and reserved, and of melancholy disposition, he was capable of sincere friendship with the few who could appreciate his real nature.

Gray died at Cambridge, July 30, 1771, and was buried in Stoke Poges churchyard. A monument to him consisting of a large sarcophagus was erected in 1799 by John Penn in a field adjoining the churchyard, and in 1913, a tablet was unveiled on the wall of 39, Cornhill, London, his birthplace. There are busts of the poet at Eton and at Pembroke College, which latter was largely rebuilt 1870-79 out of a building fund started in his honour in 1776. There is also a monument to his memory with a medallion portrait in Westminster Abbey. See English Literature.

J. McEain

Bibliography. Lives, J. Mitford, 1814; E. Gosse, 1903; Life and Letters, W. Mason, 1774; G. and his Friends, D. C. Tovey, 1890; Thomas Gray, Scholar, W. P. Jones, 1938.

Grayling (*Thymallus vulgaris*). Fish of the salmon family. It is fairly common in English rivers,

Grayling. A British fresh-water fish of the salmon family

but has only recently found its way to Scotland and is still absent from Ireland. Easily recognized by its large and many-rayed dorsal fin, it occasionally attains a weight of 4 lb., and is a good table fish.

Grayling Butterfly (*Eumenis semele*). British butterfly of heathy and uncultivated lands, found also in temperate Europe, N. Africa, and W. Asia. The wings, which have an expanse of about 2 ins., are smoky-brown in tint, with a broad zigzag ochreous band near the

Thomas Gray. The poet's tomb in the beautiful churchyard of Stoke Poges, near Slough
Homeland Association, Ltd.

blackish margin. This band bears two white-centred black spots on the forewing and a smaller one on the hindwing. The male is smaller than the female, and the markings are less bright and distinct. The brown-striped, drab-coloured caterpillar feeds upon various wild grasses. See Butterfly colour plate, No. 34.

Grays. Locality in Essex, England, part of the urban district of Thurrock (*q.v.*).

Gray's Harbour. An inlet in the coast of the state of Washington, U.S.A. The rivers Chehalis, Wishkah, and Hoquiam flow into it. The district, presided over by the twin towns of Aberdeen and Hoquiam, which form virtually a single population centre, is a leading lumber port, and the greatest plywood producing centre in the world. There is an abundant supply of Douglas fir, spruce, hemlock, and cedar. The bay has also a prosperous trade in fish; salmon, halibut, cod, pilchards, and oysters are caught, and there is a considerable fish canning industry. Aberdeen, which was settled by the Scots, has a pop. of 18,846, and Hoquiam of 10,835. The latter has an airport. The harbour was discovered by Capt. Robert Gray in 1792.

Gray's Inn. One of the four inns of court, London. On the N. side of Holborn, with Gray's Inn Road (formerly Gray's Inn Lane) on the E. and Theobald's Road (formerly King's Road) on the N., near the Chancery Lane station of the Central Line,

Gray's Inn arms

it covers 30 acres, on the site of the old prebendal manor of Portpool, town residence of the lords Gray de Wilton, 1315-1505. It passed to the priory of E. Sheen, Surrey, who leased it to law students, and has been a freehold of the Ancient and Honourable Society of Gray's Inn since 1733. Two chancery inns, Staple Inn and Barnard's Inn, were formerly attached. The cognizance of the society is a griffin, which was engraved in a work by Edmund Bunny, *The Sceptre of Judah*, 1584, inscribed Gryphus Graiensis.

The hall, 1555-60, in which Shakespeare's *Comedy of Errors* was acted, 1594, narrowly escaped destruction by an incendiary bomb in the First Great War and was almost destroyed in the Second during German air attacks on London in 1940 and 1944. The library with much of its contents suffered the same fate. A temporary building was erected to do

Gray's Inn, London. The 16th century hall, with fine panelling and hammer-beam roof; looking towards the benchers' table

duty for both. On every grand night in the dining hall is honoured the toast *To the glorious, pious and immortal memory of Queen Elizabeth*. The walks or gardens, the special glory of the inn, were laid out 1597-1600, according to tradition under the supervision of Francis Bacon, who is said to have planted the famous catalpa tree (*see* Indian Bean), the oldest in England, which may have been brought across the Atlantic by Sir Walter Raleigh. In Charles II's time and later the walks and gardens formed a fashionable promenade.

Bacon had chambers at Coney Court (burnt 1678), during 1576-1626; here he wrote *Novum Organum*, planned his *Garden of the Months*, and dated his *Essays*. He was made a benchers 1586, duplex reader 1600, and treasurer 1608. A memorial statue by F. W. Pomeroy was unveiled in South

Square, 1912. Other eminent names associated with the inn are those of Nicholas Bacon, Lord Burghley, Samuel Butler, George Gascoigne, Sir William Gascoigne, Oliver Goldsmith, Sir Thomas Gresham, Samuel Johnson, Archbishop Laud, T. B. Macaulay, Sir Samuel Romilly, James Shirley, Sir Philip Sidney, Robert Southey, and Archbishop Whitgift. Within the Jacobean gateway, in Holborn, Jacob Tonson had a bookshop. Dickens was clerk to a firm of attorneys in Gray's Inn. The Inn was noteworthy for its rookery until the birds were driven off by carrion crows. Gray's Inn has taken a leading part in the restoration of moots as a means of educating students in the conduct of cases. *Consult* Gray's Inn: Its History and Associations, W. R. Douthwaite, 1886; *Chronicles of an Old Inn*, A. Hope, 1889; *The Moot Book of Gray's Inn*, 1924.

Gray's Peak. Summit of the Rocky Mts. in Colorado, U.S.A. Situated about 50 m. W. of Denver, it attains an alt. of 14,341 ft., and is named in honour of Asa Gray (q.v.), American botanist.

GRAZ OF GRAZ. Town of Austria, the capital of Styria. It is situated on both banks of the Mur, here crossed by seven bridges, 90 m. S.W. of Vienna. Graz lies in picturesque surroundings, the original town having grown up round the Schlossberg or citadel. Among notable buildings are the Gothic cathedral (15th century), the parish church with an altarpiece by Tintoretto, and the Renaissance Landhaus. The Johanneum contains many interesting collections and a library of nearly 200,000 volumes. The university, founded in 1573, has four faculties, and normally 2,000 students. Graz is industrially important, with large steel works and rly. shops. Other manufactures are cloth, leather, paper, etc. Pop. 220,100.

Graz, Austria. The Haupt Platz or principal square. On the hill behind is the citadel

Graziani, RODOLFO (b. 1882). An Italian soldier. One of Italy's ablest military leaders, Graziani

was largely responsible for the rapidity of the Italian conquest of Abyssinia in 1935-36. Appointed viceroy of Ethiopia, here-
linquished the position to the duke of Aosta in 1937, and was chief of the general staff at the outbreak of the Second Great War. Graziani commanded the Italian forces that invaded Egypt in 1940, but after the capture of Tobruk by British troops on Jan. 22, 1941, he was recalled by Mussolini. After the surrender of

Rodolfo Graziani, Italian soldier

Great Barrier Reef. Small portion of this immense reef of coral which stretches for 1,200 miles along the coast of Queensland, Australia.

Italy, Sept., 1943, Graziani became minister of defence in Mussolini's government. He surrendered to American troops at Cernobbio on Lake Como, April 29, 1945, was imprisoned on the island of Procida, and was put on trial in Feb., 1950.

Great Adventure, THE. Comedy by Arnold Bennett, based on his novel *Buried Alive*. It was produced at The Kingsway, London, March 25, 1913, and ran for 673 performances. The leading parts were played by Henry Ainley and Wish Wynne. The theme is the bogus death and the burial in Westminster Abbey of a world-famous painter, who prefers to remain "dead." The title is misquoted from Barrie's *Peter Pan*: To die would be an awfully big adventure. Ainley

appeared in a silent film version, 1916; and Gracie Fields and Monty Woolley made a film version in 1943, retitled *Holy Matrimony*.

Great Auk. *See* Auk.

Great Australian Bight. *See* Australian Bight.

Great Barrier Reef. Coral reef 1,200 m. long, off the N.E. coast of Australia. It covers an area of 100,000 sq. m., and acts as a vast natural breakwater, the channel separating it from the Queensland coast—10 m. to 30 m. wide—providing a safe sea passage studded with islands, of which Hinchinbrook is the largest. There are numerous deep sea passages across it, opposite which lie important towns (e.g. Townsville and Rockhampton), and river-mouths (Burdekin, Fitzroy, Burnett), Raine Inlet being the safest. Pearl and *bêche-de-mer* fishing is

carried on. Captain Cook was the first to cross the reef. *See* Coral Reef; *consult also* Great Barrier Reef, W. K. Saville, 1894; *Wonders of the Great Barrier Reef*, T. C. Roughley, 1943.

Great Basin. Interior drainage area of the western U.S.A. It covers nearly the whole of Nevada and parts of Utah, Idaho, Oregon and California, is bounded W. by the Wasatch Mts. and E.

by the Sierra Nevada and the Cascades, and covers an area of more than 200,000 sq. m. A vast arid region diversified by a series of independent mt. ranges extending from N. to S., its highest altitude approaches 5,000 ft., from which it slopes away to the S. and dips beneath sea level.

Lakes are numerous, and among the largest are the Great Salt Lake and Lakes Sevier and Utah on the E., and Lakes Carson, Walker, Owens, Harney, and Malheur on the W., all saline or drained to salt lakes. The only considerable permanent river within the basin is the Humboldt river which feeds North Carson lake. Where irrigation has been applied the soil is fertile, but the greater part of the region is covered with sparse shrubs or is desert. Much mineral wealth underlies the basin, of which vast tracts are covered with alkali and salt left by evaporation, and several inches in depth, or consist of muddy bottoms covered at times by rainwater, or stony wastes left behind by mountain streams.

Great Bear. Popular name of the well-known northern constellation Ursa Major (*q.v.*).

Great Bear. Extensive lake of Canada. In the N.W. Territories, it touches the Arctic Circle. Irregular in shape, it has a length of 176 m., and breadth varying from 25 m. to 46 m.; its area is 11,200 sq. m., and its average depth 270 ft. Frozen over for the greater part of the year, it abounds in fish, and discharges into the Mackenzie river by the Great Bear river. The trading station of Fort Franklin is on its shores.

Great Britain. Name long used for the island comprising England, Wales, and Scotland, including adjacent small islands. Since the political partition of Ireland the term has sometimes been extended to include the six counties of Northern Ireland, but the longer and more correct expression is Great Britain and Northern Ireland. The official use of the word dates from 1603, when James I united the crowns of England and Scotland, and called himself king of Great Britain. There was much objection to this style, which was declared illegal by the courts of law, but it persisted. The word had been used previously, but in a looser, more poetic sense, having originated in the desire to distinguish Great Britain from Little Britain or Brittany. *See* Britain; United Kingdom.

Great Circle. Line on the earth's surface which lies in a plane through the centre of the earth, or any circle on the earth's surface which divides the world into two equal parts. Thus all meridians of longitude are halves of great circles, but the equator is the only parallel of latitude which satisfies the conditions, since the planes of other parallels do not pass through the earth's centre. The shortest line joining any two points on the earth's surface is on a great circle, hence the ascertaining of great circles is valuable in navigation (*q.v.*). Air navigators may fly by this method when weather and safety factors permit. Distance records are calculated "in a straight line"—actually on a curved great circle.

The great circle through London and Melbourne crosses Calcutta and almost touches Trinidad; that which is the edge of the land hemisphere touches Formosa, Sumatra, and almost touches Japan, Madagascar, and Cape Town.

Great Contract. Financial arrangement suggested in 1611, but not carried out, between James I

and the English parliament. It was proposed by Robert Cecil, earl of Salisbury, that James I should surrender the revenue which he raised from his tenants in the old feudal ways, by aids, fines, etc., and should in return receive a fixed sum of £200,000 a year. The commons first offered £100,000 and then agreed to double that amount, but both sides put forward further demands and the bargain was never clinched.

Great Dane. Name popularly applied to a breed of German boarhounds. It is the largest of the European mastiffs, and has long been bred in Germany and Denmark. It stands 34 inches high at the shoulder, and good specimens weigh about 180 lb. It is still employed in the Black Forest for hunting. Smooth coated, it should be grey, black, or black and yellow. Naturally its ears droop, but are usually trimmed to a pointed shape to give the animal a more alert appearance. The Great Dane was introduced to

Great Dane. Specimen of this strong and fearless breed of dog

Great Britain in 1870, when its great size and fine appearance rapidly made it a favourite. In disposition it is friendly and faithful, but its great strength and determined will make it difficult to control.

Great Dividing Range. General name of the vast mountain system of E. Australia. It extends from the N. of York Peninsula in Queensland, and trends S. and S.E. to the borders of New South Wales; it then turns S.S.W. through that state and Victoria, terminating at its S.E. extremity. The westerly extension from here is known as the Australian Alps, and also as the Great Dividing Range. The highest summits are found in New South Wales, Kosciuszko (7,328 ft.) and Townsend (7,260 ft.) being the loftiest.

There are several other peaks over 5,000 ft. The various sections of the Great Dividing Range have different names, *e.g.* the Muniong, Macpherson, and Bellender ranges, and the Blue Mountains.

Great Eastern. British steamship, built in 1858 from the designs of Isambard Brunel. The largest steamship built to that date, she was first called the Leviathan. Her

Great Eastern steamship on her first voyage to New York, June, 1860

From a contemporary drawing

dimensions were: length 692 ft., beam 83 ft., draught 25 ft., and gross tonnage 18,915 tons. She was a screw and paddle vessel and cost about £750,000. Her builders were Scott, Russell & Co., Millwall.

She crossed the Atlantic in 11 days, 1860, and later laid the Atlantic cable. Later still she laid the French Atlantic cable, the Bombay-Suez cable, and the fourth and fifth Atlantic cables. Sold for £16,000, she was broken up, the materials fetching £60,000.

Greater Rajasthan. For this state of India *see* Rajasthan.

Great Expectations. Twelfth novel of Charles Dickens. It originally appeared as a serial in *All the Year Round* between Dec., 1860, and Aug., 1861. Little more than half the length of Dickens's longer novels, it has serious claims to being his best-told story. It is written in the first person, the supposed narrator being Philip Pirrip, known as Pip; his sad tale of humble origins, sudden promise of fortune, and bitter disappointment conveys a wholesome moral, though Dickens was regrettably persuaded by Bulwer Lytton to exchange his original natural ending for a conventional "happy" one. Of many richly drawn characters the most memorable are the grotesque recluse Miss Havisham, and the simple-hearted and lovable blacksmith Joe Gargery. A British film version of the novel, made in 1946 by Cineguild was popular on both sides of the Atlantic.

Great Falls. Second city of Montana, U.S.A., the co. seat of Cascade co. It stands on the

Missouri, opposite the point at which the Sun river flows into it, and 12 m. above the falls which give the town its name. It has copper mines, and gold, silver, lead, and zinc are also worked. The surrounding area is an agricultural and stock raising region, and the town has oil refineries, smelting and electrolytic plants, flour mills, and meat packing factories. Two rlys. and an airport serve it. The Belt mts. are in the vicinity, and Great Falls is near the winter sports centre of Sun Valley. The Lewis and Clark and Jefferson national forests and some of the world's largest hot springs are also near. The city, which was founded in 1883, has a pop. of 29,928.

Great Fire. London fire which lasted four days and nights of Sept., 1666. It broke out about 2 a.m. on Sunday, Sept. 2, near the oven of one Farynor, the king's baker, in Pudding Lane, near London Bridge. A pile of faggots was by the oven, fitches of bacon stood near; the houses in the lane,

one of the narrowest in the city, had projecting storeys, and their woodwork was coated with pitch. Farynor, his wife, daughter, and manservant escaped by the roof, but the maidservant, afraid to risk the climb, was the first victim of the outbreak.

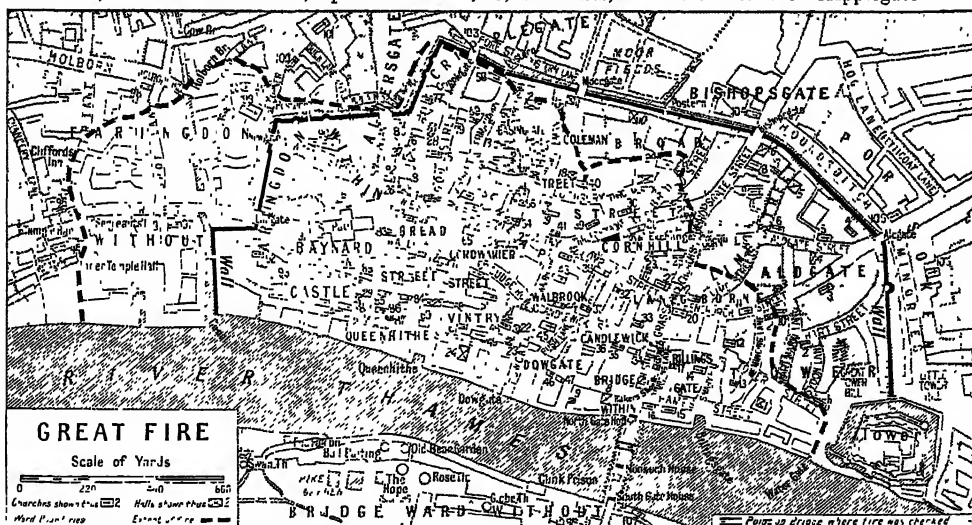

The flames spread slowly until they attacked the cellars and warehouses along Thames side. By 8 a.m. London Bridge was blazing. On Tuesday Cheapside, S. Paul's cathedral, and Guildhall were destroyed. By Thursday morning only a sixth part of the city within the walls was left standing, the liberties west towards Temple Bar were burnt out, 100,000 people were homeless, and nearly all that had remained of medieval London was obliterated, or doomed. So far as is known, however, only about a dozen people were burnt.

The area destroyed within the city walls was 373 acres; without, 63 acres and 3 roods. Not counting S. Paul's and Guildhall, 84 parish churches, 13,200 houses, 44

halls of livery companies, the city gates, Royal Exchange, all the markets except Leadenhall, the gaols, all the Inner Temple except the hall, church, part of Fig Tree Court, and the gateway to Fleet Street perished. Wharves and landing stages and boats and barges were included in the losses, the total extent of which has been estimated at £10,000,000, a sum equal to a least £40,000,000 of modern coinage.

For long the fire was attributed by many to a Papist plot. Now it is agreed that it was due to a strong N.E. wind following a period of extremely dry weather, and the inflammable nature of the buildings. Fire-engines were as unknown as fire insurance, and the blowing up of houses by gunpowder had to be resorted to to stay the flames.

The familiar epigram that the fire began in Pudding Lane and ended at Pie Corner lacks veracity; the fire burnt for 20 hours after Pie Corner had been razed; it ended in the Cripplegate area,

at Cock Lane. Not until 1668 was the task of rebuilding taken thoroughly in hand.

The Monument opposite Fish Street Hall, erected 1671-77, did not originally contain the ascription of the fire to Popish faction; this was placed upon it in 1681 after the publication of the perjuries of Titus Oates; the words were finally removed in 1830. *See* London; Monument, The *consult also* The Great Fire of London, W. G. Bell, 1920; and the Diaries of Evelyn and Pepys.

Great Fish. Bay or inlet of the Atlantic Ocean. It cuts into S.W. Africa, in lat. 16° 30' S. and long. 11° 48' E. Near the S.W. extremity of Angola or Portuguese W. Africa, it penetrates about 30 m. inland.

Great Fish. A river of Cape Province, S. Africa. For many years it formed the boundary of Cape Colony against incursions by the Kaffir tribes on the E. It drains over 12,000 sq. m. and rises in the Sneeuwbergen Mts., receiving the waters of the Graak, Tarka, and Little Fish rivers, and enters the Indian Ocean at Waterloo Bay, between Port Alfred and East London. Its length is 230 m.

Great Fish. River of Canada, also called the Back. It rises near the N. shore of Lake Aylmer, N.E. of Great Slave Lake, and, flowing generally in a N.E. direction, discharges into an inlet of the Arctic Ocean after a course of about 500 m. Sir George Back (*q.v.*) explored its shores.

Great Gable. Mt. peak of Cumberland, England. It is about 7 m. S. of Keswick and is 2,950 ft. in alt. Dangers attend a rash ascent. Near is Green Gable, 2,500 ft. high.

Great Harry. English warship, built by Henry VIII at a cost of

and is considered to mark the beginning of the Royal Navy.

Great Harwood. Market town and urban dist. of Lancashire, England. It is situated on the fringe of industrial Lancashire, adjacent to the Ribble valley and the Bowland country. It is connected by railway with Blackburn (5 m.) and Burnley (8 m.). Staple industry is cotton weaving; other industries are silk, leather, shoe, and food manufacture. Market day, Fri. Pop. 10,500.

Greathead, JAMES HENRY (1844-96). British engineer. Born at Grahamestown, Cape Colony, Aug. 6, 1844, he came to England and studied engineering under P. W. Barlow, who directed his attention to the shield system in tunneling. This Greathead made use of in the Thames tunnel constructed in 1869. The Greathead Shield (*v.i.*) in 1886 was applied to the construction of the City and South London and other tube rlys. He also invented the Ejector fire hydrant. He died Oct. 21, 1896.

Greathead Shield. Tunnelling device mainly invented by James Greathead. It consists of a steel cylinder, stiffened internally, and of a diameter slightly larger than the outside of the permanent lining of the tunnel. About halfway along this steel cylinder, hydraulic jacks are fitted; these push the whole shield forward a short distance—each "shove" about 2 ft.—as often as the miners have dug out enough at the front end to ease its progress. Thus the shield is not a cutting or excavating machine, but a travelling support for the ground outside the tunnel.

After every forward "shove" another short length of permanent lining is erected inside the rear end of the steel cylinder. Thus the tail of the shield is continually sliding forward over the last length of the permanent lining put in under its protection, but it always overlaps the permanent lining. The space of about 2 ins. between the outside of the permanent lining and the outside ground, left behind by the shield as it slides forward, is filled with liquid cement each time the shield is moved. *See* Tunnel.

Greatheart. Character in the second part of Bunyan's *Pilgrim's Progress*. He acts as guide to Christian's wife, and slays Giant Despair.

Great Lake OR CLARENCE LAKE. Lake of Tasmania, in the co. of Westmoreland. It lies S. of the Great Western Mts., and is 9 m. long and from 2 m. to 3 m. broad.

Great Lakes, THE. Chain of five fresh-water lakes in N. America. Situated between Canada and the U.S.A., they belong to the basin of the St. Lawrence river, by which they are drained to the Atlantic Ocean. In order of size they are Superior, Michigan, Huron, Erie, and Ontario, and their total water expanse is approximately 94,710 sq. m.

The surface of Lake Superior is 600 ft. above sea level, and between that lake and Erie there is a depression of 28 ft., but between Lake Erie and Lake Ontario there occurs a fall of about 320 ft., chiefly due to the precipitation of the Niagara river over a limestone ledge, which forms the Niagara Falls. The channel serving Lake St. Clair has been increased from its original depth of 9½ ft. to 20 ft., and the Detroit river has been dredged to a depth of 22 ft. The Sault Ste. Marie canal connects Lakes Huron and Superior. Lakes Erie and Ontario are joined by the Welland Canal, which, rebuilt in 1932, admits the passage of vessels drawing 25 ft.

The region surrounding the Great Lakes is one of the most productive in North America, and the cheapness of transport afforded by these waterways has enabled the farming, fruit-growing, and mining industries to be developed on a greater scale. Among the ports served by the lake system are Chicago, Milwaukee, Detroit, Buffalo, Cleveland, Erie, Toronto, Hamilton, and Kingston. The water level of the lakes, which are unnavigable because of ice for about five months in the year, is slowly sinking, and to obviate this dams have been built across the outflow channels. *See* Erie; Huron; Michigan; Ontario; Superior.

Great North Road. Highway in Great Britain between London and Edinburgh. Dating from the days of the Roman occupation, this trunk route has been for centuries the principal means of communication between England and Scotland. By ministry of Transport numbering it is A1. Towns through which it passes are Stamford, Grantham, Newark, Doncaster, Darlington, Durham, Newcastle-upon-Tyne, and Berwick-on-Tweed.

Even at the beginning of the 19th century the road was inadequate for the volume of traffic, an

£14,000. She was the first double-decked ship constructed in England, was of 1,000 tons burthen,

Great Lakes. Map of the great inland seas of the United States and Canada, important as waterways to the surrounding states and provinces, showing canals open and projected

improvement by Macadam being carried out on the S. approach to Barnet in 1825. Telford engineered most of the improvements along the highway, but not until 1933 did the completion of the last section of the North Circular Road link it up with the Great West Road (q.v.). On May 6, 1946, the minister of Transport announced a national road programme which included the construction of a number of by-passes on the Great North Road. The story of this ancient highway is told in *The Great North Road*, C. G. Harper, 2 vols., 1901.

Another Great North Road, traversing E. Africa from Nairobi to Victoria Falls, S. Rhodesia, is part of the Cape to Cairo highway.

Great Organ. Manual keyboard of an organ which controls the more solid-toned stops. Where there are two manuals, the great is the lower one; with more than two, it is usually the second from the bottom. See *Organ*.

Great Orme's Head. Headland of N. Wales, N.W. of Llandudno at the W. end of Orme's bay. The steep white limestone cliffs, pitted with large caves, are 679 ft. high. At the summit is a small church dating mostly from the 15th century, but with a Norman font. A hotel and a golf

course have been constructed on the headland, and a lighthouse stands at its N. point.

Great Plague. Terrible epidemic of bubonic plague which ravaged London and other parts of England in 1665. In 1603 there was an epidemic of plague in which 33,347 persons died in London, and in 1625 there was another in which 41,313 perished.

Great Orme's Head. View of this N. Wales headland as approached by coastal road from Llandudno
British Council

For the 15 years preceding 1665 London had been remarkably free from plague. It has been said that the infection was brought from Holland, but this is not certain, as there were always a few cases in London. In June the number of deaths became alarming, and there was a steady increase in the mortality until the end of Sept. During the winter the epidemic abated. The number of deaths in London in 1665 was 68,596. At the height of the epidemic the scenes were appalling. The doors of the houses in which the sick lay were marked with a red cross and the words "Lord, have mercy upon us," and no person was allowed to enter or leave these houses.

At first the dead were buried separately and in coffins, but when the mortality was at its worst the bodies were simply thrown into great pits. Besides shutting up the houses, fires were burnt in the streets, as these were believed to have a preventive effect. The exceptional virulence of the epidemic was confined to London and the towns in its immediate vicinity.

The plague lingered on in London through 1666, and its eventual disappearance was probably helped by the Great Fire of that year, which swept away a large area of overcrowded, narrow, and insani-

tary streets. Defoe, in his *Journal of the Plague Year*, published in 1722, gives what purports to be an account of the plague by a contemporary. See *Black Death*; *Plague*.

Great Powers. Term applied, especially during the 19th century, to the dominating countries of Europe. Their agreement virtually decided the peace of the world. The congress of Vienna, in 1815, established or confirmed the right of France, Great Britain, Austria, and Russia to be Great Powers, and after its unification in 1870 Italy was added. Towards the end of the century, the influence of Germany, the U.S.A., and Japan in world politics brought them into the list of Great Powers. The shattering of Europe by the two Great Wars put an end to this conception in international relations. See *Balance of Power*.

Great Queen

Street. London thoroughfare linking Drury Lane with Kingsway, W.C. Named after Queen Henrietta Maria, it was built about 1626, many of its houses being the work of Inigo Jones's pupil Webb. The dominating building is the Freemasons' Hall (see *Freemasonry* illus.), dedicated as a peace memorial 1933, and replacing an earlier building dating from the 18th century. The Kingsway Theatre is on the N. side. Sheridan is said to have written *The School for Scandal* at No. 55; and Joshua Reynolds and William Blake worked here as apprentices.

Great Rebellion. Name given to the civil war in England which ended in the execution of Charles I in 1649, or, according to another point of view, in the restoration of Charles II in 1660. To the royalists in the time of Charles II, as earlier, the parliamentary movement appeared as a rebellion, and the phrase obtained greater currency when Clarendon called his great work *The History of the Rebellion*. Later, however, it became thought of as a civil war. See *Civil War*.

Great Rift. Valley or depression of the earth's surface. It extends from the N. of Palestine to near the borders of Natal. It is the longest meridional land valley on the earth, being nearly 5,000 m. in length. Beginning in the neighbourhood of the Lebanon range, its

course lies through the Jordan and Dead Sea, the gulfs of Akaba and Suez, and the Red Sea, where it strikes E. through the Gulf of Aden. From Bab-el-Mandeb it crosses French Somaliland and Abyssinia, and goes through Lakes Rudolf, Manyara, and Nyasa to Sheringoma plateau, Mozambique.

At the N. extremity of Lake Nyasa the valley branches off N.W. through Lake Tanganyika, and bearing N. and N.E. it reaches Lakes Edward and Albert. From Lake Tanganyika there are S.W. and S. extensions to Lake Upemba and Lake Mweru.

Greats. Popular name for the examination in the honour school of *Litterae Humaniores* at Oxford university. The subjects comprise Greek and Latin languages, history of Ancient Greece and Rome, and various branches of philosophy.

Great Salt Lake. The Overland Limited or Mormon Express crossing the bridge over the lake

Great Salt Lake. Extensive water expanse in Utah, U.S.A. It lies in the N.W. part of the state on the E. side of the Great Basin, is about 75 m. long by from 20 m. to 50 m. broad, and has a mean depth of 20 ft. Its surface elevation is 4,220 ft. above sea level, and its area, which varies greatly, according to rainfall, was about 1,750 sq. m. in 1850, but by 1870 its size had increased to 2,175 sq. m.

A natural salt lake, its waters contain about 13 p.c. of mineral

salts, principally sodium chloride, and the production of salt is considerable. The lake is fed by the Bear, Jordan, and other streams, and through the Jordan receives the waters of Lake Utah, but it has no outlet. It is remarkable for the fact that its heavy waters do not permit the human body to sink. The existence of the lake was first reported in 1689 by Baron La Hontan. See *Salt Lake City*.

Great Schism. Period from 1378 to 1417 during which two rival popes claimed each to be the sole head of the Church. In 1378 Urban VI was elected pope, the papal court having just returned to Rome after its exile at Avignon. Against him the French party elected an anti-pope, Clement VII. In general the former was recognized by all Christendom except France, Scotland, and parts of Germany and Italy under French influence. Each party elected successors on the deaths of the two popes. Various attempts to heal the breach failed, until in 1415 the council of Constance ended the schism by the deposition of the anti-pope John XXIII. The rightful pope, Gregory XII, Urban's successor, resigned, and in 1417 a new pope, Martin V, was elected and recognized by both parties. See *Constance, Council of*; *Papacy*.

Great Seal. Emblem of sovereignty, customarily used in some monarchical countries when the will of the sovereign is expressed. There are a great seal of the U.K., and seals for Scotland and Northern Ireland. Formerly a separate official, the lord keeper, had charge of the great seal, but today it is always in the custody of the lord chancellor. A new seal is introduced on the death of the sovereign or when the old seal is worn out or the design changed. The old seal is in theory destroyed; but in practice the sovereign merely gives it a gentle tap with a hammer

Great Seal. Facsimile of the two sides of an impression of the great seal of James II. The original measures 5½ ins. diameter

(damasking). A damasked seal belongs to the lord chancellor of the time. James II, before his abdication in 1688, threw the great seal into the Thames. See Chancellor; Seals.

Great Slave. Lake of Canada, in the N.W. Territories. Its area is 10,719 sq. m., and its shape irregular. It is about 300 m. long and has several bays; the Slave and other rivers flow into it, and the Mackenzie carries its waters to the Arctic.

Great Smoky Mountains. Section of the Appalachian system, U.S.A. They extend in a S.W. to N.E. direction between Tennessee and N. Carolina, and attain an alt. of 6,636 ft. in Mt. Guyot.

Great Wall, THE. Rampart of the ancient Chinese empire, constructed in the reign of Tsin Shih Hwangti (246-209 B.C.) as a protection against the incursions of the Tartars. It stretches from beyond Lanchow, Kansu province, in the W. to Hopeh province, where it ends within a few miles of the sea at Shanhaikwan, the total length being about 1,400 m. Originally from 20 ft. to 30 ft., with towers 40 ft. to 50 ft. high at intervals of 200 yds., it has crumbled away to a low mud wall in the W., with wide gaps. It is best preserved in the neighbourhood of Peiping. See China illus. p. 2033.

Great War, THE. Name often given to the world conflict of 1914-18, which is described throughout this Encyclopedia as the First Great War, that of 1939-45 being here termed the Second Great War. See First Great War; Second Great War; also under the names of particular battles and campaigns of each.

Great Western Railway. British railway company, founded in 1835. The original line was constructed between Paddington and Bristol; continuous extensions were made and territory from London to the West of England, South and Central Wales, Birmingham and the West Midlands, Chester, and Birkenhead was later served. The track, originally

of 7 ft. broad gauge, was converted to 4 ft. 8½ ins. in 1872-92. The company was the only one of the four main lines to retain its original title under the Railways Act of 1921.

Great Western Railway arms

Its capital in 1947 was approximately £150,000,000 and its total route mileage 3,743. Itsh.q.wereat Paddington, the London terminus, and principal carriage and wagon works at Swindon. G.W.R. locomotives were painted green and black and passenger vehicles chocolate and cream. A dock system in South Wales was a G.W.R. enterprise. G.W.R. steamer services operated from Weymouth to the Channel Islands; Fishguard to Waterford or Rosslare. During the Second Great War the G.W.R. ran 44,988 trains for the forces and 66,798 government stores trains. The company was nationalised as part of British Railways, Jan. 1, 1948, the system placed under the Western region executive being approximately that of the G.W.R.

Great West Road. London arterial highway, constructed in the early 1920s between Chiswick and a point on the London-Bath road W. of Hounslow, a distance of some 5 m. The ministry of Transport numbering is that of the Bath road, A4. For most of its

length it has a quadruple track divided by a centre strip. Many light industries have found the vicinity of the eastern sections a convenient site for factories, and the whole stretch quickly became one of the earliest and most notorious examples of ribbon development. Almost opposite its junction with the Bath road a further arterial road, the Great South Western, leads to Staines (A30). In 1937 the ministry of Transport obtained powers to drive a new road connecting Cromwell Road with Chiswick, thus linking the Grt. W. Road with London's W. End.

Greaves (old Fr. *grève*, *shin-bone*). Armour for the lower part of the legs. Bronze or pewter greaves were worn by the Greeks and Romans (Gr. *knemides*, Lat. *ocreae*). In medieval times they were embossed and ornamented. They were lined with soft material and fastened by ankle rings and straps. See Armour.

Greaves. Mailed leg, showing greave between knee and ankle

Greaves, WALTER (1846-1930). British painter. Son of a Chelsea waterman and boat-builder, he was greatly influenced by Whistler, and as a youth worked in that painter's studio. He spent most of his life in Chelsea, and his work long remained comparatively unknown. In 1921 he was elected member of the Chelsea Arts club and in 1922 an early work, *Hammer Smith Bridge on Boat Race Day*, was purchased by the Chantry bequest for the Tate Gallery. His Chelsea

Regatta is in Manchester art gallery. Greaves died in poverty as a Charterhouse pensioner, as the result of an accident, Nov. 23, 1930.

Grebbe Line. Defensive position in the Netherlands, extending towards the Yssel Meer from the r. Waal. Based on a system of waterways and protected by inundations, the line was attacked by German forces on May 12, 1940. The initial assault was repulsed; but renewed attacks compelled the defenders to withdraw into Holland. In the campaigns of 1945 Canadian troops captured Apeldoorn on April 17; and the German forces retreated W. to the Grebbe Line. On May 6 Gen. Blaskowitz, German commander in the Netherlands, surrendered at

Wageningen, near Arnhem, at the S. end of the line.

Grebe (*Podiceps*). Genus of diving birds, five species of which occur in Great Britain. They are remarkable for their curiously lobed feet, rudimentary tail, and the backward position of the legs which causes them to assume on land an upright position like a penguin. They frequent ponds and lakes in

Grebe. Great crested grebe on nest among rushes

summer, and some go to the sea in winter. The little grebe is known as the dabchick (*q.v.*).

Greco, EL. The nickname (The Greek) given to the Cretan-born painter of the Spanish school, Domenico Theotocopuli (c. 1541-1614), and by which he is still generally known. See Theotocopuli, Domenico.

Gredos, SIERRA DE. Mountain range of W. Spain, dividing Old Castile from New Castile and Estremadura. It is a S.W. continuation of the Sierra de Guadarrama, and is about 100 m. long.

GREECE: IN ANCIENT TIMES AND TODAY

HENRY BAERLEIN, A. D. INNES, M.A., and Others

Here is a description of Greece today, preceding a full account of its history from ancient times to the period of the Second Great War and after. Articles on Greek Art, Law, Literature, and Religion follow. See also articles on Greek leaders, ancient and modern, e.g. Damaskinos; Metaxas; Pericles; Themistocles; Venizelos; and Greek cities, e.g. Athens; Salonica, etc.

Greece lies in the S. of the Balkan Peninsula. It has a very long coastline to the Aegean and Ionian Seas, and includes a number of islands in the Aegean Sea and off the coast of Asia Minor.

Its area is 50,271 sq. m., but so much of it is mountainous that it could never support a large population.

Arms of Greece

The mountain ranges, though not very high, divide the country into a number of small districts between which communication is difficult. The sea links the different regions of Greece. There are no navigable rivers; most of those there are dry up in summer. There are many lakes of moderate depth. The former marshy lake Copais in Boeotia was drained and became a very fertile tract of land. There are few forests and little wooded country. The climate is subtropical on the lower levels, and subject to extremes of heat and cold in the mountains. How far the present inhabitants are descendants of the ancient Greeks is disputed. The many invasions of the country, both warlike and peaceful, by other races, chiefly Slav and Albanian, have certainly brought in other stocks.

Modern Expansion

Greece today is a very much larger country than was ancient Greece. As a result of the Balkan wars of 1912-13 she acquired Macedonia, Epirus, Crete, and the Aegean Is. After the First Great War she acquired W. Thrace, and a frontier with Turkey; after the Second, Rhodes and the Dodecanese. Pop. (est.) 7,650,000.

During the latter part of the 19th and beginning of the 20th centuries, many Greeks emigrated, especially to the U.S.A., but immigration restrictions brought the movement to an end. Some 1,500,000 Greek refugees from Turkey, Russia, and Bulgaria settled in Greece between 1918 and 1924.

From 1833 to 1924 Greece was a monarchy, from 1924 to 1935 a republic, then a monarchy

again. There is one legislative chamber, the Boule or chamber, of 354 members elected for four years. There is a council of state with purely judicial functions. The written constitution can be revised as to its non-fundamental provisions by a specially elected revisionary assembly.

The short white kilt (*fustanella*) is still worn by a great many of the peasants, though in the country, as in the towns, the fashion of wearing coats and trousers and hats is spreading. The peasants are mostly smallholders owning their own land. Agriculture in many parts is backward. Only about one fourth of the country is cultivable. The chief crops are tobacco and currants, which are exported all over the world. Olives are grown extensively, and wine is made, mainly for home consumption, the resin in most of it making it unpleasant to those not accustomed to this flavour.

Food and Communications

Of the cultivated lands half are given up to growing food for the population—wheat, barley, rice, maize. Many peasants eat meat only a few times a year, on festival occasions. What meat there is is lamb; rice as an ingredient of pilaff is very common; marrows stuffed with rice and meat, and in some districts sweetmeats, are usual items in the diet; fruit, especially figs and oranges, is fairly plentiful; wine is drunk everywhere.

Until 1869 there were no railways. Their construction in this mountainous country was costly, but by 1946 there were some 1,700 m. open for traffic. There are good steamer services on the long coast-line.

When the Second Great War began, Greece had a flourishing merchant marine (some 600 ships totalling 1,780,000 tons), which went into the Allied wartime shipping pool; 75 p.c. was sunk.

The chief ports are Piraeus and Salonica (Thessaloniki). Of the Greek towns known to antiquity Sparta is modern and featureless; Thebes picturesque but small and sleepy; Laurium is disfigured by the smoke-stacks and the spoil-banks of mines. Athens and

Salonica are the only centres of population, ancient or modern, which can lay claim to the title of "city."

The Greeks are, as a nation, ever anxious to learn, hungry for education; but the teaching given in the state schools tends to be too literary, though technical schools also exist. Education is compulsory between the ages of 7 and 12.

The State Church

Among most of the more highly educated religion is either neglected or kept up merely as a form. But among the peasantry attachment to the Greek Church is strong. During the struggles for independence from the Turks and later from the Germans, the heads of the Church were leaders of the nation, a tie that remains though the Church has no direct political importance. It is a state church, Orthodoxy being the state religion. In the monasteries the hospitable entertainment of strangers is traditional. Muslims number about 130,000; their religious leaders are also paid by the state. There are some 35,000 R.C.s.

Both in the villages and in the towns, and also among the Greeks who live abroad, there is a strong love of country. Military service, which is compulsory and universal, is not felt as a hardship. Industrialisation has increased since 1922; there are textile, silk, cement, and other factories, mainly in the Athens-Piraeus area, which, with the mining of iron, magnesite, lead, and other minerals, employed 28.2 p.c. of the pop. in 1939.

ANCIENT GREECE. The history of ancient Greece may be more correctly called the history of the Hellenes. All that was most characteristic of the race was concentrated and consummated in one little state, hardly bigger than the county of Kent; but Hellas, the Hellenic area, covered not only the modern kingdom of Greece, but all the islands of the Aegean Sea and the western coast of Asia Minor; while the Hellenic expansion dominated Sicily, occupied the ports of southern Italy, and planted colonies on the African coast, and as far W. as Massilia, the modern Marseilles.

About the 15th century B.C. the Hellenes were pushing down into

Greece, to which the Minoan civilization had not extended. In the 13th century the Minoans, with their superior civilization, extended their ascendancy into the southernmost regions reached by the advancing Hellenes, and established what is called the Mycenaean civilization within the Morea or Peloponnesus.

Achaean and Hellenes

The most inclusive name of the Hellenes at this era was Achaeans or Danaans, with Aeolians and Ionians as subdivisions. About the 12th or 11th century, a new and ruder Hellenic wave, the Dorian, rolled down from the N.W. The Dorian pressure drove first the northern Aeolians, and then the southern Ionians, to push their way across the islands to the coasts of Asia Minor. It was, however, only in the S., in the eastern Morea and on the Isthmus of Corinth, that the Dorians effected a conquest, destroying the Minoan ascendancy, and then carrying their arms eastwards, across Crete and the southern islands, to the southwestern coast of Asia Minor.

By the year 1000 B.C. Hellas had formed itself; Hellenes were permanently established over the whole Hellenic area—the Greek peninsula, the islands of the Aegean Sea, and the coasts of Asia Minor. The time when the Hellenic name superseded Achaean as the common title of the race is uncertain, but it was manifestly later than the shaping of the two great epics of Homer (probably in the 9th century), who speaks always of Achaeans and Danaans, not of Hellenes. The 7th century was the era of the Western Hellenic expansion into Sicily and Italy, due to the fact that eastward expansion was blocked by geographical conditions. Powerful non-Hellenic kingdoms were already established in Asia Minor, against which the Hellenic states on the coast could make no advance across the inland hill-country.

Geographical Influences

Geographical conditions determined the character of Hellenic political development; on the one hand preventing political unification, and on the other fostering a high degree of organization in the separate political units. Every island was made a natural unit by the sea; hill ranges cut up the mainland into small areas, isolated from each other, generally tending to the evolution of a city forming the centre of an agricultural district which became a political unit where the concentrated life fostered a vigorous political activity. But the Greeks, having no common foe,

had no incentive to union either for self-defence or for conquest, the two great motives to unification.

Nevertheless, they had the common bond of religion and language, and the common characteristics of political development which caused them to feel themselves apart from the "barbarians" who had no share in their religious mysteries, and were politically undeveloped. Thus, under normal conditions, to the Greek the enemy to be suspected was the rival Greek state; the alien was the citizen of a rival state.

In each community the course of political development followed the same lines up to a certain point. From the earliest times each little state consisted of a free population of tribesmen, with their slaves—captives, or earlier peoples conquered in war; all ruled over by an hereditary king, controlled or guided by a council of the hereditary clan chiefs whose families formed an aristocracy, while the people periodically assembled for military or other purposes to confirm or possibly to reject the more important projects designed by their rulers. In course of time in every state except Sparta, which retained the kingship under pecu-

established a dynasty more or less permanent, which rested upon the employment of a paid soldiery. More commonly the second or third generation saw the forcible ejection of the tyrant and the recovery of political control by the old aristocratic families in conjunction with wealthy families from the commons, who established an oligarchy; or else the popular party established a democracy.

The more powerful cities usually exercised a certain dominion over a group of their weaker neighbours, but such a dominion rarely extended over so wide an area as that of an average English county.

Thus, by the 6th century B.C. Hellas was composed of a great number of small city states, most of them independent; though the flourishing and wealthy cities of Asia Minor, while remaining autonomous, had been compelled to acknowledge the sovereignty of the Oriental monarchy of Lydia. The 6th century was, roughly speaking, the age of the tyrants.

The Persian Menace

But the second half of this century saw a new portent—the creation of the Persian Empire by Cyrus (q.v.), and his successors, Cambyses and Darius (q.v.). The

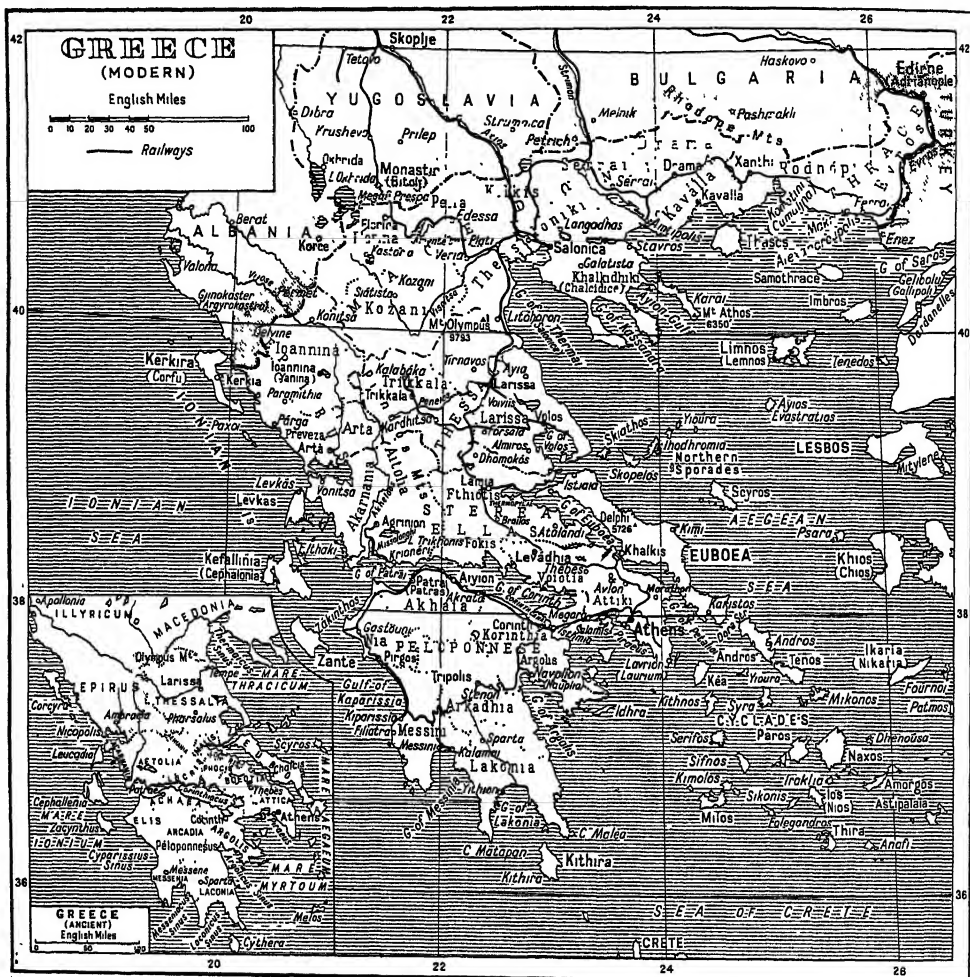

Greece. Restoration of the temple of Demeter, in which the Eleusinian mysteries were celebrated

liar conditions, the monarch lost his hereditary functions, and even if the royal family survived it became absorbed among the other noble houses.

Then came a period of struggle between nobles and commons, usually culminating in the military success of a noble who, having successfully espoused the popular cause, turned his victory to account by assuming a monarchy, shorn, however, of the sacred character originally attaching to the institution. To these monarchs the Greeks gave the name of *tyrannos*, tyrant, or rather absolute ruler. Here and there a tyrant

great empires of the ancient world, Babylonian, Assyrian, or Egyptian, had never touched Europe, and had scarcely penetrated W. of the Taurus Mountains. But now the Persians and Medes from beyond the Euphrates carried their dominion first over the whole of Asia Minor, then absorbed the Babylonian empire, and finally swept into Egypt and subjugated it. The conquest of Asia Minor meant that the Greek cities were included in the great provinces or satrapies organized by the Persian kings; and when Darius crossed into Europe, 513 B.C., and conducted an experimental campaign in the

Greece. Map of the country, showing its boundaries, railways, and chief towns. Inset, map of the ancient divisions and cities of Hellas, with the classical names of the surrounding seas

regions N. of the Danube, Hellas became conscious of the existence of an entirely new menace.

The yoke of Persia was light; she suffered her subject people to rule themselves after their own fashion so long as they paid their tribute and provided contingents to her armies when called upon. Nevertheless, in 500 B.C. the Ionic cities of Asia Minor revolted against their satrap and called upon their kinsmen across the sea to come to their aid. The revolt was crushed; but aid had actually been sent by Athens, while Sparta, acknowledged by the Greek states of the W. as the premier military state, contented herself with threats.

Darius sent envoys to demand from all the Hellenic states "earth and water" symbols of the recognition of Persia's sovereignty.

Many yielded, but Athens and Sparta refused with contumely. The result was that in 490 Darius dispatched an expedition which was to teach the Athenians a lesson, since their active participation in the Ionic revolt had excited his particular indignation. Had Athens elected to submit, or had she been wiped out, the future of the world would in all probability have been entirely changed; but although it was in vain that she appealed to the other Greek states, she had made up her mind to stand for freedom at all costs. The Persian host landed on the plain of Marathon; the little Athenian army, supported by none save the loyal city of Plataea, hurled the Persians into the sea.

The glorious victory of Marathon (490 B.C.) was a complete de-

monstration of the enormous superiority of the Greek armament, discipline, and tactics over those of the Persians; it meant that Greek troops well led could hold their own against Asiatics, in face of almost any odds. Ten years later Xerxes, the son of Darius, having resolved no longer to tolerate the defiance of his power by the insolent Westerns, gathered a vast army and fleet to crush their resistance once for all. But in the meantime Athens, guided by Themistocles, had devoted herself to the development of her fleet, and the other Greek states had realized that they must fight with Athens or perish.

Even then the selfishness of the southern Dorians made them reluctant to advance beyond the Isthmus of Corinth, which could be made impregnable. Still, the fear

that Athens might be compelled to make her own terms, involving at least the withdrawal of her fleet and the exposure of Peloponnesus to attack from the sea, drove the Spartans, to whom the control of the land forces was assigned, to occupy first the northern pass of Tempe, and when it was found that this could be turned, the nearer pass of Thermopylae.

Even then nothing more than the advance guard had been sent, while the forces of the Athenians and their island allies were on the fleets which were engaged in holding the Persian navies at bay. The Greek position was turned at Thermopylae; and Leonidas, having dismissed the major portion of his troops, fell at the head of his three hundred Spartans, winning thereby immortal renown, but not saving Hellas. The Persians overran Attica, but the Athenians drew the fleets of the Barbarians into the great naval engagement in the bay of Salamis (480) where they were annihilated.

Then at last, though again only under threat of the Athenian withdrawal, Sparta prepared for a vigorous offensive against the still vast army which Xerxes yet retained in Greece, an army which was finally and utterly shattered in 479 at Plataea; while the *coup de grâce* was simultaneously administered to the Persian navy on the Asiatic coast at Mycalé. At the same time the Hellenes in Sicily under Gela, tyrant of Syracuse, broke another Oriental wave by a crushing defeat of the Carthaginians at Himera in 480.

The importance of these years to the history, not only of Greece, but of the world can hardly be overestimated. They saw the first grand collision between Orientalism and the vital spirit of Western civilization. The triumph of Persia would have turned Athens into another Tyre at the best; the triumph of the Greeks made her the Athens of Pericles, Aeschylus, Sophocles, Euripides, and Pheidias, the mother of Socrates and Plato.

Of all the Greek states, Athens had the most to gain by a tame submission, the most to suffer through a bold defiance whatever the result might be, the most to lose by defeat. She staked all and saved her soul, and thereby saved the soul of Europe. If Persia had won, Greece would have been emasculated, the Oriental tide would have rolled on into Sicily, and Italy, Rome, at that time "mewing her mighty youth" would have been submerged, the very conception of political liberty would have been blotted out. Nor is it to be believed that, if this had befallen, Greek thought and Greek conceptions of art would have attained to anything like that development which during the next century and a half gave the Greeks that supremacy which has ever since influenced the world.

In 490 the great majority of the Greeks probably believed that resistance to the power of Persia was all but hopeless. In 479 the Greek attitude had become altogether

Greece. Traditional costumes. 1. Man from Andravida. 2. Shepherd of Morea in winter coat of straw. 3. Mahomedan peasant. 4. Man from Dhimiyan. 5. Gendarme of Samos. 6. Bride in costume of Patmos. 7. Peasant woman of Morea. 8. Woman of Corinth

different. There was a widespread disposition to follow up the great victories and to strike at Persia herself. For such an enterprise the first necessity was the whole-hearted unity of Hellas. To rout the Persian navy on the sea, and to shatter Persian armies on Greek soil, was one thing; to invade the Persian empire had, so far as the magnitude of the task was concerned, some resemblance to the invasion of Europe from England, with the added complications that would have arisen if every English county had been a separate sovereign state with no central English government.

Obstacles to Unity

The difficulties in the way of united action were greater than those of the thirteen American colonies when they opposed themselves to the power of the Mother Country. A real continuous unity of action was only possible of attainment under the direction of one recognized and unquestioned control. Despite what Athens had done, Sparta, not Athens, was the only state to which the rest were willing to concede a priority; but though the Spartan troops were admittedly of the best, Sparta herself was quite unfitted for the task of organizing a united Hellas.

Sparta remained inert and apathetic, and when it was left to Athens to take the lead, continental Greece held aloof, though the maritime states formed the Delian League (*see* Delos) under the Athenian presidency. But a naval league could not do the work.

Before five and twenty years had passed the dream of a war of aggression had in effect faded away, and the Greek states had fallen back into the old attitude of mutual hostilities and jealousies, though with this difference, that they were now grouped roughly either as allies or dependents of Sparta or as allies or dependents of Athens. For Athens, through the Delian League, was founding a sort of maritime empire. At its first formation the states of the league had maintained the navy of the league by providing contingents of ships and men; when they were permitted to substitute money payments, the ships and men were supplied by Athens, so that the navy of the league became virtually the navy of Athens, and the enormously increased power of Athens excited the jealousy of every other state, but especially that of the Spartans.

A further cause of dissension lay in the fact that in almost every Greek state, whether the government was oligarchical or democratic, there existed the two oligar-

chical and democratic parties in fierce antagonism. Oligarchical states favoured Sparta, while democratic states favoured Athens; but the antagonistic party in each state always hoped to effect a revolution with the aid of either Athens or Sparta.

The Peloponnesian War

The result was that, nearly fifty years after the Persian *débâcle*, almost all Hellas was involved in the great conflict between Athens and Sparta, which is called the Peloponnesian War. The struggle opened in 431. After ten years it was suspended, the advantage on the whole lying with Athens, whose naval supremacy was unequivocally established; but an ill-judged attempt to extend her imperial sway by a great expedition to Sicily ended in a tremendous disaster. Sparta seized her opportunity to renew hostilities, and though for a long time Athens held her own, a monstrous blunder at last enabled the Spartans to capture or destroy the greater part of her fleet at Aegospotami, and bring the war to a decisive conclusion, with Spartan supremacy completely established in 404.

The next twenty years demonstrated the inherent incapacity of Sparta for political organization; she could not rise above the conception of a Spartan dictatorship, a military tyranny. A new adversary arose when Thebes broke from her sway, and, under the leadership of Epaminondas defeated her armies at Leuctra in 371, and created a brief Theban ascendancy which, however, did not long survive the death of the great captain at the battle of Mantinea in 362.

Athens, though she had recovered much of her old strength, was still in no position to renew her bid for the leadership of Greece. But a claimant for that position now appeared in a quarter which had hitherto been regarded as at best semi-Hellenic. On the N. of Greece lay Macedonia, a loosely organized kingdom which had scarcely passed beyond the tribal system. The royal family, however, claimed a pure Hellenic descent. In 359 the Macedonian crown passed to Philip, who was spending his boyhood virtually as a hostage in Thebes. He returned to Macedonia to apply there the political and military lessons which he had absorbed.

With excellent military material ready to his hand, he shaped his Macedonians into a highly disciplined army instead of a loose congeries of clan levies; inter-

vened in the affairs of the Greeks; posed as the champion of Hellenism in punishing for an act of sacrilege the northern state of Phocis, which but for his appearance might have made a successful bid for a military supremacy; and then virtually compelled the whole of Greece not only to recognise Macedon as an Hellenic state, but to acknowledge him as the elected leader of Hellas, the captain of its armies in the revived project of an Hellenic war upon Persia.

The entry of Macedon upon the Hellenic stage was in itself a tremendous revolution, for her organized military resources were more than a match for those of any casual combination of the Greek states. Unlike the Persians, Philip could with his Macedonians apply all that the Greeks knew of the art of war, all that had made them a match for ten times their number of Asiatics. The moment had actually come when under Macedonian pressure Hellas might have been unified as a military empire. But in 336 Philip was assassinated and his crown passed to his son, Alexander the Great, a lad of twenty.

Alexander the Great

For a moment the older states thought they could shake themselves free of the new domination; the terrific energy of the young king soon undeceived them. A revolt headed by Thebes was crushed, and Alexander forthwith took up the projected task of hurling the West against the East. In eleven momentous years (334-323) he brought the whole of what had been the Persian empire under his dominion (*See* Alexander the Great), bursting even through the mountain gateways of India; but his mighty career was cut short when he was no more than thirty-three years of age in 323 B.C.

In the midst of his tremendous and unparalleled activities as a conqueror and leader of armies, the genius of Alexander had not failed either to provide temporary organization of his conquests or to indicate the scheme for permanent structure. The barrier between East and West, between Oriental and Hellenic, was to be broken down. The two were to be fused, each giving of its best to the other. Not only in Egypt but in Afghanistan and Turkistan arose cities which took from him the name of Alexandria, cities where Greeks and Macedonians were planted for the diffusion of Hellenic civilization; Greeks were settled even in the Punjab. But his dream of a universal empire

which was to be fused into homogeneity was not destined to be accomplished.

Dying with no son to succeed him, he left the vast dominion to be striven for among his generals, with the result that after a few years it had fallen into five main divisions, in Europe, in Asia Minor, in Egypt, in Syria, and in the remote East beyond the Euphrates. In the four Oriental divisions Hellenism was only an exotic; a foreign influence, an atmosphere which surrounded Macedonian and Greek dynasts, which left its traces but was never absorbed into the soil. And Alexander, failing to fuse East and West, failed no less to fuse Hellas. The Hellas he led was still only a congeries of small states forced into alliance and dominated by Macedon. So it remained after he was gone.

Athens and Antipater

Alexander was no sooner dead than Athens took the lead in forming a league—from which as a matter of course Sparta and others stood apart—for throwing off the Macedonian yoke; but, after some initial success against Antipater, the regent whom Alexander had left in Macedonia, in what is known as the Lamian war, the league was virtually dissolved by Antipater's diplomacy. Then followed the period of the struggles for supremacy between Alexander's generals, which finally settled on the Macedonian throne the dynasty of Antigonos in 278.

The last of his rivals was Pyrrhus, king of Epirus; but the career of that brilliant military adventurer, who perished in the contest with Antigonos, had scarcely any influence on the story of Greece. The Macedonian kingdom exercised no recognized authority over the Greek states, though it enforced an effective domination wherever only an isolated resistance was offered. As a matter of fact, Antigonos secured his ascendancy by setting up a *tyrannos* who was a creature of his own in most of the states.

Nevertheless, it was at this stage, about the middle of the third century B.C., that there arose among those minor states which had never claimed a leading position, the conception of a free federation of self-governing states, bound together for purposes of foreign policy. In the Peloponnesian district which still bore the ancient name of Achaea, and in Aetolia, facing Achaea, on the northern side of the gulf of Corinth, arose the Achaeans and Aetolian leagues of cities, which began by expelling the tyrants who had been imposed

upon them, and assisting their neighbours to do likewise.

Leagues of the 3rd Century

Each of the leagues was organized with what might be called a central federal council with a common commander-in-chief, and one or other was quickly joined by most of the more vigorous cities, though Sparta obstinately stood aloof. Had the Greeks in the day of their greatest glory been able to rise to the conception of an Hellenic federation in which every state would be ready to subordinate its particular interests to the common good, there might conceivably have been a true union and fusion of Hellas. But now it was too late. The leagues were jealous of each other, and Sparta was jealous of both, while both were jealous of Sparta.

Greater Hellas in the W. had never been in close touch with Hellas proper since the episode of the Athenian expedition to Sicily. Then the old struggle with Carthage had been renewed, which in the third century was merged in the struggle between Carthage and Rome. This tremendous contest was brought to a decisive issue in the second Punic War (218–201), which began at the moment when Eastern Hellas was split up between Macedon, Sparta, and the two leagues. Philip V of Macedon, unfortunately for himself, hoped to strengthen his own position by alliance with the Carthaginian Hannibal, which brought down upon him the wrath of Rome as soon as she felt herself free to extend her activities.

Greek States and Macedon

The Greek states were divided generally into those hostile to Macedon, and those which favoured her, and individually into parties which followed the same line. But the first result was that Philip was beaten by the Romans, who proceeded to declare the liberation of Greece from the Macedonian yoke (196). But though Rome abstained from assuming a formal sovereignty, it was obvious that her domination had, as a matter of fact, taken the place of that of Macedon, whose king had been made a dependent of the republic.

Rome had rewarded the states which favoured her at the expense of those which supported Macedon; but the one group considered their gains inadequate, while the other considered that they had been robbed. Consequently, as soon as Philip's successor, Perseus, sought to throw off the Roman domination he received moral support from many quarters, though no material aid. He was decisively crushed at

the battle of Pydna, in 168, and Macedon was partitioned into a group of republics. It was natural that Rome should assume a dictatorial tone towards the states whose conduct she felt justified in resenting, and that those states in their turn should resent her haughty attitude. Again the natural results followed—attempted defiance crushed by overwhelming force, and the pronouncement that since the Greeks persisted in misusing their liberty, they must lose it. The last hopeless effort for Greek independence expired with the siege and capture of Corinth, in 146, when Greece was swallowed up in the Roman Empire.

Greece and Rome

Greece fell, but in falling, in part at least, conquered the conqueror. The Greek spirit and the Roman spirit were poles apart; but if the Roman had in him something which the Greek lacked, he was nevertheless conscious that the Greek compelled his admiration by some quality in which he was himself deficient, and set himself painfully to the sincere flattery of imitation; an imitation not always discriminating, and not always successful. Roman literature and Roman art became palpably the product of effort to reproduce Greek literature and Greek art, seldom more than half understood.

The Roman formulated his canons from the Greek examples, often without grasping what was fundamental, and what was accidental, thereby creating the classicism by which he himself was hidebound; departing, however, entirely from the essential Romanticism of the Greek in the great days of Greece, when the most vigorous individuality had sought its own expression, and by its triumphant success made individuality thereafter afraid of itself. But if it was in the main, not the spirit of Greece, but the form in which it had clothed itself, that the Roman sought to assimilate, there was yet some infusion even of the spirit which may be felt in the work of the greatest of the Roman poets.

This sketch of the political history of the Hellenes shows how the conditions which fostered an extraordinary and unparalleled vitality in individual communities, actually prevented their fusion into a greater homogeneous political organization, so that they never shaped into a nation exercising an imperial sway over other peoples. The function of Hellenism was not, like that of Rome, to conquer and control the world, but to educate it, and to inspire its ideals.

A. D. INNES

From this time until the beginning of the 19th century, Greece was but a district under alien rule. By conquest it became part of the Roman empire, but except perhaps at Corinth few changes were made by the conquerors. For a time the cities were self-governing as before, subject only to the authority of the Roman governor in Macedonia.

Some of the Greeks assisted Mithradates in his struggle against Rome that began in 88 B.C., while Greece was a battleground in the civil strife in which Julius Caesar was the central figure. Under Augustus and the early emperors conditions were more settled, and this was the age in which Greek thought and culture mainly exercised its powerful influences upon Rome. The province of Achaëa was set up to include most of southern Greece, while steps were taken to form some bond of union between the cities. Hadrian did a good deal for the country in various ways. In the 3rd century Greece was invaded by the Goths, but the Romans drove them out. Later it suffered similarly from the Visigoths. Christianity made slow progress, for the cultured pagans of Athens were less susceptible to it than the northern barbarians.

Under the Eastern Empire

When the Roman empire was divided, Greece fell to the eastern or Byzantine portion and the language and influence of Greece were dominant at Constantinople. A succession of invaders entered the land and a number of Slavs settled therein, but on the whole the eastern emperors looked well to its defence. The dispute about the worship of images caused trouble and bloodshed. In the 10th century the Bulgarians invaded Greece, but they were severely beaten in 955. More momentous was the advent of the Normans from Sicily and of the Venetians.

In 1204 the Byzantine empire collapsed and Greece passed to the Latin empire of Romania. That lasted only until 1261, from which date until the arrival of the Turks the country was ruled by Frank and other foreign nobles, first drawn eastward by the Crusades. These rulers, called despots, divided between them most of the country, while the Venetians had a foothold on the coast and islands. None of the dynasties, however, succeeded in establishing themselves firmly, and in 150 years or so the emperor at Byzantium was once more master of Greece. He, however, fell before the Turks in 1453, and a few years after the fall

of Constantinople the sultan conquered almost the whole land.

By the Turk Greece was divided, apart from the islands, into six sanjaks. His rule was arbitrary and at times brutal, but not consistently oppressive. Greece was obviously affected by the series of wars between the sultan and Venice. By 1570 the former had made his mastery complete, but after Lepanto the tide began to turn, and in 1699 the Morea was surrendered to the republic, but it was reconquered in 1715. The rise of the Russian power was the next external event that affected the fortunes of Greece, and this led to freedom from Turkish rule.

The history of Modern Greece begins with the war of Independence, 1821-33, one of the overflowings of national sentiment caused by the French Revolution. It met with general sympathy in Europe. The insurgents were assisted by a British loan; and the transference of the chief naval and military commands to British volunteers, Lord Cochrane (afterwards earl of Dundonald) and Sir Richard Church, helped to bring the long and fluctuating contest to an end. But it was settled only by the intervention of the Great Powers, Britain, France, and Russia, which first by diplomacy and then by arms assisted the Greeks to establish independence.

The Bavarian prince Otto was invited to become king of the Hellenes, but his despotic methods and his employment of Bavarians only in government offices soon made him disliked. The Greek politicians, kept out of office, turned their energies to stirring up trouble; in 1843 the king was forced to grant a constitution and to dismiss his Bavarian advisers. But he neither grew in popularity nor was he able to secure good government for the country, which needed above all things a period of rest. Instead it was plunged into political struggles, in which the Great Powers took sides.

British Intervention

Twice British warships were sent to threaten Piræus, the port of Athens; the first time to enforce payment of interest on a loan arranged in London; the second time to support the doubtful claims to compensation put forward by a certain Don Pacifico, a Portuguese who called himself a British subject. Again, during the Crimean War, when Greek sympathies flowed towards Russia, foreign warships were sent into Greek waters. This so intensified

the unpopularity of the king that a few years later he was deposed, and the crown was offered to the duke of Edinburgh. But Britain had agreed with France and Russia that neither she nor they would put a prince upon the throne, so the Greeks had to look elsewhere. They chose the second son of Christian of Schleswig-Holstein (later Christian IX of Denmark), and this prince in 1863 became king as George I.

At first he was warmly welcomed, the more so because Britain took the opportunity to please the Greeks by restoring to them the Ionian Islands which had for a number of years been a British protectorate. But the strife of parties which has always hindered the progress of modern Greece became more and more violent. The king was drawn into it. He was obliged to dismiss his principal adviser, Count Sponneck, a Dane whom he had brought with him; and to agree to changes in the constitution which put the power of control into the hands of a single legislative chamber.

Financial Difficulties

There was little difference between the parties which, headed by Tricoupis and Delyannis, followed one another in and out of office for many years. Agitation against the Turks on account of their treatment of Macedonians and Cretans was carried out by a secret society, and in 1897 war broke out. The Greeks were the aggressors and suffered bitterly for their folly.

The Turkish troops were everywhere and at once victorious. The ill equipped and ill trained Greek army was defeated, and the government was obliged to beg the Great Powers to mediate and save Greece from annihilation. The one good result of the war was the liberation of Crete, which became autonomous under a Greek prince.

The only events which broke the monotony of political warfare for some time after this were the murder of Delyannis, 1905, and a revision of the constitution, 1911. But in 1912 came the Balkan War, in which Greece joined Serbia and Bulgaria against Turkey. The successes of her troops brought an addition of some 16,000 sq. m. to Greek territory. Further gains were made at the expense of Bulgaria, who in 1913 attacked her former allies, Greece and Serbia, owing to quarrels over the partition of the Turkish spoils.

The outbreak of the First Great War divided the Greek nation. Some hoped that Greece might be able to remain neutral. Others supported Venizelos and were for taking the side of Britain, France, and Russia. In the end the latter prevailed, and King Constantine lost his throne in 1917, the Powers which had guaranteed Greek independence demanding his expulsion from the country. He was succeeded by his second son Alexander, a young man of 24, who died in Oct., 1920.

Constantine's Second Abdication

Venizelos throughout the period 1917-20 was virtually dictator. Constantine was restored in Dec., 1920. The next year Greece attacked Turkey in Asia Minor. The defeat of her army in Aug., 1922, led to her loss of Smyrna and Eastern Thrace, acquired by her after the First Great War. Constantine, held responsible for this defeat by a section of the army, was forced to abdicate in Sept. He died some four months later. He was succeeded by his son George II who, however, was driven from the country at the end of 1923. In Jan., 1924, Venizelos was back as premier, but he resigned Feb. 4, through ill-health, and was succeeded by Kaphandaris. Admiral Condouriotis (*q.v.*) was regent, 1924.

A republic was proclaimed in March, 1924, Condouriotis being appointed president. In June, 1925, a revolution broke out in the Athens, Salonica, and Patras garrisons, when Pangalos, a republican general, seized power and became prime minister. Early in Jan., 1926, he proclaimed a dictatorship, and in April took over the presidency of the republic; but another revolution, headed by General Condylis, a remarkable man of peasant origin, ended the dictator's power in Aug. In 1928 Venizelos returned to Greece from retirement in Paris, becoming prime minister again until 1932. The outstanding achievement of this administration was the agreement with Turkey, Oct., 1930, which inaugurated friendly relations between Greece and her former adversary. Venizelos, succeeded by the Populist Tsaldaris, lost his popularity when he backed an unsuccessful rebellion by Gen. Plastiras, 1933. He retired once more to Paris, where he died 1936.

The people of old (southern) Greece remained predominantly monarchist, and Gen. Metaxas, an anti-Venezelist and a man of great ability, placed himself at the head

of a vigorous movement for the restoration of the king. Tsaldaris resigned, and Condylis, his minister of war, then formed a government, which brought back the king, Nov., 1935. General elections held in Jan., 1936, resulted in the formation of a government by Demerdjis, who died a month later. Metaxas, deputy prime minister and minister of war, assumed the premiership, suspended the constitution, and made himself dictator, Aug., 1936.

SECOND GREAT WAR. When the Second Great War broke out Greece remained neutral until on Oct. 28, 1940, the Italians, following an ultimatum summarily rejected by Metaxas, invaded Greece from Albania half an hour before the ultimatum expired. Winston Churchill, the British premier, immediately sent a message promising all the help in Britain's power. The Greeks not only repelled the invaders, but in turn advanced into Albania, taking more than 20,000 Italians prisoner. Metaxas, whose leadership had counted for much in this successful stand, died in Jan., 1941. His successor committed suicide less than three months later, and Tsouderos, a former governor of the bank of Greece, took up the premiership on April 21.

British Military Aid

The probability that Germany would come to the help of her Mediterranean partner led to conversations between Gen. Wavell, British *c.-in-c.* Middle East, and Gen. Papagos, Greek *c.-in-c.*, in Feb. at which the Greek commander, in view of the uncertainty of Yugoslav cooperation in case of attack, proposed to withdraw his troops from Macedonia, Thrace, and probably Albania (totalling 35 battalions), to the Aliakmon line, a short, naturally strong defensive line W. of Salonika.

CAMPAIGN OF 1941. The maximum British force that could be sent to Greece was part of the 2nd armoured div., the N.Z. div., the 6th and 7th Australian divs., and the Polish brigade. Their transport from Egypt would, it was estimated, take about 10 weeks. These were virtually all the troops in the Middle East fully equipped and fit for operations, and their dispatch meant leaving a very weak force in Cyrenaica where, however, the Italian armies had been so completely defeated that a counter attack from them could be ruled out at least for some time.

The Germans entered Bulgaria on March 1, and it was then found

that, apparently for political reasons, Papagos had not concentrated his troops as he had proposed, and that, therefore, there was every prospect of their being defeated in detail. The difficult nature of the country, the poor communications, and the severe climate in March and April added to the problems confronting the British forces under Gen. Sir H. Maitland Wilson whose dispatch to Greece began on March 5.

The German Invasion

The German invasion started on April 6. By that time the 1st armoured brigade group and the N.Z. div. had arrived complete in the forward area, and the 6th Australian div. was in process of arriving. The 12th and 20th Greek divs. were on the line which ran from the Aegean Sea E. of Mt. Olympus to Veria and Edessa, and thence N. to the Yugoslav frontier. This position had the weakness that, if the Yugoslavs were attacked and failed to hold the enemy, it could be outflanked from an easy valley that runs from Monastir to Kozani. A detachment placed in the last days of March at Amynteion to watch this gap was, after the collapse of Yugoslav resistance on April 8, reinforced.

The enemy attacked in the Amynteion area on the evening of April 10, and because the troops available were inadequate to hold the positions on which they stood, withdrawal was made to the Aliakmon line, running from Mt. Olympus along the Aliakmon river. During this withdrawal the Greek divs. disintegrated, not through lack of courage, but from lack of modern armament and the slowness and unwieldiness of their ox-drawn transport; and contact was lost with the Greek armies in Albania (Epirus) which could not now withdraw to take their agreed place in the Aliakmon line W. of Gen. Wilson's force. A further withdrawal therefore began, to the Thermopylae line, which could be held at least for a time by the Imperial forces alone.

The Germans followed rapidly, and on April 15 launched an attack on a combined N.Z. and Australian force in the Peneios Gorge. The pass was defended with spirit, and when on the 18th the Germans were masters of it, the main body of the Anzac corps had withdrawn successfully to Larissa. Mist and low cloud had so far prevented the enemy from using his air mastery effectively, but from Larissa onwards columns

Greece. The Swastika going up over the Acropolis after the German entry into Athens, April 27, 1941

on the road were attacked from the air without respite.

By the morning of April 20, the N.Z. div. occupied the Thermopylae line from the sea to the summit of the mountains, and the 6th Australian div. occupied the Brailos position covering the main road to Thebes and Athens. The 1st armoured brigade, which had lost most of its tanks through mechanical breakdown, was in reserve protecting the right and rear of the Anzac corps against a threat from Euboea. The disintegration of the Greek forces, however, made possible a German penetration on the extreme left of the line about Delphi.

Withdrawal of Forces

Clearly, little could be expected from the Greek forces in Albania, and that Greek resistance could not long continue. Piraeus, at which most of the British forces in Greece had landed, had become virtually unusable through bombing. Gen. Wavell cancelled the sailing of further British troops and arrived in Athens himself on April 19. The prime minister had committed suicide the day before, and the king, acting as head of his government, agreed that the evacuation of the British forces was essential.

On April 21 the Greek armies in the Epirus capitulated. The withdrawal from Thermopylae was covered by a brigade group of the N.Z. div., which inflicted severe losses in men and tanks on the enemy. Embarkation from open beaches began on the night of

April 24-25, and was completed on May 1. (Small groups of those left behind continued for months to reach Egypt in little boats.) The troops sent to Greece numbered approximately 57,660. Close on 43,000 were, thanks to the magnificent work of the R.N., re-embarked, but they had lost all guns, transport, and equipment other than personal equipment; 27,000 were landed in Crete (*q.v.*), the remainder taken to Egypt. German parachute troops cut the Corinth canal on April 26, and on the 27th the enemy entered Athens.

GERMAN OCCUPATION. When the Greek forces in Epirus capitulated, King George II with the crown prince and the government left Athens for Crete, whence, after a narrow escape from capture by German parachutists, he was taken off by a destroyer and landed in Egypt. In Sept. the Greek govt. was reconstituted in London where it stayed until March, 1943, when it moved to Cairo, remaining there until it returned to Greece in Oct., 1944. Throughout the German occupation of Greece, it represented Greek interests among the United Nations, and directed the raising of armed forces. Greek troops attached to the 8th army distinguished themselves in N. Africa at Alamein, and in Italy, particularly in the operations which culminated in the capture of Rimini Sept. 21, 1944.

In Greece itself the Germans immediately set up a quisling government whose attempts to

enlist support for the Nazi "new order" had no success; in town and country the people resisted their enemies. These included the Bulgars, who occupied W. Thrace and E. Macedonia, and did their best to Bulgarise them. Only 20,000 to 25,000 Greeks were drafted for work in Germany, and some of them were repatriated because of the defeatist propaganda they spread. Sabotage was widespread; in reprisal about 1,500 villages were burnt, rendering a million and a quarter homeless. Tobacco and currant harvests decreased to 11 p.c. and 34 p.c. respectively of pre-war production. A quarter of Greece's limited forests were destroyed, 90 p.c. of her large bridges and 50 p.c. of her smaller ones. Loss of life through guerrilla fighting, famine, executions, and deportation amounted to 480,000.

Guerrilla Activities

By the beginning of 1943, guerrilla activities had become widespread, but attempts to co-ordinate the various forces, whose total was estimated at 25,000 men, failed. They were divided into two politically hostile bodies, which fought one another as well as the enemy, even while their country was occupied. Their internecine strife continued after the Germans, threatened in the rear by the rapid Russian advance into the Balkans, withdrew in Sept.-Oct., 1944, and British and Greek regular forces from Italy, and then the exiled government from Cairo, arrived in Greece.

Greece. British statesmen took an active part in trying to settle the political crisis after the Greek liberation in 1944. Archbishop Damaskinos is here seen presiding over an historic conference, Dec. 28, 1944, with Winston Churchill and Anthony Eden on his right, and F.-M. Alexander on his left

AFTER LIBERATION. Distrust of the king, whose support of the Metaxas dictatorship had made him suspect among many Greeks who were not republicans, was a further complication. The British forces who had landed as friends and liberators becoming embroiled in these squabbles, Churchill and Eden flew to Greece, Dec., 1944, and called a conference of all parties, which agreed to ask the king to nominate as regent Archbishop Damaskinos, head of the Greek Church, a man who, by his courageous stand during the German occupation, had earned general confidence and respect. Under British pressure, the king, then in London, issued, Dec. 31, a proclamation making the desired appointment, and announcing his resolve not to return to Greece until invited. A general election, March 31, 1946 (boycotted by the Communist-directed E.A.M., and, to prevent intimidation of voters, observed by an Allied electoral mission of 240 teams), gave a victory to the Populist (royalist) party of 191 out of 317 seats; a plebiscite, Sept. 1, gave

68-96 p.c. of votes for the king, who returned to Greece on Sept. 27. He died April 1, 1947, and was succeeded by his brother Paul, who began his reign in a country still rent by civil war, still suffering distress as a result of the destruction of the years 1941-44 and the subsequent internal strife. For later events see N.V.

Greek Archipelago. Cluster of islands in the Aegean Sea (*q.v.*).

proper were the main centres of production; Ionia, Rhodes, and Melos had their own styles. Very soon subjects from myth and saga began to make their appearance, generally isolated scenes of combat or exploits of heroes.

Ionian art treats its material with greater breadth, expanding it so as to fill a frieze, and often disregards the unities of time and space; Doric art concentrates attention on a single motive and prefers the square field. Some remains of early metal work and painted sarcophagi from Ionia illustrate this, and the cedar-wood chest covered with carvings, which was dedicated at Olympia by the tyrant Cypselus (*q.v.*) of Corinth, seems to have combined both forms in one. The François vase, an Attic work of the early 6th century B.C., shows the handicraft of this time at its best. There is an artistic, as distinct from a literary, tradition in handling mythological subjects.

The Beginnings of Sculpture

To the same period belong the beginnings of Greek sculpture. This was at first religious; the earliest statues were those of the gods, the next those of their priests or worshippers, dedicated in temple-precincts. At first we have rude and shapeless images such as that of Apollo at Amyclae, a bronze column with head, hands, and feet attached; these rough-hewn pillars were called *Choana*. But the progress made by the Greek artist in representing the human form was very rapid. For some time he obeyed the law of frontality which prescribes that the figure shall be symmetrical about a straight vertical line, and when this limitation was overcome, he continued to represent the most typical aspect of his subject, or even to combine typical aspects of its several parts, so that we have a full-faced body with the legs of a runner in profile.*

The limits of strictly religious art were passed when athletes who won victories in the games were permitted to dedicate their statues. Hence came a powerful impulse to the study of the human form, and in due time to the reproduction of individual features, though true portrait sculpture begins at the earliest in the 5th century. Ancient writers tell of a mythical Daedalus as the founder of a school of sculptors; the names of many of his successors are historical, such as Archermus of Chios, Dipoenus and Scyllis of Crete, and Rhoeucus and Theodoros, the inventors of casting in bronze.

GREEK ART AND ARCHITECTURE

H. Stuart-Jones and F. J. Maclean

Information complementary to that contained in the two following articles will be found under the headings Athens; Acropolis; Apollo; Architecture; Art; Sculpture; Theatre; the biographies of the great sculptors, Apelles, Phidias, etc.; and the names of famous buildings, e.g. Erechtheum, Parthenon. See also Aegean Civilization; Crete; Mycenae; Troy, and plates facing pp. 3920-21.

Discoveries at Mycenae revealed an art which, had it been shown to be that of the Heroic Age of which Homer sang, belonged properly to the Greek race, and was the earliest expression of its genius. They proved, however, to be only the first stage in the process by which the civilization of the Aegean in prehistoric times was brought to light and a continuous archaeological record established, dating from the Neolithic age.

The Minoan Tradition

It became clear that Crete was in the earliest time the seat of a great power, doubtless the kingdom of Minos known to Greek tradition; and the palace of the rulers of Knossos was the centre from which its artistic influence was carried far and wide in the Eastern Mediterranean. Hence we now speak of Minoan rather than Mycenaean art, since the importance of Mycenae is secondary and contemporary with the later phases of the development in Crete. But it is very questionable whether the artists of this period were in any

sense Greeks; their pictographic script has not, it is true, been deciphered, but it seems unlikely that it was used to write the Greek tongue.

The art of the time produced masterpieces of decoration, and some remarkably naturalistic works such as the gold cups unearthed at Vaphio; but it lacks the sobriety and symmetry of true Greek art, and it seems best to suppose that Aegean civilization came to an end about 1000 B.C. owing to the invasion of waves of immigrants from the north, who founded the Greek race. The older art died out and left but doubtful traces in that which followed.

Early Greek Art

The earliest Greek art in the proper sense is represented for us almost entirely by pottery, at first adorned with geometrical patterns and a few rudely drawn figures, but later borrowing from Oriental models a wealth of plant and animal forms usually arranged in horizontal bands of decoration. Corinth and Chalcis in Greece

As in early handicraft, so in sculpture, we find an Ionic school working largely in the Aegean islands and known to us from works dedicated at Delos, but also active at Athens; and on the other hand a Dorian school which worked in the Peloponnese—where Sparta was then still an art-centre—and in the western colonies.

Sculpture soon became associated with religious architecture, the continuous frieze above the column of the Greek temple and the "metopes," or square slabs filling what had been empty spaces between the beam-ends of wooden buildings, gave golden opportunities for work in high or low relief; the triangular pediment presented a fresh problem, which the Greek was not slow to solve. In an early attempt made in Athens, Heracles is shown wrestling with Triton.

The material was a soft, calcareous tufa, which was covered by a thick layer of paint—red, blue and green. This work belongs to the 6th century, during which the Peisistratid tyrants made Athens a great art-centre, attracting from both Ionia and the Peloponnese, especially the former, the best talent of the time.

Athenian Vase Painting

Other foci of artistic development were the sanctuaries of Delphi and Olympia, which rulers, states and individuals from E. and W. filled with their offerings; and the advance towards technical mastery had made great strides even before the Persian wars (490–479 B.C.), which raised the national consciousness of the Greek to the most intense pitch, and was followed by the attainment, within a few decades, of the highest artistic perfection. In particular, the Athenian vase-painters showed a marvellous fertility of imagination, combined with great delicacy in line-drawing and skill in adapting their compositions to a curved surface. Euphronius, Duris and Hieron are the most famous, but many of the finest vases are unsigned.

The severity of the earlier works of this time, such as the bronze charioteer dedicated at Delphi by a Syracusan prince or the pediment of the temple of Aphaia at Aegina, soon gives way to the marvellous freedom of the discus-thrower of Myron. The so-called canon of Polyclitus represented the frame of the human athlete in its perfect type; and the sculptures of the Parthenon, though we cannot trace in them the hand of Pheidias himself, to whom was entrusted the general supervision of the decoration of the temple and the carving in gold and

ivory of the statue of Athena, of which a reduced copy was found at Athens, reveal both by design and execution a group of craftsmen of unsurpassed cunning.

Naturally much less is known of the painting of the same period in which Polygnotus was the most famous name; but we can perhaps form some idea of the style of his great frescoes of the fall of Troy and the under world, both at Delphi, from Athenian vase paintings. At Olympia, the great temple of Zeus, with its pediments, belongs to the earlier half of the 5th century; the statue of the god was the work of Pheidias, but we have no material for an adequate reconstruction of it.

Developments of the 4th Century

The great war which devastated Greece in the closing decades of the 5th century B.C., to some extent severed the intimate association of art with national life; it also affected the distribution of the national wealth, and led to a lowering of religious conceptions and of political standards. Thus in the 4th century we find in the finest works not so much an embodiment of ideals as a refinement of the artist's individual conception of beauty; moreover, the execution of the earlier period, masterly as it was, was surpassed by that of the great sculptors of the new time.

We possess an original by Praxiteles in the Hermes at Olympia in which the treatment of flesh and drapery, alike at once in its realism and its grace, is inimitable. We can only rely on copies for his more famous works—the Satyr and the Aphrodite of Knidos; his contemporary Scopas, who excelled in the rendering of passion, must be judged by the heads from the pediment designed by him for a temple at Tegea in Arcadia.

The athletic school of Sicily produced its master in Lysippus, of whose Apoxyomenos (an athlete scraping himself with a strigil) there is a copy in the Vatican which is more slender in its scheme of proportions than the Canon of Polyclitus. Lysippus was also a master of portrait sculpture, which now at length, in the hands of Silanion and others, attained individual realism (a fine example is the portrait of Demosthenes, by Polyuectus). He was commissioned to reproduce the features of Alexander the Great, which we recognize in many works, including the head of a marble statue found at Cyrene after the Italian occupation of Cyrenaica in 1912. Alexander also employed the greatest of Greek painters, Apelles, who, with his rival Proto-

genes, succeeded to the places occupied at the beginning of the 4th century by Zeuxis and Parrhasius. These are, however, no more than names to us. The use of colour in connexion with sculpture is illustrated by the magnificent series of sarcophagi discovered at Sidon, one of which represents Alexander in battle and the chase.

In the Hellenistic age which followed the death of Alexander, art was affected by the changed social and political conditions. The monarchies which arose from the ruins of Alexander's empire, and such communities, e.g. Rhodes, as enjoyed a measure of freedom under their protection, enlisted the services of the greater artists for the erection and adornment of their public monuments. The famous Colossus of Rhodes, which fulfilled the function of a lighthouse, was the work of Chares, a pupil of Lysippus. The Victory of Samothrace, a colossal statue of the goddess standing on the prow of a ship, which is now in the Louvre, commemorated a naval victory won by Demetrius Poliorcetes in 306 B.C. The Fortune of Antioch, an early example of the personifications popular in this period, is represented by a statuette in the Vatican; it was the work of Euty-chides of Sicily, another pupil of Lysippus.

Art in Pergamum

The kings of Pergamum were the chief patrons of art in the Hellenistic age. Their victories over the Gaulish invaders of the 3rd century B.C. were commemorated both by a series of life-sized statues and groups, some of which survive in originals and copies, the most famous being the Dying Gaul of the Capitoline Museum, Rome, and also by a number of smaller groups representing the combats of gods and giants, Athenians and Amazons, Athenians and Persians, and Pergamenes and Gauls, regarded as typical of the struggle between Greek and barbarian. The Apollo of the Belvedere, now in the Vatican, an antique copy of a bronze Greek original, assigned by some to the 4th century, perhaps rather commemorates the repulse of the Gauls from Delphi in 279 B.C.

Above all, the great altar erected on the Acropolis of Pergamum, probably by Eumenes II (197–159 B.C.) is decorated with a frieze in high relief depicting the battle of the gods and giants, in which a new art, distinguished by dramatic force and technical bravura, is brilliantly represented. A school of artists which flourished at Rhodes in the century preceding the Christian era has left us the

group of Laocoon and his sons, with its exaggerated pathos. From Tralles in Asia Minor came Apollonius and Tauriscus, the sculptors of the Farnese bull at Naples, a group which represents the punishment of Diore by Amphiion and Zethus. The scientific research of the time left its trace in the Borghese fighter of Agasias, an Ephesian sculptor, which is interesting as an example of minute anatomical study.

Decorative Arts

Artists also catered for the tastes of the wealthy class which sprang up in the capitals and other great cities of the new monarchies. Painting and mosaic were employed in the decoration of private houses, especially at Alexandria, and the discoveries of Rome and Pompeii enable us to form some idea of the results. Alexandria was the chief, but not the only, home of Toreutic, or the art of the chaser of gold and silver, of whose work Roman plate gives us the best impression. The terra-cotta statuettes and groups found in tombs, especially those of Tanagra in Boeotia, are works of great charm and delicacy.

The growth of private luxury was also responsible for the popularity of genre subjects in sculpture, of which the best example is the Boy and Goose by Boethus, for the loss of religious significance in the representations of divinities, as in the instance of the Medici Venus and the Aphrodite in the Bath of Doedalsas, and the hybrid of painting and sculpture seen in the pictorial reliefs used in wall-decoration. Lastly, after the Roman conquest, we find a recurrence to early models in the Neo-Attic school of archaizing artists.

ARCHITECTURE. Before the 7th century B.C. the architecture of the peoples inhabiting the Greek peninsula and parts of the Asia Minor coast was too deeply impregnated with Persian, Egyptian, and Assyrian elements to be regarded as a distinctive style. The discoveries at Tiryns (Troy), Cnossus, Mycenae, and other places have revealed the existence of an elaborate architecture four or five centuries earlier than the beginnings of the real Greek civilization; but those buildings had little or nothing in common with the form or spirit of what is now understood by Greek architecture. It is only after the lapse of 400 years that the national archi-

tecture begins to emerge. Even then, its massiveness and bold proportions are suggestive of Egypt rather than Greece, and it is not until the 5th century B.C. that this massiveness is refined into the combined stability and grace of Doric building.

The main principle governing Greek building was ordered symmetry combined with picturesqueness of effect. Individually, the Greek temple, fully developed, is an oblong structure enclosed by a row of columns. In its earliest form it was a small square apartment in which the image of a particular deity was placed, with a porch formed of two flanking piers, and two columns between them, on its front. The next step was to separate the apartment, or cella, from its porch by a screen with a doorway. The porch was then further developed by the addition of an outside screen of four columns, which number was subsequently increased to six, so as to enable the two at the extremities to outflank the actual front and form a starting-point for a range of columns carried round the remainder of the building. Thus was evolved the hexastyle temple, which is the typical form of the mature Greek temple enclosed in its envelope of columns. The Parthenon itself is exceptional in that it had a hexastyle portico at each end of the cella, and, outside, a further portico which was octastyle (eight-columned); but the hexastyle type is the prevailing one.

Grouping of Buildings

The building consisted of a single storey with a low-pitched roof ending in a pediment. Height was not aimed at, nor is there any great variety of outline. On the other hand, these buildings were grouped so as to secure the maximum effect of picturesqueness. No two of those which once crowned the Acropolis were placed in line with each other. They were set at various angles, conforming to the rise and fall of the ground, from which they appeared, spontaneously and naturally, to grow.

Moreover, the Greek temple, regularly outlined, exquisitely though not mathematically proportioned as it was, did not rely wholly on its form. The architectural ornament of its exterior was decked out in bright primary colours, sometimes gilded; marble was often covered with coloured stucco, and sculpture was painted, until the whole must have sparkled with points of colour in the sun.

Greek architecture was dominated at successive periods by three Orders, of which the first

and best beloved was the Doric. In Athens, one of the best preserved buildings of this Order is the so-called Temple of Theseus. Excavations carried out at Olympia in 1876 laid bare the foundations and plan of a great Doric temple of Zeus, and of others, while many similar structures have been unearthed in Crete and the islands of the Archipelago, the western coast of Asia Minor, and in Sicily and the toe of Italy, where Greek colonies existed.

The evolution of the Ionic Order is less easy to trace than the Doric. The volute capitals, which are its distinguishing feature, appear to have originated in Asia, and there are no known examples in Greece itself earlier than the 5th century. The Erechtheum, on the Acropolis, the greatest of all Ionic temples, was built about 420 B.C. In Asia Minor, however, Ionic temples existed before the Persian Wars.

Just as the use of the Doric Order reached its climax of splendour a few years after the building of the Parthenon (447 B.C.), so the maturity of the Ionic followed the Erechtheum within the space of a few years, as if, in each case, the production of a great example was needed to give the impetus to the development of the style. Doric had satisfied the early aspirations of the Greek builders to comeliness of form and fine proportions, but denied them the greater freedom of purely architectural ornament which they desired.

The Ionic Order gave them a new opportunity. The Ionic volute, in its original form, had a two-sided capital. This was found unsatisfactory at the corners of buildings where the capitals had to show their ends, while those next to them showed their broadsides and volutes. A new corner capital was accordingly invented which, by a slight modification of the volutes, was transformed into a four-sided capital, thus enabling the continuity in the whole line of capitals on a front to be preserved. This order also admitted more than one treatment of the bases of columns, and variety in the treatment of the entablature.

The Corinthian Order

The Corinthian Order, the latest of the three employed by the Greeks, was not introduced much earlier than the age of Alexander the Great. Its foliated capital appears to have been borrowed from the bell-shaped capital of the ancient Egyptians, though the acanthus leaf ornament with which the Greeks covered it was practically their own device. A little circular

building at Athens, known as the Choragic Monument of Lysicrates, is accredited as the best example of this order on Grecian soil; it was erected about 334 B.C. But the style was never fully developed in Greece, and its manifestations are chiefly found in the architecture of the decadence; it is rather a feature of Roman architecture than of Greek.

Of Greek municipal buildings very few traces remain, but in the time of Pericles (5th century) the Agora, or market place, of Athens had its porticoes and colonnades enriched with painting and sculpture in a manner befitting the great industrial centre of the city. Domestic architecture retained the Oriental type, squat and bare on the outside, with roofs sloping to the courtyard, presenting no features of architectural interest. The Greeks were not tomb-builders.

The theatres were built on a scale surpassing that of all other public buildings, both in Greece itself and in Asia Minor; the theatre at Dionysus was no less than 443 ft. in diameter; but the proscenium of these great masses of masonry were the only points treated architecturally, and none of them has survived.

Bibliography. Greek Architecture, A. Marquand, 1909; Greek Architecture, E. A. Browne, 1909; Die Baukunst der Griechen, J. Durm, 3rd ed. 1910; Hellenic Architecture, E. Bell, 1920; The Architecture of Ancient Greece, Anderson, Spiers, and Dunsmoor, 1927.

Greek Church. Name given to the Eastern or Oriental Church, the full title of which is The Holy Orthodox Catholic Oriental Church. The name Greek is given to this Church because it was Greek in origin, and most of its ecclesiastical liturgies and literature were composed in that language. The Greek Church is today the third largest section of Christendom, having some 130,000,000 members as against 230,000,000 Roman Catholics and 140,000,000 Protestants. By far the greatest number of its members belong to Russia, the remainder being scattered about Turkey, Greece, Yugoslavia, Rumania, Bulgaria, Egypt, Palestine, and Cyprus.

In primitive times the Eastern and Western parts of Christendom formed a single church, and it was only gradually that the separation took place. Many causes contributed to this result. When Constantine transferred the capi-

tal of the empire from Rome to Constantinople, it was inevitable that the Roman empire would split into two divisions, and that the political rivalry between these two divisions would be reflected in the Church.

It soon also became clear that the genius of the East differed from that of the West. The East was more interested in the speculative problems of theology, the West in form and organization. The spirit of the East finds its best expression in the writings of Origen and the Alexandrian fathers; the spirit of the West in those of Augustine. To the East we owe the metaphysical side of Christian theology, especially in Christology; to the West the doctrines of sin, grace, and predestination. For some centuries the two Churches gradually drifted apart, but it was not until the 9th century that the final rupture took place. The actual occasion for the division was a controversy upon the Filioque clause in the Nicene creed.

Points of Difference

In addition to the theological difference, there were several outstanding points upon which the two Churches diverged: (1) the Eastern Church maintained the absolute equality of the different patriarchates and refused to acknowledge the supremacy of the pope of Rome; (2) the Eastern Church refused to adopt the rule of celibacy for the mass of its clergy, and allowed all except the bishops and monks to marry; (3) the Eastern Church always maintained communion "in both kinds," and refused to consent to the Roman practice of withholding the cup from the laity; (4) it also insisted on "trine immersion" in baptism; (5) it allowed the use of the vernacular in its liturgies and public worship; (6) the Eastern Church does not accept the Apostles' or the Athanasian creed, both of which are of Western origin; but regards the Nicene creed without the Filioque clause as the basis of its faith.

As a result of its belief in the equality of the patriarchates the different national sections of the Eastern Church maintain a considerable amount of independence. The orthodox Church of Russia was formerly subject to the patriarch of Constantinople, but as it grew in importance and numbers a separate patriarchate was established at Moscow in 1582, and in 1721 a holy synod was

established at St. Petersburg whose jurisdiction extended across two continents. The national Church of Greece also secured its independence in 1852, and has a synod and archbishop of its own. Serbia (Yugoslavia), Rumania, Poland, Bulgaria, and Albania have their own synods.

Various attempts have been made at different times to bring about a reunion between the Eastern Church and the Churches of the West. At the councils of Lyons, 1274, and of Ferrara, 1439, fruitless efforts were initiated to heal the breach. The papacy has always presented an insurmountable barrier. Overtures have also been made by the Lutheran Church, but the difficulties have always proved intractable.

Special friendly relations exist between the Orthodox and Anglican Churches. At the invitation of the archbishop of Canterbury, the oecumenical patriarch sent delegations to conferences at Lambeth to discuss doctrinal questions. A joint commission of Orthodox and Anglican divines set up at Lambeth, 1931, reached agreement on some points, and, though it failed to achieve unity, proposed that the quest should be continued.

Germanos, Metropolitan of Thyateira, Exarch. of W. and Central Europe

Greek Fire. Inflammable composition used by the Byzantine Greeks for defensive warfare. According to many accounts it was inextinguishable and was able to burn under water. Its invention is ascribed to Callinicus of Heliopolis in A.D. 668. The composition of Greek fire is a matter of uncertainty. Aeneas Tacticus gives it as a mixture of sulphur, pitch, charcoal, incense, and tow, while Vegetius adds naphtha.

It was used against the enemy in various forms, the simplest being a tube packed full of the composition and thrown like the modern grenade. It was often blown through copper tubes, fixed in the prow of the vessel. There is very little doubt that gunpowder, or some composition very like it, was also used to hurl missiles of Greek fire composition which exploded on impact.

The secret of Greek fire was well kept, and the terror it inspired, apart from its devastating effects, prevented the capture of Constantinople for many centuries. The use of various forms of Greek fire was continued till the 14th century when gunpowder took its place. See Explosives; Flame Weapon.

GREEK LANGUAGE AND LITERATURE

J. T. Phillimore, LL.D., Prof. of Humanity, Glasgow, 1906-26

This article is supplemented by articles on the Greek writers, e.g. *Hesiod and Homer*; the dramatists, e.g. *Aristophanes, Euripides, and Sophocles*; *Thucydides*, and other historians. See *Acting*; *Drama*; *Theatre*; also *Alphabet*

Greek is a member of the Indo-European family of languages. The view that there existed a special affinity between Greek and the Italic languages, due to an original Greco-Italian language, is no longer held. The common primitive language of the Greek stocks is unknown; the Homeric poems, the earliest existing record, exhibit forms belonging to various times and different idioms. According to the ancient Greeks themselves, Greek once contained three (four) distinct dialects—Doric, Aeolic, (Attic) Ionic, named after Dorus, Aeolus, and Ion, the three legendary ancestors of the Hellenic race.

Modern philologists are content with two main divisions: Ionic and non-Ionic, the former including the language of Homer, the new-Ionic of Herodotus, and Attic (Athens), the latter Doric (Sparta, Corinth), Aeolic (Boeotia), and Achaean (northern Greece). At the end of the 6th century B.C. a dialect of the Ionic group, that of Athens, whose political, social, and industrial superiority had raised her to the position of the metropolis of Hellas, asserted and maintained its supremacy over the rest.

The history of the Greek language may be roughly divided into the following periods: Attic (500-300 B.C.); Hellenistic (300 B.C.-A.D. 600); Byzantine (600-1453); modern (1453 to the present day). After the subjection of Greece to the rule of Macedonia, Attic became the popular language at the Macedonian court. The conquests of Alexander in Egypt and the East, the substitution of Alexandria for Athens as the centre of learning and civilization, and the foundation of new Hellenic communities, led to its adoption as the general means of communication.

The result was the formation of a dialect called Hellenistic or Koine, universal or common Greek, as distinguished from the pure Attic. The term Hellenistic was formerly limited to the language of Greek-speaking foreigners, especially Jews, and was used with special reference to biblical Greek, but is now generally understood to mean the language spoken from the time of Alexander the Great to the establishment of the Byzantine or Eastern empire. Many specimens, in colloquial style but of no particular literary interest, have been found in Egypt. The incorporation

of Greece in the Roman Empire did not lead to the absorption of Greek by Latin; in fact, as Horace says, "the conquered took captive the conqueror." Many Latin words, however, especially official, were introduced. The military character of Roman rule checked literary initiative, and left scope for the development of the colloquial idiom.

The signs " " represent the hard (as in *hat*) and smooth breathings, the latter merely denoting a catch in the breath. Neither has any value in modern Greek. Three older letters, Ϝ, ϝ, Ϟ, the digamma, having the sound of v or w; Ϝ, the hard k; and Ϟ representing s, were dropped as being of no further use, although they were retained as numerals.

Greek Alphabet as finally adopted in 403 B.C.

The conversion of Rome to Christianity and the removal of the capital to Byzantium (Constantinople) had far-reaching effects. The classical spirit gave way to new ideas; during this period the name Greeks, as savouring of paganism, was replaced by Romæi (Romans). But the language itself was saved by the church; the fathers studied it and wrote in it, and in fact all written compositions were modelled on classical Attic. The efforts of the

Comneni (1050-1200) to revive the classical language have their parallel in those of the purists of modern Greece. The subjection of the country by the Turks had but little effect. It was chiefly seen in words relating to food and dress, and terms of abuse.

Similarly, French (chiefly referable to the Frankish empire at Constantinople, 1204) and Italian (owing to commerce with Venice) contributed to the vocabulary. But with all this the modern language cannot be called a mixed language; it is the natural analytical development of Hellenistic, a direct survival of classical Attic, though impoverished, corrupted, and modernised.

Ancient Greek was one of the most highly inflected languages of the Indo-European group. Its euphonic vowel system, the softness of its consonantal combinations, the richness of the inflexional forms, especially in the verb, its adaptability to the formation of compounds, rendered it highly suitable for rendering abstruse and scientific terms. A glance at any technical work, or indeed at the columns of a newspaper, will show how much English is indebted in this connexion to the language of ancient Greece; e.g. aeroplane, gramophone, cinematograph, telegram, telephone.

LITERATURE. The temporal range of Greek literature is enormously long. No fewer than 2,300 years divide Homer from the Turkish capture of Constantinople; and yet Homer is evidently the mature product of a high culture which had generations of primitive poetry behind it; and the Byzantine prolongation of the literature was still alive in 1453. Though not for all this time giving form to the highest and largest achievements of the human mind, Greece never, even in her decline, fell below the capacity to furnish at least an articulate chronicle of events.

Such useful longevity is only possible in languages which overflow racial and national limits, lending themselves to relays of peoples for their vehicle of thought and, thereby, part of their civilization; it is purchased at the sacrifice of idiomatic refinement. So the aesthetic beauty of the literature certainly declines as from the time when Alexander's conquests hybridised Greece. Indeed, it has been said that, whereas Greek prior to that date is unique, thereafter it became merely a literature like another. But it retained its workaday faculty of expressiveness, and was able to expand enough, after

many foreign intakes, to accommodate the quite new mind of Christianity.

A literary language is formed by one of a number of dialects establishing itself as supreme over competitors. The most expressive wins, but the power of expression is only then put to the proof when men of genius arise to make the inspiring demand upon its possibilities. As Latin among the ancient, as Tuscan among the medieval Italian dialects, so Ionic took the lead among the Greek, because Homer was an Ionian. But the great formative authors—a Dante or a Homer—borrow freely from other dialects; and the language, which eventually establishes itself as central, as the mother tongue, prevails by absorption as well as by exclusion. Both these ways of selection belong to its vigour. The language of Homer's *Iliad* and *Odyssey*, as well as that of Hesiod's *Works and Days*, has a strain of Aeolic in it.

Ionic and Attic

Ionic, once hallmarked by Homer, was further assured of primacy by Archilochus (7th century B.C.), a writer whom ancient criticism regularly esteemed as next only to him in greatness. And through the intermediate stage of Old Attic, Ionic emerges into the eventual Attic which is in perfection during the period between Pericles and Alexander. Thanks to the genius of Pindar, Doric maintains itself in Lyric during the 5th century; but after that time the mediums for composition are Attic, for prose; and for poetry, an artificial decorative diction.

Attic is the most Greek of Greek, and much that is commonly called Greek is distinctively Attic. The greatest legacy which Attic literature bequeathed to the world was not the masterpieces of beauty, crowded thick into two intense centuries (from Aeschylus to Menander is only three lifetimes), but language perfected as a reasoning instrument. The essence of Attic is that art and science (which in a romantic view are enemies) here are sisters: beauty and truth, two names for one ideal; writing, just the best of talk immortalised, having shed the triviality, but kept the ease. Attic may be said to culminate in Plato.

But the qualities to which Attic alone gave an intellectual determination are not absent from the literature of the other dialects. Sappho, whose reputation would probably suffer if her complete works were recovered, Alcaeus and Alcman all have the sharpness of touch which goes with high sensibility. The beauty of good Greek

is naked beauty, a grace of speech like the grace of proportion in a human body. These talents are there, but only devoted to the concerns of passion and of fancy; Athens applied them to discovery and reasoning.

The Greeks were unrivalled in inventiveness; they left no literary form undiscovered, if we except such an essentially informal composition as the Latin *Satura*, which had no unity about it but the author's personality. Yet even here the Roman claim of originality is doubtful. Forms have developed and shifted; what existed only in miniature for them has been executed on a great scale by moderns (e.g. the psychological narrative or novel of character). But it is almost literally true to say that one cannot point to any kind of modern book from which it would not be possible to ascend by a legitimate strain of pedigree to a Greek ancestry. Thus the literature of the ancient Greeks is the perfect field in which to study the curious laws (sketched by Brunetière and Ouyré) of the development of forms in literature.

We find certain forms corresponding to certain political epochs. Wares must have a market. The proper audience must exist. Homeric epic presupposes an aristocracy in whom the tradition of heroic chivalry and patriarchal polity still survives, at an interval sufficient to suffuse historical outlines with legend. Drama requires much intensity of city life for its atmosphere; it results from an increasing pressure from prose, i.e. poetry modifies itself into this form in order to keep a hold on the strictly intellectual purposes which prose expressly exists for—to prove and to persuade. For tragedy is poetical casuistry.

Athenian Comedy

The development of oratory belongs, of course, to democracy, a condition when men need to go armed in tongue and wit for their safety. The New Comedy of Manners is the entertainment of a cultivated bourgeoisie, living securely and serenely in a homogeneous society: the product of an Athens which has retired from being a great state. Greek genius never invented a more catholic form: it could be acclimatised anywhere.

Just when the literature of independence had evolved its complete round of manifestations, Macedonian imperialism provided the royal courts of Seleucia, Pergamum, and (pre-eminently) Alexandria, to foster all that range of productions for which democracy

has no use: the Callimachean and Theocritean schools of verse, the methodic curiosities of science, and the patient pieties of disinterested inquiry, to which mankind owes most of its knowledge of the past.

At every stage in a history which is motley with local diversities (Hellas, though small in area, having many centres or compartments) and violently accented with revolution (for they were a morally unstable people), the Greek genius rose to the challenge of creating the literary monument proper to that occasion. As their political philosophy traced a necessary cycle of politics from monarchy through aristocracy—plutocracy—democracy, to autocracy, so did they actually exemplify the normal successions of literature.

The Transformation of Homer

The forms continue duly to ramify and recombine themselves till every spark of vitality was worked out, e.g. when epic becomes impossible (because with increasing refinement of detail, no man's imagination can execute the line of beauty on the colossal scale), every element of epic yet persists, but transformed. The emotion of a Homeric battlepiece now vents itself in a chorus or a rhesus of tragedy, i.e. the stock is continued by a cross with lyric in that case, and rhetoric in this. Similarly, the Homeric *Aristeia* takes new life as the Epinikian ode. Selected out of the general fabric of tradition, those stories in which the law of destiny and retribution is written in letters of blood and fire, are now enhanced to their full significance; and what has been a few lines of detail in Homer becomes for Aeschylus the Orestean trilogy.

Here was a certain peculiar quality of events when a super-human power or scheme or law cuts into the quick of human affairs, to stultify pride; it was latent in the poetical mass. Greek genius elicits it, gives it full relief, appropriates the Dionysiac mummeries as pulpit or stage to manifest it, and names it once for all *tragic*. The same principle may be traced in other successions; of the hymn, older than Homer, and now too exhausted to tempt ambition any more, there yet survives something able by alliance with epinikian and rhetoric, to give birth first to the patriotic rhetoric of Herodotus' *Chronicles*, and later to Isocrates' *Panegyric*.

Tragedy itself has worked out its possibilities with Euripides, but it died only to come to life again in New comedy. Even the peculiar, inimitable Attic product, the Old comedy, left descendants in satire

and lampoon. With the Greeks no mood was ever at a loss for means of expression. The typical experience of Greece has at least taught us a few principles; such as, that great lyric and great oratory do not belong to the same age (since they are alternative modes); and that in times of great scientific discovery poetry will be mainly decorative.

The Growth of Prose

What marks the definite triumph of the Ionian in the competition for intellectual headship and spokesmanship of Greece, is the institution of prose. Poetry had attained to a very high range of facility, and had successfully discharged the functions of pleading and arguing besides its peculiar birthright of expressing mood, impulse, and the pride of life, while as yet nobody ventured the idea that language could be artistically beautiful and yet released from metre; release from a discipline or a constraint is how the Greek conceived this momentous revolution, the development of prose.

The discoverers of the Iambic had given to versified thought the lightest, easiest, most unaffected uniform that it could wear until the stern convention of artistic dignity was broken. But there came a moment when thought rebelled. It was as though some Chinese decree which ordained dancing as the only ceremonial mode of progression, were abrogated in favour of walking. The motive was the scientific curiosity which characterises the Ionian mind: it was Ionian philosophers and historians who made a new intellectual instrument out of unmetrical language, a medium hitherto reserved at best for annals, registers, etc., which might form the materials of history, and for the informal sayings and conversations of sages who professed no systematic theory.

Prose does not appear until the 6th century B.C., a round hundred years after Archilochus; and it does not impose itself at once as necessary in philosophy. Xenophanes (born c. 580), and long after him, Parmenides (c. 520) and Empedocles (c. 484), wrote in verse. But all the historians, from Cadmus and Pherecydes onward, used the new medium.

During the greatest period (the 5th century B.C.), as is usual at high points of civilization, we find Greek poetry and prose closely approximating. The reconciling force was rhetoric, i.e. the study of style. The systematic analysis of language was begun in Sicily by Corax and Teisias; but the first great masters

of self-conscious prose are Gorgias, Thrasymachus, Antiphon, and the other Sophists. They developed the effectiveness of language for argument and appeal by principles which are of fundamental validity. Earliest professors of dialectic and literature, under their influence the dividing line between prose and verse was narrowed down to actual metre; prose even assumed the emotional rhythm; and verse (dramatic) was refined away from the pomp of Aeschylus to the discreet pliancy of Sophocles; and this approximation continued as long and in so far as poetry continued to be a form of action at all, i.e. concerned with proving or persuading. A great prose writer like Thucydides has a poetical imagination; a great poet like Euripides has a scientific intellect.

But a century later and the two diverge again: poetry, now made wholly to please, "dresses up" without regard to common usage. Prose, devoted to science, in the hands of Aristotle's school, becomes almost as exact and dispassionate an instrument as algebra. Indeed, there is no modern science which might not conveniently use Greek as a language, adequate to all its requirements in facility and accuracy. From the 4th century B.C. onward prose prevails: no books that deeply changed anybody's mind were written in verse henceforth.

The Koiné Dialektos

But after the loss of Athenian independence there is both a general decline in creative power and also a disestablishment of Attic from its position of dominance. The new capitals form new local centres, of which Alexandria is the chief. To correct this artistic decentralization, natural necessity evoked a new common language, the *Koiné Dialektos*, a federative language, as though English, American, and Pidgin-English were to coalesce nowadays.

It was cheap Greek, preserving somewhat of the readiness and frugality of Attic as an instrument, but more or less discoloured by contact with non-Hellenic on the fringes of the Mediterranean world; Greek written by and for Jews, Egyptians, Syrians, Italians, etc. Undistinguished rather than degraded, it offered the prose-artist no adequate means of refined craftsmanship. It was a medium out of which hardly anything but religious inspiration could make style.

Consequently, though serious writers, such as Polybius, Plutarch, Marcus Aurelius, used this ordinary Greek as it came to their

hand, Latinisms, barbarisms, neologisms, and all, without nicety, and never found themselves cramped for expression, more conscious stylists began as early as the 1st century A.D. to write a literary Greek, studiously learned from classical models, for their ornamental purposes. There were several waves of such Atticism, conscious renaissances of an obsolete fashion worked by academic aristocracies; the most famous is that to which Dion of Prusa (c. A.D. 40-117), Lucian (c. A.D. 125-185), a Syrian, and the Philostrati (c. A.D. 150-250) belong. The Atticist renaissances, and likewise all the poetry produced after the downfall of Athenian liberty, addressed themselves to learned coteries, not to the general average of an intelligent bourgeoisie as before.

Literature, it has been said, became now a chamber concert for virtuosos. Thus there is a regular barrier between, on the one hand, the poetry of Callimachus, Euphorion, the Anthology Little Masters, or the prose of Lucian and Alciphron; and on the other, the New Testament (on its literary side) and the popular propagandism of such sects as Cynicism.

In the Greek Romances we have a singular phenomenon: an essentially un-Attic, only half-Hellenic thing, neglected all through the classical period, and finally taken up into polite literature in the period of Atticist renaissance. These stories, coming so late as they did, and so evidently creatures begotten in senility, have yet exercised a far greater influence on later literatures than any other product of the Greek genius after Plutarch. The poem of Nonnus (*Dionysiaca* in 48 books), produced more than 1,200 years after Homer in the Homeric convention of diction, is an extraordinary literary fact. Here, far down the centuries, was a Syrian in Egypt, imitating an epic which is despised only because the past brilliance of Greece obscures it.

Procopius and S. Romanos

A sort of final spasm takes place in the epoch of Justinian when Procopius in history, and Palladas in epigram, show themselves competent still to employ intelligently the literary machineries of 1,000 years earlier; and at the same period the Eastern Church astonishes us by breaking out into a Christian lyricism. S. Romanos (b. c. A.D. 500) is an original poet, 1,000 years after Pindar; and from the fountain which he struck out, a stream runs far into the Middle Ages, and by devious channels eventually finds its way

1 Archaic amphora, or two handled storage jar
2 Hydria, or water jar 3 Kylix, or wine cup
4 Amphora, signed by Exekias 5 Krater, or wine
mixer. In black-figure vases the figures were drawn
with a dense lustrous varnish, varying from black to

olive-green according to the degree of firing, on fine clay
of a rich orange-red colour, white and purple were added
for accessories. In red-figure vases, which succeeded
them, the figures were left in the ground colour and
were thrown up by the black varnish background.

GREEK ART: ATTIC WARES OF THE 6TH TO THE 5TH CENTURIES B.C.

British Museum

Arms and armour: shield (front and side) and spears, sword and scabbard, and, right, a pair of greaves

Domestic utensils: a basket, standard and hanging lamps, tripod table, and, above, a handled patera for libations

Pottery vessels: five amphorae (two handed vases); top, left, a wine-jug, two hand-lamps, and, below each hand-lamp, a stemmed drinking cup

Musical instruments: syrinx or pipes, lyres and citharae, crotalon or castanets, tympanum or tambourine, and tibiae or flutes

Fine vases: amphora embellished with graceful Bacch in thians, entwined swan headed handles and vine-wreathed neck, and other water-jugs and wine-jugs painted with bulls' heads, human figures, and conventional designs

GREEK ART: BEAUTY OF DESIGN STILL UNSURPASSED APPLIED TO ARTICLES IN COMMON USE

into the West, where once more the traditional fertilising power of Greek influence on Latin minds is exemplified.

Symonds, 1893, repr. 1920; *Paideia*: Greek Culture, W. Jaeger, 3 vols., 1939-45.

Greek Law. Term generally applied in a restricted sense to the judicial procedure of the Greek states, virtually to that of Athens, the only city, with the exception of Gortyna (*q.v.*) in Crete, of which a detailed account exists.

At Athens there were various officials who exercised different functions in the settlement of civil and criminal cases. Thus, of the nine archons, the eponymus had the supervision of family disputes, the basileus of religious, especially murder questions, the polemarchus of disputes between resident aliens and foreigners. The court of Areopagus or the 51 *ep'etai*, who sat in different courts according to the nature of the case, tried cases of wilful murder, homicide, and arson.

The Forty, four to each tribe, resembled the English magistrates in petty sessions. They went round the demes, settling unimportant private cases in which the sum involved was less than 10 drachmae (about 8s. 6d.). Otherwise, the matter was handed on by them to one of the *diastetai* or arbitrators, who formed a sort of court of first instance. If his decision was rejected, he impounded and sealed up all documents and evidence to be reproduced at the regular trial before the *heliastai* or dicasts, the equivalents of the modern jury, by whom most cases, both civil and criminal, were tried in later times. The dicastai were 6,000 in number, 600 from each tribe, and had to be over 30 years of age. The actual number of jurymen, chosen by lot, varied from 201 to 2,501, the odd figure being obviously intended to prevent the number of votes from being equal.

Actions were distinguished as public (*graphē*) or private (*dikē*), although they frequently ran into one another, *dikē* being used to include both. When the state was directly or indirectly affected, this constituted ground for a public

action. Such an action could be brought by any full citizen, except in murder cases, where the nearest relatives were obliged to prosecute, but if he failed to secure one-fifth of the votes, he was fined 1,000 drachmae (about £40) and sometimes in civil cases he had to pay the defendant one-sixth of his claim. Private suits were brought by the person directly affected.

The process went through three stages. The plaintiff summoned the defendant to appear on a certain day before the magistrate who was to preside. The plaintiff handed a written statement of the charge and of the declarations of the witnesses to the magistrate, who decided whether there was a case. Both parties deposited fees (*prytaneia*), which went to the successful litigant. If the defendant failed to appear, judgement went against him by default.

The next step was the preliminary examination (*anakrīsis*). At this the defendant could put in a counter-claim or a plea that, even if the charge made were true, there was some informality which relieved him of the obligation to meet the charge directly. If no such plea were put forward or were rejected by the magistrate, the case was ordered to proceed.

The dicasts, chosen by lot by the officials called *thesmothetai*, assembled in their special court, the Heliastai, the same magistrate presiding. Both plaintiff and defendant delivered speeches on their own behalf, but they were allowed to have advocates to assist them, and their speeches were often written by persons who made a special business of it. The length of time allowed for each speech was measured by the clepsydra or water-clock. The verdict was given by ballot, bronze voting tablets being used, whole for acquittal, pierced in the centre for condemnation. There was no appeal from the verdict, but a new trial could be demanded if it transpired that a witness had committed perjury.

Penalties consisted of capital punishment, inflicted by hurling the condemned into a deep pit near Athens, or by administering hemlock to him in prison; banishment; *atimia* or loss of the privileges of citizenship; confiscation of property; and fines. The execution of the sentence was carried out by various officials, that of death by a body called the Eleven.

Such a method of legal procedure was highly unsatisfactory. The dicasts had no judge's sum-

ming up to influence their verdict; they were not responsible like the regular magistrates, who had to give an account (*euthyna*) of their term of office; all kinds of appeals *ad misericordiam* were made by the litigants, such as bringing in their wives and children dressed in rags. The emoluments, however, appealed to the ordinary citizen, who was able to live on them without doing any other work.

Greek Letter Society. Name given to the secret fraternity of students found in most American colleges and universities. It takes its name from the initials of the Greek words adopted as a motto, and these, with their "grips" and rituals, are the only secrets of these societies. There are more than sixty, each with a chapter of from 20 to 30 members in many different institutions. The total membership of a Greek letter society is sometimes as high as 40,000. The richer chapters have fraternity houses, in which the members live.

Fraternities have been condemned as undemocratic and encouraging cliques and extravagance, laws against them having been actually passed in certain states; but their numbers and property make them important.

The oldest and most famous Greek letter society, Phi Beta Kappa (initials of *philosophia biou kubernētes*, philosophy the guide of life), was founded in 1776 at the College of William and Mary, Williamsburg, Virginia. Suspended in 1781 through the successive occupation of Williamsburg by the British, French, and American armies, it survived in the chapters it had established at Harvard and Yale. A branch was inaugurated in England in 1925. It has abandoned its original secrecy, and dropped its social for academic activities. The possession of the "key" (a gold watch-key), its badge, carries no little scholarly prestige. Women undergraduates have founded their own Greek letter societies or "Sororities," numbering in 1947 about 30. Organizations in engineering, law, medicine, and other professions are also designated by Greek letters.

Greek Religion. Greek religion is not the same as Greek mythology. The latter is an account of the words and deeds of the superhuman beings called gods; the former is concerned with the nature and functions of these beings, and the worship and ritual by which they were approached.

There is no doubt that the religion of the Greeks, as it appears in the Homeric poems, was preceded by an earlier religion. It has been established that an earlier civilization, to which the name Aegean or Minoan has been given, preceded that of the Greeks. The Greeks themselves are the result of the blending of earlier inhabitants, neither Indo-European nor Semitic, with invaders who descended from central Europe, the last of these being the Dorians. How far Greek religion is an admixture of the beliefs of the original inhabitants with those of the Indo-European invaders; whether the Greeks ever worshipped stones, trees, plants, and animals; what part foreign influences, Asiatic and especially Egyptian, played in the formation of Greek religion as first known to us, are still unsettled questions.

Greek religion was originally neither monotheistic nor merely symbolic of a mystic system brought from the East. Nor was it purely a nature-religion, as was argued from the fact that comparative philology had shown that many of the old Vedic deities, who bore similar names to those of the Greek gods, were personifications of nature. Similarity of name does not necessarily imply a similar conception of the nature of the god. Thus, one who in the Greek hierarchy holds high, even the highest, rank may be insignificant in another.

The Greater and Lesser Gods

Greek religion was essentially anthropomorphic. The gods were conceived of as immortal, possessing the forms of men, their vices and virtues, but infinitely superior in power and influence. They may be divided into (1) the gods of the sky, whose home was on Mt. Olympus, ruled by Zeus; (2) the gods of the seas and rivers, ruled by Poseidon; (3) the chthonian gods, or gods of the underworld, ruled by Hades. With these greater gods were associated numerous inferior deities. As the individual gods differed in power and wisdom, so they enjoyed different degrees of veneration in different states. New epithets from time to time indicated altered and extended functions.

The Greek believed himself to be surrounded by gods, upon whom he was himself dependent, and not only he alone, but his family and

the greater family, the state. At the same time he professed nothing in the nature of religious dogma; there was nothing that could be properly called a priesthood, specially gifted with a knowledge of things divine. The Greek could believe what he pleased, except deny the existence of the gods or attack the existing religion.

Inexorable Fate

An important element in Greek religion was Moira (Fate), representing the physical and moral laws that inexorably governed the universe, to which even the gods had to bow. Hence it was incumbent upon them to see that men kept and did not violate these laws, and they meted out rewards and punishments accordingly. The relation between men and gods, whose favour was to be gained and whose wrath appeased by various rites and sacrifices, and whose pleasure was learnt from the oracles, was regarded as a sort of contract. If the individual or state required the aid of the gods, they on their part had to give of their best in return.

That the Greeks believed in the existence of the soul after death is shown by propitiatory rites such as were performed, e.g., at the festival called Anthesteria, by offerings laid on the tomb which the shade of the departed was supposed to haunt, and by the honours paid to distinguished persons or local divinities such as Hercules and the oekist or founder of a colony, who were dignified with the title of heroes.

Up to the time of the Peloponnesian War, the general belief in the gods remained unshaken among the people. After that time, a general moral, social, and political decay set in. The people became impregnated with the scepticism of the philosophers and of dramatists like Euripides. Unbelief and religious indifference took its place, succeeded by superstition, which in turn led to the prevalence of mystical sects and rites like those of the Orphic and other mysteries, and to the introduction of foreign divinities. See Hero; Mystery; Mythology; Oracle; Orphism.

Greeley, HORACE (1811-72). American journalist. Born on a New Hampshire farm, Feb. 3, 1811, he joined the staff of a country newspaper at the age of 15, and in 1831 made his way to New York as a journeyman printer. After a first failure with a paper called *The Morning Post* (1833), he founded *The New Yorker* in 1834, the literary excellence of which gained him an immediate reputation. He started *The Tribune* in 1841, and the large circulation of this paper in the N. and W. gave Greeley an opportunity of preaching his political doctrines.

The question of slavery early engaged his attention, and by 1850 *The Tribune* was an unflinching advocate of abolition. Delegate to the fateful Republican national convention of Chicago in 1860, Greeley helped forward the nomination of Lincoln, and staunchly supported the president through the war. He was one of the bailies of Jefferson Davis, and thereby incurred the anger of a large section of the northern public. Vigorously opposing the re-nomination of Grant in 1872, he was himself nominated by the Liberal Republicans, and carried six southern states; but the consequent mental strain, coupled with the loss of his wife, proved too much, and he died suddenly, Nov. 29, 1872. See Life, A. H. Sotheran, 1892.

Horace Greeley

Horace Greeley. The house in Amherst, New Hampshire, in which he was born

Greely, ADOLPHUS WASHINGTON (1844-1935). American explorer. Born at Newburyport, Mass.,

Adolphus W. Greely,
American explorer

March 27, 1844, he served in the Civil War (1861-65). Remaining in the army, he became a brigadier-general in 1887. He was appointed in 1881 to command a polar expedition, and with a party of 25 reached the then farthest North (83° 24'), crossing Grinnell Land to the Polar Sea. Two relief expeditions failed to find them, and when the third succeeded, only seven of his party were alive. His *Three Years of Arctic Service*, 1883, gives an account of his expedition.

Greely was largely employed in the signal arrangements of the Spanish-American War, was in charge of the relief operations at San Francisco after the earthquake in 1906, and was promoted major-general the same year. He retired in 1908, and died in Washington, Oct. 20, 1935.

Green. River of Kentucky, U.S.A. Rising in the centre of the state, it flows for 300 m. W. and N.W. to the Ohio river, about 7 m. above Evansville. Locks and dams have made the river navigable for small steamers to Greensburg, about 200 m. upstream.

Green. Headstream of the Colorado river, U.S.A. Rising on the slopes of the Wind River range in Wyoming, it follows a S. course through the Uinta Mts., in which it has cut a series of deep cañons, and joins the Grand river in the S.E. of Utah to form the Colorado. Its length is about 710 m.

Green, CHARLES (1785-1870). British aeronaut. Born in London, Jan. 31, 1785, he interested himself in aeronautics and, on the coronation of George IV, in 1821, was the first to ascend in a carburetted hydrogen gas balloon, from Green Park. After this, he made many ascents, and in 1836 he ascended from Vauxhall in his Great Nassau balloon, taking eight passengers. In 1838 he made two ascents from Vauxhall, attaining 19,335 ft. and 27,146 ft. respectively. His last ascent was in 1852, and he died March 26, 1870.

Green, JOHN RICHARD (1837-83). British historian. Born in Oxford, Dec. 12, 1837, he was educated at Magdalen College School and Jesus College. He held an

incumbency at Stepney, but ill-health compelled him to abandon parish work, and for a time he was librarian at Lambeth Palace. He had soon a reputation by contributions to *The Saturday Review*, and from about 1868 devoted himself to historical study. He died at Mentone, March 7, 1883.

Green's great work is his *Short History of the English People*, perhaps the most popular of its kind; it appeared in 1874, and there have been many editions. In this he avoided the conventional historical divisions, and laid more stress upon social and religious movements than upon kings, wars, and treaties. But its great attraction is its style, for it abounds in passages that linger in the mind. Its accuracy cannot be seriously questioned, but its author's knowledge of the later centuries was hardly equal

John Richard Green,
British historian
After J. Sandys

to that of the earlier ones. His more detailed *Making of England*, 1882, and *Conquest of England*, 1883, are of great value to students of the Anglo-Saxon period.

Green's *Letters* were edited by Leslie Stephen in 1901. In 1877 he married Alice Sophia Amelia Stopford, daughter of the archdeacon of Meath. She edited several editions of her husband's work, and wrote *Town Life in the 15th Century*, 1894; *The Making of Ireland*, 1908; *Studies from Irish History*, 1926-27. She died in Dublin, May 28, 1929.

Green, THOMAS HILL (1836-82). British philosopher. His father was a clergyman, and he claimed descent from Oliver Cromwell. Born at Birkin, Yorks, April 7, 1836, he was educated at Rugby and Balliol College, Oxford. In 1860 he was elected to a fellowship at Balliol, and in Oxford remained all his life, being from 1878 professor of moral philosophy. He died March 26, 1882.

His was the most penetrating influence in the Oxford of his day, and, through his pupils, on English political and moral philosophy it was profound. In politics he was a Liberal, in some matters an advanced Radical. He took great interest in education and was actively concerned in movements for the betterment of the working classes. As a philosopher he was, under the influence of Kant, Hegel,

and Fichte, the chief representative of English critical idealism, opposed to the empiricism of Mill and Spencer.

Knowledge to Green was the reproduction of an eternal mind in human personality. The entity which embraces all relations of experience is the infinite, absolute subject, the eternal, pure self-consciousness, the synthetic principle of unity which manifests itself in the individual. As a political philosopher he accepted in the main Hegel's theory of the state, but adapted it in certain particulars to meet his own views. It is only in the state of society that the individual can find the rightful sphere for his activities. Green's teaching is contained in *Prolegomena to Ethics*, and *Lectures on the Principles of Political Obligation*, both published after his death.

Green, VALENTINE (1739-1813). British engraver, born near Chipping Norton, Oxon, Oct. 16, 1739.

Valentine Green,
British engraver
After Abbott

He refused to take up law, and studied line engraving under Robert Hancock of Worcester. In London he took up mezzotint, and before he was 30 achieved an unqualified success. His prints after Benjamin West's *Return of Regulus to Carthage*, and *Hannibal Swearing Eternal Enmity to the Romans*, were the largest mezzotints until then produced. He translated Reynolds's portraits with rare sympathy and skill, and proofs in prime condition now fetch high prices. Green exhibited at the R.A. in 1774, and in 1775 was elected associate engraver and became mezzotint engraver to George III.

In 1789 the elector of Bavaria gave him the sole right to engrave and publish prints after the originals in the Düsseldorf Gallery, but he had completed only 22 plates when the gallery was destroyed in 1798 during the siege by the French. On the foundation of the British Institution in 1805 he was appointed keeper. He died in London, June 29, 1813. His plates number 400, and though he is best known by his portraits, he engraved many subjects by old masters, such as Rubens's *Descent from the Cross*, Domenichino's *Virgin and Child*, Murillo's *S. John with the Lamb*. Ludovico

Carracci's Entombment of Jesus, and Agostino Carracci's Venus and Cupid. He also engraved portraits after Van Dyck, Romney, etc.

Greenaway, KATE (1846-1901). A British artist. Born in Hoxton, London, March 17, 1846,

Kate Greenaway,
British artist

she studied at the South Kensington art school, Heatherley's Academy, and the Slade School. Her earlier efforts were limited to valentines and Christmas cards although she exhibited occasionally, for the first time at the Dudley Gallery in 1868, and at the Royal Academy in 1877.

The work with which Kate Greenaway's name is chiefly identified consists of drawings, chiefly in colour, but often in black and white, illustrating stories and poems for children. The girls and boys are garbed in the costume of the early 19th century, and the resulting pictures are quaint and attractive, being saved from the pedantry of archaism by the juvenility of the figures and charm of composition.

Her work enjoyed an immense vogue, and for a long time "Kate Greenaway" frocks were the fashion for little girls.

From 1880 almost to her death at Hampstead, Nov. 6, 1901, not a year passed without several books from her hand. Some she wrote as well as illustrated, such as *Under the Window*, 1879, and *Marigold Marsh*, 1885, the latter perhaps the most commercially successful. *Consult* A Century of K. G., A. C. Moore, 1946.

Greenbacks. Popular name for an American legal tender non-interest-bearing paper currency, with devices printed in green ink on the back of the notes. It was first issued in 1862 as a war revenue measure. But when the Treasury began to withdraw these notes under the Funding Act of 1866, so strong an opposition was aroused that its operations were suspended by congress. In 1874

there came into existence a Greenback party opposed to the reduction of the amount of these notes; this party in 1878 sent 14 members to congress. The greenbacks are now a permanent part of the national currency.

Green Bay. Opening of Lake Michigan, penetrating for 120 m. S.W. into Wisconsin, U.S.A. It has a greatest breadth of 20 m. and an extreme depth of 120 ft., and derives its name from the colour of its water. The Fox river enters at its head, and its mouth is obstructed by a number of islands.

Green Bay. City of Wisconsin, U.S.A., the co. seat of Brown co. A port of entry at the head of Green Bay, on the Fox river, 112 m. N. of Milwaukee, it is served by rlys. Green Bay stands near the site of an old Indian village and was permanently settled about 1745. It was incorporated in 1838 and became a city in 1854. The oldest town in the state, it is the

Kate Greenaway. P Peeped In It, a characteristic Greenaway drawing from the Apple Pie alphabet S. Kensington Museum

seat of the earliest R.C. diocese in the North-West.

An important rly. centre, its harbour is accessible to the largest lake vessels, and a large trade is carried on in coal, lumber, fish, dairy products, and grain. It contains rly. repair shops, lumber yards, paper mills, and canneries, and manufactures agricultural implements, machinery, gas engines, flour, bricks, and tiles. Pop. 46,235.

Green Belt. Rural area surrounding a populous area and protected against development; especially that encircling Greater London. After the First Great War many local authorities sought to preserve the rural areas adjoining large cities; but plans for securing a green belt for London

were interrupted by the Second Great War. In 1945, under the Greater London plan, an area surrounding the city and about 5 m. beyond the suburban ring was designated a green belt, intended primarily for the recreation of Londoners. It was to preserve the North Downs, the Chiltern escarpment, Epping Forest, and Burnham Beeches, as well as certain of the royal and private parks. *Consult* Green Belt Cities, F. J. Osborne, 1946.

Green Cloth, BOARD OF. Department of the British royal household. It is presided over by the lord steward, who has under him the master of the household and other officials. It is charged with the duty of supervising the household, including the kitchen, arrangements of the court, etc., the office being at Buckingham Palace. It is so called because of the covering of the table at which the lord steward and his subordinates sat. *See* Lord Steward.

Greene, WILFRID ARTHUR GREENE, 1ST BARON (b. 1883). British lawyer. He was educated at Westminster and Christ Church, Oxford, being called to the bar in 1908. Taking silk in 1922, he was standing counsel to Oxford university, 1926-35, and a lord justice of appeal, 1935-37. Appointed master of the rolls in 1937, he was chairman of the council of National Buildings Record, 1941-45. Knighted and made P.C. in 1935, he received a barony, 1941, and was a lord of appeal in ordinary from 1949.

Greene, GRAHAM (b. 1904). British author. Born Oct. 2, 1904, he was educated at Berkhamsted and Balliol College, Oxford. His first novel, *The Man Within*, 1929, foreshadowed the psychological adventure stories which brought him fame: *Stamboul Train*, 1932; *A Gun for Sale*, 1936; *Brighton Rock*, 1938. *The Power and the Glory*, a novel with a Mexican background, was awarded the Hawthornden prize in 1940, and *The Heart of the Matter*, with a W. African setting, received the James Tait Black prize in 1948. He also wrote *Journey Without Maps* (a trip through Liberia), 1935; *A Mexican Journey*, 1939; *The Ministry of Fear*, 1943; and stories on which the films *The Fallen Idol*, 1948, and *The Third Man*, 1949, were based.

Greene, HARRY PLUNKET (1865-1936). British singer. Born in co. Wicklow, June 24, 1865, he was educated at Clifton, and studied singing in Florence and

Stuttgart. He made his debut in London as a baritone in The Messiah, 1888, and during the 1890s became associated with the Three Choirs Festival, creating the part of Job in Parry's oratorio. In 1900 he sang bass in Elgar's Dream of Gerontius at its first performance. In recitals he introduced songs written for him by Stanford and Parry. Professor of singing at the R.A.M. and R.C.M., he was in 1936 on the B.B.C. music advisory committee. Greene, who married a daughter of Parry, published Interpretation in Song, and a Life of Stanford, both standard works. He died Aug. 19, 1936.

Greene, NATHANAEAL (1742-86). An American soldier. Born Aug. 7, 1742, at Potowomut, R.I., the son of a Quaker, on the outbreak of the War of Independence he enlisted as a private in the colonial army. In 1775 he was appointed to command the Rhode Island contingent with the rank of brigadier-general. At the battle of Brandywine he led a reserve force, and in 1780 he was made commander of the army of the South, in which capacity he eventually cleared Georgia and N. and S. Carolina of the British. He died near Savannah, June 19, 1786.

Nathanael Greene
From the statue in the
Capitol, Washington

Greene, ROBERT (c. 1560-1592). British poet and dramatist. Born at Norwich, he was educated at St. John's College, Cambridge. After leading a dissolute life abroad, he returned to England about 1580. One of the company of "university wits," the first brilliant products of the Elizabethan age, he passed his life in alternate periods of happiness and almost suicidal depression, and died of a surfeit, Sept. 3, 1592.

His writings include pamphlets (in reality short novels) which contain most of his verse and plays; the first appeared in 1583. In a long series of fanciful but dull stories, Pandosto, or The Triumph of Time, 1588, provided Shake-

speare with the theme of The Winter's Tale. Of greater interest are autobiographical pamphlets, e.g. Greene's Vision; Never Too Late to Mend, 1590; and Greene's Groatworth of Wit bought with a Million of Repentance, published posthumously, 1592, containing a historic reference to Shakespeare as a rising dramatist. His plays include The Comical History of Alphonsus; the Honourable History of Friar Bacon and Friar Bungay; the History of Orlando Furioso; and the Scottish History of James IV. Greene's Works were edited by A. B. Grosart, 1881-86.

Greene, WILLIAM FRIESE (1855-1921). An English inventor. He was born Sept. 7, 1855, at Bristol, and served his apprenticeship in photographic research under J. A. R. Rudge. He exhibited in 1885 moving photographs recorded on a rotating glass disk. In 1889 Greene took out a provisional patent for the first camera and projector, using sensitised celluloid film, and soon made his first picture, views of the traffic at Hyde Park Corner. He then patented his devices for stereoscopic cinematography, 1893, and for colour films, 1898, and was at one time in touch with Edison on a project for talking pictures. Until 1915 Greene lived in poverty. He died suddenly, after speaking at a meeting convened by the cinematograph industry, May 5, 1921.

Green Earth. Name given to a dark greenish soft mineral substance, a hydrous silicate rich in iron. It is found chiefly in cavities of eruptive rocks or ancient lavas.

Greenfinch OR **GREEN LINNET** (*Chloris chloris*). Common British bird, greenish yellow on the back, with yellow underparts, one of the handsomest of small birds. The female is less brightly coloured than the male. The greenfinch feeds upon grain and seeds, and often rears two broods.

Green Flash. A brilliant green coloration, lasting for a few seconds, seen at sunset (or sunrise) under favourable conditions. The phenomenon is due to the unequal refraction of light of different colours; blue and green being refracted more than yellow and red. With the last glimpse of the sun, only green light from the upper limb can reach the observer.

Green-fly. Popular name for various species of plant-lice (fam-

ily Aphididae) of the insect order Hemiptera, sub-order Homoptera. They are soft-skinned, with delicate legs and the mouth-parts modified into a fine piercing organ through which they suck continuously the juices of plants. The young are hatched out in a form similar to the adult. Some adults have four exceedingly delicate hyaline wings with only a few strengthening nervures.

After autumn pairing, eggs are laid which hatch in spring, the brood consisting mainly of imperfect, wingless females which, without pairing, bring forth living young. These after three weeks exhibit the same power of virgin production, which is continued through several generations. This power accounts for the enormous and rapid multiplication of green-fly on roses, etc. Most species of green-fly are provided on the upper surface of the hind-body with a pair of tubes through which liquid wax is ejected at their enemies—ichneumon-wasps, ladybirds, and syrphus-flies.

Ants feed on the honey-dew of the aphid, a sweet substance which is its excrement. On account of the advantage thus derived, ants frequently take special care of flocks of green-fly that they place on suitable plants—roots in the case of certain subterranean species. Green-fly may be brown, grey, or black coloured as well as green. Green-fly carry virus diseases from plant to plant in feeding. See *Aphis illius*; Virus.

Greenford. A residential area of the Middlesex borough of Ealing, England. It is on the Central line. It was styled Greneforde in Domesday Book, and Greenford Magna to distinguish it from Greenford Parva, which has been generally known since the 16th century as Perivale (q.v.). Situated between Southall and Harrow, the manor belonged to Westminster Abbey until the dissolution, and passed in 1550 to the see of London. The rectory and advowson have belonged since 1725 to King's College, Cambridge. The Early Perp. flint and brick church, dedicated to the Holy Cross, and restored 1871 and 1882, contains brasses and old stained glass. A factory, on the Grand Union Canal, still used for industrial purposes, is that in which Perkin perfected his production of

Greenfinch, a British hedgerow bird

aniline dyes from coal tar. Horsenden Hill, a well-known eminence, is between Greenford Green and Perivale. Pop. 15,244.

Greengage. Fruit tree of the family Rosaceae, and genus *Prunus*. The greengage is really a variety of plum and needs the same system of culture. It was first introduced into Great Britain from the monastery of Chartreuse in France, by Lord Gage, and it is supposed that the fruit is one of the primary and necessary ingredients in the preparation of the liqueur which bears the name of the monastery. It is largely grown in France, from which the chief supplies of Great Britain are derived. It is greatly valued as a dessert fruit.

Green Gland. The sac-like organ responsible for much excretory activity in crustacea such as the crayfish. It is a truly coelomic space and probably the only vestige of the true coelom, apart from cavities of the gonads, remaining in the crustacea.

Greenheart (*Nectandra rodiaei*). Timber-tree of the family Lauraceae. A native of British Guiana, it attains a height of 60 or 70 ft. It has alternate leathery leaves and tubular flowers. Its timber is of great strength and durability, and yields planks of great length,

Greenheart. Foliage, flowers, and fruit, with section, of this timber tree

while the ash-coloured bark (Bibiru-bark) is used medicinally in fevers and as a tonic.

Greenhithe. Parish and village of Kent, England. It is situated on the Thames, 2½ m. E. of Dartford, with a rly. station. In the vicinity are numerous chalk pits. Ingress Abbey, to the E., on the site of a grange which belonged to Dartford Priory, is a semi-Gothic mansion built partly of stone from old London Bridge. The church of S. Mary the Virgin dates from 1855.

Greenhouse. Term applied to a structure of wood and glass

erected for the protection and propagation of plants unable to survive the rigours of winter. The two chief types of greenhouse are the span-roof and the lean-to; the former is built in the open, the latter usually against a wall. They will last

Greenhouse. Span-roof type, the framework made of wood laid on a brick foundation. Top, steel framed greenhouse

indefinitely if the framework is set on a brick wall 2½ to 3 ft. high and if the woodwork is painted from time to time.

The cheaper greenhouse has a base of wood which also must be laid on a brick or concrete foundation to prevent its being in contact with the ground. Steel greenhouses have come into use, and some have been made of concrete. The span-roof type is generally so placed that the ends face N. and S., thus all parts are exposed to light and sunshine. The lean-to type is usually built against a sunny wall, but for the cultivation of ferns a shady wall is best.

The best way to heat a greenhouse is by a boiler and hot water pipes, the heat being supplied by a coke burning furnace built into the wall. An apparatus of this kind will maintain a minimum temperature of about 50° F. Successful management depends largely on maintaining an equable temperature at night and in dull weather, and in so arranging the ventilation that the warmth rises gradually as outdoor temperature increases. The top ventilators must be opened early in the morning in spring and summer, more ventilation being given as the sun's heat increases. As the sun

declines, the ventilation should be reduced, the greenhouse being closed before the sun has ceased to shine on the roof. Watering pot-plants correctly is important; the soil should be moistened only when it is moderately dry and then watered thoroughly. See Conservatory.

Green Howards. Infantry regiment raised in 1888 as the 19th Foot and known as the Yorkshire

Green Howards (Yorks Regt.) badge

Regt. (Alexandra, Princess of Wales's Regt.) from 1881 to 1920. The nickname of Green Howards was given because after it was raised it was commanded by Sir Charles Howard and the men wore green facings. Its first honour was gained at Malplaquet, and it fought at Fontenoy. The regiment saw service in America, India, Ceylon, and the Crimea, and after the Tirah campaign of 1897 served throughout the S. African War. Twenty-four battalions were raised for service in the First Great War and gained the honours: Ypres, 1914, '15, '17; Loos, Somme, 1916, '18; Arras, 1917, '18; Messines, 1917, '18; Valenciennes; Sambre;

France and Flanders, 1914-18; Vittorio Veneto; Suva; During the Second Great War battalions took part in the campaigns in Norway, Persia, Syria, N. Africa, Sicily, Burma, and N.W. Europe. One was converted into a light A.A. battery, another into a parachute battalion, a third into a reconnaissance regiment.

Greenland. Large island, mainly within the Arctic Circle, the only colonial possession of Denmark. Its area is about 826,000 sq. m. Lying N.E. of British N. America, its most northerly point, lat. $83^{\circ} 39' N.$, is about 1,600 m. from its S. extremity in Cape Farewell, lat. $59^{\circ} 45' N.$ Its extreme breadth is 700 m. The coast is characterised by rugged cliffs, rising sheer from the ocean, with deep and tortuous, fjord-like, glacier-filled indentations, piercing inland in some cases for nearly 100 m. The principal inlets are Independence Fjord, Inglefield Gulf, Disco Bay, Scoresby Sound, Kane Basin, Petermann Fjord, Sherard-Osborn Fjord, and Franz Josef Fjord. The Greenland Sea lies off its E. coast, Denmark Strait separates it from Iceland in the S.E., while Davis Strait, Baffin Bay, Smith Sound, and the Kennedy and Robeson Channels divide it from Ellesmere Island, Devon Island, and Baffin Island on the W.

Nearly the whole of Greenland is an elevated plateau, the mean alt. being 4,500 ft.; but in places there are eminences approaching 10,000 ft. The valleys have been filled in by accumulations of snow, so that its whole area presents a continuous and fairly level ice sheet extending from sea to sea. The largest of the glaciers is the Humboldt in the N.W., reputed to be the largest in the world. It discharges into Kane Basin on a front of 55 m. Other large glaciers are the Great Karaiak, the Jacobshavn, and the Petowik, all on the W. coast. The only ice-free areas are on parts of the S.W. and S.E. coasts during summer, when Arctic flora appears, with herbs, shrubs, and mosses in the N. and saxifrages, poppies, heath, anemones, with Arctic birch, alder, and willow, in the S.

The climate is extremely cold and foggy in winter, but during the short summer in the S. the mean temperature is $48^{\circ} F.$ Animals are not numerous, being represented by the polar bear, reindeer, musk ox, etc. Birds are more plentiful. The inhabitants are Eskimos, found N. of Melville Bay, between Cape York and Etah.

The country is divided into two inspectorates—the southern, which touches lat. $67^{\circ} 20' N.$, and the northern, with undefined N. limits. The principal settlements are Upernivik, the most northerly village in the world; Godhavn, on the island of Disco, the capital; Sydproven, Christianshaab, Umanak, Jacobshavn, Sukkertoppen, Frederikshaab, Ivigtut, and Julianehaab. Trade is done in whale and seal, oil, furs, cryolite, and eiderdown. There are extensive fishing grounds round the coasts with cod and haddock as the principal catch.

Greenland was discovered and named towards the end of the 10th

Greenland. Map of the Danish colony, most of which lies within the Arctic circle

century by a Norseman, Eric the Red, who planted a colony on the S.W. coast. His son, Leif Ericsson, when on a voyage from Norway to Greenland, is supposed to have discovered the mainland of America. Christianity was introduced and a bishopric established in the 12th century.

Intercourse with Europe was maintained until the beginning of the 15th century, when the increase of the Arctic ice completely imprisoned the colony and precluded all access. This settlement is said to have extended 200 m. in the S.E. of Greenland, and possessed several churches and monasteries. Nothing certain is known of the fate of the settlers.

In 1585 John Davis visited the country, but found only Eskimos, among whom were a few Norse traditions. In 1702 Hans Egede, a Danish missionary, founded

Godthaab on the W. coast. Others followed him, and the pop. is now 18,431. The largest settlement is Sydproven, and the most important, Godthaab. During recent years the immense ice-cap has been crossed by Nansen, Peary, Rasmussen, De Quervain, and Koch; and much geographical knowledge of the coast and the neighbouring seas obtained.

On April 10, 1941, the U.S.A. took Greenland under its protection, after learning that German aircraft had been flying over the territory, and obtained permission from the Danish government to establish air, wireless, and meteorological bases. Secret German weather reporting stations were discovered and destroyed. Consult The First Crossing of Greenland, F. Nansen, 1891; Greenland, M. Vahl, 1930; Greenland, V. Stefansson, 1943.

Greenland Sea. Arm of the N. Atlantic Ocean, lying N. of lat. $70^{\circ} N.$, between Greenland on the W., Spitsbergen on the E., and Iceland on the S. Its breadth is about 400 m., and its depth varies from 2,550 fathoms off Spitsbergen to 1,000 fathoms off the W. coast of Jan Mayen. The current from the Arctic Ocean runs down the E. shore of Greenland.

Green Line. Coach services between London and the Home counties. The green coaches of this line were introduced by the London Passenger Transport Board in 1930, to provide rapid transport between London and country districts. On Aug. 31, 1939, the vehicles were withdrawn and converted into ambulances, 400 being ready for duty at the outbreak of the Second Great War. Services were again in operation by Dec., 1940, but discontinued once more in Sept., 1942, the coaches doing duty with the civil defence and U.S. army as ambulances and mobile canteens. Services were resumed in 1946, and from 1948 came under the London Transport executive of British Railways.

Green Mountain Boys. An irregular military force raised by Vermont (the Green Mountain State) in 1775, mainly to defend its independence against the claims of New York. The principal exploit of this body during the War of Independence was the capture of Fort Ticonderoga, when its leader, Ethan Allen, demanded the surrender of the British garrison "in the name of the great Jehovah and the Continental Congress."

Green Mountains. Northern section of the Appalachian system, U.S.A. The range extends in a N. direction from near the Hudson river in New York through Massachusetts and Vermont. Its general elevation is from 2,000 ft. to 2,500 ft. above sea-level, the highest summits occurring in the N. and centre of Vermont, Mt. Mansfield, 4,364 ft., being the loftiest.

Part of the range forms the watershed of the affluents of the Cumberland river and the streams flowing to the Hudson river and Lake Champlain. Extensive forests of pine, spruce, and other trees cover the slopes of the range, which contains rich deposits of iron, marble, manganese, etc.

Greenock. Municipal and police burgh and seaport of Renfrewshire, Scotland. It stands on the

Greenock arms

S. side of the Firth of Clyde, 22m. W.N.W. of Glasgow, and is served by rail and steamer. Buses connect it with Port Glasgow on the E. and Gourock on the W.

The chief buildings include the town hall and municipal buildings, the Watt Institution, Greenock library, and custom house. There are a technical college and other colleges and schools; also several hospitals and charitable institutions. The oldest church is a 16th century building, now removed to the esplanade. In its churchyard Highland Mary (*q.v.*) was buried, but her remains are now in the cemetery. John Galt lies in Inverkip St. burying ground. There are parks and two golf courses, while along the sea front is a fine esplanade.

The chief industries of Greenock are shipbuilding, marine engineering, and sugar refining. The port has been continuously improved since it was first opened in 1710. There are several harbours, with docks both wet and dry, and a great extent of quays and other accessories of a first-class port. Also great shipbuilding yards. Other industries are concerned with worsted, rope, tanning, tin, aluminium, and wooden boxes. Distilling and oil refining are carried on. Greenock became a burgh in 1635, and a flourishing seaport after the union of Scotland with England in 1707. Here James Watt was born, and on the site of his birthplace is the Watt engineering, navigation, and wire-

less telegraphy school; the burgh was also the birthplace of Captain Kidd, the pirate. It is governed by a corporation, and sends one member to parliament. Pop. est. 81,700.

During the Second Great War, Greenock, with the adjoining port of Gourock, became the largest base of the Royal Navy and an embarkation port for those going overseas. It suffered only two nights of severe air raids, May 5 and 6, 1941. The naval dockyard was closed in 1946; in the same year a memorial to the Fighting French navy was unveiled here.

Greenockite. Ore mineral of cadmium, cadmium sulphide (CdS). Rarely in hemimorphic crystals, differently terminated at the two ends, and translucent to transparent, it occurs usually as a yellowish earthy coating associated with zinc minerals, commonly sphalerite. Greenockite has been prepared artificially and is not uncommon as a furnace product.

Greenore. A seaport of co. Louth, Eire. It stands on the N. side of Carlingford Lough, 2 m. S.E. of Carlingford. It has a rly. station, and was formerly a mail packet terminus of a service from Holyhead. Pop. 765.

Green Park. Open space in London. It covers 54 acres between Piccadilly and St. James's Park and Constitution Hill. A favourite resort of Charles II, it had a notoriety for duels, the duchess of Cleveland witnessing a combat here in 1696 between her lover Fielding and Sir Henry Colt. Queen Caroline's library was in the park, but was pulled down for the purpose of erecting Stafford House.

Green Pastures, THE. Play by Marc Connelly. Based on Roark Bradford's novel *Ol' Man Adam an' His Chillun*—the Bible story as visualised by a negro preacher—this allegory aroused much controversy when it was produced on the New York stage in 1930, but was awarded the Pulitzer prize. A screen adaptation in 1937 was memorable for Rex Ingram's performance as De Lawd. As the play transgresses the rule against any stage impersonation of God, the Lord Chamberlain's office has not been able to permit public performances in Great Britain; but the film was shown, and a radio version was broadcast by the B.B.C.

Green Room. Room in a theatre set apart for the social use of actors and actresses, so called, it is supposed, because

green used to be the prevailing colour of its wallpaper, or furniture, or both.

Greensand. Two series of beds of sands and sandstones which form the lower part of the Cretaceous system. Known as upper and lower, in Kent and Surrey they are separated by a clay development, the Gault. The prevailing green colour is due to grains of glauconite scattered through the beds. Lower Greensand is well developed in the Isle of Wight, where the beds are 100 ft. thick, and S.W. England, and forms a rim round of the Weald. At Leith Hill, Surrey, they reach an elevation of 965 ft. The thickness and character of the beds are variable. Greensand makes good building stone, as characterised by Bargate stone, near Reigate, and Kentish Rag, near Maidstone. The beds extend from Wiltshire through to Cambridgeshire, often as yellow and brown sands, with ironstone. Upper Greensand is quite distinct from Lower in its fossil contents. See Cretaceous; Gault.

Greensboro. A city of North Carolina, U.S.A., the co. seat of Guilford co. It is 80 m. W.N.W. of Raleigh, and is served by the Southern rly. and an airport. It contains the women's college of the state university and three colleges for negroes. A large trade in tobacco, maize, cotton, and lumber is carried on, and there are manufacturing plants for cotton goods, machinery, carpets, and flour. Greensboro was founded in 1808, named after Gen. Nathanael Greene, who won a battle here in 1781, and received a city charter in 1870. Pop. 59,319.

Greensburg. City of Pennsylvania, U.S.A., the co. seat of Westmoreland co. It is 31 m. E.S.E. of Pittsburgh, and is served by the Pennsylvania rly. In the midst of bituminous coalfields and natural gas resources, it has rly. shops, coke ovens, and makes metal products. Greensburg was settled in 1771 and incorporated 1809. Pop. 16,743.

Greenshank (*Tringa nebularia*). Wading bird of the snipe family, so called from its olive legs. It visits Great Britain in autumn and winter, and is most common in the N. of Scotland, where it is usually found by the shore, feeding on small crustaceans and molluscs.

Greenstick Fracture. Term describing a break in a young bone which bends without fission after the manner of a sapling.

Greenstone. Name applied by geologists and miners to altered basic igneous rocks such as basalt

or dolerite. The alteration of the original rock produces such minerals as epidote and chlorite, which give the characteristic dark green colour.

Greenville. City of S. Carolina, U.S.A., the co. seat of Greenville co. It stands on the Reedy river, near the foot of the Blue Ridge Mts., 160 m. N.E. of Atlanta, and is served by rlys. and an airport. It contains Furman university and a women's college. Settled in 1776, it was incorporated in 1831, and became a city in 1868. Pop. 34,734. Another Greenville, in Mississippi, is the co. seat of Washington co.; pop. 10,835.

Greenwell, DORA (1821-82). A British author. She was born at Greenwell Ford, Durham, Dec. 6, 1821, and died March 29, 1882. Her work, while individual, has much in common with that of Christina Rossetti. Marked by deep religious feeling, it touches ancient myths and medieval legends; it caught from Greek exemplars a love of beauty, a flair for the simple but subtly expressive word, an acute sense of the enigma of life; and its musical quality bespeaks the author's love of German lyric and Provencal and Italian rhyme.

In *Carmina Crucis*, 1869, her treatment of the story of Persephone is typical; in the poem *Poet and Painter* (Lucretius and Leonardo da Vinci) she contrasts differing forms of unbelief; in *Camera Obscura*, 1876, the poem *Between Two Worlds* embodies a vision of the passing dead in terza rima of haunting impressiveness. She touched the heroic in her *Song of Roland*, *The Battle Flag of Sigurd*, and *The Flaming Oar*. Her prose work included memoirs of Lacordaire, 1868, and John Woolman, 1871; *The Patience of Hope*, 1860. *Essays*, 1866; and *Colloquia Crucis*, 1871. *Consult Life*, C. M. Maynard, 1926.

Greenwich. Parl. and mun. bor. of London. It is on the right bank of the Thames, 6 m. S.E. of London, with a railway station and connected with the Isle of Dogs (q.v.) by a tunnel, opened in 1902, for foot passengers (railway station, N. Greenwich), and by Blackwall Tunnel (q.v.) with Blackwall. There is bus and tram communication with the City. The bor. is bounded W. by Deptford, S. by Lewisham, and E. by

Woolwich. Sixth in size of the London bors., it contains Greenwich Hospital, Naval College, and Observatory, described separately; the National Maritime Museum; the Herbert and Brook Fever Hospitals, the parish church, and several almshouses. Its open spaces include the park, 185 acres; Blackheath, 267 acres; and part of Woolwich Common. There are telegraph, engineering, and chemical works. Notable inns are the Trafalgar, and the Crown and Sceptre.

Once a Danish encampment, Greenwich was originally, and for centuries, a small fishing town. The manor, once the property of the abbey of S. Peter, at Ghent, was transferred to the Carthusian priory at Sheen, and was later given to Humphrey, duke of Gloucester, who enclosed a park of 200 acres, rebuilt the palace on part of the site now occupied by Greenwich Hospital, and erected a tower, Greenwich Castle, on the hill where the Observatory stands. Henry VIII, who was born and baptized at Greenwich, here married Catherine of Aragon. His daughters Mary and Elizabeth were born and his son Edward VI died here. James I settled palace and park on his wife Anne of Denmark. Charles I lived at Greenwich until the outbreak of the Civil War; Cromwell resided here, and at the Restoration the place once again reverted to the crown. The palace was partly rebuilt, and formed the nucleus of the hospital.

The parish church, dedicated to S. Alphege, who was martyred here by the Danes in 1012, was rebuilt in 1718; it was badly damaged by fire after an air raid of the Second Great War, which caused heavy destruction in all parts of the borough. Lavinia Fenton, duchess of Bolton, was buried in the churchyard in 1760. Dr. Johnson lived in Church Street in 1737. Down to 1857, two fairs, notable for their boisterous character, and described by both Dickens and Thackeray, were held annually at Easter and Whitsun. One M.P. is returned. Pop. 82,230. *Pron.* Grin'-itch.

Greenwich. Town of Connecticut, U.S.A., in Fairfield co. It stands in a picturesque position on Long Island

Sound, 27 m. N.E. of New York City, at the S.W. extremity of the state, and is served by rly., besides having connexion with New York by steamer and electric rly. A residential district for artists, writers, and business men, and a holiday resort, it is noted for oysters. It was settled in 1614. Pop. 35,509.

Greenwich Hospital. British institution founded for aged and infirm sailors, and since 1873 the home of the Royal Naval College. Situated on the right bank of the Thames, 5 m. below London Bridge, it occupies the site of an old royal palace, and of its successor, built by Humphrey, duke of Gloucester, and named by him Placentia. Charles II, in 1667, began to rebuild the palace from designs by Inigo Jones and Webb, but only one wing was completed. Building was resumed under William III and Anne, from designs by Wren. In 1705 the new buildings were opened as a seamen's hospital, in memory of the naval victory of La Hogue, and of Queen Mary, consort of William III. In 1934 the National Maritime Museum was established in the Queen's House.

The buildings consist of several groups. The original design of the massive river façade is ascribed to Webb. To a second group belong the completion and extension of the river façade, and the S. blocks, which were designed by Wren, with fine colonnades and the W. and E. domes. (See *Architecture illus.*, p. 572, and *Flood-lighting illus.*). The E. dome was completed by Hawksmoor. To

Greenwich Hospital. The painted hall, designed by Wren and embellished by Sir James Thornhill

Greenwich arms

the second group belongs also the painted hall, once the dining hall, designed and carried out by Wren. The pavilions at each extremity of the terrace were built in 1778. The King Charles buildings are divided from those of Queen Anne by a great square on the river front. The statue of George II in the centre was executed by Rysbrack out of a single block of white marble, captured from the French by Rooke.

Beyond the square are the hall and chapel, each with a beautifully proportioned dome. Other buildings are the old infirmary, now the Seamen's Hospital; and the Royal Hospital School, the central part of which was designed by Inigo Jones. The painted hall contains relics of Nelson and other naval men. The chapel, burnt in 1779, was rebuilt 1779-89, and restored 1851 and 1882. The N. and S. fronts of the hospital are of Portland stone, and the W. of brick. On the terrace are two obelisks in memory, respectively, of J. R. Bellot, French Arctic explorer (d. 1853), and the marines who fell in the New Zealand war of 1863-64. The buildings were frequently damaged by German bombs in the Second Great War. See Maritime Museum.

Greenwich Mean Time. Artificial measure of time in use at the Royal Greenwich Observatory. To meet variations of solar and sidereal time, an artificial measure, computed from sidereal time, presupposes the earth to be travelling round the sun at its actual constant speed, but without any allowance being made for variations of the earth's motion on its axis. G.M.T. is accepted throughout the world as standard; and ships' chronometers are regulated by the Greenwich time signal. The B.B.C. transmits the same signal, the last of six pips giving the exact moment of G.M.T. See Time.

Greenwich Naval College. In full the Royal Naval College, Greenwich, founded in 1873 for the higher education of officers of the Royal Navy, Royal Marines, and dominion navies. Army and R.A.F. officers also attend courses. Some private students in naval architecture are accepted. The president is a flag officer, who is assisted by the captain of the college, a director of studies, and a staff of naval officers, civilian professors, and lecturers. The buildings were begun as a royal palace in 1662, completed for Greenwich Hospital, and adapted for the needs of the college after

the system of in-pensions ceased in 1869.

Greenwich Observatory, ROYAL. Institution directed by the British astronomer royal. Founded by Charles II, designed by Wren, and built on a hill in Greenwich Park, on the site of a tower built by Duke Humphrey, it was handed over to Flamsteed, the first astronomer royal, in 1676.

Greenwich Observatory. Right, the original building designed by Wren (1675) for Flamsteed, first astronomer royal; the other structures are extensions completed in 1899

From here is reckoned the zero meridian of longitude, fixed by international agreement, 1884; the world system of time zones is based on Greenwich mean time. Admiralty chronometers and watches are supplied, repaired, and rated at the observatory, in connexion with which are magnetic and meteorological observatories (the latter at Leith Hill, Surrey).

The work in all the observatories is continuous, the instruments are numerous and of the highest quality, and only visitors making serious scientific inquiries are, as a rule, admitted. On the E. wall are a 24-hour electric clock, and various standards of length. A new building was completed in 1899; a fine view of S.E. London and part of Kent can be obtained from the terrace. Details of the work carried on are supplied in annual official reports. A little to the E. are the buildings erected to contain the reversible transit circle and a 36-in. reflecting telescope; when it was hit by German bombs in Dec., 1940, the dome housing the big altazimuth suffered severely.

Because the smoke in the atmosphere and the bright skies at night caused by artificial lights—both results of the spread of London—interfered with astronomical observations, it was decided in 1946 to move the observatory to Hurstmonceux Castle, Sussex; but before the move, which was to be spread over several years, could be started, alterations and additions to buildings at Hurstmonceux had to be carried out.

Greenwich Village. District of New York, bounded by W. 14th St., Greenwich and 6th Avenues, W. Houston St., and the Hudson River. It has no rural characteristics. Inhabited in the main by artists and authors, it suggests a blend of Chelsea and Bloomsbury, with perhaps a touch of Grub Street. Here is the Whitney museum of American art.

Greenwood, HAMAR GREENWOOD, 1st VISCOUNT (1870-1948). British politician. Born Feb. 7, 1870, at Whitby, Ont., Canada, he was educated there and entered the state agricultural dept. He then came to England, sat as Liberal M.P. for York, 1906-10, and Sunderland, 1910-22, and was under-secretary for home affairs in 1919. Chief secretary for Ireland during the critical years 1920-22, he bore the responsibility for many repressive measures adopted in Ireland by the British government. Representing E. Walthamstow as Conservative M.P., 1924-29, he was treasurer of the party, 1933-38. Greenwood became a baronet 1915, K.C. 1919, baron 1929, and viscount 1937. He died Sept. 10, 1948, and was succeeded by his son David (b. 1914).

Greenwood, ARTHUR (b. 1880). English politician. A graduate of the Victoria university, Manchester, he lectured on economics at Leeds university and took an active part in the workers' educational movement. He entered parliament in 1922 as Labour M.P. for Nelson and Colne, was minister of Health in the second Labour government of 1929-31, and sat continuously for Wakefield from 1932. Having

Arthur Greenwood, English politician

been deputy leader of his party, Greenwood was minister without portfolio responsible for the study of post-war reconstruction in the Churchill cabinet, 1940-42, and lord privy seal in the Attlee cabinet of 1945. He was paymaster-general in 1946 and again minister without portfolio in 1947. A privy councillor from 1929 and C.H. from 1945, he wrote on Labour questions.

Greenwood, FREDERICK (1830-1909). British journalist, born in London, March 25, 1830. He was first editor of *The Queen*, 1861-63; assistant editor, with G. H. Lewes, 1862-64, and then editor, 1864-68, of *The Cornhill Magazine*; and first editor of *The Pall Mall Gazette* from 1865. When in 1880 its proprietors and politics were changed, he and his staff resigned, and started *The St. James's Gazette*, of which he was editor until 1888. He founded and edited *The Anti-Jacobin*, 1891-92. He died at Sydenham, Dec. 14, 1909.

Greenwood devoted special study to foreign affairs, was a strong opponent of Gladstone's anti-Turkish policy, and suggested to Beaconsfield the purchase by Great Britain of Ismail Pasha's Suez Canal shares. Of his novels the best is Margaret Denzil's History, 1864. He wrote *The Lover's Lexicon*, 1893, and *Imagination in Dreams*, 1894. He figures as Richard Rockney in Meredith's *Celt and Saxon*.

Greenwood, THOMAS (1851-1908). A British librarian. Born near Stockport, May 9, 1851, he began business life as a clerk in a hat works, and then became a library assistant at Sheffield. He founded in London a number of trade journals, wrote a biography of Edward Edwards, the librarian, 1902, and was the author of *Public Libraries, Their Organization, Use, and Management*, 1886, 5th ed. 1894. He formed a large bibliographical library, which, with the library of Edwards, he presented to Manchester. Greenwood died at Elstree, Nov. 9, 1908.

Greenwood, WALTER (b. 1903). British novelist and dramatist. Born at Salford, Dec. 17, 1903, he became a pawnbroker's clerk at 12 and held a succession of ill-paid jobs. Having lived on the dole during periods of unemployment, he wrote in 1933 a novel, *Love on the Dole*, which, adapted for the stage, and produced at the Garrick Theatre, London, 1935, achieved over 390 performances; a screen version appeared in 1941. Another play was *Give Us This Day*, 1936. A film, *Six Men of*

Dorset, 1944, was based on the story of the Tolpuddle Martyrs.

Greenwood Case. Sensational trial at Carmarthen assizes, Nov. 2-9, 1920, of a Kidwelly solicitor who was charged with administering arsenic to his wife. He was defended by Sir Edward Marshall Hall, K.C. The trial was remarkable for the extreme conflict of evidence, and for the weakness of the evidence for the prosecution, and it brought out strongly the defects of the circuit system, under which the accused man was kept in prison more than four months awaiting his trial on a capital charge, before his acquittal at the hands of the jury.

Greet, SIR PHILIP BEN (1857-1936). A British actor-manager. Born Sept. 24, 1857, on a training ship in the Thames which his father commanded, he was educated at the Royal Naval School, New Cross. In 1879 he first acted at Southampton, and after playing in London, entered on management in 1886. For 25 years he toured with Ben Greet companies, chiefly in Shakespeare, and settled in New York, 1902-14. Associated with Shakespeare productions at the Old Vic, 1914-18, the staging of English plays in Paris, 1924-26, and the origins of the Open Air Theatre, Regents Park, he was knighted in 1929. He died May 17, 1936.

Gregale. Name given to a dry N.E. wind which blows over Malta. It has been identified with the Bora, which often rages with great severity in the Adriatic, and the Euroclydon, which wrecked S. Paul's ship (Acts 27).

Gregarines. Parasitic protozoa, found in the bodies of invertebrates, chiefly the arthropods. There are a large number of species, among the more important being those found in the earthworm, lobster, cockroach, and cuttlefish. The effect of the presence of these parasites on the bodies of their hosts is as a rule slight. See Sporozoa.

Gregg, JOHN ALLEN FITZGERALD (b. 1873). An Anglo-Irish ecclesiastic. He was born July 4, 1873, and educated at Bedford School and Christ's College, Cambridge. Appointed curate of Ballymena, 1896, he became a canon of S. Patrick's cathedral, Dublin, and chaplain to the lord lieutenant, 1912. He was Archbishop King's professor of divinity at Trinity College, Dublin, 1911-15, and held the sees of Ossory, Ferns, and Leighlin, 1915-20. He was archbishop of Dublin, 1920-38, and was

appointed archbishop of Armagh and (Protestant) primate of all Ireland, 1939.

Grégoire, HENRI (1750-1831). French bishop and revolutionary.

Born of peasant stock at Vého, Meurthe-et-Moselle, Dec. 4, 1750, he was educated for the priesthood by the Jesuits at Nancy. In the states general of 1789 he was prominent as one of the revolutionary clerics who joined with the third estate. With the latter he attacked the privileges of the clergy, though firmly maintaining his Catholic beliefs, and, under the new civil constitution of the Church, was elected bishop of Blois, 1791. In 1792 he strongly advocated the abolition of the monarchy, and became president of the convention in Nov.

During the consulate he continued to work for ecclesiastical reform, but, opposing Napoleon's concordat with Pope Pius VII, resigned his bishopric in 1801. In the senate he vainly opposed the establishment of the empire, and worked against it during its last months in 1814. After the Bourbon restoration, however, he was forced to live in retirement. In 1819 he was elected to the chamber for Isère, but the election was quashed by a special vote. Grégoire finally retired and wrote on ecclesiastical history. He died at Auteuil, May 28, 1831.

Gregorian Calendar. Calendar introduced by direction of Pope Gregory XIII in 1582. The pope declared that Oct. 5 that year should be called Oct. 15 and ten days omitted. It was a reform of the Julian calendar, but was not adopted in Great Britain until 1752. See Calendar.

Gregorian Chant. Term applied to the plainsong system used in the rendering of the music of the services of the church as supervised and settled by S. Gregory. The principal eight modes or tones may be described as represented by the white notes alone of the pianoforte, with the exception of an occasional B flat to avoid the harshness of the tritone. The four authentic modes are No. 1 (Dorian, E to D), No. 3 (Phrygian, E to E), No. 5 (Lydian, F to F), and No. 7 (Mixo-Lydian, G to G). Coupled with each of these but lying a fourth lower, is a plagal mode distinguished by an even

Henri Grégoire,
French revolutionary

number and having the prefix hypo to the Greek term. Each pair has the same final, but a different

The same in modern notation

Gregorian Chant. Tone VIII, 1st ending, with transiteration into modern notation

dominant, i.e. the note to which the recitation is chanted. The dominant of an authentic mode is the fifth degree except when, as in No. 3, that happens to be B; then the dominant is the sixth. The dominant of a plagal mode is a third lower than that of its associated authentic mode, except that C takes the place of B as before.

Structurally, the chant begins with an intonation, used in every verse of the Canticles, but only in the first verse of the Psalms, followed by a reciting note (dominant) and a melodic extension called the mediation. This closes the first portion of the chant. The second begins with a reciting note (dominant again), and concludes with a melodic extension called the ending. Each of the tones has various endings. It is not necessary that the ending should close on the final, which, however, is always supplied by the antiphon which precedes and follows each canticle or psalm.

In addition to the eight principal tones others are sometimes used. The material being the same, the only difference lies in the notes taken as finals and dominants. As in all plainsong, the music is noted on a four-line staff with either the For the C clef, and for performance is transposed to any convenient pitch. See Ambrosian Chant.

Gregorovius, FERDINAND (1821-91). German historian. Born at Neidenburg, E. Prussia, Jan. 19, 1821, he was educated at Königsberg, and became a teacher. He passed much of his life, however, in Italy, and his great work is his History of Rome in the Middle Ages. Accurate, detailed and scholarly, this monumental work in many volumes traces the history of the city, and with it of the papacy, from about 400 to 1534 (Eng. trans. A. Hamilton, 1894-1900). Gregorovius wrote a number of other historical works, includ-

ing a Life of the Emperor Hadrian (Eng. trans. R. Martineau, 1855), and some poems. He died at Munich, May 1, 1891.

Gregory. Salt lake of S. Australia. It lies between Lake Eyre and Lake Blanche in lat. 29° S. and long. 139° 10' E. Its length is 40 m., and maximum breadth 10 m.

Gregory THE ILLUMINATOR (c. 257-332). Apostle of Armenia and saint. Descended from the royal race of Parthia, his family were killed in revenge after his father, Anak, had assassinated the king of Armenia. The boy was educated as a Christian at Caesarea, and later returned to Armenia, probably about 290. He is said to have been imprisoned there for 14 years, and to have been released as a reward for healing King Terdat (Tiridates) of a disease. He later became the head of the Armenian Church, but gave up office in 331 and spent the rest of his life in a cave.

Gregory NAZIANZEN (c. 330-390). Saint and father of the Eastern Church. He was a native of Nazianzus, in Cappadocia, of which place his father became bishop. His mother was a woman of deep piety. He studied at the two Caesareas, Alexandria, and Athens, and had Julian, afterwards Roman emperor, for fellow student, and Basil for friend. He assisted his father at Nazianzus, was made bishop of Sasima, was elected bishop of Constantinople, and, one of the most eloquent orators of the early church, became famous for his defence of the Nicene faith and his opposition to Arianism and Apollinarianism. Jerome was one of his pupils.

His consecration as bishop of Constantinople took place in 381, but the Macedonian and Egyptian bishops contending that the canons of Nice limited a bishop to one diocese, he resigned and spent the rest of his life in his birthplace. His writings include letters, which abound in beautiful thoughts, poems, and 45 orations which won for him the title of Theologian. The best edition of his works is the Benedictine, Paris, 1778-1840. *Consult* memoir, C. Ullmann, 1825, Eng. trans. G. F. Coxe, 1857.

Gregory of NYSSA. Greek saint and father of the church. Born at Caesarea about 331, the younger brother of S. Basil, who brought him up, he taught rhetoric for some years, after which he was ordained, and about 371 was appointed bishop of Nyssa in Cappadocia. In 375 he was deposed on a false charge of misappropriating church funds, three years later he was restored to his see, and took part in the Councils of Constantinople in

381 and 394. He probably died in 396. His numerous writings all dealt with theological and ecclesiastical questions.

Gregory of TOURS (538-594). Frankish historian. Born at Clermont-Ferrand, Nov. 30, 538, he was educated for priesthood. In 573 he was made bishop of Tours, a position which gave him a standing in the Frankish realm. The civil wars of the time were constantly at his doors, but he seems to have been equal to most emergencies. He died, Nov. 17, 594. Gregory wrote in Latin several works, but only his History of the Franks is of any importance. The early part of this is mainly legend and tradition, but for the 6th century, when the author narrates contemporary or nearly contemporary events, it is perhaps the most valuable authority extant.

Gregory. Name of 16 popes. Gregory III, pope 731-41, was a Syrian whose reign was troubled by Lombard invasions. Gregory IV, a Roman pope, 827-44, was involved in the feuds of the Frankish emperor, Louis the Pious.

Gregory V, pope 996-99, the nominee of his cousin, the emperor Otto III, was the first German pope. Gregory VI received the papacy from his godson, the youthful profligate pope, Benedict IX, April, 1045, in exchange for a large sum of money. Benedict subsequently regretted his resignation, an anti-pope Sylvester III put in a claim, and the Roman clergy appealed to the German king, Henry III, to establish order. Benedict and Sylvester were banished, and a synod at Sutri, Dec. 1046, declared that Gregory had become pope through simony. Henry then arranged that a German, Clement II, should be elected pope, and Gregory resigned. He died in Germany early in 1048.

Gregory I CALLED THE GREAT (c. 540-604). Pope 590-604. Born at Rome, he was the son of Gordianus, a Roman patrician.

About 574 he threw up a promising worldly career—he held the office of prefect of the city the previous year—to become a monk. His family estates in Sicily were given up for the foundation of monasteries, and his home on the Caelian Hill was converted into a religious house dedicated to S. Andrew, where Gregory lived in retirement for some years.

In 578 Pope Pelagius II ordained

Ferdinand Gregorovius, German historian

Gregory the Great, Pope, 590-604

him one of the 7 deacons of the city, and the following year dispatched him on a special mission to Constantinople with the object of obtaining help from the emperor against the Lombards now actively threatening Rome.

On his return to Rome after six years' absence, he devoted himself to teaching and literary work; this period is also marked by the incident, related by Bede, of his meeting the English youths in the Forum which fired him with the project for the conversion of England. His original idea was to go himself, and he had actually started when the pope, to whom Gregory acted as confidential secretary, prompted by the Romans, sent urgent messages desiring his return. In 590 he became pope, and in 596 he sent Augustine to Britain. Gregory's remarkable gifts of management and organization were displayed in his scheme of relief for the needs of the refugees thronging Rome, no less than by the reorganization of the vast estates constituting the patrimony of the Church. He gave his name to that mode of plain chant (Gregorian) which, supplanting previous modes, became pre-eminently the music of the Church.

Gregory's Letters (collected in 14 volumes) are a witness to his unceasing labours in the supervision of the whole Church, not merely as a firm upholder of the supremacy of the papacy over East and West, but as overseer of local ecclesiastical affairs, the election to vacant sees, and the holding of local synods.

The first monk to become pope, Gregory's influence tended naturally to enhance the importance of the monastic system and to bring it into closer relationship with the Church. The action which placed Gregory at variance with the Byzantine emperor when the former took upon himself to arrange terms of peace with the Lombard chiefs, marks a distinct stage in that process by which the papacy arrived at temporal sovereignty.

The weight and influence lent to the papacy by Gregory's pontificate gained Gregory his title of Great. He was canonised by popular acclamation immediately after his death, March 12, 604, and ranks as a doctor of the Church. His festival is kept March 12 throughout the Roman Catholic Church. Gregory's special emblem in art is a dove which, according to the story, was seen sitting on his head as he dictated his Homilies. See Augustine; Papacy; *consult also* Pope Gregory the Great and his Relations with Gaul, F. W. Kellett, 1889; Gregory the Great, J. Barmby,

1892; Gregory the Great, His Place in History and Thought, F. H. Dudden, 1905.

Gregory II (d. 731). Pope 715-731. A Roman, of the Savelli family, he started his ecclesiastical career as a pupil in the papal *Schola Cantorum*. Under Sergius I (687-701) he was made sub-deacon and papal almoner (*sacellarius*) and later papal librarian. After becoming pope

Gregory II,
Pope, 715-731

he was visited by the Englishman Winfrid or Boniface, whom the pope authorised to preach to the heathen "on the right bank of the Rhine." Gregory II died Feb. 11, 731.

Gregory VII (c. 1025-85). Pope 1073-85. His name was Hildebrand, and he was born in Tuscany of obscure and, probably, humble origin. Educated at the Cluniac monastery on the Aventine Hill, Rome, where his uncle was abbot, he was created cardinal-deacon by Pope Leo IX, and administrator of the papal estates, where he proved the possession of those gifts of administration which distinguished his later rule.

Resisting the attempts of the Romans to make him pope on the death of Leo IX, he managed to secure the nomination of his candidate who became pope as Victor II in 1054. The latter was succeeded in 1057 by Stephen IX, who died while Hildebrand was engaged on an embassy to Germany. It had been the pope's wish that Hildebrand should succeed him, and he forbade an election to take place until after Hildebrand's return, but a faction seized the opportunity to set up a pretender, who assumed the title of Benedict X. The pseudo-pope was, however, disposed of by the prompt action of Hildebrand, whose own candidate again ascended the papal throne as Nicholas II.

A succession of German popes had tended to increase the imperial influence, particularly in the matter of elections to the papal throne, to a dangerous extent. A decree now promulgated vested the right of electing a pope in the college of cardinals, thus placing the appointment alike out of the power of the emperor no less than

out of that of the Roman patri- cians with their factions. On the death of Pope Nicholas in 1061, the malcontents among the Italian factions set up an anti-pope who, under the title of Honorius II, created a schism which lasted three years. Eventually Hildebrand's candidate prevailed and was enthroned as Alexander II.

The reform movement, meanwhile, continued to gain ground under Hildebrand, who, made arch-deacon in 1059, was now created papal chancellor. At last on the death of Alexander, Hildebrand, who had guided the policy of his six predecessors, was chosen by popular acclamation, subsequently was canonically elected, and ascended the papal throne as Gregory VII. In accordance with some vague reference to the emperor's voice in papal elections, embodied in the decree of Nicholas II, he deferred consecration until notice of his election had received imperial acknowledgment; no such sanction was ever sought again.

Gregory's first care was thus to secure peace with secular authority in order to further the aims which he put forward at his first Lenten Synod held in Rome, March, 1074. The reforms there promulgated, the abolition of simony, and the moral discipline of the clergy set forth in decrees involving clerical celibacy and continence, were intended as means only to an end, of which the uplifting and purifying of the clergy were necessary conditions.

The uproar created throughout Europe by the promulgation of these decrees did not deter Gregory, who followed them up by sending his legates over the country with authority to depose such of the clergy as should refuse to submit, and he enforced them still further by attacking the real root of the evil, i.e. lay investiture or the appointment to ecclesiastical offices by secular persons, an old abuse against which the reforming body in the Church had protested in vain. The decree of the synod which excommunicated any lay person, emperor or king, who should confer an investiture in connexion with any ecclesiastical office, brought the pope into collision with the whole secular force of Europe, while the interests involved and the personal character of the combatants embittered the struggle.

The emperor, Henry IV, who previously had confessed his misdeeds against the Church and promised amendment, was now summoned to appear before a council at Rome to answer for his conduct.

Gregory VII,
Pope, 1073-85
After Raphael

Henry's answer was to summon a meeting of his supporters at a great council held at Worms, January, 1076. Defending the emperor against the charges laid against him, they proceeded to depose the pope himself, this decision being announced to Gregory by letter in which the emperor addresses the pope as "Hildebrand, no longer Apostolic but a false monk."

Gregory responded by excommunicating the emperor at a synod in Lent (1076), deposing him and absolving his subjects from their allegiance. Henry, finding himself gradually abandoned by his partisans and faced with the possibility of the election of another emperor, felt compelled to submit, and hurried to Italy. The story of his three days' humiliation in the snow outside the walls of the castle of Canossa is well known.

Yet the triumph of Hildebrand was more apparent than real; at the price of an outward show of mortification Henry was able to obtain all he desired. He again incurred excommunication in 1080, but the death of one enemy, Rudolf of Swabia, elected by the German princes at the council of Augsburg in 1077 to succeed him, enabled him at last to concentrate all his forces on his greater enemy the pope. Having set up an anti-pope in the person of the excommunicated archbishop of Ravenna, who took the name of Clement III, he marched on Rome, where on March 21, 1084, he caused himself to be crowned by the pseudo-pope. Meanwhile Gregory, obliged to leave Rome, took refuge first at Monte Cassino, the great Benedictine monastery, and then at Salerno, where he died May 25, 1085. One of his last acts was to release from sentence of excommunication all his enemies except Henry and the anti-pope. Gregory VII was canonised by Paul VI in 1606. The extent of his reforms entitles him to be called the greatest medieval pope. *Consult* Hildebrand and His Times, W. R. W. Stephens, 1898; Life and Times, A. H. Mathew, 1910; Life, A. J. Macdonald, 1932.

Gregory VIII (d. 1187). Pope. His name was Alberto di Morra, and he became a monk. In 1155 he was made a cardinal, and in 1172 papal chancellor. In the same year he was one of the two legates sent to England by the pope to inquire into the circumstances attending the murder of Becket, and from him Henry II received absolution. As pope Oct.-Dec., 1187, he tried to effect a reconciliation with the emperor Frederick I in order to present a united front against

Saladin. He died at Pisa, Dec. 17, 1187, whither he had gone with the object of making peace between the two rival seaports of Pisa and Genoa, on whom depended the naval and transport operations of the projected crusade.

Gregory IX (c. 1145-1241). Pope 1227-41. Born at Anagni in the Campagna district, his name

Gregory IX,
Pope, 1227-41

was Ugolino, Conte de Segni. Under his relative, Pope Innocent III (1198-1216), he was made a cardinal 1206, and in 1207-9 was legate on important diplomatic missions to Germany. By Pope Honorius III he was created plenipotentiary legate for Lombardy and was deputed to preach a new crusade to the Holy Land. Ugolino ascended the papal throne March 19, 1227, on the death of Honorius, and three days later summoned the emperor Frederick II, who had taken the cross on his coronation in 1220, to the fulfilment of his vow. This was the beginning of a struggle between the papacy and the empire, which lasted the whole of Gregory's pontificate, and only ended with the death of Frederick in 1250.

The emperor apparently complied with the summons, sailed from Brindisi in Sept., and returned in three days. The pope, distrusting his sincerity, launched on him sentence of excommunication, Sept. 27, 1227, but he could not prevail on the princes and bishops of Germany generally to acquiesce in the sentence which released them from their oath of allegiance to Frederick, and the publication of the ban in S. Peter's, Rome, so excited the Ghibellines that the pope fled from the city to avoid the violence of the mob.

The emperor, disregarding the sentence, continued his crusade, and wrote from Jerusalem, March 17, 1229, to announce the success of the expedition; the Holy City was once more in Christian hands, and Frederick crowned himself in the church of the Holy Sepulchre. His triumph seemed complete, but his position was intolerable. He abruptly left Syria and returned to Europe to find his opponent a fugitive at Perugia.

Gregory returned to Rome in Feb., 1230, and a peace between the two belligerents was concluded in July. But athwart the Hohenstaufen dream of universal domination lay the papacy, represented

by a figure as indomitable as Frederick himself, and trouble soon broke out. For a time the struggle was maintained by the Lombard League, which Gregory joined on the avowal of the emperor's intention to extend his empire over almost the whole of Italy, including the papal states. On March 20, 1239, Gregory again excommunicated Frederick, and later gave orders for a general council to assemble at Rome at Easter, 1241. But Frederick, who had defeated the league at Cortenuova, 1237, continued his progress in spite of a reverse before Brescia the following year, and effectually prevented the meeting by threats and violence. Advancing with his army, he was already within sight of Rome when news arrived that his opponent had died on Aug. 22, 1241.

In contrast with this struggle is Gregory's attitude towards the Mendicant Orders, whose rise is the prominent religious feature of the period. He was appointed Protector of the Friars Minor in 1220 at the special request of S. Francis, whom he canonised in 1228; and he was the friend and patron of S. Dominic. The pope sought in the Friars, as well as in the older orders, instruments for the conversion of the heathen in the remoter parts of Europe, in Asia, and in Africa. He made unsuccessful attempts to induce the Eastern Church to return to the unity of Christendom.

Gregory's special legislation, which withdrew heresy cases from secular jurisdiction and brought them before special tribunals on which members of the new religious Orders, and more particularly Dominicans, were appointed to sit, dates the medieval Inquisition as a creation of his pontificate.

Gregory X (1210-76). Pope 1271-76. Born at Piacenza, his name was Teobaldo di Visconti. He was elected pope Sept. 1, 1271, after a vacancy of nearly three years in the Holy See following the death of Clement IV. Gregory was not a cardinal, nor even a priest, when the choice of the cardinals at Viterbo fell upon him, and he was engaged at the time in an expedition to the Holy Land. Ordained priest six days after his entry into Rome, March 13, he was consecrated pope, March 27, 1272. Gregory's aims were peace for Europe, the reform of the Church, and the reunion of Christendom by the abolition of the Eastern Schism. In the cause of peace he endeavoured to reconcile the warring factions of Guelph and Ghibelline; he persuaded the German electors to choose a new emperor on the death (1272) of Richard of

Cornwall, and loyally supported their choice against rival claimants. In the interests of reform he summoned a General Council which met at Lyons, May, 1274, where he promulgated the new law of the Church for papal elections.

But the passion of Gregory's life was for the Holy Land and the kingdom of Jerusalem then tottering to its fall. His death (Jan. 10, 1276) put an end to his preparations for a fresh crusade and dissolved the new reunion of East and West. He received local veneration as a saint in Italy, where his feast is kept on Feb. 16.

Gregory XI (1331-78). Pope 1370-78. His name was Pierre Roger de Beaufort, and he was created a cardinal at the age of eighteen by his uncle, Clement VI. On Dec. 30, 1370, he was elected pope. The seventh in succession of the Avignon popes, the most mem-

Gregory XI,
Pope, 1370-78

orable act of his pontificate was the re-transference of the see to Italy. Beginning with plans for reform and reconciliation, he was forced to concentrate his efforts on quelling the rebellion of his own subjects. When Gregory laid Florence under a ban, the citizens sent S. Catherine of Siena to Avignon to intercede for them (June, 1376). She failed in her embassy, but induced the pope to return to Rome. Contrary to the advice of his court Gregory sailed for Italy, and made his formal entry into Rome, Jan. 17, 1377, thus ending the 70 years' exile. He died March 27, 1378.

Gregory XII (c. 1327-1417). Pope 1406-15. Angelo Corrarò, or Correr, who as Gregory XII was recognized as rightful pope during the Great Schism (1378-1417), was born at Venice of a noble family, became bishop of Castello in 1380, and in 1405 cardinal.

Gregory XII,
Pope, 1406-15

He was elected to the papacy in succession to Innocent VII in 1406. Before the election each cardinal vowed that in the event of his own election he would abdicate his right provided that the anti-pope Benedict XIII would do the same.

The proposal to do this immediately after the election fell through, and subsequently the pope pro-

ceeded to make cardinals of the members of his own family, contrary to his promise to the conclave. The Council of Constance (1414-18) declared the deposition of all anti-popes and received Gregory's abdication, conferring on him the bishopric of Porta, which he held up to his death, Oct. 18, 1417.

Gregory XIII (1502-85). Pope 1572-85. Ugo Buoncompagno was born Jan. 7, 1502, at Bologna, at the university of which he studied and taught. Coming to Rome in 1539, he was employed successively by Paul III, Julius III, Paul IV, and Pius IV. He was

Gregory XIII,
Pope, 1572-85

sent by Pius IV, in 1559, in a confidential capacity to the Council of Trent, where he remained until it closed in 1563, and the following year was made cardinal. He was elected pope on the death of Pius V.

Faced with the loss to the Church of whole nations through Protestantism, Gregory sought a remedy in the building and endowing of colleges and seminaries for the training of propagandists and candidates for the ministry. Among the foundations built or endowed by him was the Jesuit College, Rome, an Order on which Gregory relied for missionary work in China, Japan, and India. An order was given by him for a Te Deum to be sung in Rome in celebration of S. Bartholomew's Day.

The most memorable act of his pontificate was his reform of the Julian calendar (*see* Calendar). Gregory's method of replenishing his treasury, depleted by his building schemes, by confiscating old properties the titles to which he claimed as lapsed, involved him in much trouble with his subjects. He died April 10, 1585.

Gregory XIV (1535-91). Pope 1590-91. The son of a Milanese senator, Niccolò Sfondrati, he was born Feb. 11, 1535, and educated at the universities of Perugia and Padua. In 1560 he was made bishop of Cremona, and cardinal in 1583. Elected pope in succession to Urban VII, by the advice of Philip II of Spain he joined the league against Henry IV of France. He died Oct. 15, 1591.

Gregory XV (1554-1623). Pope 1621-23. Alessandro Ludovisi was born at Bologna, studied at Rome under the Jesuits, and graduated at the university of his native city. Returning to Rome, he was ap-

pointed to various offices by successive popes, was made archbishop of Bologna in 1612 and cardinal in 1616 by Paul V, whom he succeeded as pope in 1621. His pontificate was responsible for two decrees of importance, the first establishing a regular mode and

Gregory XV,
Pope, 1621-23

ritual in the conduct of papal elections, the second constituting a special and permanent congregation for the control of foreign missions. He died at Rome, July 8, 1623.

Gregory XVI (1765-1846). Pope 1831-46. Mauro, or Bartolomeo Alberto Cappellari, born at Belluno in Venetia, Sept. 8, 1765, entered a Camaldolese monastery and became a priest. Sent to Rome, in 1800 he was made abbot of San Gregorio on the Coelian Hill.

Gregory XVI,
Pope, 1831-46

Forced during the Napoleonic troubles to retire from Rome, he returned thither on the fall of the emperor. In 1825 he was created cardinal.

His election to the papacy, Feb. 2, 1831, in succession to Pius VIII was the signal for an outbreak of revolution in the papal states which was only kept in check with the assistance of armed force from Austria. Gregory was wholly opposed to any measure of democratic control, and the Encyclical of 1832, rejecting the appeal of Lamennais, Lacordaire, and Montalembert, showed him equally unsympathetic to political liberalism. He died June 9, 1846

Gregory, AUGUSTA, LADY (1859-1932). An Irish dramatist. The youngest daughter of Dudley Perse of co. Galway, she married in 1881 Sir William Gregory (d. 1892). Lady

Lady Gregory,
Irish dramatist
Berestford

Gregory was an enthusiastic promoter of the Irish literary revival. Two remarkable works, *Cuchulain of Muirtemme*, 1902, and *Gods and Fighting Men*, 1904, render Irish

sagas into the idiom of the Irish peasantry, into which she also translated three of Molière's plays, *The Kiltartan Molière*, 1910. Her own plays, produced by the "Irish Literary Theatre, which with Yeats she helped to found, include *Spreading the News*, *The White Cockade*, *The Rising of the Moon*, *The Workhouse Ward*, *The Gaol Gate*, and *The Full Moon*. Lady Gregory died May 22, 1932. Her Journals were edited by L. Robinson, 1946.

Gregory, Sir Richard Arman (b. 1864). British scientist. He was born at Bristol, Jan. 29, 1864, and educated at Queen Elizabeth's Hospital there and the Royal College of Science. He became assistant editor of *Nature* in 1893 and was editor 1919-39. Emeritus professor of astronomy at Queen's College, London, Gregory was president of the Royal Meteorological Society, 1923-29, and of the British Association for the Advancement of Science, 1940-46. Knighted in 1919, he was made a baronet in 1931 and F.R.S. in 1933. His numerous publications on geography, physics, and chemistry include *The Vault of Heaven*; *Education in World Ethics and Science*.

Gregory's Powder. *Pulvis Rhei Compositus* or compound powder of rhubarb. It consists of rhubarb 25 parts, heavy and light magnesium carbonates each 32½ parts, ginger 10 parts. It is a purgative. Dose 10 to 60 grains.

Greiffenhagen, Maurice William (1862-1931). British artist. Born in London, Dec. 15, 1862, of a Russian father and an English mother, he studied at the R.A. schools, and long successfully practised black and white work, especially in connexion with Rider Haggard's tales. In 1906 he was appointed head of the "life" dept. of the Glasgow School of Arts, and in 1916 was elected A.R.A., and R.A. in 1922. He is represented in the Chantry bequest. He died Dec. 27, 1931.

Greifswald. One of the oldest and, in the later Middle Ages, most important towns and ports of Pomerania, Germany. It stands 2 m. from the mouth of the Ryckgraben, 20 m. S.E. of Stralsund. Founded 1241, endowed with urban rights 1250, it was a member of the Hanseatic League from 1278. Its university, founded 1456, specialising in Nordic and Finnish studies, was the oldest of Prussia's universities when the district was annexed in 1815. From 1648 to 1807 Greifswald

was the seat of the Swedish government of Pomerania; during 1807-10 under French rule. In 1945 it fell to the Russians. It has a spa for rheumatic diseases. The church of S. Mary is typical of northern brick Gothic (13th century), and that of S. Nicholas has a 330-ft. tower (14th century). Pop. 29,722.

Greisen. Rock consisting of quartz and mica. It is a variation of the granite in which it occurs, being recrystallised granite in which the feldspar has been replaced by quartz and mica. It is often associated with deposits of tin and tungsten ores.

Greiser, Arthur (1897-1946). Danzig politician. Starting as a mason, becoming an oil merchant, and a motor boat owner, he entered the Danzig parliament and became a prominent advocate of Nazism about 1930, acquiring notoriety by thumbing his nose at the League of Nations assembly during a Danzig discussion, 1936. Gauleiter of Poznan (Posen) under Hitler in the Second Great War, he was said to have transferred 50,000 Polish peasant families from their homes in two years, and to have massacred 100 political prisoners on one occasion at Zgerz in 1942. His capture was announced by the Russians, April 4, 1945. Condemned as a war criminal, he was executed at Poznan, July 21, 1946.

Greiz. Town of Germany, in Thuringia, formerly the capital of the principality of Reuss-Greiz (or elder branch). It stands on the White Elster, 50 m. S. of Leipzig, the new town being on the left bank and the old town on the right. Notable features are a 16th century castle built on an eminence overlooking the town, two handsome palaces, formerly the re-

sidences of the prince of Reuss, a university, several churches, and government buildings. Greiz has machine, paper, and chemical plants. Pop. 39,903.

Gremlins. Goblins playfully invented by the R.A.F. during the Second Great War. These sprites were blamed for any inexplicable occurrence that might befall an unfortunate air crew. Mysterious petrol stoppages, a jammed gun, the failure of an aircraft to fly level, the erratic behaviour of a compass, were all attributed to the malignant influence of gremlins. There were male, female, and baby gremlins, each having its own sphere of influence.

Grenada. Island of the W. Indies, in the Caribbean Sea, belonging to Great Britain. It is the

Grenada arms

southernmost of the Windward group, which forms a united colony 86 m. due N. of the W. end of Trinidad. Area, 133 sq. m. Pop. est. 88,016.

This is one of the most beautiful islands of the W. Indies, with diversified scenery, a delightful climate, and exceedingly fertile soil suitable for the raising of tropical produce. Of volcanic origin, a wooded range of mountains, reaching an elevation of 2,751 ft. in St. Catherine's Mt., traverses the island from N. to S. It includes several extinct volcanoes, whose craters are now lakes, the chief being the Grand Etang and Lake Antoine. There are numerous small rivers, besides hot mineral springs. One-fourth of the area is cultivated, and agriculture is the principal occupation.

The chief products are cacao, coffee, sugar, rum, nutmegs, mace, cotton, cotton seed, arrowroot, hides, timber, and turtles, most of these being exported. The most prominent industry concerns cacao, and there is a sugar factory. The roads are good, the rainfall abundant, and there is steamer communication with the neighbouring ports and islands.

St. George's, the capital and the seat of the governor of the Windward Islands, is built on a peninsula and has an excellent harbour, nearly landlocked; it is a coaling station. Other towns are Gouyave, Sauters, and Grenville. Grenada is administered by a legislative council, with a governor assisted by seven nominated and seven elected members.

Discovered by Columbus on Aug. 15, 1498, it was settled by

Grenada. Map of this West Indian Island in the Caribbean Sea

the French—the natives still speak a French *patois*. Captured by the English in 1762, it was retaken by the French in 1779, and finally restored to Great Britain in 1783. In 1795 the French landed troops on the island, causing an insurrection, which was not quelled until the following year.

Grenade. Small missile containing an explosive charge, sometimes referred to as a bomb. A primitive form of grenade was used during the 15th century. It was filled with gunpowder and had a wooden, earthenware, or metal casing, the fuses being crude and uncertain. Hand missiles were employed after 1660 by special troops called grenadiers (*g.v.*), and were in common use during the 17th–18th centuries. Having fallen into disuse, they were revived in a high explosive form in the Russo-Japanese War of 1904, and in the trench fighting of the First Great War.

The principal anti-personnel grenade of the British army is the Mills or No. 36 grenade, invented

Grenade. Sectional diagram showing principal parts and explosive mechanism of a Mills grenade

during the First Great War. It consists of a barrel-shaped metal casting, externally grooved in segments to ensure good fragmentation. It weighs 1½ lb. and contains 2½ to 3 oz. of high explosive. The safety fuse is ignited mechanically as soon as the grenade is thrown; this happens on the release of a striker actuated by a spring, which until then has been retained by a lever. On withdrawing the safety pin, the lever is held to the grenade by the thrower's fingers, but on the grenade being released, the loose lever is freed and a cap is struck which ignites the length of safety fuse. Originally there were two lengths of fuse, one burning four and the other seven secs.; but after accidents, the four-sec. fuse was standardised.

Rifle grenades are used to increase the range, and were originally of the percussion type, with

a steel tail rod, inserted into the barrel of the ordinary service rifle and propelled by the gases of a blank cartridge. This tended to damage the rifle and led to the introduction of the discharger cup. A short cylindrical cup is attached to the muzzle of the rifle, the grenade is placed in it and discharged by the gases from a blank cartridge acting on the base of the grenade. Range is governed by elevation of the rifle, and by a gas-check with adjustable gasports. The Mills grenade can be adapted for firing from a discharger cup by the addition of a gas-check plate.

The anti-tank grenade No. 73 has a percussion fuse, and a tinned plate casing containing about 3½ lb. of high explosive. The fuse has a safety device consisting of a pin attached to a tape; the tape unwinds with the rotation of the grenade during flight, and so withdraws the safety pin. Until the grenade is ready for throwing, the tape is prevented from unwinding by a safety cap. The phosphorus or A.W. grenade, used against tanks, vehicles, pillboxes, etc., ignites spontaneously as soon as the glass casing is broken. The sticky or S.T. grenade is a high explosive projectile with a five-sec. time fuse, designed to stick on impact and used against armoured fighting vehicles. It consists of a glass flask in a sticky woollen cover, and contains 1½ lb. of high explosive. A throwing handle incorporates a device for igniting the safety fuse. This grenade is effective only against lightly armoured vehicles.

Grenadier. Literally, a soldier who throws a grenade. He appeared first in the 17th century, the early custom being for each regiment to have its company of grenadiers. The French led the way, their example being soon followed in England and elsewhere; in England soon after the formation of the standing army each battalion had its grenadier company. The grenadiers were picked men, and this company was usually regarded as the leading one in a regiment, taking the place of honour on parade.

The next step was to form these companies into battalions. This was done in France and Prussia more than in England, and hence arose the regiments that now bear the name grenadiers. Grenadier companies ceased to exist in the British regiments soon after 1850. The grenadier's special head-dress was a pointed

cap of embroidered cloth, having peaks and flaps; or a lobse fur cap similar in shape.

Grenadier Guards. THE Regiment of the British army. Raised by Col. Russel in 1660, from men who had served in a King's Royal Regt. of Guards, a Cavalier unit formed in Flanders in 1656, it became the body-guard of Charles II. The premier regiment of

Grenadier Guards badge

Foot Guards, the Grenadier Guards won their first battle honour at Tangier in 1680; their second at Namur in 1695; and Gibraltar was added in 1704–05. Then followed Marlborough's four great victories. They fought at Dettingen and Fontenoy; and two battalions were with Moore at Corunna. During the Peninsular campaign the regiment gained also the honour of Nive. Two battalions lost more than 1,000 men at Quatre Bras and Waterloo, receiving the title of the First or Grenadier Regt. of Foot Guards. Later honours were won in the Crimea, Egypt, and South Africa.

In the First Great War the history of the regiment after Sept., 1915, was that of the Guards division; and the honours include most of the principal battles fought in France and Belgium. During the Second Great War three battalions went to France in Sept., 1939, and in 1942 four battalions were included in the newly-formed Guards armoured division, with which they were associated until June, 1945. Grenadier guards fought with the 1st and 8th armies in N. Africa, and with the latter in Italy.

With the other Foot Guards the Grenadiers have the privilege of guarding the royal palaces and the Bank of England, and of marching through the City of London with fixed bayonets. On April 21, 1942, Princess Elizabeth was appointed hon. colonel of the regiment.

Grenadines. Cluster of small islands and islets in the Caribbean Sea, belonging to Great Britain. They lie between St. Vincent and Grenada in the W. Indies, and are apportioned administratively between St. Vincent and Grenada. Carriacou, the largest, is attached to Grenada, covers 11 sq. m., and contains most of the pop., having 7,104. Only three of the islands are inhabited, but the soil is fertile.

Grenfell, BERNARD PYNE (1869-1926). British archaeologist. Born at Birmingham, Dec. 16, 1869, and educated at Clifton and Queen's College, Oxford, he began exploration work in Egypt in 1894. In company with A. S. Hunt he discovered at Behnesa in 1896-97 and 1905-06 immense hoards of Oxyrhynchus papyri. He was appointed professor of papyrology at Oxford in 1908, and honorary professor in 1916. Grenfell and Hunt published jointly papyri from Oxyrhynchus, Tebtunis, Hibeh, and other finds. The *Sayings of Our Lord*, 1897; and *New Sayings of Jesus*, 1904, were issued separately. Grenfell died May 17, 1926.

Grenfell, DAVID RHYS (b. 1881). British politician. He was born at Penrheol, near Swansea, June 27, 1881, and worked as a miner from the age of 12 until he was 35. He qualified as a colliery manager and was appointed miners' agent in 1916. In 1922 he entered parliament as Labour member for Gower. He was a member of the forestry commission, 1929-42; of the royal commission on safety in mines, 1939; and secretary for mines, 1940-42, in the Churchill govt. He was made C.B.E. in 1935.

Grenfell, JULIAN HENRY FRANCIS (1888-1915). An English poet. Eldest son of Lord Desborough (q.v.), he was born March 30, 1888, and educated at Eton and Balliol College, Oxford. He boxed for Oxford and the army. After winning the D.S.O. in the First Great War, he was wounded and died at Boulogne, May 26, 1915. He is chiefly remembered for his poems *Into Battle*, and *To a Black Greyhound*.

Grenfell, SIR WILFRED THOMASON (1865-1940). British medical missionary. Born near

Sir Wilfred Grenfell,
British medical
missionary
Elliot & Fry

Chester, Feb. 28, 1865, he studied medicine, became house surgeon at the London Hospital under Treves, and fitted out the first hospital ship for North Sea fishermen.

establishing homes for their use. In 1892 he visited Labrador, living in the trading ports of the Hudson's Bay Company, where he treated some 900 patients. Here he set himself the task of introducing education, health, and social services. His

schemes for the development of the country were supported by lecture tours in Great Britain, Canada, and the U.S.A., until, greatly with American help, the International Grenfell association was founded with an endowment of over £200,000. A chain of hospitals at 150-mile intervals was built throughout Labrador, with nursing stations, orphanages, public schools, welfare clinics, and fishermen's institutes. "Grenfell of Labrador" was knighted in 1927. His publications, mainly autobiographical, included *A Labrador Doctor*, 1918; *Forty Years for Labrador*, 1932. He died in Vermont, Oct. 10, 1940.

Gren Foundation. Foundation for promoting closer co-operation between the Scandinavian countries by scientific research. Established by a Swede, Axel Wenner Gren, in 1937, it provides about £50,000 a year for scientific research in order to strengthen the work of social and economic improvement.

Grenoble. City of France, in the dept. of Isère, the old capital of Dauphiné. It stands on the Isère,

Grenoble, France. Pont d'Hôpital over the Isère. Behind the city lie the snow-covered French Alps

75 m. S.E. of Lyons, and is beautifully situated at the foot of Mt. Rachais. The chief buildings are the cathedral of Notre Dame, partly of the 11th century; the church of S. André, with its monument to Bayard; and the old church of S. Laurent. Secular edifices include the palais de justice, the library, with a fine collection of manuscripts, books, and paintings, and the university. Grenoble is a river port, and is noted for its manufacture of gloves.

The city existed under the Franks, and even earlier. It was part of Provence before becoming part of France, and as the chief town of Dauphiné was an important place, retaining certain privileges until the Revolution. It was occupied by German forces after the Allied landings in N. Africa in Nov., 1942, but became a centre of the French resistance movement. On Nov. 13-14, 1943, an artillery park was destroyed.

and the De Bonne barracks were blown up on Dec. 2, more than 700 Germans being killed or wounded. American troops liberated Grenoble on Aug. 23, 1944. Pop. 102,161.

Grenville, WILLIAM WYNNDHAM GRENVILLE, BARON (1759-1834). English statesman. Born Oct. 25,

Lord Grenville,
British statesman
After J. Jackson, R.A.

1759, he was the youngest son of George Grenville (q.v.). Educated at Eton and Christ Church, Oxford, he entered parliament for Buckingham in 1782. His family connexions

made his way easy, and having for a short time been secretary to his brother, Earl Temple, lord-lieutenant of Ireland, he became paymaster-general under Pitt in 1783. In 1786 he was made vice-president of the committee on trade; in 1789, having been for a few months Speaker, he became home secretary, and in 1791 foreign secretary. He had been a peer since 1790.

Grenville remained in office with Pitt until the two resigned in 1801, the period being a most eventful one, but his attachment to Fox prevented him from returning to power in 1804. In

1806, on Pitt's death he and Fox formed the coalition ministry of "all the talents" but this lasted only until March, 1807, as Grenville, who was premier, refused to pledge himself against relief to Roman Catholics. As an unofficial member he took part in public life, acting mainly with the Whigs, until his death at Dropmore, Jan. 12, 1834, when the peerage became extinct. A fine classical scholar, Grenville also edited Lord Chatam's letters to Thomas Pitt.

Grenville, GEORGE (1712-70). English statesman. Born Oct. 14, 1712, he was educated at Eton and Christ Church, Oxford, was called to the bar in 1735, but adopted a political career, and from 1740 till his death sat for the borough of Buckingham in the house of commons. He was made a lord of the admiralty in 1744 and of the treasury in 1747; treasurer of the navy, and a privy councillor in 1754, and secretary of state for the northern department, and first

lord of the admiralty in 1762. He was prime minister from 1763 to 1765, the period being chiefly

George Grenville,
English statesman

notable for the prosecution of John Wilkes, in 1763, and the passing of the American Stamp Act in 1765. He was known as "The Gentle Shepherd," a nickname due to Pitt's quoting the words of the old song, "Gentle shepherd, tell me where," when Grenville was wearying the house with complaints. Grenville died in London, Nov. 13, 1770.

Grenville OR GREYVILLE, SIR RICHARD (c. 1541-91). English sailor. Belonging to an old

Cornish family, in his youth he is reported to have fought with distinction in the Austrian service against the Turks in Hungary. He was one of the members for Cornwall in the parliaments of 1571 and 1584, and was sheriff of the county in 1571.

In 1591 Grenville was appointed vice-admiral, or second in command, under Admiral Sir Thomas Howard, of a squadron sent to the Azores to intercept the homeward bound Spanish treasure fleet. Spain had, however, learned of the dispatch of this squadron, and sent a fleet of 53 vessels to the Azores, where they arrived, Aug. 31. Howard's fleet, anchored north of Flores, numbered only 16, and at least half his men were sick with scurvy, so he hurried his men aboard, and put to sea.

For some reason the *Revenge*, Grenville's flagship, was unable to follow, and was cut off. Grenville thereupon determined to pass through the Spanish line; he made a dash, but was becalmed under the lee of the enormous galleons, whose men boarded her, and after a fierce fight captured and overwhelmed the few survivors of her crew. Mortally wounded, Grenville was taken aboard the Spanish admiral's flagship, where he died a few hours later. For fifteen hours 150 men had fought hand to hand against 5,000 Spaniards, and it was not until their number was reduced to 20 that they yielded. The story is finely told in Tennyson's poem, *The Revenge*.

Gresford. Colliery village of Denbighshire, Wales, 3 m. N. of Wrexham on the rly. A mine explosion followed by fire caused 264 deaths on Sept. 22, 1934.

Gresham, Sir THOMAS (c. 1519-79). English merchant and financier. Born in London, second son of Sir Richard Gresham (d. 1549), lord mayor of London in 1537, and an ancestor of the marquess of Bath, he came of an old Norfolk family. Educated at Gonville Hall, now Gonville and Caius College, Cambridge, and a student at Gray's Inn, he joined the Mercers' Company, and amassed a fortune.

Knighted by Queen Elizabeth, he acquired lands in Norfolk and Suffolk, and had mansions at Mayfield, in Sussex, and Osterley, in Middlesex. He was lamed for life by a fall from his horse in 1560, and lost his only son in 1564, and, deciding to devote his wealth to public ends, carried out, in 1566-68, a project of his father's by founding the Royal Exchange. He died, Nov. 21, 1579, and was buried in St. Helen's Church, Bishopsgate.

He bequeathed one moiety of the Exchange to the city corporation, the other to the Mercers' Company, in trust for the foundation of the Gresham Lectures. He

Sir Thomas Gresham, English merchant
After Holbein

left his house in Bishopsgate Street for the use of the lecturers, founded eight almshouses, and left money for other charities. *Consull* Life and Times, J. W. Burgon, 1839; *Life*, F. R. Salter, 1925.

Gresham College. Educational centre in London. It was originated by Sir Thomas Gresham (q.v.), who

Gresham College
arms

left his residence in Bishopsgate Street to the corporation of the city of London and the Mercers' Company, for the purpose of starting lectures in various subjects. In 1597 the lectures were organized and begun,

Gresham College. The courtyard of Sir Thomas Gresham's house in which Gresham College was started
From an old print

and they have been continued ever since. There are seven lecturers, and each delivers twelve lectures a year. They are on divinity, astronomy, music, geometry, law, physic, and rhetoric.

Gresham's Law. Economic law that may be roughly stated as "bad money drives out good." It was first expressed thus in a document of 1560, dealing with the proposed reforms of the coinage, but its present name was only given by H. D. Macleod, in 1858, in the belief that Sir Thomas Gresham was responsible for the statement made in the above proclamation. The truth of the law is amply proved by experience. Where there are two forms of currency, each being legal tender, persons will naturally pay their debts in the less valuable one, retaining any of the more valuable one they may have, which thus will tend to disappear from circulation. The existence of this law is a strong argument against bimetallicism (q.v.).

Gresset, JEAN BAPTISTE LOUIS (1709-77). French poet and dramatist. Born at Amiens, Aug. 29, 1709, he is remembered chiefly for one capital comedy, *Le Méchant*, and a burlesque poem, *Vert-Vert*, which contains beneath its humorous story of a convent parrot some shrewd satire on monastic life. He died at Amiens, June 16, 1777.

Grès Ware. Variety of stoneware. The finer qualities are made of a mixture of clay, quartz sand, lime or barytes. Cologne grès was celebrated. *Pron.* gray.

Greta. River of Cumberland, England. It is a tributary of the Derwent, which it joins near Kes-

A munition-making township sprang up during the First Great War around Greta Green. The whole undertaking cost £9,000,000, and employed at one time 24,700 persons. It was sold in 1924. The worst accident in British railway history occurred on the old

Caledonian line, one mile north of Greta on May 22, 1915, when a troop train ran into a stationary local train. The work of rescue had scarcely begun when the London-Glasgow express crashed into the wreckage. The troop train catching fire, 227 soldiers were killed and 200 injured.

Greta Bridge. From the famous water colour by J. S. Cotman of the bridge over the river Greta in N.W. Yorkshire

Reeve Collection, British Museum

wick. Its length is 4 m. Overlooking it is Greta Hall, where Southey lived from 1803 until his death in 1843, and Coleridge from 1800 to 1809.

There are two rivers of this name in Yorkshire. One is a tributary of the Tees, while the other rises near Ingleton and falls into the Lune. The former is the stream described by Scott in *Rokeby* and in poems, and painted by Cotman and Turner. Greta Bridge is on the main road between Bowes and Catterick.

Gretna Green. Village of Dumfriesshire, Scotland. It is 9 m. N.W. of Carlisle, near the little

Gretna Green. The smithy where formerly many runaway couples were married

river Sark that divides England from Scotland. Its situation close to the border was convenient for runaway marriages, because here couples could take advantage of the Scottish marriage laws. The marriages were usually performed by the blacksmith or innkeeper in his smithy or inn. The practice flourished from 1770 until abolished July 1, 1940. On the English side of the Sark is Gretna village.

Grétry, ANDRÉ ERNEST MODESTE (1741-1813). Belgian composer. Born at Liège, Feb. 8, 1741, he became a chorister in a church and when quite young produced some symphonies. For seven years he studied in Rome, and afterwards, on the advice of Voltaire, settled in Paris. Grétry devoted himself almost entirely to the composition of comic operas, upon the form of which he exercised considerable influence. The best known are *Richard Coeur de Lion*; *Lucille*; *Zémire et Azor*; *L'Amant Jaloux*; and *L'Épreuve Villageoise*. In France he became the most popular composer of his day. He died Sept. 24, 1813.

Greuze, JEAN BAPTISTE (1725-1805). French painter. Born at Tournus, near Mâcon, Aug. 21, 1725, he studied under Charles Grandon (1691-1762) of Lyons. His first exhibited picture, *A Father Expounding the Bible to his Family*, gave promise of a highly successful career, and in 1755 his *Blind Man Duped* secured his election to the Academy. A sojourn in Italy modified

his style to some extent, but on returning to Paris he resumed his work in genre. In 1769 he submitted his *Severus Reproaching Caracalla*, a

poor production in what was meant to be the historical mode, and though the Academy now admitted him, he was classed only with painters of genre. He suffered heavy pecuniary losses in the Revolution, and with the Directorate a complete change in the prevailing taste in art took place. He died in poverty in Paris, March 21, 1805.

The works of Greuze which have commanded most attention (and the highest prices) since his death

Greuze. *Psyche*, the picture formerly called *Sorrow*, painted in 1788
Wallace Collection

have been mainly tenderly painted, if sentimental, studies of young women. Examples are in the Louvre, Paris, and the National Gallery, London.

Greville, CHARLES CAVENDISH FULKE (1794-1865). A British diarist. Born April 2, 1794, he was

a great-grandson of the earl of Warwick, and a grandson of the duke of Portland. Educated at Eton and at Christ Church, Oxford, he secured the position of secretary of Jamaica, a non-

resident sinecure. In 1821 he became also clerk of the privy council, and remained until 1859. He kept a diary throughout his official career, which contains valuable material. The first part was published in 1875, a preface being contributed by his friend Harry Reeve. The whole, known as *The Greville Memoirs*, had appeared in seven volumes by 1887. Greville's comments on royal personages are so frank that some

Greville

passages in the first volumes were suppressed. A later edition, 1927, aroused much discussion. He died Jan. 18, 1865. His *Correspondence* with Reeve was edited by A. H. Johnson, 1924.

Grévy, François Paul Jules (1807-91). President of the French republic, 1879-87. Born at Mont-

F. P. J. Grévy,
French president

sous-Vaudrey, Jura, Aug. 15, 1807, he was a strong republican while a law student in Paris. After the revolution of 1848 he was elected deputy in the constituent assembly, sitting also in the legislative assembly, 1849-51, when, opposed to the *coup d'état* of Napoleon III, he returned to the bar. Under the third republic, he was president of the national assembly, 1871-73, and of the chamber of deputies, 1876-79.

Grévy succeeded MacMahon as president of the republic, Jan. 30, 1879. Although his signature of peace with China in 1885, made an inconclusive end to French difficulties in Tongking, and in home affairs his record lacked distinction, he was re-elected for seven years in Dec. But his reputation was severely damaged by revelations that his son-in-law (Daniel Wilson) was trafficking in honours and offices, and Grévy resigned Dec. 2, 1887. He died at his birthplace, Sept. 9, 1891.

Grew, Nehemiah (1641-1712). English botanist. The son of a clergyman, he was born at Atherstone, educated at Cambridge, but took his degree as a doctor of medicine at Leyden. In 1672 he began to practise in London, and soon had a large connexion, but his best work was done as a student of botany. His researches were embodied in his *Anatomy of Vegetables*, begun 1672, and his *Anatomy of Plants*, 1684, and to him and Malpighi are due the foundations of our knowledge of plant anatomy. Grew was secretary of the Royal Society from 1677 until his death, March 25, 1712. A genus of trees, *Grewia*, is named after him.

Grey, Charles Grey, 2nd Earl (1764-1845). British statesman. Born at Fallodon, Northumberland, March 10, 1764, he was the eldest son of Gen. Charles Grey who became 1st earl in 1806 and died 1807. Educated at Eton and King's College, Cambridge, the

younger Charles in 1786 was M.P. for Northumberland and soon associated himself with Fox and the Whigs. His first experience of office was in the coalition ministry of 1806-07, in which he was first lord of the admiralty and then foreign secretary.

The successor of Fox, Grey did not greatly distinguish himself in opposition during the long period of Tory ascendancy that ended in 1830. However, when the Whigs were returned to power in 1830, his dignified presence, his stately eloquence, his unblemished character, and his parliamentary experience marked him out as the only possible premier. His ministry was responsible for the great Reform Act; Grey conducted the negotiations with the king, and after handing in his resignation secured the promise that forced the measure through the house of lords. He remained in office when the reformed parliament met, but serious differences in the ministry led to his resignation in July, 1834. He died at Howick, July 17, 1845. The correspondence between Grey and William IV over the Reform Bill was edited by the 3rd earl, 1867. *Consult also* Lord Grey of the Reform Bill, G. M. Trevelyan, 1920.

Grey, Henry George Grey, 3rd Earl (1802-94). A British politician. The eldest son of the 2nd earl, he was born Dec. 28, 1802. Educated at Eton and Trinity College, Cambridge, he entered parliament in 1826, and in 1830 became under-secretary for the colonies in his father's ministry. During 1835-39 he was secretary for war, and during 1846-52 was colonial secretary. Thenceforward out of office, he remained an active figure in public life, and his age did not prevent him from strongly opposing Home Rule for Ireland. He died at Howick, Oct. 9, 1894.

Grey, Albert George Grey, 4th Earl (1851-1917). British administrator. He was born in St. James's Palace, Nov. 28, 1851, the son of Gen. Charles Grey, private secretary to Queen Victoria, and was educated at Harrow and Cambridge. He was M.P. for S. Northumberland, 1880-85, and

Grey
After Lawrence

Northumberland (Tyneside), 1885-86. A great traveller, he was in S. Africa in 1894 when his uncle died, and he succeeded to the earldom. He became administrator of Rhodesia in 1896, and was a director of the South African Company, 1898-1904. From 1904 to 1911 he was governor-general of Canada. On his return to England, Earl Grey threw himself into public work with zest, two of his chief projects being Dominion House and the Public House Trust. He was also keenly interested in agricultural reform, and worked for an Irish Convention. He died Aug. 29, 1917, being succeeded in the peerage by his son Charles Robert (b. Dec. 15, 1879).

Grey of Fallodon, Edward Grey, 1st Viscount (1862-1933). British statesman. Born April 25, 1862, he belonged to the family of which Earl Grey was the head. He was educated at Winchester and Balliol College, Oxford, and in 1882 succeeded his grandfather, Sir George Grey, in the family baronetcy and estates, the former dating from 1814. When he first entered the house of commons for Berwick in 1885 he was known as the amateur champion of tennis and a keen angler. Chosen under-secretary for foreign affairs in 1892, in 1895 he joined the Rosebery group of the Liberal opposition. He supported the government over the S. African War, and formed, with Haldane and Asquith, the Liberal Imperialist League in opposition to the "little Englanders."

In 1905 Campbell-Bannerman appointed Grey foreign secretary. His first act in that office, which he was to hold for eleven years, was to support France at the conference of Algiers, 1906. In the Agadir crisis of 1911 he showed well-timed firmness, authorising Lloyd George's famous Mansion House speech. To Grey goes the credit for summoning in 1913 the conference of ambassadors in London, which settled many Balkan questions.

In assessing Grey's achievement history is most concerned with his actions immediately preceding Aug. 4, 1914. He constantly maintained that foreign policy should be a matter of careful steering rather than bold strokes French

1st Viscount Grey,
British statesman

and Russian ambassadors had told him that the only chance of peace was a firm declaration that England would fight, but this chance was not taken. Grey did not care to gamble on public opinion or to risk splitting his party; so his justly famous speech of Aug. 3, 1914, which laid the facts before parliament and proved the justice of England's case, was of no avail in preventing war.

During the war he did much to preserve the solidarity of the Allies and helped to bring Italy to their side in 1915. With Turkey, Greece, and Bulgaria, he failed. In his dealings with the U.S.A. he showed wisdom and tact, particularly over the tension caused by the blockade. In Dec., 1916, he resigned with Asquith.

Already a K.G., he was created viscount in 1926, refusing an earldom as one was already held by the head of his family. He became an active supporter of the League of Nations, and for a time was Liberal leader in the house of lords; but his activities were somewhat hampered by impaired eyesight. He died Sept. 7, 1933.

Dignified, reserved, a man of scrupulous honour, completely disinterested, yet sadly handicapped by his constitutional dislike of taking decisions, Grey was less a great statesman than a great gentleman and patriot. He published a volume on Fly-Fishing, 1899; his autobiographical *Twenty-Five Years* (1892-1916), 1925; *Falloon Papers*, 1926; *Charm of Birds*, 1927; *Speeches on Foreign Affairs* (1904-14), 1931. *Consult* Life, G. M. Trevelyan, 1937.

Grey, Sir George (1799-1882). British politician.

G. Grey

Grandson of the 1st Earl Grey, he was born at Gibraltar and educated at Oriel College, Oxford. He became a barrister, and in 1832, as a Whig, entered the house of commons for Devonport. From 1847 to 1852 he represented N. Northumberland, and from 1853 to 1874 Morpeth. In 1834 and during 1835-39 Grey was under-secretary for the colonies. When the Liberals came into office in 1846 he was appointed home secretary, leaving office in 1852. After a

Lady Jane Grey, Queen of England
From a contemporary portrait

brief term as colonial secretary he returned to the home office in 1855 and was there until 1858 and again 1861-66. He died at his residence, Falloon, Sept. 9, 1882.

Grey, Sir George (1812-98). British administrator. Born at Lisbon, April 12, 1812, son of an officer killed at Badajoz, he was educated at Sandhurst. In 1829 he took up a commission in the 83rd Foot, but retired from the army in

Sir George Grey,
British administrator

1839 with the rank of captain. He took part in 1836 and 1839 in adventurous expeditions along the N.W. coast of W. Australia and along the N. and S. coasts of Shark's Bay. He was governor of S. Australia, 1841-45; of New Zealand, 1845-53, and 1861-67; of Cape Colony, 1853-60; and prime minister of New Zealand, 1877-79. He was made a K.C.B. in 1848, lived in London after 1894, and dying Sept. 20, 1898, was buried in S. Paul's cathedral. He wrote on the dialects of W. and S.W. Australia. His early expeditions, Polynesian mythology, and the traditions and history of the New Zealand race.

Grey, Lady Jane (1537-54). Nine days queen of England. Daughter of Henry Grey, duke of Suffolk, great-grand-daughter of Henry VII, and cousin of Edward VI, she was remarkable for her beauty and accomplishments. Under her tutor, John Aylmer, afterwards bishop of London, she acquired great proficiency in Greek, Latin, Italian, French, and Heb-

rew, and her learning aroused the admiration of the great scholars of the day, Roger Ascham professing amazement at her skill in both speaking and writing Greek. In pursuance of a project to alter the royal succession from the Tudor to the Dudley family, she was married, May 21, 1553, to Guildford Dudley, son of the duke of Northumberland, and her accession was announced July 10, after the death of Edward VI. On July 19 her reign ended, for Mary Tudor was proclaimed in London. Jane was sent to the Tower, and her life would probably have been spared but for the participation of her father, the duke of Suffolk, in Wyatt's rebellion, after which, with her husband, she was beheaded on Tower Hill, Feb. 12, 1554. *Consult* The Tudor Pawn, J. Lindsey, 1938.

Grey, Zane (1875-1939). American novelist. He was born at Zanesville, Ohio, Jan. 31, 1875, and educated at the university of Pennsylvania. Having studied law, he practised in New York, 1898-1904. He won wide popularity by his romances of adventurous life in the American wild. Many were turned into films. *Betty Zane*, 1904, was followed by a rapid succession of volumes, including *The Spirit of the Border*, 1905; *Desert Gold*, 1913; *Wildfire*, 1917; *The Man of the Forest*, 1920; *Forlorn River*, 1927; *Sunset Pass*, 1931. In *Tales of Swordfish* and *Tuna*, 1927, and similar books, he described fishing experiences. He died Oct. 23, 1939.

Greyfriars. Two parishes, Old and New Greyfriars, Edinburgh, Scotland. The name derives from a Franciscan monastery of Observantines founded 1436 by James I, and destroyed in 1547 by the English. The old church, built 1614, and restored after a fire in 1845, had a spire, destroyed 1721; the new church was added in 1721, and its organ was the first introduced into a Scottish Presbyterian place of worship. On the gravestone of Boswell of Auchinleck

Greyfriars, Edinburgh. The historic churches, seen from the S.E.

Greyfriars, Edinburgh. Martyrs' Memorial in the churchyard, commemorating 1,200 Covenanters

was signed the National Covenant, Feb. 28, 1638. During June-Nov., 1679, 1,200 Covenanters, taken prisoner at Bothwell Brig, were interned here. In 1707, in a corner of the churchyard, was erected the Martyrs' Memorial.

The churchyard contains many memorials of a time when, in Stevenson's words, every mason was a pedestrian Holbein. *See also* Covenanters.

Greyhound. Breed of dog of Eastern origin, famed for its great speed. One of the oldest breeds of domesticated hunting dogs, it is represented on ancient Egyptian monuments. It is distinguished by its slender form, long legs, and long rat-like tail. Its muzzle is long, and well adapted to seize an animal going at great speed.

The English greyhound is the best known of the group, and is claimed as the parent of the others.

It is smooth-coated, probably the result of breeding, for most other hounds of this type have rough coats. Coursing matches with greyhounds are held, but they are more popularly associated with racing against an electric hare. *See* Greyhound Racing.

Greyhound Racing. Chasing of a mechanical

hare by greyhounds in an enclosed track. The sport originated in America where, in 1917, O. P. Smith, of Chicago, introduced his mechanical hare on a course at Tulsa, Oklahoma. Charles Munn acquired exclusive rights to the electric hare and built a track at Manchester in 1926. In 1927 another was opened at the White City, London. Now greyhound racing is carried on in many large centres throughout Great Britain, as well as in other countries. More than 2,000,000 attend British meetings each month, nearly half of them at London's 15 tracks.

The mechanical hare is carried on a rail round the track, controlled electrically, and is set in motion just before a lever raises the front of the traps containing the dogs. The dogs never catch the hare, whose speed is regulated by mechanical control, but in their efforts to overtake it give wonderful exhibitions of speed. Quare Times created two

Greyhound. Thoroughbred example of this breed of sporting dog

world records in 1946, running 525 yds. in 28.95 secs. and 550 yds. in 30.38 secs.; the former was broken in 1948 by Priceless Border with 28.64 secs.

Totalisators have been installed at the principal British tracks,

the turnover for 1949 being £77,000,000. Under the Betting and Lotteries Act, 1934, betting cannot take place by bookmakers or totalisator unless the track is licensed by the local authority. There may not be betting on more than 8 races in a day, which must be carried out within four hours. On four special days in the year betting may be on 16 races and extend for 8 hours. In May each year the licensing authority fixes for all tracks in its area 104 days in the year beginning July 1 on which betting is allowed. The operator of the totalisator deducts 16 p.c. of the stake money (10 p.c. govt. tax, and 6 p.c. for himself), and distributes the rest.

Neither the occupier of a track, nor his servant, agent, or anyone having any interest in any part of the track, may act as a bookmaker on that track.

Greymouth. Chief town of Westland, South Island, New Zealand. It is on the larger W. Coast rly., and has rly. connexion with Christchurch. At the mouth of the Grey river, it has a good harbour, carries on gold mining, brickmaking, and sawmilling, and is in the chief coal mining area in the country. Pop. 8,460.

Grey Powder (*Hydrargyrum cum Creta*). Drug compounded of 1 part of mercury with 2 parts of prepared chalk. Dose, 1-5 grains. It is a valuable purgative and intestinal disinfectant for children, especially when there is sluggish liver function.

Greytown OR SAN JUAN DEL NORTE. Port of Nicaragua, on the extreme S.E. of the Caribbean Sea. It is closed to foreign trade. Motor boats ply between here and Granada, via the San Juan river and Lake Nicaragua. Pop. 1,000.

Greyhound Racing. The dogs emerging from the traps at a London stadium. Right, a race in progress
Left photo Greyhound Racing Association

Greywacke (Ger. *grauwacke*). Hard, gritty, grey-brown, yellow, or dark coloured rocks of the older formations. Remarkable for the great variety of its constituents, quartz, feldspars, etc., it is common in the S. of Scotland, N. Ireland, and Wales.

Greywether. Blocks of sandstone found thickly strewn over the surface of the country in Dorset, Wiltshire, Surrey, N. France, etc. It is so called from its fancied resemblance to sheep.

Griboiedov, ALEXANDER SERGEEVICH (1795-1829). Russian dramatist. Born at Moscow, Jan. 4, 1795, he entered the army, but forsook that career for the civil service. While a diplomatic secretary at Tiflis, he began the work by which he is remembered, *The Mischief of Being Clever*. This comedy was so biting a satire on Russian society of the day that it was rejected by the censorship—although a great success in private circulation among the younger generation—and was not publicly performed until 1831. Griboiedov was arrested as a notorious liberal in 1825, but was cleared of the charge. He negotiated the treaty at the end of the 1828 campaign against Persia, but was killed in an attack on the Russian embassy at Teheran, Feb. 11, 1829.

Grid. Lines on military maps (also on contemporary Ordnance Survey maps of Great Britain), used for giving map references. Grid lines divide a map into a series of squares, and each line is numbered. The heavy grids enclose an area representing 100 km. by 100 km., which is subdivided by lighter grids into squares 10 km. each way. By dividing the smaller squares into tenths and numbering the tenths along the horizontal and then along the vertical, with the coordinates numbered from 0 to 9, starting at the bottom left-hand corner of the square, it is possible to give six-figure map references.

Grid. Network of electrical transmission lines, with associated transformer and switching stations, interconnecting power stations over a wide area of Great Britain. Its function is to convey electrical energy to the required point from wherever it can be most economically generated.

The electricity supply industry as it existed before nationalisation (1947) was economically and financially a complex structure. The public was supplied, in districts, by "authorised under-

takers." These might own and operate a complete system—generating stations, sub-stations, distribution networks—or they might act as retailers only, owning and operating the sub-stations and distribution networks necessary for supplying the public, but not actually generating electricity, which they purchased as a bulk supply from other sources. There were also power companies who specialised in generation; they could be regarded as wholesalers only. Other concerns might operate as both wholesalers and retailers, supplying the public and, at the same time, giving bulk supplies to other concerns.

The Central Electricity Board which operated the grid was not primarily a wholesaler, nor was it a retailer. It could conveniently be regarded as a kind of exchange or transport system for the wholesalers, which distributed the load amongst them to allow them to operate with maximum economy as a whole. It did not supply the public direct, and it actually owned a trifling amount of the country's generating plant. It confined itself to operating interconnected stations, which in 1946 numbered 142 "selected" and 51 "non-selected." The C.E.B. thus was responsible for the production of over 99 p.c. of the electricity produced by authorised undertakers (N. Scotland excluded).

The advantages conferred by the grid may be seen by consideration of an exaggerated example of a station in an area where there is little demand during the night. As electricity must be available, and there is no practicable method of storing it on a large scale, the alternators must run all night on a light load, consuming steam and coal to no purpose. With grid interconnection such a station could shut down completely for a great part of the night. This interconnection reduces the amount of spare generating machinery held against emergency demands; as well as lessening the chance of failure of supply due to a breakdown.

The Central Electricity Board was subject to some measure of control, both by the government and by the Electricity Commissioners (*q.v.*), its primary concern being (to quote the Electricity Supply Acts of 1926 and 1935) "to ensure that the production of electricity for the public requirements shall be effected at the lowest possible total cost." It was not run as a profit-making concern, its rates of purchasing and selling electricity being so adjusted that its expenditure of income was covered (with interest on borrowed money and sinking fund charges) with a margin of profit approved by the commissioners. From 1927 it expended some £86,000,000, including about £17,000,000 on the standardisation of the frequency of A.C. supplies. The savings to the country in coal, generating plant, and costs much outweighed this sum. Both the C.E.B. and Electricity Commissioners were abolished by the nationalisation Act of 1947.

Grid Rectifier. An electrical apparatus. When power engineers realized that the mercury arc rectifier was practically a mercury-vapour-filled diode valve on a large scale, radio practice was copied by converting it into a triode by the addition of a grid. Since most power rectifiers are polyphase—having 3, 6, 12 or more anodes to the one "pool" cathode—the change consists of inserting a grid in each anode arm just below the anode itself by means of a small insulating bush;

Grid Rectifier. Diagram showing arrangement of a typical air-cooled grid rectifier

the grid being a perforated graphite plate or an arrangement of parallel metal strips. The general arrangement is illustrated in the opposite page.

The grid enables the rectifier to be used—(1) as a rectifier with the addition of voltage control by grid regulation; (2) as a high-current self-acting switch or contactor, with as many elements or "ways" as there are anodes; when used in a D.C. circuit, energising one of the grids causes a current to flow, instantaneously reaching its full maximum value, and persisting until the main circuit is broken elsewhere; when used on an A.C. circuit, the current can be started at any desired point in the cycle, but is extinguished at the next zero point—this is the basis of grid voltage control of circuits, since it enables the area of each half-cycle to be readily varied, and hence the R.M.S. value of the voltage to be changed at will; (3) as an inverter, converting D.C. into A.C. at any frequency applied to the grid. This pilot frequency may be derived from a special oscillating circuit, or from the output of another A.C. source with which it is running in parallel.

Grid System. Rectangular lay-out of a city or town in which most streets are straight and intersect at right angles. See maps of Melbourne; New York; Washington, etc.; also Town Planning.

Grieg, EDVARD HAGERUP (1843-1907). Norwegian composer. Born of Scottish origin

Edvard Grieg, Norwegian composer

at Bergen, June 15, 1843, he studied at Leipzig, 1858-62, and at Copenhagen under Gade. On his return to Norway he became intimate with Nordraak and, until that composer's death in 1866, worked at his project of founding a Norwegian school of music. Having started a musical union at Christiania (Oslo), he conducted its concerts 1867-80, and in 1879 played at Leipzig his piano concerto in A minor, which established his reputation. Grieg made the first of three visits to London in 1888; apart from travels abroad, he lived a retired life near Bergen, where he died Sept. 4, 1907.

One of the most popular lyrical composers, Grieg adapted the

classical structure to themes closely allied to traditional tunes. Famous works by "the little master" include the incidental music to Ibsen's *Peer Gynt*; the piano concerto; the *Holberg suite*; and elegiac pieces. At his best in small, lyrical compositions, he wrote many songs, strongly coloured by his individual harmonic contrasts, e.g. *Im Kahne*, *Die Alte Mutter*, *Ich Liebe Dich*. Many were made famous by his wife Nina (1845-1935).

Grieg, NORDAHL (1902-43). A Norwegian poet. A native of Bergen and nephew of Edvard Grieg, he was born Nov. 1, 1902; attended Oslo university; at 19 sailed to Australia before the mast, and became an active Communist. A scholarship took him to Wadham College, Oxford, 1923-24, and in 1927 he went as war correspondent to China, later reporting the Spanish civil war. His first poems appeared in 1921, and a novel, *The Ship Sails On*, three years later. His plays include *Barabbas*, 1927; *The Atlantic Ocean*, 1932; *Our Power and Glory*, 1935. His book, *The Young Dead*, includes translations of Keats, Shelley, and Brooke. After the fall of Norway, Grieg joined the air force in England, and was lost in a raid over Berlin on Dec. 2-3, 1943. His war poems were translated into English by G. M. Gathorne-Hardy under the title *All That is Mine, Demand*.

Grierson, SIR GEORGE ABRAHAM (1851-1941). British scholar. Born Jan. 7, 1851, at Glenageary, co. Dublin, he was educated at Shrewsbury and Trinity College, Dublin, and was in the Indian civil service, 1873-1903. Eminent as an Oriental scholar, specialising in Indian languages and dialects, he mastered 179 and 544 respectively. His *Linguistic Survey of India*, comprising 18 vols., was published irregularly, owing to the First Great War; one of the greatest feats of modern scholarship, it was responsible for drastic changes in the teaching of Indian universities. Grierson, who was knighted in 1912 and received the O.M. in 1928, died at Camberley, March 7, 1941.

Grierson, SIR HERBERT JOHN CLIFFORD (b. 1866). A Scottish literary historian. He was educated at King's College, Aberdeen, and Christ Church, Oxford, becoming professor at Aberdeen in 1894. An authority on the 17th century poets, he was professor of rhetoric and English literature at

Edinburgh, 1915-35, and rector of the university, 1936-39. Grierson was knighted in 1936. His published works include *The First Half of the 17th Century*, 1906; *Lyrical Poetry from Blake to Hardy*, 1928; *Carlyle and Hitler*, 1933; *The English Bible*, 1944; *Critical History of English Poetry* (with J. C. Smith), 1945. He edited the poems of Donne, and was part-editor of the *Oxford Book of 17th Century Verse*, 1934.

Grierson, JOHN (b. 1898). A Scottish film director. Born at Deanston, Perthshire, April 26,

John Grierson, Scottish film director

1898, he was educated at Glasgow, Durham, and Chicago universities. On joining the Empire Marketing Board, he formed a film unit, evolving the documentary film. He then

formed a G.P.O. film unit. Pictures with which he was associated included *Drifters*, 1929; *Industrial Britain*, 1933; *Song of Ceylon*, 1935; *We Live in Two Worlds*, 1937. During the Second Great War he was commissioner of the National Film Board of Canada. In 1948 he became controller of C.O.I. film activities. His book about films, *Grierson on Documentary*, was published 1946.

Grierson, SIR ROBERT (c. 1655-1733). Scottish laird, and persecutor of the Covenanters. He presided at the trial and execution of the Wigtown Martyrs, and after the revolution of 1689 was fined and imprisoned. He died of apoplexy. He used the thumbkins in enforcing the Test Act. He was the original of Sir Robert Redgauntlet in Scott's *Wandering Willie's Tale*.

Griffenfeld, PEDER SCHUMACHER, COUNT (1635-99). Danish statesman. He was born in Copenhagen, Sept. 3, 1635. In 1663 he became librarian to Frederick III, and later the king's secretary. During 1673-76 he controlled the country's foreign policy, and aimed at establishing a Scandinavian League. Arrested for treason by his political enemies, he was sentenced to death; but the sentence was commuted to imprisonment for life. A victim of injustice, Griffenfeld died after 22 years in prison, March 12, 1699.

Griffin or **GRYPHON** (Gr. *gryps*, Lat. *gryphus*). Mythical monster, part lion, part eagle, supposed to

Male Griffin in heraldry

typify strength and vigilance. It figures in Persian sculpture as a guardian of treasure, on Greek coins, in classical architecture, and Teutonic legend.

Often confused with the dragon, it is represented in heraldry with the body, tail, and hind legs of a lion, and head, neck, breast, fore legs, and wings of an eagle, and with forwardly pointed ears. When represented rampant it is said to be segreant. The male griffin has no wings, but is armed with protruding rays or tufts of hair, and sometimes horned like the unicorn.

The armorial crest of the city of London is a griffin's sinister wing argent, charged with a cross gules; the supporters are griffins elevated and endorsed, argent and charged on the wings with a cross gules. The Temple Bar Memorial, at the junction of Fleet Street and the Strand, popularly known as The Griffin, erected at a cost of £10,600, and unveiled Sept. 8, 1880, is surmounted by a "griffin," designed by C. B. Birch. See Gray's Inn.

Griffin on the Temple Bar Memorial, London, erected 1880

Griffin, BERNARD WILLIAM (b. 1899). British cardinal. He was born at Birmingham and educated at Cotton College and S. Mary's, Oscott. He studied at the English College in Rome from 1921 and was ordained priest in 1924. Secretary to the archbishop of Birmingham, 1927-37, and chancellor of the archdiocese, 1929-38, he became bishop auxiliary in 1938. At 44 he was named archbishop of Westminster to succeed Cardinal Hinsley, and was created cardinal and proclaimed at consistory, Feb. 18, 1946. During the Second Great War he worked unceasingly for a just and lasting peace; afterwards he visited Germany to congratulate the bishops on their resistance to Hitler.

Griffin, GERALD (1803-40). Irish dramatist, novelist, and poet. He was born in Limerick, Dec. 12,

1803, and came to London in 1823. His works include *Tales of the Munster Festivals*, 1827, and *The Collegians*, a novel, 1829, new ed. 1896, on which Dion Boucicault founded the play of *The Colleen Bawn*. Griffin formed the teaching society of the Christian Brothers. He died in Cork, June 12, 1840. His *Complete Works*, with a Life, were edited by his brother, William Griffin, 8 vols., 1842-43.

Griffith, ARTHUR (1872-1922). First president of the Irish Free State and founder of Sinn Féin (q.v.). Born March 31, 1872, in Dublin, where he was educated by the Christian Brothers, he was apprenticed to a printer at 15; two years later he founded, with William Rooney, the Celtic Literary Society. He emigrated in 1897 to S. Africa, but returned to Dublin in 1899 to begin a career as journalist and pamphleteer. Among many unpaid contributors to his papers were Yeats and "A.E." The United Irishman, founded 1899, became known, after bankruptcy, as *Eire*. In 1904 Griffith published *The Resurrection of Hungary*, which was to become the text-book of the new Irish nationalist movement. In 1906 he founded Sinn Féin as a daily, which gave its name (*We Ourselves*) to a vigorous political movement.

Griffith emphasized the need for an Irish industrial revival, and never advocated physical violence. Although he joined the Irish Volunteers in 1913 and took part in the gun-running exploit at Howth (q.v.), he was not concerned in the Dublin insurrection of 1916. He was later arrested by the British, released, and again detained. While interned in England in 1918 he was twice elected M.P. (Sinn Féin) for East Cavan. Released at the general amnesty, he was chosen acting president of the illegal Dáil Éireann in 1920. With Michael Collins and other ministers he signed the Anglo-Irish treaty of Dec., 1921. Scarcely had he become president of the I.F.S. when he fell dead, Aug. 12, 1922. Griffith was a man of high ideals and honour as well as a brilliant controversialist.

Griffith, DAVID WARE (1880-1948). American film director. Born in Kentucky, Jan. 22, 1880,

he appeared in a film, *The Eagle's Nest*, 1907, and directed his first picture, *The Adventures of Dolly*, 1908. He evolved screen technique of far-reaching significance, bringing into artistic prominence methods of emphasis, e.g. close-up, fade-out, cut-back, and dissolve. His masterpiece was *The Birth of a Nation*, 1914. *Intolerance*, 1915, *Broken Blossoms*, 1920; and *Way Down East*, 1921, were outstanding for tension, use of rhythm, and the principle of slow and quick cutting. Griffith later made *Orphans of the Storm*; his first talking picture, *Abraham Lincoln*, appeared 1931. He died July 23, 1948. See Cinematography.

Griffith, FRANCIS LLEWELLYN (1862-1934). British Egyptologist. He conducted excavations in Egypt in 1884, becoming an assistant at the British Museum in 1888. He was reader in Egyptology at Oxford, 1901-24, professor until 1932, and was honoured by archaeological bodies all over the world. His greatest work was in the deciphering of papyrus; and he became an acknowledged master of the translation of hieroglyphics. He died March 14, 1934.

Griffith, SIR SAMUEL WALKER (1845-1920). Australian politician. Born at Merthyr Tydfil, June 21, 1845, he emigrated young to Australia. Educated at the university of Sydney, in 1867 he was called to the bar. Having settled in Queensland, he became associated with its politics and in 1883 was made premier. He held the office until 1888, and again 1890-93, after which he was chief justice of Queensland. He had much to do with drawing up the constitution of the Commonwealth of Australia, and in 1903 was chosen its chief justice. Retiring 1919, he died at Brisbane, Aug. 9, 1920. He had been a knight since 1886.

Griffith Observatory. American observatory on Mt. Hollywood, near Los Angeles, Calif. It was given to Los Angeles by the will of Col. J. Griffith and was opened May 14, 1935. It included a 12-in. refracting telescope, a planetarium theatre, and the hall of science. Exhibits include a million-volt Tesla coil, polarised light, spectra of gases, and geological formations.

Griffiths, JAMES (b. 1890). British politician. He was born at Ammanford, near Swansea, and educated at a council school and the Labour College, London. He was secretary of the Ammanford trade council, 1916-19, and presi-

Arthur Griffith, first president of the Irish Free State

dent of the South Wales Miners' Federation, 1934-36. Entering parliament in 1936 as Labour member for Llanelly, he became a member of the party executive in 1939, Griffiths was appointed minister of national insurance, 1945, and colonial secretary, 1950.

Griffon. European breed of dog. A rough-coated animal, it is somewhat taller than the setter

Griffon. The Brussels griffon, a terrier-like miniature dog

and of a grizzled liver colour. The dogs are used in hunting game birds. The Brussels griffon is a Belgian dog; it is small, red, short-nosed, and at one time was popular as a pet in England. The word is used sometimes as a variant of griffin. See Dog, colour plate.

Grigg, Sir (Percy) James (b. 1890). English politician. Born at Exmouth, Dec. 16, 1890, he was educated at Bournemouth and St. John's College, Cambridge. He entered the Treasury department in 1913 and during 1921-30 was principal private secretary to successive chancellors of the exchequer. He was chairman of the board of inland revenue, 1930-34. Appointed permanent under-secretary for war in 1939, he succeeded to the War ministry, 1942-45, sitting as Nationalist M.P. for East Cardiff. In 1946-47 he served as executive director of the International Bank for Reconstruction and Development. He was created K.C.B. in 1932.

Grigorescu, Nicolas (1838-1907). Rumanian painter. Born at Vacareshti-Restoaia, Rumania, May 15, 1838, the son of an agricultural labourer, he was saving his wages as a painter of icons to enable him to study in Paris, but was persuaded to remain in his native land to produce pictures for churches and monasteries. But the call to Paris proved irresistible, and in 1861 he was received into the congenial society of the Barbizon school. The forest scenery provided many themes for his brush, and his *Sunset at Barbizon*

—now in the Simu Museum at Bukarest—ranks as his master-piece in landscape. Returning to Rumania, he was captivated by the manners of the gipsies, Jews, and shepherds of the Danubian states and incidents in their lives inspired several of his best pictures.

In 1870 he again made his home in France, but in 1877 he hastened to bear his part in the campaign against the Turks, of which he left a magnificent memorial in his *Attack at Smailan*, purchased by the government for the town hall at Bukarest. Portraiture also attracted him, and his portraits of his king and queen ("*Carmen Sylva*") are among his most brilliant works. He died at Campina, in Rumania, July 21, 1907, universally regarded as the greatest painter his country had produced.

Grigorovitch, Dmitri Vasilievitch (1822-1900). A Russian novelist. More or less inspired by George Sand, he began with *The Village*, 1846, a series of remarkable stories rendering with great faithfulness the conditions of the peasantry under the system of serfdom. Other of his works were *Anthony the Unlucky*, 1848; *The Valley of Smiedov*; *The Fishers*, 1853; and *The Colonists*, 1855. His stories, though lacking in literary skill, possess a lasting value as ethnographical studies.

Grijalva. River of S.E. Mexico. Named after its discoverer, Juan de Grijalva, the Spanish explorer, it rises in Guatemala, and flows 300m. W., N.W., and N. to the Gulf of Campeche, near the Bay of Tupilco. For a part of its course it forms the boundary between the states of Chiapas and Tabasco. It is navigable for about 50 m.

Grille. Dod. Pen-name adopted for his earlier writings by the American short-story writer Ambrose Bierce (*q.v.*).

Grille. French word meaning literally a grating of metal or wood, used to screen a window or other aperture. The close iron grating in prison cells through which prisoners converse, without being able to come into personal contact with their visitors, is called a grille. The grille was the name given to the barrier behind which women formerly heard debates in the house of commons. This

was removed in 1918. Tombs are often protected by grilles. A beautiful example is the one surrounding Queen Eleanor's tomb in Westminster Abbey.

Grillparzer, Franz (1791-1872). Austrian dramatist. He was born in Vienna, Jan. 14, 1791, and after studying law entered the Austrian civil service in 1813, remaining in it until he retired with a pension in 1856. At the age of 25 he made his first great dramatic hit with *Die Ahnfrau* (*The Ancestress*), a ghost tragedy that made him famous. It was followed by a succession of pieces that made the author's name the most notable in Austrian literature. His other early plays included *Sappho*, 1819 (several Eng. trans.); a trilogy on *Das Goldene Vlies* (*The Golden Fleece*), 1821; and *König Ottokar*, 1825, an historical play on a 13th century king of Bohemia.

In 1826 Grillparzer visited Goethe at Weimar. In 1828 came another historical play, *Ein treuer Diener seines Herrn* (*A Faithful Servant*); then came *Des Meeres und der Liebe Wellen* (*The Waves of the Sea and of Love*), 1831, the story of Hero and Leander; and *Der Traum, ein Leben* (*The Dream, a Life*), 1835; these two plays were long leading favourites on the German stage. In 1835 his comedy *Weh' dem der lügt* (*Woe to Him Who Lies*) proved a failure and disheartened the author. He had earlier published a volume of poems and on Jan. 21, 1848, produced his chief prose story, *Der arme Spielmann* (*The Poor Fiddler*). He died in Vienna, Jan. 21, 1872, leaving three unacted plays, *Die Jüdin von Toledo* (*The Jewess of Toledo*); *Ein Bruderzwist im Hause Habsburg* (*A Brother's Quarrel in the House of Habsburg*); and *Libussa*, a fine drama on the queen-founder of Prague, perhaps his most profound work. His collected works were published in 20 vols., at

Grille. Triple metal spikes (candlesticks) surmount the grille around Queen Eleanor's tomb in Westminster Abbey

Stuttgart, 1892-94, and in 1890 a Grillparzer Society was founded in Vienna.

Grimaldi, JOSEPH (1779-1837). English clown. Born in London, Dec. 18, 1779, and belonging to a family of clowns and dancers, he danced at Drury Lane and Sadler's Wells when quite an infant, and made his greatest success in the pantomime of Mother Goose at Covent Garden in 1806. His singing of such ditties as Tippetty-Witchet and Hot Codlins aroused great enthusiasm. He died in London, May 31, 1837. His *Memoirs* were edited by Dickens, 1838.

Grime's Graves. Flint mines of the Stone Age at Weeting, Norfolk, which in 1870 Canon Greenwell, their explorer, claimed as Neolithic. Within 20 acres there are 254 pits, 20 ft. to 60 ft. across, and 40 ft. deep, often with lateral tunnels. Red-deer antlers were used as picks, chalk cups as lamps.

Grimm, JAKOB LUDWIG KARL (1785-1863). German philologist and folklorist. Born Jan. 4, 1785,

at Hanau in Hesse-Cassel, he studied law at Marburg, visited Paris in 1805, and in 1808 became librarian to Jerome Bonaparte at Cassel. His first book, on the Meistersingers, 1811, was followed in 1812 by the first collection of Kinder-und Hausmärchen, made by him

and his brother, and continued in 1814 and 1822. These tales, translated into many languages, in English as Grimm's Fairy Tales, have immortalised the brothers Grimm.

In 1829 Jakob went to Göttingen as librarian and lecturer, accompanied by his brother, but political changes led to their dismissal. In 1840 both were invited to professorships in Berlin. Jakob's most important works are

Deutsche Grammatik, 1819, and *Geschichte der deutschen Sprache*, 1848, which revolutionised the

Joseph Grimaldi, the clown, in Harlequin and Friar Bacon
From a sketch by G. Cruikshank

study of Teutonic philology; *Deutsche Reichsalterthümer*, German Legal Antiquities, 1828; *Deutsche Mythologie*, 1835, Eng. trans. 1879-88. The brothers began a German Dictionary and edited many old German classics. Jakob died, Sept. 20, 1863.

His younger brother, Wilhelm Karl (1786-1859), born at Hanau Feb. 24, 1786, after holding a post in the Cassel library, became sub-librarian at Göttingen in 1830, and professor at Berlin in 1840. His whole life was the counterpart of his brother's. His chief independent work was *Die deutsche Heldensage* (German Heroic Saga), 1829. He died Dec. 16, 1859. See Philology.

Grimmelshausen, HANS JAKOB CHRISTOFFEL VON (c. 1625-76). German author. Born at Gelnhausen, near Hanau, Prussia, he was carried off at the age of ten by Hessian troops, and led an adventurous life with the army as camp follower and soldier of fortune. After the conclusion of the Thirty Years' War in 1648, nothing is known of him until 1667, when he was chief magistrate of Renchen, in the Black Forest.

Two years later Grimmelshausen published what has been described as the one German prose classic of the 17th century, *The Adventurous Simplicissimus* (Eng. trans. 1912). It is an extraordinary medley of adventure and observation, largely based on its author's own experiences. Occupying an important place in the annals of picaresque fiction, *Simplicissimus* throws valuable light on the social side of the Thirty Years' War, while its closing chapters on its

hero's desert-island experiences might have inspired Defoe's *Robinson Crusoe*. Grimmelshausen wrote many other works under various pseudonyms, mostly anagrams of his name.

Grimm's Law. In philology, the name given to the regular sound-shifting or consonantal interchange between (1) Sanskrit, Greek, and Latin; (2) Low German; (3) High German. The rule is that an aspirate in (1) corresponds to a soft consonant in (2) and to a hard consonant in (3); a soft consonant in (1) corresponds to a hard consonant in (2) and an aspirate in (3); a hard consonant in (1) corresponds to an aspirate in (2) and to a soft consonant in (3): Greek, *thura*, English *door*, German *Tor*; Greek *thēr*, English *deer*, German *Tier*; Latin *dens*, English *tooth*, German *Zahn*.

Many apparent exceptions have been explained by what are known as Verner's and Grassmann's Laws, and others will probably be found to be the result of other phonetic laws not yet discovered. Grimm's Law takes its name from the philologist, Jakob Grimm (*q.v.*), who first definitely formulated it, although the principle had already been enunciated by a Danish scholar, Rask. See Philology.

Grimsby OR GREAT GRIMSBY. Co., mun., and parl. bor. of Lincolnshire, England. It stands

Grimsby arms

near the mouth of the Humber, 15 m. S.E. of Hull, and 168 m. N. of London on a main line from King's Cross.

The chief buildings include the parish church of S. James, a 13th century building; town hall, corn exchange, and custom house. There are a 16th century grammar school, public library, nautical school, and benevolent institution for seamen. The principal industry is fishing; Grimsby has some 300 steam trawlers, being probably the largest fishing centre in the world. During 1945 over 2,000,000 cwt. of fish were landed, worth nearly £8,000,000. It has an import and export trade, especially in coal, machinery, timber, grain, iron, and dairy produce. Other industries are shipbuilding, marine engineering, brewing, rope making, chemical works, and flour mills.

Grimsby was a Danish settlement and became a borough soon after the Norman Conquest. It was soon a flourishing port, but after a time entrance to it was

J. Grimm

Wilhelm Grimm

made difficult by the accumulation of sand. In the 19th century it was a fishing centre. Docks were built, a great extension being made by the Manchester, Sheffield and Lincolnshire rly. during 1849-54. During both the Great Wars the trawlers and fishermen were employed in mine sweeping, patrolling, etc. Thousands of buildings were damaged in 28 German air raids of 1940-45. The town is called Great Grimsby to distinguish it from Little Grimsby, a village near Louth. One M.P. is elected. Market days, Mon., Tues., Fri., Sat. Pop. est. 78,790.

Grim's Dykes. Folk-name for several prehistoric entrenchments in Great Britain. There are examples at Berkhamsted, Herts; Wealdstone, Middlesex; and Downton, Wilts. Like Devil's Dykes (*q.v.*), the name indicates their mysterious origin; both are used of that from Mongewell to Henley, Oxon, 10 m. long; and of others at Princes Risborough, Bucks, and in Dorset. It is variously spelled Grime's, Graeme's, and Graham's. See Antonine's Wall.

Grimsel. Mountain pass of Switzerland, in the Bernese Alps. It leads from the valley of the Aar, in the canton of Berne, to that of the Rhône in Valais, and reaches an alt. of 7,100 ft. From Meiringen the carriage road leads past Handegg, joining the Furka route W. of the Rhône glacier. There is an old hospice near the Grimsel lake, and beyond is the Todtensee or Lake of the Dead.

Grimspound. A prehistoric stronghold on Dartmoor, Devon, England. Having an area of four acres, containing the remains of 24 Bronze-age hut-circles, it is enclosed by two irregularly oval walls of coursed granite, 3 ft. 6 ins. apart, 530 yds. long, and originally 8 ft. high, with three entrances. They served to defend the village flocks and herds against animal and human foes.

Grimthorpe, EDMUND BECKETT, 1ST BARON (1816-1905). British lawyer. Born May 12, 1816, a son of Sir E. B. Denison, whose surname he dropped on inheriting the baronetcy, he went to Eton and Trinity, Cambridge. Called to the

Grimsby. The hydraulic tower at Grimsby docks, a well-known landmark on the river Humber

bar at Lincoln's Inn in 1841, he became Q.C., 1854, and was chancellor and vicar-general of the province of York, 1877-1900. He was a vigorous controversialist in ecclesiastical and architectural matters, as shown in the restoration of S. Alban's Abbey carried out under his sole direction and at his expense. The term "Grimthorping" was applied to any ruthless restoration of ancient cathedrals. He also designed the clock tower of the houses of parliament, known as St. Stephen's tower. He was made a peer in 1886 and died April 29, 1905, having made a fortune as a lawyer at the parliamentary bar.

Grindal, EDMUND (c. 1520-83). English prelate. The son of a farmer, he was born at St. Bees and educated at Cambridge. Ordained in 1544, he became known as a religious reformer. Ridley secured promotion for him, one post being that of chaplain to Edward VI, but on the king's death he left England for Frankfurt. He returned in 1559, Mary being dead, and was made master of Pembroke Hall, Cambridge, and bishop of London in succession to Bonner.

Grindal showed little desire to punish Nonconformists, and is usually regarded as a weak ruler of his diocese, which he left in 1570 to become archbishop of York, where again he was less zealous than the extremists liked. In 1575 he was chosen archbishop

Edmund Grindal, English prelate
After De Vos

of Canterbury, where he was strong enough to refuse to obey Elizabeth when she ordered him to suppress the prophesyings or meetings of Puritan clergy. He was therefore suspended from the non-spiritual duties of his office and not restored to these until 1582. Grindal died at Croydon, July 6, 1583.

Grindelwald. Valley of central Switzerland, in the Bernese Oberland. It is 13 m. long by 4 m. broad, and its rly. station is 11 m. S.E. of Interlaken. The Black Lütschine river flows through the valley, which is enclosed by the peaks of the Wetterhorn, Schreckhorn, Mettenberg, Eiger, and Faulhorn. Two glaciers descend almost to the river.

A favourite excursion centre in both summer and winter, it has many hotels and shops between

Grindelwald, Switzerland. The Bernese valley, looking east towards the Wetterhorn

the hamlet of Gydisdorn and the rly. station. A wooden church was replaced by a stone one about 1180, which in turn was superseded by the present church, 1793. The valley lies at an alt. of 3,410 ft. and has good pasturage as well as some orchards. The inhabitants are mostly German-speaking Protestants.

Grinding. Term formerly applied almost exclusively to the sharpening of tools, cutlery, etc., or the smoothing of any hard substance by rubbing away its surface. Crushing and pulverising machinery were also included (*e.g.* flour milling, pulverised fuel, preparation of Portland cement). Latterly, however, the use of grinding machines for accurate production of interchangeable components of engines and machinery has become standard practice in large engineering works.

The grinding or sharpening of tools, cutlery, etc., is carried out on rapidly revolving power-driven wheels. In tool grinding the whole operation is carried out mechani-

cally to ensure an accuracy of the angles of the cutting edges of such tools as drills, impossible with hand-ground tools. Most of the process is wet grinding, *i.e.* water or other fluid is supplied when the wheel makes contact with the work. Dry grinding is still used for pointing needles and prongs of forks, finishing steel pens, etc.

For smoothing purposes various methods are used. Brass and bell work call for powdered pumice stone; a sand blast serves for cleaning, sharpening, frosting, etc. The sand blast is particularly useful for resharpening worn files. For grinding glass lenses and metal specula emery powder is used; and for jewels diamond dust. Plate glass is ground flat by grinding two sheets of the glass together with increasingly firm layers of suitable material.

Absolute Accuracy Essential

Grinding machines for production of finished parts must be constructed as accurately as any other; since an error of as little as 0.0005 in. may be sufficient to condemn the part operated on. Provision must be made to prevent the particles of abrasive material torn from the wheel from reaching the sliding surfaces of the machine. Usually the part to be ground is machined to within a few thousandths of an inch by ordinary cutting tools, so that the grinding wheel will not be subjected to appreciable wear during use.

Operations may be classified as (1) grinding of flat surfaces; (2) external grinding of cylindrical surfaces; (3) grinding of internal cylindrical surfaces (*e.g.* bores of motor car cylinders); (4) grinding of wheel teeth accurately to shape. "Centreless" grinding is also used for rapid finishing of small cylindrical parts to size. Machines may be (a) those in which the position of the grinding wheel is fixed during the operation, while the work moves longitudinally; (b) those in which the wheel moves axially along or radially across the work, which rotates or remains fixed. In class (a) the drive to the wheel is simpler, but the traversing of the work may introduce difficulties. Class (b) is more generally used for short pieces of work.

Grinding wheels are made up of grains of abrasive material held in position by a bonding material. Abrasive materials may be emery, corundum, and quartz, or manufactured products of the electric furnace, such as fused aluminium oxide and silicon carbide. The

nature of the bond depends upon the use to which the wheel is to be put; most widely used is the vitrified bond, of clay, feldspar, and flint, moulded to shape and vitrified at 2,400° F. Size and spacing of the grains will depend upon the nature of the operation. Surface speeds vary between 4,500 and 6,000 ft. per min.

PRODUCTION GRINDING. The enormous improvement in the manufacture of artificial abrasives opened the way to the large-scale use of grinding methods for shaping and forming metal, plastics, and substances otherwise turned in a lathe or shaped in a milling machine. The artificial abrasive materials are ground and pulverised to a number of standard grain sizes, and processed to furnish standard grades of hardness. The wheels are made in many shapes, ranging from a solid disk to a hollow, cupped shape; and in sizes from a tiny wheel used to form the screw-threads on a machine tap to one a yard in diameter. Steel parts which used to be machined in the soft, untempered state were apt to warp or become distorted in subsequent heat treatment. When grinding is substituted, the part may be first hardened and tempered, and then threaded by a grinding wheel, so obviating any subsequent distortion. See Abrasives; Carborundum; Emery.

Gringo. Colloquial term employed in the Latin American republics to designate a traveller or settler of other European origin, especially British or Anglo-American. Like Dago (*q.v.*), it came into use in the 1880s, and is apparently a variant of Griego (Greek).

Gringoire, PIERRE (c. 1480–1539). French dramatist. Having produced *Le Chateau de Labour*, a didactic poem, 1499, he was frequently commissioned to write plays for Philip of Austria. In the society of *Enfants sans Souci*, he held the highest office, that of *Prince des Sots*. He had great influence on contemporary drama, and in his entertainments used political propaganda. In poems and moralities he attacked church and pope, but for his last 20 years the "French Aristophanes" was orthodox.

A French daily newspaper of the same name, famous for political cartoons, was one of the most popular journals of the Right. During the German occupation of France, 1941–45, Gringoire favoured collaboration, and after the liberation was suppressed.

Grinnell Land. This is part of Ellesmere (*q.v.*), an island of N. America.

Griqualand East. Part of the Transkeian Territories in the N.E. of Cape Province, S. Africa, lying S.E. of Basutoland and S.W. of Natal. Annexed to Cape Colony in 1875, it was named after the Griquas, a tribe of mixed Dutch and native descent. The chief Adam Kok III led 3,000 followers in an epic trek over the Drakensberg to found Kokstad, now the capital with a pop. of 5,588. Although the Griquas received a treaty on favourable terms, they were unsatisfactory settlers, and most of them sold out. Griqualand East is a fertile, healthy, and picturesque country, with an area of 6,602 sq. m. and a pop. of 17,306 whites and 1,100,000 natives.

Griqualand West. Region of Cape Province, S. Africa, lying N. of the Orange river and W. of the Orange Free State. It was annexed by Great Britain, Oct. 17, 1871, after an arbitration court had decided that it was the property of the Griqua chief Waterboer and not part of the Orange Free State. It was annexed to the Cape in 1877, but not actually incorporated until 1880. The discovery of diamonds at Kimberley (*q.v.*) in 1867 attracted immigrants to this district. De Beers, Belmont, Barkley West, and Griquatown (the capital until superseded by Kimberley) are mining centres. The area of the region is 15,197 sq. m.

Gris, JUAN (1887–1927). Spanish painter. José Victoriano González was born in Madrid, March 23, 1887. His parents intended him to be an engineer, but at 19 he went to Paris. First exhibiting at the *Salon des Indépendants* in 1912, he worked with Picasso and Matisse, and in 1926 executed the décor for three ballets for Diaghilev. He died May 11, 1927. Gris, whose work was strongly influenced by the Cubists, was one of the few Spanish painters to dominate the Post-Impressionist world of Paris. His pictures were purchased by leading European galleries, and in 1936 a complete exhibition was held in London.

Grisaille (Fr. *gris*, grey). Species of grey colour obtained by mixing black and white in varying proportions. Grisaille is a valuable medium for monochromes, is common in stained-glass windows and mural decoration, and is used freely, *e.g.* by Van Dyck, for sketches. The ancient Greek painters, who knew nothing of

chiaroscuro, found grisaille helpful in their schemes of gradation and modelling, as it enabled them to represent the appearance of relief. Once it was employed by many artists for blocking in their subjects, but the practice was condemned when the intermixture of white was excessive, because the dried rapidly and did not blend with the colours of the over-painting.

Griselda, GRISSELL, GRIZZLE, OR GRISELDIS. Heroine of traditional fiction. She is regarded as the model of wifely obedience and patience. Her story, generally derived from Boccaccio, who may have got it from an earlier source, has been told by Petrarch, by Chaucer (in the Clerk's Tale), has several times been treated dramatically, in Germany by Hans Sachs (1546), in England by John Phillip (1565), Henry Chettle (1603), and others, and has been rendered in ballad form.

Grisette (Fr. *gris*, grey). Name given in France to a girl or young woman of the working class. It implies a certain capacity for enjoyment and an absence of restraint, but not necessarily immorality. The name was given because the girls were usually dressed in garments made of a woollen cloth called grisette from its grey colour.

Grisi, GRULLA (1811-69). Italian singer. Born at Milan, July 28, 1811, she made at 17 her first

Giulia Grisi,
Italian singer

appearance as a professional soprano in Rossini's *Zelmira*. In 1832 she made her reputation in the same composer's *Semiramide*. At the Théâtre des Italiens, Paris, she regularly appeared until 1849; she first came to London in 1834. One of the quartet which included Rubini, Tamburini, and Lablache, and one of the great operatic singers of the century, she died in Berlin, Nov. 29, 1869.

Her sister Carlotta, ten years younger, appeared as a dancer in Paris in 1840, and next year created the title rôle in the ballet *Giselle*.

Gris Nez (Fr., grey nose). Cape of France, in the dept. of Pas-de-Calais, on the Strait of Dover at its narrowest point. It is the nearest part of France to the English coast. Many Channel swimmers have started their attempts at this point (see Channel Swimming). In the Second Great War,

Canadian troops overcame the last of the German garrison at Gris Nez on Sept. 29, 1944, capturing the big gun batteries that had been bombarding Dover and other towns for four years.

Grisson OR HURON (*Galictis*). Carnivorous mammal of the weasel family found in S. America and Mexico. It is about as large as a marten, and is grey on the back and dark brown on the underparts, with yellow tips to the tail and ears. It lives in hollow trees and clefts in the rock, and preys upon small birds and mammals.

Grisons (German *Graubünden*). Easternmost and largest canton of Switzerland. It is bounded N. and E. by Austria and S. by Italy, and has an area of 2,746 sq. m. Composed of the basins of the Upper Rhine and the Inn, with that of two tributaries of the Ticino and one of the Adda, it is almost wholly mountainous, comprising most of the ancient Rhaetia. There are many mineral springs, forests, and mt. pasturages, the lower ones sustaining a fine breed of cows. The climate is generally severe, and the vegetation alpine, though the vine and maize are grown in sheltered spots.

The capital is Coire or Chur; other towns are Dissentis, Davos, St. Moritz, and Arosa, all renowned for winter sports. The canton includes the Engadine or upper valley of the Inn, noted for its scenery. One of the most sparsely populated cantons, of its pop. nearly half are R.C. and German-speaking, and the rest speak Romansch or Italian—all three languages being official. Pop. 128,247.

Until 1798 the canton consisted of three leagues—the League of God's House (1367), the Grey League (founded 1395), and that of the Ten Jurisdictions (1436). These combined in the Three Perpetual Leagues in 1471. After a troublous history Grisons joined, 1799-1801, the Helvetic Republic, and in 1803 the Swiss Confederation.

Grist (A.S., to grind). Word originally applied to the act of grinding corn. It came to be used for the corn ground and the meal produced, and colloquially for anything that is a source of profit. Grist is also used for a size of rope; e.g. common grist is a rope 3 ins. in circumference.

Grit. Consolidated sand of which the particles are angular and comparatively coarse. The term has local significance in many districts. See Sand; Sandstone.

Grizzly. Name of a large bear. The word means rather grey. A powerful creature, the grizzly inhabits the mountainous districts of the west of Canada and the U.S.A. It is much larger and heavier than the brown bear, which to some extent it resembles, and is dangerous when attacked or hungry. See Bear.

Groat (Low German *grote*, great). English silver coin, now demonetised. The groat was first

Groat. Two sides of the coin minted by Edward III, 14 ins. diameter

issued in England by Edward III in 1351, minted at London and York, its original value being one penny, but coming to have the value of fourpence. A new issue was made by Henry VII, but the groat was discontinued in 1662. It was revived as a silver fourpenny piece by William IV in 1836, and the fact of its issue having been advised by Joseph Hume gave it the popular name of the "Joey." Issue was dropped in 1856, and it was demonetised in 1887.

The Scots groat was issued at Edinburgh by David II in 1358, and James V coined a $\frac{1}{4}$ groat in 1527. An Irish groat was issued by Henry VI in 1460. See Coinage.

Grocer. Originally grosser, one who sold goods by *peso grosso*. In modern usage the word is applied to a retailer of tea, sugar, coffee, spices, etc., which are known collectively as groceries. In medieval times he was known as a spicer. In the U.K. the grocers have a regular trade organization, their own journals, etc. The term greengrocer for a vendor of green-stuffs is analogous.

Grocers' Company. Second of the twelve great livery companies of the City of London. It

Grocers' Company arms

had its origin in a fraternity of S. Anthony founded May 9, 1345, by 22 members of the Ancient Guild of Pepperers; their duties included that of "garbling," or preventing adulteration of drugs and spices, and the charge of the King's Beam, which weighed all merchandise sold by *peso grosso*,

whence the name grocer is probably derived. In 1427 was acquired the site in Princes St. on which the present Grocers' Hall stands; in 1428 the original hall in Old Jewry was finished and the first charter granted.

The Great Fire of 1666 nearly ruined the company, destroying not only its hall but property in the city. The hall was rebuilt and let as a residence for the lord mayor. In 1694 it was leased to the newly-formed Bank of England, of which Sir John Houblon, a grocer, was the first governor.

Charles II was an honorary member of the company, and William III accepted the office of sovereign master in 1689. Freemen and honorary members included George V as duke of York, Sir Philip Sidney, William Pitt (whose portrait hangs in the hall), Sir Robert Peel, Lord Roberts, and A. J. Balfour. A bequest of property in 1556 led the Grocers' Company to found Oundle School. It endowed scholarships and gave freely to hospitals, in particular to Lister Institute and the London Hospital, for which it built a new wing in 1876.

Grock. The stage name of a Swiss clown, whose real name was Charles Adrien Wettach. Born on Jan. 10, 1880, he made an international reputation, and was especially popular in Paris and in London, where he frequently appeared at the Coliseum. Difficulties

Grock,
Swiss clown

over income tax in 1924 were said to have led him to desert the English stage. As an artist he ranked among the great clowns for his inimitable and infectious appreciation of his own jokes and his tragicomic miming.

Grocyn, WILLIAM (c. 1446-1519). English classical scholar. He was born at Colerne, Wilts, and educated at Winchester and New College, Oxford, of which he was fellow, 1467-81. A friend of More, Linacre, Colet, and Erasmus, who called him his *patronus et praeceptor*, he studied in Italy, 1488-90, under Politian and Chalcondyles, was a pioneer of the New Learning, and among the first publicly to teach Greek at Oxford. While in Italy he made the acquaintance of the printer Aldus Manutius (*q.v.*). He was divinity reader at Magdalen College, 1481-

88, prebendary of Lincoln cathedral, held benefices at Newton Longueville, Deepdene, London (S. Lawrence Jewry), Shepperton, and East Peckham, and was master of All Hallows, Maidstone, where he was buried. A monument has been raised to his memory in the church at Newton Longueville.

Grodno. Town of White Russia S.S.R., 160 m. N.E. of Warsaw on the main rly. to Leningrad. It stands on the river Niemen, and until 1917 was the chief town of the Russian government of Grodno. There are cloth, silk, tobacco, soap, and machinery factories, and trade is done in corn, timber, and hemp. In the neighbourhood are the mineral springs of Duskieniki. The pop. is est. at 30,000; formerly it was double.

Once part of the principality of Lithuania, after the Polish-Lithuanian union in 1569 Grodno became one of the meeting places of the combined diet. The second partition of Poland was signed here, 1793. A battle was fought at Grodno between the German and Russian armies, Sept. 1-4, 1915; the Germans carried the forts on the W. and N. sides and entered the town, but the Russians developed a counter-attack and re-entered the town, retiring again with a considerable force that had seemed in danger of being surrounded. Grodno became Polish in 1923. In the Second Great War, the Russians entered Grodno without opposition, Sept. 22, 1939, and retained the place after the partition of Poland. German troops captured it June 22, 1941, on the invasion of Russia, and lost it again, July 16, 1944. Lying just E. of the Curzon Line, the town was ceded to the U.S.S.R. in 1945.

Grog. Burnt fireclay used in the manufacture of refractory bricks or crucibles. Normal unburnt clays contain a high proportion of water, and hence tend to contract rapidly when strongly heated. The contraction may be so rapid and irregular that it causes cracking and premature failure of the crucible or brick. Therefore some burnt clay, old crucibles or used fire-brick, is suitably ground and added to the clay before the bricks or crucibles are shaped. This stable material not only reduces the effect of contraction during firing, but stabilises the whole refractory during use. Grog also increases the resistance of bricks to erosion.

Grog. Name applied by sailors in the Royal Navy to their ration of rum. The word is said to be

derived from Old Grog, a nickname of Admiral Vernon, so called from his coarse, or program cloak. In the days of the four-wheeled cabs, cabmen used to drink rum mixed with hot water, a slice of lemon, and a bit of sugar, which they called grog. *See Rum.*

Grogging. Name for an ingenious evasion of excise dues. Casks containing spirit absorb into the wood in time an appreciable quantity of spirit which can be extracted by rinsing and other processes. By the Finance Act of 1898 grogging and the possession of a cask so treated, or of any spirit obtained by the process, are offences punishable by a fine of £50.

Groin. In architecture, the angle formed by the intersection of arches or vaults. Groined vaulting is so called to distinguish it from barrel or other forms of arch construction in which no such intersection takes place. *See Gothic Architecture.*

Grolier, JEAN, VICOMTE D'AGUSY (1479-1565). French book collector. Born at Lyons, he entered the French diplomatic service, and was ambassador in Milan and Rome. He began collecting books, which he had splendidly bound and generally lettered in Latin with the legend "Jean Grolier and his friends." In 1537, on his return to France, he became treasurer under Francis I. Ten years after his death, which occurred Oct. 22, 1565, his famous library of about 3,000 volumes was sold; a number of the books are in the Bibliothèque Nationale, Paris, others in the British Museum. The Grolier Club, New York, founded in 1884 to encourage the application of art to book production, was named after him. *See Bookbinding.*

Gromwell (*Lithospermum*). A genus of annual and perennial herbs and shrubs of the family Boraginaceae. Natives of Europe, temperate Asia, and N. America, they have bristly or hairy alternate leaves, and funnel-shaped, white, blue, or yellow flowers in clusters. Common gromwell (*L. officinale*) has greenish-yellow flowers; in corn gromwell (*L. arvense*), an annual, they are creamy-white; and in purple gromwell (*L. purpureo-caeruleum*) they are bright blue-purple.

Gromyko, ANDREI (b. 1909). Russian diplomatist. He was born July 5, 1909, in the district of Gomel. He graduated from the Minsk institute of agricultural economics, and was appointed to the scientific staff of the institute of economics. In 1939 he

was chief of the division of American countries in the people's commissariat of foreign affairs, resigning soon to go to Washington. Succeeding Maxim Litvinov as ambassador to the U.S.A. in 1943, he led the Russian delegation at the Dumbarton Oaks and San Francisco conferences. Gromyko was chief U.S.S.R. representative at the U.N. assembly, 1946, and permanent Russian representative on the security council, being released from his duties as ambassador in April. In Oct. he became a deputy foreign minister, and first deputy in 1949.

Groningen. N.E. prov. of the Netherlands. It is bounded N. by the North Sea, N.E. by the Dollart, W. by Friesland, E. by Hanover, and S. by Drenthe. Area, 895 sq. m. The surface is flat and swampy in the S.E. district, where there has been reclamation. There is good grazing land in the N. The prov. is mainly agricultural, though there are industrial and shipping industries and coast fishing is carried on. The few rivers are unimportant. Groningen suffers from sea encroachment and has to be protected by a system of dykes and embankments. The chief towns are Groningen, the capital, Delfzijl, Appingedam, and Winschoten. The principal products are wheat, barley, oats, flour, potatoes, rye, and oil seeds. Pop. est. 442,085.

Groningen. A town of the Netherlands, capital of the province of Groningen. It stands at the junction of the Hunse with the Drentsche Aa, 32 m. by rly. E. of Leeuwarden. Intersected by numerous canals, it has wide streets and gabled houses of the 17th century, and is surrounded by boulevards on the site of the ramparts. Among the principal buildings are the Gothic Martini church, dating mainly from the 13th and 16th centuries, with a lofty tower and a fine organ; the university, founded 1636, had 1,611 students in 1946; a museum; the Stadhuis, built 1792-95; the 16th century law courts; the 13th century Gothic Aa chapel, rebuilt in Renaissance style in 1725. There is a large market.

Groningen is the most important town in the N. Netherlands, and carries on a large trade in grain and rape seed. Its harbour is accessible

Groningen, Netherlands. Martini church and the market place

to small sea-going vessels. The principal manufactures are textiles, tobacco, cigars, mirrors, furniture, machinery, sugar, and gold and silver articles; there are also large printing and lithographic establishments, and some shipbuilding.

Groningen is mentioned in the 9th century, and from the middle of the 11th century was under the bishop of Utrecht. A member of the Hanseatic League from 1282, it was taken by Prince Maurice of Orange in 1594, and successfully withstood a siege by Bishop Bernhard von Galen of Münster in 1672. The fortifications were razed in 1874. During the First Great War there was an internment camp here for British and Belgians. When German forces invaded the Netherlands on May 10, 1940, no attempt was made to defend the town or prov. Units of the Canadian 2nd division entered Groningen on April 14, 1945, and the Germans surrendered on April 16 after a fierce struggle in the centre of the town. In the course of the war, 425 houses were destroyed. Pop. 128,828.

Gronov or **GRONOVIVS.** Name of a family of German classical scholars and men of science, all connected with Leyden. Johann Friedrich (1611-71), a native of Hamburg, became professor of history and eloquence at Deventer and of Greek at Leyden. The founder of the Dutch school of Latinists, he edited a number of Latin classics. His son Jakob (1645-1716), professor of Greek

literature at Pisa and of belles-lettres at Leyden, is best known by his *Thesaurus Antiquitatum Graecarum*, a learned but undigested mass of information on Greek antiquities. Jakob's son, Abraham (1695-1775), was librarian of Leyden, and edited various classical authors. Another son, Johann Friedrich (1690-1760), was a well-known botanist, whose son, Lorenz Theodor (1730-77), was the author of works on zoology, especially ichthyology.

Groom (old Fr. *gromet*, boy). Term applied to a manservant in charge of horses. In addition to his stable duties, a groom is usually expected to accompany his master when riding. From its earlier and more general use for any male attendant, the word survives as the title of certain officials in the lord chamberlain's department of the British royal household, whose duties are to attend the sovereign. The groom of the stole is next to the vice-chamberlain and in charge of the stole worn on state occasions. There is a similarly styled appointment in the queen consort's household.

Groom in the word bridegroom is derived from the A.S. *guma*, man, cognate with the Lat. *homo*, the "r" having been intruded as a result of confusion with groom.

Groombridge, STEPHEN (1755-1832). British astronomer. Born Jan. 7, 1755, he succeeded to the business of a linen-draper in Smithfield, and it was not till 1802 that he was able to study astronomy seriously. In 1806 he began compiling a catalogue of stars down to 8.9

S. Groombridge, British astronomer
From a print

magnitude, within 50° of the North Pole, and six years later he was made F.R.S. He had made some 50,000 observations and was engaged upon the completion of his catalogue when attacked by paralysis. Groombridge died March 30, 1832; his work was published in 1838, under the supervision of Airy.

Groot or **GROETE, GERHARD** (1340-84). Dutch reformer. Born at Deventer, he became a wandering preacher, and founded the Brothers of the Common Life (*g.r.*), a communal society which continued to flourish till the Reformation. He also instituted

Groningen town arms

houses of Augustinian canons. He died of the plague, Aug. 20, 1384.

Groote Eylandt OR GREAT ISLAND. Largest island in the Gulf of Carpentaria. It lies off the S.E. coast of Arnhem Land, N. Australia, and measures 40 m. in width and length. Its mountainous centre and barren shores have been little explored.

Groote Schuur. Official residence of the premier of the Union of S. Africa. It is near Rondebosch station, about $3\frac{1}{2}$ m. S. of Cape Town, Observatory Road connecting the two. The house was formerly the residence of Cecil Rhodes, who built it, but there appears to have been one here before 1652. Near it is the Rhodes Memorial, the statue of Physical Energy. by G. F. Watts.

Gros, ANTOINE JEAN, BARON (1771-1835). A French painter. Born in Paris, March 16, 1771, he studied under David and in Italy. Having won the approval of Napoleon by his picture of The Battle of Arcola, he made him the central figure of many canvases, now in the Louvre and at Versailles: Napoleon Visiting the Plague-stricken at Jaffa, 1804, The Battle of Aboukir, 1806, Napoleon at Eylau, 1808, and The Battle of the Pyramids, 1810. After the Restoration Gros continued to paint in the grand manner, his chief work being the decoration of the dome of the Panthéon. Depressed at losing his hold on the public, he drowned himself in the Seine, his body being found at Meudon, June 26, 1835. *Pron.* Grō.

Antoine Jean Gros,
French painter

Grosbeak (Fr. *grosbec*). Either of two birds of the finch family, nearly related to the hawfinch. The scarlet grosbeak (*Carpodacus*) frequents marshes; the pine grosbeak (*Pinicola*) is larger, and found in woodlands, common in the pine forests of N. Europe, and a rare winter migrant to Great Britain. The male is rosy pink, the female bronze. The birds have a large and massive beak. *See* Beak.

Grosbeak. Bird of
the finch family

Groschen. A coin once current in many lands, whose name was derived from Lat. *grossus*, big.

Groote Schuur, near Cape Town,
the official residence of the premier
of South Africa

In Germany it arose after the Crusades as a larger, silver, multiple of the *pfennig*; in France it appeared in 1226 as the *gros tournois*; in Bohemia a Prague variety was coined. It was reduced in value and mostly made from copper in the 18th century, equaling $\frac{1}{4}$, later $\frac{1}{8}$, of a thaler, or $\frac{1}{16}$ of a gulden or florin. England had its equivalent in the groat. Catherine I of Russia had a *grosch* circulating in Poland. In Italy a *grosso*, later in consequence of its depreciation called *grossetto*, circulated in the 13th-17th centuries. The name was revived for the smallest coin of Austria after the First Great War; one *schilling* being equal to 100 groschen, of about $\frac{1}{4}$ penny each.

Grosche, FRANCIS (1731-91). An English antiquary. Born at Greenford, Middlesex, the son of an opulent Swiss jeweller; he was Richmond herald, 1755-63, and became F.S.A. in 1757, but squandered his fortune. Prolonged tours resulted in his *Antiquities of England and Wales*, 1773-87. While collecting the material for his *Antiquities of Scotland*, 1789-91, he met Burns, who wrote warning brother Scots that "a chiel's amang ye takin' notes." Grosche wrote on Ancient Armour and Weapons, 1785-89; Military Antiquities, 1786-88; and Antiquities of Ireland, 1791-97. He died in Dublin, June 12, 1791.

Gross. Numerical unit and measure of quantity. It equals a dozen dozen, i.e. 144, and is used in reckoning many classes of goods. A great gross is 12 gross, i.e. 1,728.

Grossenhain. A town of Eastern Germany. It stands on the Röder, 20 m. N.W. of Dresden, and is a rly. junction for Frankfurt-on-Oder, on the Berlin-Dresden line. It is a manufacturing

town with cloth factories. Other industries are connected with machinery, paper, and glass works. Grossenhain has been in many hands from time to time, falling successively to the Bohemians and the margraves of Meissen and Brandenburg. There was a battle here in 1813 between French and Russians. Pop. 13,293.

Grosseteste, ROBERT (c. 1175-1253). English prelate and scholar. Born of humble parentage at Stradbroke, Suffolk, and educated at Oxford, he became chancellor of the university, and in 1224 the first rector of the Franciscan school at Oxford. In 1235 he was elected bishop of Lincoln. He at once set himself to reform abuses in his diocese, and became one of the most resolute champions of the independence of the clergy. In 1239 he quarrelled with the Lincoln chapter over his right of visitation, a dispute which lasted six years, and was eventually decided by the pope in his favour. He was a profound Greek scholar, bringing Greek books to England and making Latin versions of them, and was a skilled physicist and mathematician. He died Oct. 9, 1253, and is buried in Lincoln cathedral.

Grosseto. Maritime prov. of Tuscany, Italy, at the head of the Tyrrhenian Sea. It is backed by a branch of the Apennines, rising in Mt. Amiata to 5,470 ft., and includes most of the Maremma. Mostly barren and unhealthy, it yields timber, quicksilver, and Siena earths. The malarial marshes of the ancient Lacus Prelius have been reclaimed, and are now pastureland. The chief rivers are the Ombrone and the Albegna. The island of Elba lies about 13 m. off the coast. The capital is Grosseto. Area, 1,735 sq. m. Pop. 176,887.

Grosseto. Town of Italy, capital of the prov. of Grosseto. It stands near the Ombrone, 39 m. S.S.W. of Siena. Its handsome red-and-white marble cathedral, begun late in the 13th century and restored in 1855, and the 14th century citadel betray Siennese influence. The cathedral cloisters were razed in the Second Great War, when Grosseto was the centre of an extensive system of German airfields. The town was captured by the 5th army, June 16, 1944. The Municipio holds a rare collection of bronzes, cinerary urns, and vases, besides other Etruscan relics. A few miles N.E. of the city are the sulphur baths of the ancient Rusellae, one of the 12 cities of the Etruscan League. Its cyclopean walls and ruins are still

extant, although the place was deserted about 1150.

The principal trade is in cattle, cereals, horses, and machinery. Dating from the Middle Ages, the bishop's see was transferred here from Rusellae about 1138. In summer the official headquarters are removed to Scansano, 20 m. S.E. Malaria has seriously depopulated the town. Pop. 26,428.

Grossmith, GEORGE (1847-1912). British actor and entertainer, born Dec. 9, 1847. He was associated with his father as reporter at the Bow Street police court. In 1870 he became an entertainer, and in 1877 began his career as actor and singer in Gilbert and Sullivan opera by appearing in *The Sorcerer* at the Opéra Comique, afterwards taking a leading part in eight more of these pieces at The Savoy. In 1889 he resumed his old career as entertainer, achieving much success at the piano in London, the provinces, and the U.S.A. With his brother Weedon (*v.i.*) he wrote the celebrated *Diary of a Nobody*. He died at Folkestone, March 1, 1912.

His son, also George (1874-1935), went on the stage at 18, in Gilbert's *Haste to the Wedding*, 1892. After playing in *The Shop Girl*, at the Gaiety, London, 1894, he appeared there in popular pieces until 1913. He entered management with Laurillard, with whom in 1919 he opened the Winter Garden Theatre, and was managing director of Drury Lane Theatre, 1931-32. He made films wrote the song *Yip-i-addy* and was its original singer, in *Our Miss Gibbs*, 1909, and in 1933 published his reminiscences, *G. G.* He died June 7, 1935.

Grossmith, WEEDON (1853-1919). British artist and actor, brother of George Grossmith the elder. He studied in the R.A. schools and exhibited at the R.A. and Grosvenor Gallery. In 1885 he appeared on the stage at Liverpool, and he made his first

Geo Grossmith

appearance in London at The Gaiety in 1887. In 1891 he produced and acted in *A Pantomime Rehearsal*, which ran for two years; and maintained his success, which culminated in his own play, *The Night of the Party*, 1901. His last appearance was in *The Misleading Lady* at The Playhouse, 1914. With his brother he wrote for Punch, and himself illustrated, *The Diary of a Nobody*, 1892, repr. with memoir by B. W. Findon, 1920, and in several later edns.; and in 1913 published his reminiscences, *From Studio to Stage*. He died June 14, 1919.

Grossulariaceae. Family of (often) spiny shrubs. They are natives of the N. temperate regions and the Andes, gooseberry and currant being well-known examples. They have alternate leaves, and tubular or bell-shaped flowers, the calyx being the conspicuous part owing to the minute size of the petals. The fruit is a berry filled with juicy pulp surrounding the seeds. These shrubs are included in the Saxifragaceae. See Currant; Gooseberry.

Grossularite. A calcium-aluminium member of the garnet group of minerals, calcium-alu-

minium silicate ($\text{Ca}_3\text{Al}_2(\text{SiO}_4)_3$), often containing subordinate iron. Grossularite is typical of the metamorphosed, impure calcareous rocks, and is common near intruded igneous rocks and in certain crystalline schists. See Garnet.

Gross-Venediger. Mt. mass of the Noric Alps, in the Hohe Tauern, on the borders of Tirol and Salzburg. It lies between the Gross Glockner and the Drei Herrn Spitze, and reaches an alt. of 12,010 ft. The Klein-Venediger, adjoining, attains 11,420 ft.

Grosvenor. Name of a family that holds three British peerages. The earliest Grosvenors were found in Cheshire in the 12th century. One of them who lived at Eaton, near Chester, was made a baronet in 1622, and was the ancestor of Sir Richard Grosvenor, made Earl Grosvenor in 1784. The earl's descendants became marquesses and then dukes of Westminster. The second peerage is the barony of Ebury, conferred in 1857 on Lord Robert Grosvenor, a son of the 1st marquess of Westminster. The third, the barony of Stalbridge, was bestowed in 1886 on Lord Richard Grosvenor, a son of the 2nd marquess. He was chief Liberal whip 1880-85, and for many years chairman of the L.N.W.R. *Pron.* Grove-ner. See Westminster, Duke of.

Grosvenor Gallery. London art gallery, founded in Bond Street in 1877 by Sir Coutts Lindsay (1824-1913), a painter of talent. The object of the gallery was the annual exhibition (by invitation) of pictures by artists who were supposed, rightly or wrongly, not to enjoy the favour of the R.A., and the type of pictures exhibited incurred some ridicule, expressed by W. S. Gilbert in *Patience* (1881) when he sang of "the greenery-gallery, Grosvenor Gallery, foot-in-the-grave young man." During the 1880s it became the centre of the aesthetic movement, famous exhibitors including Burne-Jones and Whistler.

Grosvenor House. London hotel in Park Lane, built on the site of the former home of the duke of Westminster. The original mansion on the S. side of Upper

Grosvenor House, London. Entrance to the former mansion, demolished 1928. Top, the new Grosvenor House

Weedon Grossmith, British actor Russell

Grosvenor St. was built for the duke of Gloucester, brother of George III. Its west wing contained a famous collection of pictures. Bought by Lord Leverhulme in 1924, the house was demolished in 1928, large blocks comprising service flats and shops being erected on the site.

Grosvenor Square. One of the great squares of London. It is approached from Park Lane by Upper Brook St. and Upper Grosvenor St., Mayfair. About six acres in area, it was laid out by William Kent for Sir Richard Grosvenor (d. 1732) in 1695, and completed in 1725. The central gardens occupy the site of Oliver's Mount—whence Mount St.—a redoubt thrown up by the citizens in 1643 on the approach of Charles I after Edgehill.

Since the middle of the 18th century a fashionable quarter, the square was not lighted by gas until 1839. One of its early residents was the 4th earl of Chesterfield, at whose house Dr. Johnson was kept waiting in an anteroom. At No. 22 William Beckford entertained Nelson; at No. 23 the 12th earl of Derby was married to Elizabeth Farren the actress; at No. 6 Joseph Neeld, M.P., formed his collection of pictures. No. 39 (now 44) was a meeting place of the Cato Street conspirators. Lord Chancellor Hardwicke, Rockingham, Lord North, Wilkes, Stratford de Redcliffe, Bulwer Lytton, the philanthropic earl of Shaftesbury, Pusey, and J. Pierpont Morgan were among other residents.

Towards the end of 1942 buildings in the square were taken over by the headquarters staffs of U.S. forces of the Second Great War. A year later nearly every house was occupied by naval, military, or air force personnel, the property being lease-lent to the U.S. government. The U.S. Office of War Information was also here for a short time. The square was therefore chosen as the site for the British national memorial to the war-time president of the U.S., F. D. Roosevelt, unveiled by his widow, April 12, 1948, and entirely subscribed for in small sums by the British public. The selected design, in which a garden enshrines an upright sculptured figure of the president by W. Reid Dick, was the subject of some controversy, one view being that, because Roosevelt throughout his presidency had been a cripple from infantile paralysis, he should not be represented as a standing figure.

Grote, GEORGE (1794-1871). British historian. Born at Beckenham, Kent, Nov. 17, 1794, and

Grote

After S. P. Denning

educated at Charterhouse, at 16 he entered his father's bank. He read widely in the classics and economics and philosophy. In addition to working at the bank for over 30 years, Grote also entered politics, becoming M.P. for the City of London in 1832, and was interested in the promotion of the university of London. Among his friends were the Mills, father and son, Brougham, and Ricardo. In 1843 he retired from the bank and devoted his leisure to the completion of his *History of Greece*. Though written as a vindication of democracy, the history, completed 1856, remains a monument of research and sound historical judgement, enriched by passages of great eloquence. Among other books by Grote are one on Plato and the other companions of Socrates, 1865, and another (unfinished) on Aristotle, 1872. Grote died June 18, 1871, and was buried in Westminster Abbey.

Grotefend, GEORG FRIEDRICH (1775-1853). German archaeologist. Born at Münden, Hanover, June 9, 1775, he became successively professor at Göttingen, 1797, Frankfurt, 1803, and Hanover, 1821. He was chiefly known as a Latin and Italian philologist until he won lasting fame by his decipherment of the Babylonian cuneiform inscriptions. He died Dec. 15, 1853.

Grotesque. Ancient form of decorative painting or sculpture, in which nature was distorted, parodied, or exaggerated. Thus, in one variety, human and animal forms were combined in fantastic

Grotesque creature worked into the architectural ornament of Senlis Cathedral, France

By courtesy of Macmillan & Co.

fashion and interwoven with flowers and foliage, partly to tone down what might otherwise have been merely repulsive. The idea did not necessarily imply ugliness, but rather something bizarre, with a touch of the absurd and incongruous, in which sense the Romans often introduced it into the decorations of their buildings. The word is French, from Ital. *grottesca*, curious painted work found in grottoes. See Dance of Death.

Groth, KLAUS (1819-99). German poet. Born at Heide, Holstein, April 24, 1819, he was the first writer of importance to use Low German as a literary medium. He achieved fame with *Quickborn*, 1852, poems of Dithmarschen life. In 1858 he was appointed lecturer in German at Kiel university, and professor, 1866. He died at Kiel, June 2, 1899.

Grotius, HUGO (1583-1645). Dutch jurist, known in Holland as Huig van Groot. Born at Delft,

April 10, 1583, son of a lawyer, of a branch of the French noble family de Cornets, which took the name of Groot, he showed extraordinary intellectual abilities and as a boy acquired a wide knowledge of the classics. Having studied at Leyden and in France, he became a practising lawyer, but found time to write Latin verses and dramas.

In 1603 he was appointed historiographer of the United Provinces; other public positions were also given to him; but his share in the politics of the time led to his fall. Of tolerant spirit, he wished to mitigate the fierce hostility between the religious parties in Holland, but in this he failed. Regarding the Remonstrants (*q.v.*) as less fanatical than their opponents, he joined and assisted Barneveldt in stating their case. In July, 1618, however, Maurice of Orange made a sudden move against Barneveldt and his party, and Grotius, in 1619, was sentenced to imprisonment for life. He escaped from Loevenstein in 1620, owing to the wit and devotion of his wife; reaching Paris, he lived for some time in poverty in France. After a time his fortunes mended, and having entered the Swedish service in 1634 he was made ambassador to France. He died at Rostock, Aug. 28, 1645.

In exile Grotius wrote his monumental work, *De jure belli ac pacis*, published in 1625 in Paris. He wrote other works of the kind, bringing to his task an immense fund of learning. He also wrote on theological questions, and his *Annals of the Netherlands* is the best contemporary account of the revolt against Spain.

His fame, however, rests upon his *De jure*, the foundation of modern international law. It deals not only with peace and war, as the title suggests, but with the powers and duties of states. The main idea which we owe to him is that there is a foundation in morality for states and a test in morality for their activities.

Grotius visited England and was intimate with the greatest scholars of his day, Casaubon and his master, Scaliger, among them. More than 3,000 of his letters have been published. See *International Law*; consult also *Life and Works* W. S. M. Knight, 1925.

Grotius Medal. Award for services to the cause of peace, instituted 1925 on the 300th anniversary of the publication of Grotius's *De jure belli ac pacis* by the Dutch league of nations society. There is a gold and a bronze medal. Recipients of the gold medal include Briand, 1926; Kellogg, 1929; Lord R. Cecil (Lord Cecil of Chelwood) and Nansen, 1930; W. S. Churchill, 1949.

Grotius Society. British learned society founded 1915 to discuss problems of public and private international law. Foreign lawyers are admitted as honorary and corresponding members. The headquarters are at 2, King's Bench Walk, London, E.C.4.

Grottaferrata. Village of Italy, in the prov. of Rome. It is 13 m. S.E. of Rome by electric rly. A Greek monastery was founded here by Nilus in 1004. The 11th century church, rebuilt in 1754 and restored in 1902, has frescoes by Domenichino.

Grotto (Fr. *grotte*; Lat. *crypta*). Cave or recess in the earth, particularly one made or enlarged artificially for use as a shrine or retreat.

On July 25, the festival of St. James the Great, it was formerly the custom of the faithful to fasten a shell in hat or coat and make pilgrimage to the shrine at Compostella to which, according to tradition, his body was translated. Shell grottos with a figure of the saint were set up by the wayside, where those too poor to make pilgrimage could make their offerings to commemorate the day. Children

in many countries preserve the custom, though not its purpose, by erecting little decorative shrines of oyster shells and soliciting money with the cry, Remember the grotto.

One of many notable grottos is the Dog's grotto, *Grotta del Cane*, by the lake of Agnano, near Naples. Over the floor of this carbonic acid gas rises to a height

of some 18 ins., stupefying dogs taken into the grotto. There is a famous Blue Grotto at Capri (*q.v.*).

Grouchy, EMMANUEL, MARQUIS DE (1766-1847). French soldier.

Born in Seine-et-Oise, Sept. 5, 1766, he joined the Revolutionaries, notwithstanding his aristocratic birth, and assisted in suppressing the royalist rising in La Vendée. He fought in Italy in 1798, and, becoming

one of Napoleon's most trusted leaders, took part in the battles of Hohenlinden, Friedland, and Wagram. He was in the Russian campaign of 1812, and did good service in the retreat after Leipzig. His failure to appear with his division against the British on the field of Waterloo was said by Napoleon to have lost the battle—although the emperor had ordered Grouchy to watch the Prussians. After Waterloo he was proscribed and took refuge in the U.S.A., but was permitted to return in 1819, and in 1830 received his old style of marshal. He died at St. Étienne, May 29, 1847.

Ground Annual. In Scots law, a payment charged upon certain lands, something like the English ground rent. It is paid on land once the property of the Church, such being the feu duties paid to the lords of erection, the successors of those who received the lands at the Reformation. It is also used for the annual payment made some-

Grotto at Morgat, Brittany: a natural cavern in the rocks only approachable from the sea

times by builders for the use of land for building purposes.

Ground Bass OR **BASSO OSTINATO.** Short musical phrase repeated many times with varied treatment. It is usually in the bass part, but is sometimes transferred to an upper part. The ground bass has been used from the 17th century to the present day, and fine examples occur in Bach's well-known *Passacaglia*; Purcell's *Chaconne* in *The Fairy Queen* and many of his vocal works; Handel's choruses *Envy*, *Eldest Born of Hell* (*Saul*), and *To Song and Dance* (*Samson*); and in the *St. Paul's Suite*, by Gustav Holst.

Ground Gunner. Designation, or trade, established in the R.A.F. in 1939 to man the light A.A. artillery defending airfields at home and overseas. Ground gunners were in constant action on coastal fighter aerodromes during the battle of Britain. When the R.A.F. Regiment was formed in 1942, they were incorporated into its A.A. squadrons.

Ground Ice. Name given to the natural phenomenon more usually called *Anchor Ice* (*q.v.*).

Ground Ivy (*Nepeta hederacea*). Perennial prostrate herb of the family *Labiatae*. It is a native of

Europe and N. and W. Asia. The trailing stems are 2 ft. or more in length, with opposite, kidney-shaped leaves, round-toothed at the edges. The tubular, blue-purple flowers are produced in whorls of from three to six at the base of the leaf-stalks. This plant is no relation to the ivy (*Hedera helix*). Bitter and aromatic, it was formerly employed in brewing, and a tea was made from its leaves.

Ground Ivy. Foliage and bluish flowers

Ground Nut, PEA-NUT, MONKEY NUT, OR EARTH-NUT (*Arachis hypogaea*). An annual herb of the family Leguminosae. It is a native of S. America and the W. Indies and is cultivated in most trop. latitudes. The leaves have four oval leaflets, and the pea-like flowers are yellow. After pollination the flower-stalk lengthens and curves to the ground, in which it buries the incipient fruit, which there develops into the yellowish wrinkled pods which contain two seeds. These are of great value as food, in the manufacture of margarine.

Ground Nut, showing lengthened flower stalks and buried fruits

Ground Nut Scheme. British government plan for large-scale cultivation of ground nuts in British E. Africa. See N.V.

Ground Pigeon. Name used for the pigeons classed in the genus *Streptopelia*. The turtle dove is a familiar example. They are less arboreal in habit than some of the other groups, and as a rule have longer legs.

Ground Rent. Name given to the rent paid for the ground on which a house or other building stands, as distinct from that paid on the building. Builders and others often take land on lease, paying usually a fixed annual sum for a fixed term of years. If a man, having built on the land, i.e. having improved it, lets it to another at a higher price, this is known as an improved ground rent. The taxation of ground rents is frequently called for, under a misapprehension that they escape the usual burdens. Income-tax is paid upon them, and, although the ground landlord pays no part of the rates, yet this consideration affects the contract, the ground landlord charging a lower price for his land than he would do were he assessed directly to the rates. See Lease; Rent; Single Tax.

Groundsel. Stem with flowers and leaves

Groundsel (*Senecio vulgaris*). Annual herb of the family Compositae. A native of Europe and N. Africa, it has succulent stems 6 ins.-1 ft. in height, with slender leaves cut into irregular lobes

and coarsely toothed. The drooping flower-heads are yellow, succeeded by a small globe of fluffy, silky hairs which carry the fruits everywhere.

Ground Speed. The speed of an aeroplane relative to the earth's surface, as distinct from its speed through the air. If an aeroplane is flying at 200 m.p.h. air speed against a steady wind of 20 m.p.h., its ground speed will be 180 m.p.h. See Airspeed.

Ground Squirrel (*Tamias*). Alternative and popular name for the chipmunk (q.v.).

Group. A formation of the R.A.F., consisting of two or more wings, and itself a subdivision of an allied or R.A.F. command. A group is normally commanded by an air vice-marshal or air commodore. A famous example in the Second Great War was No. 11 (fighter) group, responsible for the defence of London and S.E. England in 1940, and forming part of Fighter Command.

Group Captain. A Royal Air Force officer, corresponding in rank to a captain in the Royal Navy or a colonel in the army. Four rings, worn on the cuff or epaulette, are the insignia of the rank, which is also the lowest entitling the holder to wear gold braid on the peak of the cap. The equivalent of this rank in the W.A.A.F. is group officer, with similar insignia.

Groups, THEORY OF. Modern development of higher algebra. It deals with the transformation of algebraic forms. The theory of groups of substitutions was suggested by E. Galois, a French mathematician (1811-32); a new theory of groups of substitution was due to the Scandinavian mathematician Sophus Lie, whose investigations on this subject were published 1888-93. Consult Theory of Groups of Finite Order, W. Burnside, 2nd ed. 1911.

Grouse. The name applied by zoologists to all members of the family of game birds known as Tetraonidae, which includes more than 30 species; but popularly used in a more restricted sense. Four species of grouse occur in the N. of Great Britain. The ptarmi-

gan, which turns white in winter, is found only in the wilder districts of Scotland; the blackcock, the female of which is known as the grey hen, is much larger, and is said still to occur in S.W. England as well as in Scotland; the capercaillie, largest of all, became extinct in Great Britain in the 18th century, but was reintroduced in 1837 and is now fairly plentiful in Angus, Perth, and Stirling; the red grouse, or moor cock, is by far the most plentiful, and the bird commonly implied when speaking of grouse.

The red grouse (*Lagopus scoticus*), which measures about 15 ins. in length and weighs 20-30 oz., is found only in the British Isles, and is one of the few species exclusively British. On the Continent and in Asia and N. America it is represented by a similar willow grouse, and some authorities regard the two as varieties of the same species. But the willow grouse turns white in winter, which the red grouse never does; its note is somewhat different; and its food and habits are not the same. Anatomically the two birds are almost identical.

Grouse are found on the moors throughout Scotland and the surrounding islands, except the Shetland; in the northern counties of England, in some parts of Wales, and thinly throughout Ireland. The birds nest in March on the ground, usually in the shelter of a tuft of heather or other herbage, and the number of eggs varies from six to fourteen. In

Grouse. The red grouse, one of the few species exclusively British W. S. Burridge, F.Z.S.

colour they are usually reddish-yellow, blotched with brown, but they vary greatly. Unlike many game birds, the grouse is monogamous. The food consists mainly of the young shoots of the heather, but grubs and insects are also eaten.

Sometimes, but rarely, plumage is black; in some districts it is not uncommonly spotted with white on the breast and underparts. The colour varies after the moults. The hen moults in spring and autumn, the cock in autumn and winter. See Blackcock; Egg; Ptarmigan.

GROUSE SHOOTING. The two legitimate methods of killing grouse are by shooting them over dogs, and driving the birds to the guns with the aid of beaters. The

advantages of the latter method, which is now more in favour, are that the guns can be stationed at fixed positions, usually in well-placed butts, which conceal the sportsmen, and that the fact of the birds being driven gives a greater chance of the older and stronger birds being killed first. Though never reared and fed artificially like the pheasant, grouse are carefully preserved on the moors and need considerable attention, as wet seasons, overcrowding, and epidemic diseases are very apt to reduce their numbers. The shooting season in Great Britain for grouse extends from Aug. 12 to Dec. 10. See Sporting Gun.

Grove, Sir George (1820-1900). British writer on music. Born at Clapham, Aug. 13, 1820, he was

educated as a civil engineer. His main interests, however, were in music, and in 1833 he became the first director of the new Royal College of Music and was knighted. He

Sir George Grove,
British writer

was editor of Macmillan's Magazine, 1868-83, and put together the first edition of the Dictionary of Music and Musicians, of which a third edition appeared in 1927. He published Beethoven and His Nine Symphonies, 1896. One time secretary of the Society of Arts, he died May 28, 1900.

Grove, Sir William Robert (1811-1896). A British lawyer and scientist. Born at Swansea, July 11, 1811, he was called to the bar in 1835 and became a judge of the high court 1873. He made a number of scientific discoveries and invented the Grove cell, while his theoretical work in the transmission of electric currents did much to make possible electric lighting. A fellow of the Royal Society in 1840, he was vice-president of the Royal Institution in 1844. In 1846 he published The Correlation of Physical Forces. Knighted 1871, he died Aug. 1, 1896.

Grove Cell. Primary cell comprising two metals and two liquids named after Sir W. R. Grove (*v.s.*). A porous pot containing a platinum plate and strong nitric acid is situated within an outer glass vessel and surrounded with dilute sulphuric acid. The other electrode is a zinc roll; this is attacked by the sulphuric acid and the hydrogen liberated passes

into the porous pot and reduces the nitric acid to nitrous and forms water. The chief disadvantage of the cell is that disagreeable and irritating nitrous fumes are given off. The Bunsen cell is similar to the Grove but substitutes a carbon plate for the platinum electrode.

Growth. Gradual increase in size. The term is used chiefly in connexion with living organisms. In the simplest of these growth involves only the enlargement of the single cell. In more complicated organisms the process results from the enlargement and multiplication of cells to a definite plan. Answering to some unknown control, cell groups, each according to its kind, take up their stations in an organism. Nerve cell calls to nerve cell to form the nervous system; liver cell to liver cell to form the liver structure. An equally mysterious law causes cells to arrange themselves in the future animal in preparation for a function not yet established. Thus, within the brain the centre of hearing is forming while on the exterior of the animal ears are simultaneously in preparation. In higher plants growth is initiated by the meristems at the apices of stems and roots and may be continued by the activity of cambium which occur in their thickness.

Different systems mature at different rates; e.g. the eye is already declining in capacity before the power of the mind has reached its zenith. Often the different parts of an organism grow at various rates. If the antlers of a stag grow faster than the stag, there must come a point at which the antlers are too big for the animal to manage. In practice it has been found that often the growth rate of one part of an animal is related to that of the whole animal by a fairly simple mathematical statement. The principle has been discussed by J. S. Huxley in Problems of Relative Growth (1932).

Growth can be stimulated by the agency of chemical substances, notably the anterior pituitary hormone and the active substance of the plant colchicum. Such "auxins" act on both animal and vegetable organisms.

From the moment of conception an animal is under sentence of death, the rate of subdivision and growth of the embryonic cells slowing down even before birth. The cause of cessation of growth is unknown. Some unrecognized factor puts the mechanism of

growth into reverse and the structure moves towards disintegration. Mechanism and vitalism are terms describing two rival schools of thought about growth; mechanism regarding the animal as a machine conditioned by circumstance, vitalism holding that it is imbued with and driven by some life force.

In medicine a malignant growth is a tumour such as cancer. Any abnormal increase in any part of the body may be called a growth. In crystallography a crystal is said to grow, while retaining its proportions. See Cancer; Cell; Embryology; Physiology; Plant.

Groyne. Projection built out to sea to obstruct the continuous drift of shingle or sand. On sea coasts where tidal currents prevail, littoral drift occurs, i.e. a gradual travel of shingle or sand along the shore, with usually a preponderating tendency in one direction. This may result in a give-and-take effect on straight stretches, or according to the configuration of the coast-line and other influencing factors, it may result in certain localities being denuded of their share of detritus and rendered more liable to erosion by the sea. To check this action groynes are projected from the shore, generally down to about low-water mark, against which detritus such as shingle or sand heaps itself on one side. Groynes are usually constructed of heavy timber planks bolted to and supported by driven piles and raking struts for resisting the pressure of the heaped-up mass. Sometimes they are built of masonry. See Breakwater.

Grozny. Town of the U.S.S.R. Formerly, although situated in the autonomous area of Chechen-Ingushetia, it belonged administratively to the N. Caucasian area. Chechen-Ingushetia lost its independence after the Second Great War and was renamed Grozny region. The town of Grozny lies on the Zunzha river and on the rly. connecting Makhach-Kala with Rostov, the Caucasus mts. being immediately S. It is the centre of rich oil and naphtha areas, and a station on the oil pipeline from the Caspian port of Makhach-Kala to the Armavir refineries. Another pipe-line runs from Grozny to Tuapse on the Black Sea. The pop. has grown rapidly since the opening up of the oil areas, and in 1939 was 172,468. German armies in their drive for the Caucasian oilfields during the Second Great War approached in Oct., 1942, within a few miles of

Grozny, but were then halted. On the ground that they collaborated with the enemy, the people of what is now Grozny region lost their independent status.

Grubber. Term loosely applied to various forms of cultivator. By it the ground is deeply stirred, without being turned over as it is by ploughing. See Cultivator; Hoe.

Grub Street. Old name of a London thoroughfare in Cripplegate (q.v.). E.C., running N.E. from Fore Street to Chiswell Street, and known since 1830 as Milton Street. Described by Stow as having been inhabited by bowyers, fletchers, and bow-string makers, and satirised by Pope and Swift as the home of the poorest and most helpless of literary drudges—whence the application of its name to writers and literary efforts of a mean character—the thoroughfare was destroyed by German bombs in the Second Great War. John Foxe, the martyrologist, once lived in Grub Street.

Grudziadz. This is the Polish form of the name of the town called in German Graudenz (q.v.).

Grün. ANASTASIUS. Name taken by the Austrian poet Anton Alexander, Count von Auersperg (q.v.).

Grünberg. (Pol. Zielona Gora). A town of Silesia, since 1945 under Polish administration. It is 35 miles by rly. N.W. of Glogau. It had textile industries and lignite mines, made machinery, and did a large wine trade, German champagne being made from the yield of the vineyards in the district. Pop., pre-war, 25,543.

Grundtvig, NIKOLAI FREDERIK SEVERIN (1783–1872). A Danish theologian, educationist, and poet.

Born Sept. 8, 1783, the son of the pastor of Udby, Zealand, he was educated in Copenhagen. In 1821 he was made pastor of Praestrød in Zealand and in 1822 chaplain of S.

Nikolai Frederik Grundtvig, Danish theologian. After C. A. Jensen

Saviour's Church, Copenhagen. In 1825, in answer to Clausen, Grundtvig wrote his famous protest against the rationalistic tendency of the day in The Church's Reply. Clausen retaliating by exposing Grundtvig's unorthodoxy, the latter was deprived of his chaplaincy in 1826. In 1839 he returned to clerical work, and in 1861 became bishop. He died Sept. 2, 1872.

He wrote Northern Mythology, 1808; A Summary of Universal History, 1812; Roskilda Rhymes and Roskilda Saga, historical poems, 1814; Songs, 1815; Northern Verses, 1838; and A Handbook of Universal History, 1833–42. Grundtvig was famous as an educational reformer; his system of continuing the work of the elementary schools (Folkskola) in high schools (Folkshøgskola) has borne wonderful fruit.

Grundy, Mrs. In Great Britain, the personification of conventional respectability. The name is taken from Thomas Morton's comedy, Speed the Plough (1798), in which one of the characters frequently refers to Mrs. Grundy—"What will Mrs. Grundy say?"—as the embodiment of the social proprieties.

Grus (Lat., crane). Southern constellation, named by Dirck Keyser. It is just south of Piscis Australis. See Constellation.

Gruyère, La. District of Switzerland, in the canton of Fribourg. A pastoral region, it lies in the Saane valley and is celebrated for its cheese. The inhabitants are mostly French-speaking and Roman Catholic. The chief town is Bulle with a 13th century castle, but the historic capital is Gruyères, standing on a hill at an alt. of 2,713 ft., with a fine old castle of the counts of Gruyères, who became extinct in the 16th century; it is restored and contains frescoes and old weapons.

Gruyère Cheese. The most famous Swiss cheese; now made also in the Jura and in Italy. The German name is Emmentaler. It is a hard cheese characterised by nut-shaped holes, due to gases formed in its manufacture. The curd is cooked in copper vessels, and pressed in adaptable moulds. Its excellence depends on the slowness with which it is matured. The popular belief that it must be made of goats' milk is unfounded.

Guacharo OR OIL BIRD (*Steatornis caripensis*). A remarkable bird, native of the N. part of S. America, related to the nightjars. The size of a crow, a feeder on hard nuts and fruits, it is entirely nocturnal, sleeping during the day in dark caverns. Little is definitely known about the nesting of the birds, but the young are extensively used as a food by the S. American Indians, and also as a source of oil. It is brownish grey in

general colour, and leaves its breeding and sleeping caverns at night with a loud clicking note. These peculiar birds, which have become objects of great interest to naturalists on account of their nocturnal methods of feeding, are found in Trinidad, Venezuela, Ecuador, Peru, and Colombia.

Guaco. Name given by S. American Indians to several plants, but confined by naturalists to a climbing Composite plant of the order Eupatoriaceae. The plant is remarkable for its supposed property of making anyone who eats its leaves immune from snake bites.

Guadalajara. Prov. of Central Spain. It is bounded N. by the prov. of Soria, S. by Cuenca, E. by Saragossa and Teruel, and W. by Madrid. Mountainous in the N. and E., its highest elevations rise nearly 7,000 ft. in the Guadarrama range on the N. frontier; elsewhere it is an undulating plateau. The prov., which is served by the Madrid-Saragossa rly., is drained by the Tagus and its tributaries, the Tajuna, Jarama, Henares, and Guadiale. Silver and salt are worked, and iron and lead exist; but the chief industries are sheep and goat rearing and agriculture. Olive oil, wine, silk, flax, and saffron are produced. Area, 4,709 sq. m. Pop. est. 206,081.

In the civil war, Nationalist troops launched an offensive from Sigüenza S.W. towards Guadalajara and Madrid on March 10, 1937. The main force was a mechanised Italian column, which suffered a reverse on the 14th and retreated to Brihuega, that town being captured by Republican troops on the 18th. The retreating Italians were attacked by aircraft and routed with heavy loss.

Guadalajara. Town of Spain, capital of the prov. of Guadalajara. It stands on the left bank of the Henares, at an alt. of over 2,000 ft., 33 m. E.N.E. of Madrid on the rly. to Saragossa. The chief buildings are two 15th century palaces, and the old Mendoza palace, all dilapidated; the church of San Francisco, with a mausoleum, or

Pantheon, in which many of the Mendoza family lie buried; and a 16th century town hall. There are besides a museum, a library, a school for military engineering, a few quaint churches, and a military aerodrome. Woollen fabrics, soap and bricks are manufactured.

Guacharo. Specimen of the Trinidad species

Evidences of Roman activity include the foundations of a fine stone bridge and of the aqueduct across the river. The Roman and Visigothic Arriaca or Caraca, its present name is derived from the Moorish Wad-al-hajarah, or Valley of Stones. Captured by the Moors in 714, the town passed to Castile in 1081. Pop. 13,536.

Guadalajara. Second city of Mexico and capital of the state of Jalisco. Situated near the Rio Grande de Santiago, it stands at 5,095 ft. above sea level, 280 m. W.N.W. of Mexico City by rly. Another rly. and excellent roads connect it with the U.S. border. The city is planned on modern lines. The see of a bishopric, its cathedral, completed in 1618, is one of the most magnificent ecclesiastical structures in the country and contains a celebrated painting by Murillo. Other buildings are the university, the bishop's palace, the government building, a public library containing nearly 30,000 volumes, an academy of fine arts, and several educational institutions.

Trade in the agricultural produce of the district is carried on, and the city has steel, iron, and glass industries, besides manufactures of cottons, woollens, flour, leather, and art pottery. It has suffered from several earthquakes. In July, 1914, Guadalajara was surrendered to the Constitutionalists by the Federal forces. Pop. 227,733. *Prom. God-al-a-hahra.*

Guadalaviar (Arab. *Wad-el-abyad*, white river). River of E. Spain. It rises in two headstreams in the Sierra Albarraoín and the Sierra de Gudar, uniting at Teruel, where it bends S. and then E.S.E., to discharge its waters into the Mediterranean 2 m. beyond Valencia, after a course of about 150 m. The right-hand stream, above Teruel, is known as the Alfambra. The Guadalaviar is noted for its romantic scenery. Near its mouth the river is canalised, and forms part of the water supply of Valencia. There was heavy fighting along the river during the civil war, when Teruel was captured by Republican troops on Dec. 21, 1937, after a six days' battle.

Guadalcanal. One of the Solomon Islands in the S.W. Pacific. In lat. 10° S., long. 160° E., it was discovered and named by the Spaniards in 1567. Area, est. 2,500 sq. m. After the First Great War the Solomons were administered by Australia under League of Nations mandate.

Guadalajara, Mexico. The cathedral, built in the early 17th century, seen from the south-west

The Japanese invaded Guadalcanal in Jan., 1942, with the object of establishing air and naval bases. On Aug. 7, U.S. marines landed under cover of a naval and aerial bombardment and secured a foothold. On the night of Aug. 8-9, a Japanese cruiser force sank four Allied cruisers in the channel between Guadalcanal and Tulagi and a counter-offensive was launched against the marines. Fighting was intensified in Oct. when fresh Japanese forces were landed. A naval victory, Nov. 13-16, helped to consolidate the American positions on the Solomons. The marines, reinforced by troops, maintained a steady offensive, and by Feb. 10, 1943, the Japanese garrison had been annihilated.

Guadalquivir (Arab. *Wad-al-kebir*, great river). River of S. Spain, the ancient Baetis. It rises by various headstreams in the mts. in the E. of the prov. of Jaén, and flows first N.E., then in a W. and S.W. direction, emptying into the Atlantic about 20 m. N. of Cadiz. Its length is 360 m. Second only to the Ebro in importance, its waters, with its tributaries, most of Andalusia. It flows with a full stream all the year round, being fed in summer by the melted snow from the mountains and by heavy rains in winter. The tide is perceptible as far as Seville, which can be reached by vessels up to 1,000 tons, a distance of 70 m., while Córdova can be reached by small craft.

Principal tributaries are the Genil, Guadiana Menor, and the Guadajoz on the left bank, and

the Guadalimar and the Jandula on the right. Near its mouth the surrounding district, called Las Marismas, is a marsh, caused by the river overflowing its banks, and, before Seville is reached upstream, it branches, forming the islands of Isla Mayor and Isla Menor. The drainage area is computed at 2,900 sq. m.

Guadalupe. A river of Texas, U.S.A. Rising in Kerr co., it flows mainly S.E. for 250 m. to San Antonio Bay, being joined by the San Antonio river 20 m. from its mouth. For part of its course it is navigable by steamers.

Guadalupe Hidalgo. Village of Mexico, about 3 m. N. of Mexico City. It has a collegiate church, and a shrine dedicated to Our Lady of Guadalupe, saint of the country. By a treaty concluded here, Feb. 2, 1848, Mexico ceded New Mexico and Upper California to the U.S.A. and agreed to the Rio Grande as the boundary line.

Guadarrama, SIERRA DE. A mountain range of Central Spain. From the W. the mountains traverse the centre of the prov. of Avila and then mark the frontier between the provs. of Segovia and Soria on the N. and Madrid and Guadalajara on the S. They trend from S.W. to N.E., and divide the valleys of the Douro and Tagus. The loftiest point is the Pico de la Peñalara, with an alt. of 7,870 ft. Extensions on the S.W. are known as the Sierra de Gredos. There was inconclusive fighting in the mountains N. of Madrid on July 28, 1936, during the Spanish civil war; and Gen. Franco's forces suffered a reverse in the same

district on Aug. 25. Republican troops withdrew from their positions in this region during the encirclement of Madrid by the Nationalists in Oct.

Guadeloupe. Two islands of the Lesser Antilles, W. Indies, ranking since 1947 as a dept. of France. In the W. Atlantic, S. of Antigua and N. of Dominica, the two islands are separated by a narrow strait called Rivière Sallée. The large western island, Guadeloupe proper, is called Basse-terre, the eastern being known as Grande-terre. Total area, with dependencies, 688 sq. m. Basse-terre is of volcanic origin, and a range of mts. forms its backbone from N. to S. Among the volcanoes the most famous is La Soufrière (alt. 5,000 ft.), others being Les Deux Mamelles, and La Grosse Montagne. Grande-terre is of coralline formation, and its surface nowhere exceeds 500 ft.

There are no rivers of any importance, as they are apt to dry up in summer, leaving only shallow pools. Forests of valuable timber abound, and mangroves flourish on the swampy coast. The soil is extremely fertile, the chief products being coffee, cacao, sugar, bananas, and rum. The climate, though hot, is not unhealthy, but the colony is subject to destructive storms. The principal port is Pointe-à-Pitre (pop. 43,551), at the S. entrance to the Rivière Sallée, and there are safe anchorages in the roads of Basse-terre and in the Bay of Mahault. There are five dependencies, which embrace the islands of Marie Galante, Désirade, St. Martin, Les Saintes, and St. Barthélemy. The seat of the government is at Basse-terre (*q.v.*), a town of 13,638 inhabitants. There is steamer connexion with France. Pop. 304,239.

Guadeloupe was discovered by Columbus in 1493. It was taken in 1635 by the French, who relinquished it to the British in 1759. It changed owners many times during the next 50 years, and was finally ceded to France 1814.

Guadiana. River of S. Spain, the ancient Anas. It rises in head-streams in the provs. of Cuenca and Albacete, and flows, partly underground, generally in a W. direction, through the provs. of Ciudad Real and Badajoz. From the city of Badajoz (*q.v.*) it flows S.S.W., forming for nearly 40 m. the boundary between Badajoz and the Portuguese prov. of Alemtejo. Continuing through Portuguese territory, it bends S. and S.S.E. along the frontier of

the Portuguese prov. of Algarve and the Spanish prov. of Huelva, to fall into the Atlantic between Villa Real de San Antonio in Portugal and Ayamonte in Spain. Its length, including its principal headstream the Zaccara, is about 500 m. The chief tributaries are the Jabalón, Cobres, Ardilla, Zujar, Rucas, and Bullaque. It is navigable only for 40 m. from its mouth, which is nearly choked by shoals. At Mertola, the head of navigation, the river is spanned by a Roman bridge of 81 arches, built by Trajan. It drains an area of about 32,000 sq. m.

When Badajoz was captured by Gen. Franco's troops on Aug. 9, 1936, during the civil war, there was heavy fighting along the river.

Guadix (Arab. *Wad Ash*, water of life). City of Spain, in the prov. of Granada. It stands on the N. slope of the Sierra Nevada, a junction on the Granada-Almeria rly. It has ancient walls and a ruined Moorish castle. Its 18th century cathedral is built on the site of a mosque. There is trade in brandy, cottonwool, flax, and cereals; manufactures include building materials, earthenware, hats, etc. There are mineral springs and iron and copper mines in the vicinity. Once covered with water, the whole undulating district is intersected by gullies cut by the retiring floods. Guadix la Vieja, 5 m. to the N.W., the Roman Acci, is the traditional seat of the first Iberian bishopric (2nd century). Pop. 21,584.

Guaduas. Town of Colombia, in the prov. of Cundinamarca. It stands near the river Magdalena, 45 m. N.W. of Bogotá. At an alt. of 3,300 ft., it is a centre of sugar, coffee, and fruit cultivation. There are large asphalt deposits near.

Guaiacol. A colourless oily liquid, occurring in crystals, obtained by fractional distillation of wood-tar creosote, or synthetically. It has antiseptic properties in tuberculosis and rheumatism.

Guaiacum. Genus of tropical Amer. trees of the family Zygophyllaceæ, of which the most important species is *Lignum vitae* (*q.v.*).

Gualdo Tadino. A town of Italy, in the prov. of Perugia. It stands on a spur of the Apennines, at an alt. of 1,750 ft., 22 m. by rly. N. of Foligno. A walled town, it has a cathedral, and the town hall contains pictures by Nicolo Alunno. There are manufactures of earthenware and silk, and trade in millstones, cereals, and olive oil. In the neighbourhood are scanty remains of the ancient Tadinum,

where Narses, one of Justinian's generals, defeated Totila the Ostrogoth in 552.

Guaileguay. Town of Argentina, in the prov. of Entre Rios. It stands on the navigable river Guaileguay, 8 m. by rly. N.E. of Puerto Ruiz. It has tanneries, flour mills, slaughter houses, and meat curing and soap factories, and is the centre of a rich grain and pastoral region. There is rly. connexion with Buenos Aires. Pop. 25,000.

Guaileguaychú. A town and river port of Argentina, in the prov. of Entre Rios. It stands on the Guaileguaychú, 10 m. from its entry into the Uruguay. It is on the Paraná-Concepción rly., carries on a brisk trade along the river, manufactures meat products, and has tanneries and refrigerating plant. Pop. 30,590.

Guam. Largest and southernmost of the Mariana islands in the Pacific Ocean, belonging to the U.S.A. About 130 m. S. of Saipan, its length is 32 m., breadth between 4 and 10 m., area about 225 sq. m. The climate is warm and healthy. Earthquakes, not often destructive, are common; typhoons sometimes cause serious damage. The island is low and of coral formation in the S., hilly in the N. Densely wooded and well watered, it yields coconuts, rice, citrus fruits, sugar, maize, coffee, and timber; copra is the chief export. Cattle and buffaloes are reared. Guam was ceded to the U.S.A. by Spain in 1898. The capital is Agaña, and the port of entry Piti.

The island was never strongly garrisoned, and the Japanese, having bombed it the day after Pearl Harbour, Dec. 8, 1941, landed without difficulty and captured the whole island in four days. U.S. forces established beach-heads on July 20, 1944, and reoccupied the island by Aug. 10. The towns suffered severe damage in the fighting. Guam is administered by the U.S. navy. The people, while classed as U.S. nationals, had few of the rights of citizens, but a civilian commission in 1946 recommended that they be granted citizenship and a larger voice in their own government. Pop. 23,136.

Guan. Group of game birds of genus *Penelope*. Found in S. America, they include about 15 species. Large birds, nearly related to the curassows, they usually have naked throats and wattles. They are found in the forests, and go in large flocks, except in the nesting

season. They vary considerably in colour from green to brown. Most are amenable to domestication.

Guanabacoa. Town of Cuba. Situated about 6 m. by rly. E. of Havana, of which it is a residential suburb, it has a theatre, a hospital, and medicinal springs. An old town, formerly occupied by Indians, it was chartered in 1743, and captured by the British in 1762. Pop. 19,000.

Guanaco OR **HUANACO** (*Lama huanaco*). Species of llama. Ranging from Peru to Patagonia, it is rather larger than the vicuña, a good specimen being rather more than 4 ft. high at the shoulder. Guanacos live in large herds in the mountains and are difficult to approach, though in captivity they are easily domesticated. The term llama is usually applied to a domesticated breed of this species. It has the curious habit of resorting to certain places at the approach of death, and the ground in these "cemeteries" is often white with its bones.

Guanajuato. Inland state of Mexico. Situated on the central plateau, at an alt. of about 6,000 ft., it is one of the most thickly populated states and has an area of 11,804 sq. m. Mountainous in the N., it is watered by the Lerma and its tributaries, and contains several lakes. Gold, silver, tin, lead, mercury, and copper are extensively worked. Stock-rearing and agriculture are important industries, and cotton and woollen goods, flour, beer, and spirits are manufactured. The state is served by the National rly. and connected by highway with Mexico City. Guanajuato is the capital. Pop. 1,046,490.

Guanajuato OR **SANTA FÉ DE GUANAJUATO.** City of Mexico. The capital of Guanajuato, 250 m. by rly. from Mexico City, it is situated 6,550 ft. above sea level, on both sides of the Cañada de Marfil, a narrow defile. A branch line to Silao connects it with the main National rly. Among the principal buildings are the Alhóndiga de Granaditas, built for a public grain store and now the prison, the cathedral, the mint, the government palace, a college, and superb theatre. The silver mines were the most valuable in the country, but increasing depth has made

Guanaco, the wild llama found in various parts of South America

them difficult to work. The chief manufactures are woollen and cotton goods, chemicals, soap, pottery, and flour. Guanajuato was founded in 1554. It suffered great damage in the war of independence, during which it was taken in 1810. Pop. 40,000.

Guanare. Town of Venezuela, capital of Portuguesa state. It stands near the river Guanarito, 50 m. S.E. of Trujillo. Founded in 1593 it is an important centre of a coffee, sugar, and cattle producing district. Pop. 14,000.

Guanches. Aboriginal people of the Canary Islands. Descended from a Libyan immigration into Tenerife by sea in the dawn of history, they were subsequently affected by other arrivals, especially in Grand Canary. Early Mediterranean — perhaps Phoenician — traders brought some cultural elements of Egyptian origin, especially the practice of embalming. Their social institutions, polyandry, abandonment of the aged, separate paths for the sexes,

and their non-metallic technology (rough pottery, bone and shell ornaments, stone and wood implements) were determined by their insulation. Mastered by Spain in the 15th century, they remain the substratum of the Hispanified pop. of the archipelago.

Guanidine. An alkaline substance with a caustic taste which occurs in vetch seedlings and sugar beet. It was prepared originally in 1861 by Strecker by the oxidation of gua-

nine, and hence received the name guanidine. Guanidine, which is a poisonous substance, forms a series of crystalline salts with acids.

Guanin OR **GUANINE.** Substance first found in guano, 1845. It is an important constituent of such organs as the pancreas, spleen, liver, and testicles of animal's and germ cells of plants. It is also formed from the shells and outer coverings of minute crustaceans, and gives rise to the cells called iridocytes in the scales of sea trout and true salmon that give them their silvery appearance. The fish obtain guanin from the shellfish on which they feed, and since these are much more plentiful in the sea, the sea fish acquire a silvery appearance absent in the brown trout and other river fish. The silverying of the body of saltwater fish acts as a protection, making them almost invisible when viewed from the side.

Guano (Peruvian *huana*, dung). Name originally given to the accumulated excreta of birds found principally upon the shores and islands of the South American coast, chiefly Peru and Chile, and little frequented islands in the Pacific Ocean. The original deposits of land and sea birds have been much depleted by commercial demand, and artificial substitutes are largely employed. The principal ingredients of guano are phosphorus and ammonia.

Guantánamo. Town of Cuba. Situated in the S.E. of the island, it is about 10 m. from Guantánamo Bay, and is connected by road, rly., and air with Santiago, 40 m. to the W., and Caimanera, its port, 12 m. to the S. Leased to the

Guanajuato. Market place in the capital city of the Mexican state

U.S.A. as a naval station in 1903, it has a large and safe harbour, and carries on a considerable export trade in sugar, coffee, and lumber, the products of the locality. Guantánamo was occupied by a British naval force in 1741, and was settled by French emigrants from Haiti about the beginning of the 19th century. Pop. 68,372.

Guapay or **RIO GRANDE**. River of Bolivia, tributary to the Mamoré. Rising in the dept. of Cochabamba, it flows S.E. and then N.W., receiving the Piray and the Yapaconi on its right or S. side. The mainhead stream of the Mamoré, it is often called the Rio Grande or Great River. Its length is about 550 m.

Guaporé or **ITÉNEX**. River of Brazil. It rises in Matto Grosso, and flows N.W., joining the Mamoré. For part of its course it forms the boundary between Brazil and Bolivia. It has a length of about 940 m., and is navigable for small craft up to Matto Grosso. It gives its name to a state area (98,135 sq. m.; pop. 24,696).

Guaqui. Town of Bolivia, in La Paz dept. The terminus of the Guaqui-La Paz rly., it stands on Lake Titicaca near the mouth of the Desaguadero, and is the chief port on the Bolivian side of the lake, with steamer communication to Puno in Peru. Near are the world-famous pre-Inca ruins of Tishuanaco (*q.v.*). See Titicaca.

Guarana (*Paullinia cupana*). A climbing shrub of the family Sapindaceae. It is a native of Brazil, and has alternate, compound leaves, tendrils, and small whitish flowers in sprays. The pear-shaped fruit is three-celled, each cell containing a single seed partly enveloped in an aril (like the mace of nutmeg). These seeds are dried and ground to a fine powder, moistened and kneaded into a dough which is rolled into sticks 6-8 ins. long. It is grated into sugar and water, and drunk as a beverage. Its essential principle is identical with that of tea, and it is supposed to ward off all sorts of disease.

Guaranda. Town of Ecuador, the capital of Bolívar dept. On the river Llangama, it is reached from Cajabamba on the Guayaquil-Quito rly. by a branch road. It is the centre of production of cinchona bark, from which quinine is prepared, and exports cereals and timber. Pop. 12,000.

Guarani (Caraió, warrior). Term loosely applied to a group of S. American Indian tribes of allied speech, belonging to the Caraió race. They are round-headed,

and massively built. The Bolivian tribes retain the long octagonal huts, roomy canoes, long bows and arrows, and body-paint of the early Caribs. See Chiquitos; Chiriguano; Cocamas; Omaguas.

Guarani, **RUINS OF**. Locality in Argentina, near Posadas in the prov. of Misiones. They are reached by motor or launch. The ruins of San Ignacio show the remains of ancient Jesuit missions, consisting of four great squares, a cathedral, and a college, set in lush tropical vegetation.

Guarantee (O.F. *garantie*, warranty). Term of English law. It means a promise to be answerable for the debt, default, or miscarriage of another. Guarantee necessarily supposes three parties and two obligations: (1) the creditor or person with whom the principal obligation is entered into; (2) the principal debtor, or person who enters into an obligation with the creditor; and (3) the surety or guarantor, who enters into a secondary obligation with the creditor that the principal debtor shall perform his obligation.

The obligation guaranteed may be a mere debt, or it may be the performance of a contract, *e.g.* when someone guarantees that another shall do certain work in a certain way, or in a certain time. The common fidelity guarantee is merely a contract to guarantee the faithful carrying out of his contract by a servant, etc. A guarantee must, under the Statute of Frauds, be evidenced by writs signed by the guarantor. A guarantee is a contract requiring the utmost good faith. The creditor must disclose everything he knows which might affect the mind of the guarantor, *e.g.* if A is to guarantee the honesty of a servant of B's, and B knows, and does not tell A, who does not know, that the servant has previously been guilty of theft, the guarantee is bad. During the currency of the guarantee the creditor must not deal with the principal debtor behind the guarantor's back so as to make the guarantee more onerous. The Partnership Act, 1890, provides that a continuing guarantee given to a firm or to a third person in respect of the transactions of a firm is, in the absence of agreement to the contrary, revoked as to future transactions by any change in constitution of the firm, to or in respect of which the guarantee was given.

Guarantee Association. Society for guaranteeing persons against loss. In the U.K. the most usual kind is one which, in

return for annual payments, undertakes to make good any defalcations on the part of persons in positions of trust, *e.g.* a cashier. In the U.S.A. are many societies that guarantee titles to land, rents, trade debts, investments, etc.

Guard. Word used in several senses, generally with the idea of protection. In one sense the guard means soldiers on duty to protect the person or residence of the sovereign, or military headquarters. In London and Windsor mounting the guard and changing the guard are ceremonies of some interest. From guard comes the word guards to denote regiments of soldiers, although yeomen of the guard is an example of the older use of the word. See Guards; Sentinel.

Guarda. District of Portugal, in the prov. of Beira Alta. South of the rider Douro, it is bounded on the E. by the Spanish prov. of Salamanca. The Serra da Estrela traverses the S. part of the district, which is well watered and productive, containing several important towns. Guarda is the capital. Area, 2,116 sq. m. Pop. 294,166.

Guarda. A city of Portugal, capital of Guarda district. It is the highest inhabited city in the country, standing at an alt. of 3,460 ft. on the N.E. slopes of the Serra da Estrela, 105 m. by rly. N.E. of Coimbra. Enclosed by ancient walls, it has a ruined castle, built as a "guard" against the Moors, hence the name. The stately cathedral dates from the 16th century, and there is a large sanatorium. Pop. 7,129.

Guardafui, **CAPE**. Most easterly portion of the African continent. It is in Somaliland, on the S. shore of the Gulf of Aden. A bold and commanding headland, it presents the appearance of a crouching lion when approached from the S. The surrounding country is rocky and barren, but several small coast villages are situated near the cape.

Guardant.

In heraldry, used of a four-footed beast standing sideways, with its face turned to the spectator.

If walking past

Guardant in heraldry in profile it is passant; if looking backwards, it is described as regardant.

Guardi, **FRANCESCO** (1712-93). Venetian painter, born Oct. 5, 1712. He became a pupil of Canaletto. His master's rendering of architecture was firmer and more accurate, but Guardi was a better

colourist, and depicted atmospheric effects with truer feeling, and water with greater buoyancy. There are several good examples in the National Gallery, London. Guardi died Jan. 1, 1793.

Guardian (O.F. *garder*, to guard). In English law, person appointed by the father or by the court to look after the person of an infant. The father can appoint a guardian by his will, but cannot oust the mother, who will act with the father's nominee. A guardian can forbid his ward's marriage, control his education, and limit his pocket money, and generally takes the place of the father. If the ward is refractory the guardian can make him a ward of court by applying to the chancery division. A guardian *ad litem* is a person appointed by the court to represent an infant defendant. A guardian is not allowed to make a profit out of his office, and his duty is to see that the ward is brought up in a manner befitting his station in life. A guardian cannot interfere with the ward's religion, which must be that of his father until he is old enough to choose.

In England, guardians of the poor were men and women elected by the ratepayers to look after the poor. Boards of guardians were abolished in 1930, their functions being transferred to co. and co. bor. councils. See Poor Law.

Guardian Angel. In the early Church it was believed that each individual was under the care of a particular angel, also that a good angel and a bad angel were in constant conflict for the possession of each man's soul. Of Biblical references, Gen. 24, vv. 7, 40; 48, v. 16; Ex. 23, vv. 20, 23; 32, v. 34; 33, v. 2; Ps. 91, v. 11; Dan. 3, vv. 25, 28; 6, v. 22; Matt. 18, v. 10; Rev. 1, v. 20; 2, v. 1 are among those cited in this connexion. The theme of the guardian angel is frequent in literature, and is used by the poets, from Shakespeare downwards. See Angel.

Guards. In the military sense, soldiers of superior type, prestige, and privilege. They were originally the bodyguard of emperors and kings, and in many countries the nucleus of the standing army. Famous bodies of guards were the Praetorians at Rome, the Gardes du Corps and Swiss Guards in the service of the kings of France, the old and young Guard of Napoleon, and the Papal Guard. Up to the time of the First Great War the Prussian Guard was considered the *corps d'élite* of the German army. The Red Army has guard formations.

In England the kings had their bodyguard from early times, and the yeomen of the guard and the king's bodyguard for Scotland are survivals of that period. The existing Guards date from the time of Charles II, and were then divided into horse and foot. The horse guards consist now of three regiments, 1st and 2nd Life Guards and Royal Horse Guards, collectively known as the Household Cavalry. The foot guards are the three old regiments, 1st, 2nd, and 3rd, or Grenadier, Coldstream, and Scots Guards, to which the Irish Guards were added in 1902 and the Welsh Guards in 1915. During the First Great War a new unit, the Machine Gun Guards, was temporarily established. Together they form the brigade of Guards. The Guards Armoured Division (*v.i.*) was a unit of the Second Great War. The title of Dragoon Guards is merely a name given to certain cavalry regiments. The national memorial to the Guards' services in 1914-18 was unveiled Oct. 16, 1926, on the Horse Guards Parade, London. See Army.

Guards Armoured Division.

Formation of the British army in the Second Great War, made up of

Guards Armoured Division badge

regiments and battalions of the Household Brigade. The well-known badge worn by the Guards division in the First Great War was reintroduced for it; the sign was a white eye on a blue shield with a red border. This division was formed in Sept., 1941, and as part of 8th corps landed in Normandy in June, 1944, took part in the fighting at Caen and Falaise, and led the advance to the Somme.

It was the first formation to enter Brussels on its liberation, Sept. 3; advanced to Nijmegen in an attempt to link up with the 1st airborne division at Arnhem; and took part in the operations that cleared the area between the Meuse and Rhine, Feb.-March, 1945. The division crossed the Rhine and fought its way across Germany to Bremen and Cuxhaven, accepting the surrender of the latter port in May. On June 10 it was converted to an infantry unit and designated the Guards division.

Guards' Chapel. The Royal Military Chapel, known as the Guards' Chapel, is in Wellington Barracks, Birdcage Walk, London. By a direct hit from a flying bomb during morning service on June 18,

1944, it was virtually destroyed. Few of the congregation, which numbered 180, escaped death or injury. A large metal hut was erected on the site of the former nave. The chapel was opened 1838, and reconstructed 1877-79. It contained hundreds of memorials to officers and many colours.

In 1947 it was proposed that the Household Cavalry should share with the Guards the use of a rebuilt chapel and that an exterior hall and cloister should commemorate men of the Guards regiments and Household Cavalry who fell in the Second Great War.

Guárico. Large inland state of Venezuela, having a river of the same name. It is a level grass plain bounded on the S. by the Orinoco. Cattle, horses, and mules are reared. The capital is San Juan. Pop. 135,089.

Guarini, GIOVANNI BATTISTA (1537-1612). Italian poet. Born at Ferrara, Dec. 10, 1537, he was for some time a professor at the university there. At the age of 30 he entered the service of the duke of Ferrara. He is chiefly remembered as the author of *Il Pastor Fido*, a pastoral drama first produced 1585; and wrote *Rime*, 1601. He died at Venice Oct. 6, 1612.

Guarneri or **GUARNERIUS.** The name of one of the three great families of Italian violin makers of Cremona, who flourished during the 17th-18th centuries. Andreas, first of the family, was a companion of Stradivarius in the workshop of Amati, and his work dates from about 1650-95. He was succeeded by his sons, Peter and Joseph, and his grandson, Peter, son of Joseph: but the most celebrated of the family was his nephew, Joseph. He was known as *del Gesù*, because the letters I.H.S. appear after his name on the labels of his violins. His finest instruments date from 1725-40. Consult *The Violin Makers of the Guarneri Family*, W. H., A. F., and A. E. Hill, 1932.

Guaruja. A resort in Brazil, seen in a popular excursion from Rio de Janeiro. The usual trip past the famous orchid garden on the sea front, returning along the Santos Beaches to Santa Terezinha, whose summit gives a superb view of Rio Bay.

Guastalla. City of Italy, in the prov. of Reggio Emilia. It stands near the river Po, and is a rly. junction 19 m. by rly. N. of Reggio. Founded by the Lombards in the 7th century, it was the scene in 1734 of an Austrian defeat by the Franco-Sardinian forces.

Guatemala. Republic of Central America. It has an area of 45,452 sq. m. and is bounded on

Guatemala arms

N. and W. by Mexico; S.W. by the Pacific Ocean; S. by Salvador and Honduras; E. by British Honduras and the Caribbean Sea. The Gulf of Honduras, an arm of the Caribbean forms the 70 m. Atlantic coastline, on which is the harbour of Puerto Barrios handling 75 p.c. of the import trade. The Pacific coastline is about 200 m. long with San José as its most important port. Both Puerto Barrios and San José are connected by railroad with the capital, Guatemala City, largest town in Central America, and are linked by a 5,000-mile network of motor roads with most parts of the republic and with neighbouring countries, and by air with all parts of N. and S. America.

The country is divided into five regions; the lowlands of the Pacific coast; the volcanic mountains of the Sierra Madre, which form the main watershed between the Pacific and Atlantic river systems; the series of high valleys, lying north of the main mountains, enclosed by peaks; the mountains of the Atlantic littoral; and the great plains of Petén, a level, undulating country, comprising about one-third of the total area of the country. Earthquakes are of frequent occurrence, but only two of the numerous volcanoes are still active, Santa Maria (12,300 ft.) being the more so. Tacana (13,330 ft.) and Tajumulco (13,814 ft.), both near the Mexican frontier, are the highest peaks.

Guatemala is well watered with short and rapid streams on the S.W. and slower, more developed rivers on the E. The two main rivers are the Motagua (250 m.) and Cajabon (180 m.), both navigable for light craft and flowing into the Gulf of Honduras; the Usumacinta, which forms part of the boundary

with Mexico, flows into the Bay of Campeche. The larger lakes are Izabal (36 sq. m.), Petén (27 sq. m.), Atitlán (17 sq. m.), and Amatitlán (9 sq. m.).

The chief industry is agriculture. Guatemala is exceedingly fertile. Coffee normally constitutes about 70 p.c. of the exports, bananas (about 20 p.c.) coming next. The chief coffee districts are in the highlands on the Pacific slope from Guatemala City to the Mexican border, and in the centre around Coban. There are estimated to be over 100,000,000 coffee plants yielding about 920,000 bags. The banana plantations near Puerto Barrios on the Atlantic slope are now rivalled by new banana estates recently opened up on the Pacific side for the supply of the Californian market, and the exports amount to about 4,600,000 bunches in normal years. Guatemala has almost a monopoly of the chicle gum, used for chewing gums in N. America and grown mostly in the Petén province. Other crops include maize, the staple food of the people; rice of excellent quality; beans; soya beans, recently introduced; tobacco; wheat, now increasingly cultivated; and cotton of short staple but virtually immune to insect pests, white, and of exceptional strength. Two cotton mills supply 40 p.c. of the native requirements. There are important cattle estates on the Pacific coast, and live cattle are exported. The official estimate of live-stock (1943) showed 729,241 cattle; 107,356

horses, mules, and asses; 438,330 sheep and goats; and 289,887 pigs. Other products are coconuts, rubber, horn, and honey. Of the last about 2,500,000 lb. are exported annually with over 110,000 lb. of beeswax. Production of rubber and quinine increased during 1939-45.

There is little mining. About 90,000 oz. of gold are produced from alluvial deposits. Sulphur is obtained almost pure from the volcanoes. White marble is quarried near Zacapa, and there is a limited production of lead, chromium, manganese, and mica. There are also deposits of silver, coal, lignite, tin, cinnabar, antimony, plumbago, asbestos, bitumen, porphyry, and zinc.

Wealth of Timber

The country is rich in timber, notably mahogany, cedar, and dyewoods. The N. provinces contain vast unexplored forests, and about 150 varieties of timber have been classified. Exports of mahogany, pine, and balsa wood amount to about 30,000,000 cubic ft. annually. The water power resources of the country, estimated at 1,300,000 horse-power, have been developed only to the extent of 16,500 h.p.

The bird and forest life of Guatemala is remarkable, and the thick jungles swarm with chattering monkeys and parrots. Other animals are the cougar, jaguar, tapir, antbear, wild pig, ocelot, puma, deer, and armadillo. Reptiles include the alligator, iguana, turtle, boa, and many other kinds of snakes. Insect life is abundant and annoying, including mosquitoes, locusts, tarantulas, and grasshoppers.

As a result of recent road-making almost all of the cities of any importance can be reached by motor car over well-made roads at any season of the year. From the capital, motor-bus services run to San Salvador, capital of Salvador, and to regions covered by nearly 5,000 miles of highways. The Aerovias de Guatemala runs frequent local air services from the capital.

The unit of currency is the quetzal, with an exchange value of \$1.00, U.S. currency, sub-divided into silver coins of quarter quetzal, ten cents, and five cents; copper coins of two cents, one cent, and half a cent. The U.S. \$ is legal tender. The official language is Spanish; there is complete religious liberty, Roman Catholicism being the dominant religion. The metric system of

Guatemala, Central America. The inset map shows the position of the republic in relation to the rest of the American continent

Guatemala City, Central America. 1. The cathedral, replica of the one destroyed by earthquake in 1918. 2. Aviation beacon, known as the Tower of the Reformer, spanning the highway from the city to the airport; built in 1935, it commemorates the former president, J. R. Barrios. 3. Memorial to Christopher Columbus in Central Park

weights and measures is used, but old-fashioned Spanish standards are still current in country districts.

Of the population of 3,450,752, between 50 and 60 p.c. are pure Indian. Most of the remainder are of mixed Spanish and Indian blood, with small numbers of pure Spanish stock and a few Negroes. Large numbers of the Indians are closer to aboriginal habits and life than in any other section of N. or S. America.

Education is free. The university of Guatemala, founded 1678 as the university of San Carlos de Borromeo, is situated at the capital. Military service is compulsory between the ages of 18 and 50.

During the first thousand years of the Christian era, the ancient Mayan civilization flourished here, followed by the Aztec culture, but both were preceded by a nameless culture older than either. In addition to the many mounds and pyramids, there are architectural remains, much eroded by rainfall and masked by jungle vegetation, of volcanic stone, wonderfully carved with colossal heads and figures of gods, notably near San José, Baúl, Pantaleón, Quirigua, Tikal, and Chacula.

Guatemala was conquered by Pedro de Alvarado, 1522-24, and was ruled by Spain for nearly 300 years, becoming independent of Spain in 1821 and joining the confederation of Central America, which lasted until 1839. In 1854,

Rafael Carrera, an obscure Indian, was appointed president for life; he died in 1865, and was succeeded by General Cerna, who was deposed in 1871 and succeeded by Justo Rufino Barrios, who formed an alliance with Honduras against Salvador, later declaring himself supreme head of Costa Rica, Nicaragua, Honduras, and Salvador, as well as Guatemala. He was killed in battle and the new president, General Manuel Barillas, made peace. Civil war in 1906 was quelled by the joint intervention of President Theodore Roosevelt and President Porfirio Diaz of Mexico. Guatemala declared war on Germany, Italy, and Japan, in Dec. 1941.

Under the new constitution, established 1945, there is a single chamber national assembly of representatives (one for every 50,000 inhabitants) chosen for a term of four years by direct popular vote, one half being elected every two years. Representatives are not eligible for re-election until after one term has elapsed. The president is elected for six years, and is ineligible for re-election for another twelve years. Should a president attempt to succeed himself the constitution sanctions rebellion. Women over 18 who can read and write may vote and hold office; all men over 18 have the vote and if illiterate may hold municipal but not national offices.

Guatemala is administratively divided into 22 departments.

Principal towns are Guatemala City, the capital (185,896); Puerto Barrios (26,003); San José (10,784); Antigua, the former capital (22,839); Coatepeque (26,733); Coban (44,165); Escuintla (47,444); Jalapa (45,174); Mazatenango (28,261); Quetzaltenango (45,711); Quiché (17,830); Retalhuleu (19,700); San Marcos (11,300); Sololá (16,233); Totonicapán (30,103); Zacapa (50,886).

The climate, depending on the altitude, varies greatly. Between 3,000 ft. and 8,000 ft. the days are warm and the nights cool. The coastal lands and N. regions, low-lying, hot, humid, tropical, are covered with dense jungle. The rainy season is May to Oct. See Honduras, British.

Guatemala. Capital city of the republic of Guatemala, Central America, and largest city in Central America (pop. 185,896). On a plateau, 4,880 ft. alt., it has tropical highland climate (temp. 45°-85° F.; rainfall 45 ins. a year). Excessive rain in 1949 caused floods which killed 4,000 and rendered 70,000 homeless. It is the commercial centre of the country and is connected by rail with the two main ports of Puerto Barrios on the Atlantic coast and San José on the Pacific coast, as well as by a network of automobile roads. There is also a good airport. The city was founded in 1776, after the destruction by earthquake of the former capital, now called Antigua, some 25 m. distant, but the new capital was itself

Guayaquil, Ecuador. The 2½-mile water-front, flanked by consulates, warehouses, and shipping offices

destroyed by earthquake on Jan. 3, 1918. In 1920 the rebuilding of the city was begun, being completed in 1928. Its surroundings of green hills and stark volcanoes are impressive. The streets are wide and the public buildings, including the national palace, chamber of deputies, university, museum, and institute of public health, are imposing. The four principal churches, the cathedral (an exact replica, completed 1940, of the one destroyed in the 1918 earthquake), Cerro del Carmen, La Merced, and Santo Domingo, are exceptionally beautiful even in a continent famous for its beautiful churches.

Guava (*Psidium guajava*). Small tree of the family Myrtaceae, a native of the W. Indies. The branches are four-sided, the leaves opposite, oval, and downy beneath, and the flowers white, single or in clusters of three. The fruit is apple- or pear-shaped, with thin, yellow rind filled with pulpy yellow or red flesh, of acid-sweet flavour, in which are numerous hard, kidney-shaped seeds. It is made into guava jelly and guava cheese. The purple guava is *P. cattleianum*, a native of Brazil.

Guaviare, GUAYABERO, OR LESSERS. River of Colombia, a tributary of the Orinoco. It rises in the Cordillera near Bogotá, and flows generally E. for 700 m. It is navigable for small craft for most of its course.

Guayaquil OR SANTIAGO DE GUAYAQUIL. The chief seaport and commercial city of Ecuador, capital of the prov. of Guayas. It stands on the W. bank of the Guayas, 30 m. from the mouth. It is the port for Quito, from which it is about 288 m. S.S.W. by rly. and with which it is joined by airline and the Simon Bolivar highway.

building. The university is a famous seat of learning. There are large shipyards and a good harbour, protected by a breakwater.

Manufactures include liquors, soap, mineral waters, alcohol, hats, and food products, and there is trade in tobacco, hides, cotton, rubber, bark, cacao, quinine, and metals. Export of cacao hence is still the economic mainstay of Ecuador. The port is visited by European steamers via the Panama Canal. A conflagration in 1896 destroyed much of the city. Pop. 159,937.

Guayaquil, GULF OF. Large inlet of the Pacific Ocean, on the W. coast of S. America, between Ecuador and Peru. It is 100 m. wide at its mouth, and contains the island of Puná, 32 m. long and 12 m. broad.

Guayas. Coastal province of Ecuador, comprising the low alluvial districts surrounding the Gulf of Guayaquil, and including since 1885 the Galápagos Islands. It is heavily forested and traversed by many rivers. The climate is hot, damp, and unhealthy. The cultivation of cacao is the main industry; coffee, cotton, rice, and tobacco are also produced. Apart from the Quito and Guayaquil rly. in the E. there are no facilities for land transport, all produce being carried by water. Guayaquil, the capital, is the only considerable town in the prov., which has an area of 8,331 sq. m. (excluding islands) and est. pop. of 441,660 (largest in the country).

Guaycuru. Family of primitive S. American Indian tribes, mainly in the Gran Chaco, N. Argentina. Their speech is more guttural and primitive than that of the Guarani. See Abipones; Charruas; Tobas.

Guaymas. Seaport of Mexico, in the state of Sonora. Situated in the Gulf of California, it has a fine natural harbour, affording secure anchorage, and is connected by a line to Nogales with the rly. system of the U.S.A., also by rly. with Mexico City. Chief exports are gold, silver, and pearls, and the sea fishing is unexcelled on the Pacific coast. Pop. 11,000.

Gubbings OR GUBBINS (Dialect-word, fish-parings). Contemptuous name formerly given to an uncivilized community in the vicinity of Brent Tor, Devon, England. They were reputed in Fuller's Worthies of England, 1662, to have descended from several social outcasts two centuries earlier, and to have multiplied without marriage. They occupied mean hovels or caves, subsisted on pilfered sheep, and spoke a debased local dialect. They developed great fleetness of foot, avenged all wrongs, resisted the civil power, and were governed by an elected king. The tradition was graphically utilised in Kingsley's Westward Ho! The colloquialism "greedy Gubbins" as a variant for greedy guts still lingers. See Doones, The.

Gubbio. City of Italy. In the prov. of Perugia, it is the ancient Iguvium and the medieval Eugubium. It lies at the base and on the slopes of Monte Calvo, at an alt. of 1,600 ft., 26 m. south of Urbino. The city is typically medieval, with many old palaces and churches. The cathedral dates from the 13th century, and the Gothic palace of the dukes of Urbino was rebuilt in Renaissance style. The municipal palace contains the bronze tablets known as the Eugubine Tables (*q.v.*).

The Palazzo dei Consoli (1332-46), a huge pinnacled building with

Gubbio, Italy. Church of S. Giovanni Battista. On the left, part of the Palazzo dei Consoli

a tower, is now a national monument. It received one shell hit in the Second Great War. Above this palace stands the convent of Sant' Ubaldo. The Festa dei Ceri (Feast of Candles) is an interesting procession through the city to the convent, which takes place annually on May 15. Gubbio has long been famous for its majolica ware. Pop. 30,500.

Guben. Town formerly of Prussia, since 1945 in Polish hands. A rly. junction, it stands on the Neisse, 22 m. S. by E. of Frankfurt-on-Oder. It had textile and other industries, including the making of hats and cloth, also pottery, paper, etc., and its buildings include a Gothic church and an old town hall. It is an old town and suffered much in various wars. After being in turn under the rule of Bohemia and Saxony, it passed to Prussia by the treaty of 1815. Pop., pre-war, 44,364.

Gubernatis, ANGELO, COUNT DE (1840-1913). Italian scholar. Born at Turin, April 7, 1840, he became professor of Sanskrit at Florence in 1863, but resigned the position on marrying a relative of Bakunin (*q.v.*), with whose revolutionary theories he was impressed. He was re-elected to the professorship in 1867. In 1876 he was Italian delegate at the international congress of Orientalists. He founded the Indian Museum at Florence, and in 1891 became professor of Sanskrit at Rome. He died Feb. 26, 1913. His chief works include *Zoological Mythology*, 1872; *La Mythologie des Plantes*, 1878-82; *Manzoni*, 1878; *Peregrinazioni Indiani*, 1886-87; *La Serbie et les Serbes*, 1897; *La Roumanie et les Roumains*, 1898.

Gudbrandsdal. Valley dist. of S. Norway. It is the central part of the main valley, with ramifications of the river Lougen. Emerging from Lake Miosen, this river flows N.W. to Møre co., the Gudbrandsdal running from the Romsdal to Lillehammer. Allied forces landed at Aandalsnes in the week after the German invasion of April, 1940, and advanced to Dombaas, a contingent going to Lillehammer, where Norwegian troops were endeavouring to stem the German advance up the valley. Outnumbered and without aeroplanes or armour, the British withdrew on April 25.

Gudea. Sumerian ruler of Lagash. He reigned about 2450 B.C. He imported from distant lands cedar beams, diorite, copper, and gold, for adorning his buildings. De Sarzec found beneath his tem-

ple of the moon-god Ningirsu many headless diorite statues, one having on the knees a drawing-board with a building plan. A head subsequently found and refitted to its torso revealed the portrait of Gudea, who won divine honours. See *Babylonia*.

Guden. Largest river of Denmark, in Jutland. It traverses the prov. of Viborg, and flowing N.E. into the Randers Fjord, an opening of the Kattegat, 15 m. N.E. of Randers. Its length is 80 miles.

Guderian, HEINZ (b. 1888). A German soldier, born in Poland. Commissioned in a Jaeger regiment in 1906, he served on the Western Front and as a staff officer in Italy, 1914-18. In 1933 he assumed command of the Black Drivers' unit, Germany's first regular tank corps; in 1935 he was given command of all armoured formations, and led the advance into Austria in 1938. In a textbook he set out the strategy of mechanised warfare, based upon Gen. de Gaulle's *Army of the Future*, written previously.

Hitler authorised Guderian to create the panzer divisions which helped to destroy the Polish and Allied armies in 1939-40. But in the campaign against Russia he met with reverses, sixteen divisions under him being routed at Kaluga in 1941. Guderian was responsible for much of the strategy and equipment of Rommel's armour in the N. African campaigns. After the attempt on Hitler's life in July, 1944, Guderian succeeded Jodl as chief of the general staff; in Oct. he was supreme commander on the Russian fronts; and he was still holding a command at the German surrender in May, 1945.

Gudgeon (*Gobio*). Genus of small fresh-water fishes, of which one species is common in most British rivers. It is related to the carp, and has two small barbels

Gudgeon, a small fresh-water fish

on the snout. It is usually found on the gravelly bed of the stream, is easily caught, and is fairly good eating.

Gudgeon Pin. Pin connecting the piston-rod with the connecting rod at its small end, allowing the latter freedom of movement.

The term is applied to any such connecting pin. See *Internal Combustion Engine*; *Steam Engine*.

Gudrun or **KUDRUN.** German romantic epic. In its existing form (13th century) it is of later date than the *Nibelungenlied*, to which in metrical form it is somewhat similar. It deals with the romance of the heroine whose name it bears, daughter of a Friesland king, and of her parents, and embodies many legends of the North Sea and coasts of Normandy.

Guebwiller or **GEBWEILER.** Town of France, in Alsace (Haut-Rhin dept.). It is situated 14 m. S.S.W. of Colmar at the entrance of the valley of the Lauch, a stream running down from the Vosges Mts. The church of S. Leodegar, begun in 1182, and restored in modern times, deserves mention. The industries include the manufacture of sugar, textiles, machinery, etc., and near by is produced one of the best brands of Alsatian wines. Pop. 10,085.

Guedalla, PHILIP (1889-1944). British historical writer. Born of Jewish parentage, March 12, 1889,

Philip Guedalla, British writer

he was educated at Rugby and Balliol College, Oxford. Called to the bar in 1913, he practised for 10 years. Ignes Fatui, a volume of his parodies, appeared in 1911, and in 1914 he published *The Partition of Europe, 1715-1815*. With *Supers and Supermen*, 1920, he made his reputation as a witty and vivid portrayer of character. His best-known studies included *The Second Empire*, 1922; *Palmerston*, 1926; *The Duke* (biography of Wellington), 1931; *The Hundred Days*, 1934; *The Two Marshals* (Bazaine and Pétain), 1943. Guedalla's style in biography was likened to that of the cinema, with its devices of close-up, flash-back, etc. He died Dec. 16, 1944.

Guelder Rose (*Viburnum opulus*). Small tree of the family Caprifoliaceae, native of Europe, N. and W. Asia, and N. America. The smooth leaves are cut into three strongly toothed lobes. The whitish flowers form a cluster of which the central ones are small ($\frac{1}{4}$ in.) and perfect, of a creamy tint, while those of the outer ring are three times the size, quite white, and without pistil or

Guelder Rose. Cluster of flowers of this hedgerow tree

stamens. In the garden guelder rose, or snowball tree, all the flowers are sterile like this outer row. The wild plant is more beautiful, for in autumn the fertile flowers have been succeeded by large juicy berries of a wonderful translucent red. The flowers secrete nectar, and on the leaf-stalks are cup-shaped glands filled with nectar for ants, which keep the plant free from caterpillars.

Guelph or **GUELF**. Italian form of the German word *Welf*, and as such that of one of the parties in the medieval struggle between Guelphs and Ghibellines (*v.f.*). Meaning wolf, it began as the Christian name of a race of nobles who were powerful in Bavaria in the 11th and 12th centuries. One of them, Henry the Proud, became duke of Bavaria, and also duke of Saxony, and his son Henry the Lion was one of the most powerful of the German princes. The word became the battle cry of their followers, and was taken to Italy, where it became Guelph.

Guelph was also used as the name of the family to which the electors of Hanover and therefore the sovereigns of Great Britain from 1714 to 1837 belonged, these being descended from the early Welfs. It became more prominent during the years that followed the loss of his throne by George V of Hanover in 1866. His cause was spoken of as that of the Guelphs; the sum of money set aside for him was known as the Guelph fund; and there was a Guelph press. See Hanover; Wettin.

Guelph. A city of Ontario, Canada, capital of Wellington co. It stands on the Speed river, about 60 m. W. by S. of Toronto. It is served by the C.P.R., and the C.N.R., and is unique in having its own street rly., which, leased to the C.P.R. since 1887, has reduced the municipal taxes yearly. There are factories making

iron goods, furniture, carpets, textiles, beer, soap, etc., the motive power being derived from the falls of the Speed; and the town is a market for agricultural produce. It has a city hall and market, and is the seat of Ontario Agricultural College and Macdonald Institute, visited annually by 50,000 farmers. Guelph was founded in 1827 by John Galt (*q.v.*). Pop. 23,274.

Guelphs and Ghibellines. Political factions, prominent in Italian history from the 12th to the 14th century. Primarily they denoted the division into imperialist and anti-imperialist parties, the supporters, that is, of the supremacy of the emperor, as head of the Holy Roman Empire, in Italy, and his opponents, at the head of whom was the pope.

The papacy disputed the headship of Christendom with the emperor, and there was consequently a natural alliance between the papacy and the Guelphs, while the Ghibellines supported the emperor. Theoretically, the Guelphs were the champions of local and popular liberties and freedom from foreign domination; but in the eyes of the Ghibellines they were the champions of a decentralisation which meant anarchy, and also of ecclesiastical ascendancy. The Ghibellines stood for a strong central authority.

In the middle of the 13th century the house of Hohenstaufen was finally overthrown; imperialism and papalism ceased to provide the fundamental distinction. But party factions still clung to the old labels, and they became even more prominent as designating local parties than they had been as expressing great political principles, for which, however, they still stood in the minds of idealists such as Dante. The feud, which was especially strong in Florence, was carried into almost every relation of life, and each had its distinct habits and customs in dress, manners, and the like. In the course of the 14th century the old names as well as the old principles were gradually displaced, and virtually disappeared in the 15th century. See Ghibelline; Hohenstaufen.

Guenon (Fr., monkey). Large group of African monkeys of the genus *Cercopithecus*. They are slender with long tails and small callosities on the buttocks. Their hair has a mottled appearance, due to each hair bearing coloured rings. They are usually found in small droves in the forests, and are

very pugnacious. In captivity they make good pets, as they are docile and hardy, and are easily taught to perform tricks. See Monkey.

Guérara, **GOURARA**, or **GERRARA**. District in the Algerian Sahara, forming the most northerly chain of oases S. of Algeria proper. It consists of the oases of Tin Erkouk, Timimoun, Tabelkoza, Sebkhah, Fatis, Tahantas, and Charouin. It contains over half a million date palms, consisting of more than 40 species. It was occupied by France in 1902.

Guercino. Nickname of the Italian painter Barbieri (*q.v.*).

Guéret. Town of France. In the dept. of Creuse, of which it is the capital, it is 48 m. N.E. of Limoges, standing at the foot of the Puy de Gaudy. The chief building is the prefecture, a house of the 15th century, and there is a museum, but there are no remains of the abbey of S. Pardoux round which the town grew. There are a number of industries, and the town is a market for the cattle and other produce of the surrounding district. It was formerly the capital of La Marche.

Guereza (*Colobus*). Group of African monkeys, notable for the fact that the thumb is either absent or rudimentary. They include about 12 species, but are little known, as they live in the tops of forest trees and seldom survive captivity. Most are black and white, and have long silky hair valued in the fur trade. See *Colobus*; Monkey.

Guericke, **OTTO VON** (1602-86). German scientist. Born at Magdeburg, Nov. 20, 1602, he studied at several German universities, also at Leyden. He was city engineer at Erfurt, and was burgo-master of Magdeburg in 1646. He died at Hamburg, May 11, 1686. Guericke is best known as the inventor of the air pump. He also invented the manometer, and discovered that two bodies equally charged with electricity will repel one another.

Guérin, **CHARLES** (1873-1907). French poet. Born at Lunéville, he was the son of a wealthy family of manufacturers and led a life of leisure. His first important work was *Le Cœur Solitaire*, 1898, a volume of elegiac poetry overcast with melancholy. *Le Semeur de Cendres*, 1901, was his masterpiece. A period of inner struggle was ended by his conversion to Roman Catholicism, and *L'Homme Intérieur*, 1905, showed him in more tranquil mood. Within his range, Guérin is regarded as one of the great modern French poets.

Guérin, Eugénie de (1805-48). French writer. She was born at Albi, Tarn, sister of the poet Maurice de Guérin (1810-39), to whom she was devotedly attached. Her *Journal et Lettres*, published in 1862, Eng. trans. 1865, reveals her as a woman of notable character, a mystic, and a strong Catholic. She died May 31, 1848. Matthew Arnold included a study of brother and sister in his *Essays in Criticism*.

Guernica. Town of Spain, in the province of Biscay, 17 m. E.N.E. of Bilbao. In 1937, during the Spanish civil war, Gen. Franco's forces were advancing on Bilbao, and on April 27 this undefended town, the "holy city" of the Basques, was razed to the ground by German aircraft supporting Franco's Nationalist forces. Some 4,000 bombs were dropped, fire followed. The Spanish govt. gave casualties as 1,654 killed, 839 wounded, out of a pop. of c. 7,000. This first manifestation of a new savagery produced world-wide shame and horror, which found vivid expression in a gigantic painting by Picasso. The rebuilding of Guernica was completed in 1946.

Guernsey. One of the Channel Islands. Second in size to Jersey, it is about 7 m. long and 6 m.

Guernsey arms

broad, and has an area of 24½ sq. m. St. Peter Port, the capital, on the S.E. coast, and St. Sampson's are the only places of any size, the others being small fishing and inland villages. From St. Peter Port steamship communication is normally maintained with Southampton, Weymouth, Plymouth, London, and France; there are also daily air services to the English mainland, and to Jersey and Alderney.

Much of the land is divided into small holdings, and some cereals are grown. The Guernsey breed of cattle is famous. Granite-quarrying and fishing have declined, and the chief industry is market gardening, large quantities of tomatoes, grapes, flowers, etc., grown chiefly under glass, being produced, mainly for the English market.

A picturesque island, especially in the S., where the rugged coast is broken by numerous bays, Guernsey is a favourite holiday resort. There are numerous prehistoric remains and notable buildings of later date include Castle Cornet, a fortress begun in the 13th cent., and old churches at St. Sampson's, St. Martin's, Vale, and Côtel. Domestic architecture includes some picturesque manor houses.

The bailiwick of Guernsey includes Alderney, Sark, Herm, and Jethou. Guernsey, whose new constitution came into force, Jan. 1, 1949, is governed by committees appointed by the two assemblies, the states of deliberation (legislature) and the states of election. Justice is administered by the royal court. The chief officials, appointed by the crown, are the lieut.-gov., the bailiff (who presides over both assemblies and the royal court), and high legal officials. The island is in the diocese of Winchester. At St. Peter Port are Elizabeth College, a public school, and also a Ladies' College.

Although Guernsey was demilitarised early in the Second Great War, the island was bombed and machine-gunned by the Germans before they occupied it on July 1, 1940. It was liberated May 9, 1945. Civil government

was restored on Aug. 25, the new governor being Maj.-Gen. (later Lt.-Gen. Sir Philip) Neame, V.C. In 1946 Guernsey purchased the island of Herm from the British government. Pop. bailiwick, 46,352; island, 44,432. Consult *Archaeology of the Channel Islands*, Vol. 1, T. D. Kendrick, 1928; *Guernsey Past and Present*, R. Durand, 1933.

Guernsey Lily. (*Nerine sarniensis*). A bulbous herb of the family Amaryllidaceae, a native of S. Africa. The strap-shaped leaves appear later than the flowers, which are lily-like, salmon-coloured, and form a large cluster at the top of a stout flower-stem.

Guernsey Lily. Flower-head and strap-like leaves

Guerrazzi, Francesco Domenico (1804-73). Italian author and politician. Born at Leghorn, Aug. 12, 1804, he studied law at Pisa, but early turned to literature and politics. A political agitator, he was often imprisoned, and while in prison wrote his principal work, *The Siege of Florence*, 1836. He died Sept. 23, 1873. Pron. Gwerratsi.

Guerrero. S.W. state of Mexico, bordering the Pacific. Situated on the declivity of the Anahuac plateau, it is extremely mountainous, the greater part of its surface being covered by the Sierra Madre. The valleys of the Rio de las Balsas, or Rio Mexcala, and the smaller streams produce cereals, coffee, cotton, tobacco, and other crops. The mineral wealth is extensive. The capital is Chilpancingo, and the seaport Acapulco. Area, 24,885 sq. m. Pop. 732,910.

Guerrilla Warfare (Span. *guerrilla*, little warfare). Operations of inhabitants who take up arms to defend their homes and to harass the army of an invader. Guerrillas recognize no laws or customs of war; they present no target for a disciplined force to attack; living off the country, and assisted by the inhabitants, they are independent of transport, and gather and disperse rapidly. They have a widespread intelligence system in the population.

During the French occupation of Spain in the time of Napoleon the Spaniards had an excellent guerrilla system. The S. African War, 1899-1902, was prolonged by guerrillas after the Boer armies had been defeated. Dervishes, Zulus, Burmese, Kaffirs, Maoris, and frontier tribes of India used guerrilla tactics against British forces. The French in Morocco and

Guernsey. St. Peter Port, capital of the second in size of the Channel Islands

Algeria were often outwitted by bands under Abd-el-Krim and Abd-el-Kader.

Guerrillas in the Second Great War tied down Axis troops in China, Norway, Russia, Yugoslavia, France, Poland, Greece, and the Philippines. In Russia they were recognized by the army, which supplied them with arms, ammunition, equipment, and ambulances. It was estimated that they inflicted more than 300,000 casualties on German and satellite troops, besides disrupting lines of communication. The French Maquis grew out of the efforts of young men to avoid conscription for labour and came to control whole districts in Savoy and the Vosges. Before D-day they were in radio communication with Allied headquarters and carried out acts of sabotage against German communications. Gen. Eisenhower reported that their activities were worth three extra divisions. The F.F.I. were recognized by Allied H.Q. and the Germans were warned to treat them as regular forces. The Polish underground army, organized during the siege of Warsaw, was commanded by Gen. Bor, or Komorowski. Three railways connecting Germany with the Eastern front passed through Poland, and in June, 1944, 54 trains were derailed. Also 379 Gestapo agents were killed, and 71 actions fought. A German army was immobilised in Greece and Yugoslavia for three years by Greek patriots, Marshal Tito's partisans, and the Chetniks. Guerrilla tactics were employed by the Long Range Desert Group in N. Africa and the Chindits (*q.v.*) in Burma.

Guesclin, BERTRAND DU (1320-80). A French soldier. Born in Brittany, he was trained to arms, and when young made a reputation by his skill in the tournament. He fought in the civil war raging in Brittany, 1341-42, and there became one of the most renowned opponents of the English. He was constantly in the field, and his exploits were many and glorious, although more than once he was taken prisoner. When peace was made in 1360, he marched into Spain at the head of an army of mercenaries, and there was again taken by the English at Navarrete. On the renewal of the war between England and France he was instrumental in recovering several districts for his king. He died July 13, 1380. Made constable of France, 1370, he is regarded as the greatest French soldier of his age, and a pattern of chivalry.

Guest, LADY CHARLOTTE ELIZABETH (1812-95). Former name of the Welsh scholar later known as Lady Charlotte Elizabeth Schreiber (*q.v.*).

Guest, SIR JOSIAH JOHN (1785-1852). British ironmaster. Born Feb. 2, 1785, he entered the ironworks of his father at Dowlais, Glam., of which he became manager in 1815. He had already introduced considerable improvements in making iron, and under him the works became the largest of their kind, employing 12,000 workers. He became their sole proprietor in 1849. They now belong to the firm of Guest, Keen & Nettlefolds. Guest was M.P. for Honiton, 1826-31, and for Merthyr Tydfil, 1832-52. He was made a baronet in 1838, and died at Dowlais, Nov. 26, 1852. His eldest son was made Lord Wimborne (*q.v.*).

Guetar (great-land). American Indian tribes of semi-advanced culture in central Costa Rica, at the time of the Spanish conquest. Situated between the primitive Guatuso and the Talamancan people, their territory was bounded on the Atlantic side by the San Juan and Matina rivers, and on the Pacific by the Barranca and the Terraba.

Gueux, LES (Fr., the beggars). Name specially applied to those Netherlanders who revolted against the Spaniards in the 16th century. The name is supposed to have originated in 1566, when a party of nobles took their petition of grievances to the regent, Margaret, duchess of Parma. To induce her to face them, someone asked if she were afraid of *ces gueux*, these beggars, and the petitioners, men of wealth and position, hailed the epithet as an honour, taking as their symbols the wallet and the bowl of the beggar.

The sequel was the revolt against Philip of Spain, and although the original league was broken up the Dutch republic really arose from it. In the struggle the *gueux de mer*, or sea-beggars, were privateers who, with the connivance of William of Orange, preyed upon the shipping of Spain. Their great exploits were the seizures of Brill and Flushing in 1572.

Guevara, ANTONIO DE (c. 1490-1545). Spanish author. Passing his youth at court, in 1518 he became a Franciscan friar and was appointed preacher to the court of Charles V. Made bishop of Guadix in 1527, two years later he published Marco Aurelio con el Reloj de Principes, which appeared in London in 1532 as The Golden Book of Aurelius, Emperor and Eloquent Orator. This Diall of Princes, as a later translation puts it, inspired Lyly's Euphues, 1578, and so the euphuistic school of literature. See Euphuism.

Guevara, LUIS VÉLEZ DE (1579-1644). Spanish writer. Born at Ecija, he was educated at the university of Osuna. For a time he was a soldier and afterwards a courtier, but most of his life was devoted to writing. He died at Madrid, Nov. 10, 1644. Guevara wrote over 400 plays and a novel, El Diablo Cojuelo (The Lame Devil), on which Le Sage based Le Diable Boiteux.

Guggenheim. Name of a family of American capitalists. Meyer Guggenheim, a Swiss Jew who settled in the U.S.A. in 1847, acquired copper interests in California, and in developing these was assisted by seven sons. The Guggenheims were known as the copper kings, their mining and metallurgical business at one time controlling nearly half the world copper output. The second son, Benjamin (1855-1912), went down with the Titanic. The John Simon Guggenheim memorial foundation was established in 1925 for the advancement of research and for creative work in the arts. Fellowships of about £500 per annum are granted for varying periods.

Guiana. Territory in the N.E. of S. America. Bounded W. by Venezuela and E. by Brazil, it is divided into three sections—

Guiana. Map of the British, Dutch, and French colonies on the S. American Atlantic seaboard.

British, French, and Dutch Guiana. The general term Guiana is sometimes used to include Brazilian Guiana, territory lying to the S. The surface slopes gently from the level coastal tract to the Tumuc Humac range in the S. and to the Pacaraima range in the W. Large forested areas, inhabited by wild Indians, exist towards the S., which is partly unexplored. Before 1793 this region was divided between France, Spain, Portugal, and Holland. Its coasts were first explored by Spaniards in 1499-1500. See Arawak; *consult also* Guiana: British, Dutch, and French, J. Rodway, 1912.

Guiana, BRITISH. The only British territory in S. America. It is bounded N.

British Guiana arms

by the Atlantic, S. by Brazil, W. by Venezuela, and E. by Surinam. It includes the settlements of Essequibo, Berbice, and Demerara, and has an area of 83,000 sq. m. Inland for a distance of from 10 m. to 40 m., the country consists of rich alluvial flats and mudbanks deposited by the numerous rivers. This coastal strip is the only part under cultivation, and virtually the only part inhabited. The land thereafter rises towards the interior and culminates in the ranges of Pacaraima and Acaray in the S.W. and W., Roraima, in the former, reaching an alt. of 8,735 ft.

The chief rivers are the Essequibo (600 m.), the Berbice (350 m.), and the Demerara (180 m.). The first drains more than half the country; the Demerara admits steamers to Georgetown, the capital. The Corentyne or Courantyne on the E. boundary, Demerara, Barima, and Berbice are navigable for about 100 m. from their mouths, other streams for short distances only, being obstructed by rapids and cataracts. The climate is hot and the rainfall heavy; fever is prevalent in the low-lying districts.

The chief products are sugar, rice, coconuts, coffee, cacao, wild rubber, maize, wheat, vanilla, and citrus fruits. Cattle, sheep, horses, pigs, goats, and donkeys are reared. The exports include sugar, rum, charcoal, bauxite, timber matches, balata, and rice. Gold is mined and precious stones include diamonds of high quality. There are about 154 m. of rly. opened for traffic. In addition there are 366 m. of good roads and 319 m. of

river navigation and canals. Airways operate within the colony and to the W. Indies and U.S.A.

Administration of the colony is in the hands of a governor and council under a constitution of 1928. Flora and fauna abound. From the Berbice the huge water lily *Victoria regia* was first obtained. Kaieteur Falls on the Potaro rank with those of Niagara and Victoria, dropping 741 ft. over a channel 300 ft. wide. The colony was originally founded by the Dutch, who settled on the Essequibo c. 1620. In 1781 it was captured by the British and, after changing owners several times, was finally ceded to the British in 1814. During the Second Great War a base was leased to the U.S.A. for 99 years under the Anglo-American naval agreement of 1940 (*see* Atlantic Bases). Subscriptions in the colony for the purchase of aircraft to be presented to Great Britain amounted to £42,500. Pop. est. 373,598.

Bibliography. Tropical Wild Life in B.G., W. Beebe, G. I. Hartly, and P. G. Howes, 1917; Laws of B.G., Sir C. Major, 1930; Constitutional History of B.G., Sir C. Clementi, 1937.

Guiana, DUTCH. This territory, also called Surinam, is so described in this Encyclopedia.

Guiana, FRENCH. Colony of S. America, belonging to France, and ranking since 1947 as a dept. It lies between Surinam on the W. and Brazil on the E. and S., while the Atlantic washes its shores on the N. Area 34,740 sq. m. The Maroni river flows along its W. boundary, and the Oyapock marks the E. frontier. Other rivers are the Ouya, Sinnimari, Mana, and Approuague. The continuation of the Acaray range or Tumuc Humac mountains extends along the S. boundary. The flat alluvial tract on the coast is exceedingly fertile; while vast areas are forested.

The chief products are sugar, coffee, cacao, rice, maize, manioc, and bananas. Gold mining is the principal industry. Rubber, pepper, spices, rum, rosewood essence, woods, hides, balata, and fish glue are exported. The colony includes the so-called island of Cayenne, on which stands the capital of the same name. It is separated from the mainland by the forking of a river. The chief ports are Cayenne (which has an airport), Oyapock, and St. Laurent-du-Maroni. The colony is administered by a governor assisted by a council, and is represented in the French parliament by a deputy.

French settlers arrived at Cayenne in 1604. In 1763 the French government dispatched 12,000 emigrants to the colony, but nearly all succumbed to the ravages of disease and the climate. Captured by the British and Portuguese in 1809, it was returned to France in 1814. From 1852 it was a penal settlement, Alfred Dreyfus being a notable prisoner, but in 1946 the transportation of convicts ended. In 1943 popular opinion caused the authorities to sever relations with Vichy and adhere to Gen. de Gaulle. Pop. 30,876.

Guicciardini, FRANCESCO (1483-1540). Italian historian. A Florentine, born March 6, 1483,

contemporary and friend of Machiavelli, he was a practical man of affairs, and has been described as the realist where Machiavelli was the idealist. Despite holding opposite views,

Francesco Guicciardini, Italian historian
From a print

he cynically adapted himself to the service of rulers, popes, or Medici. In 1534 he retired and devoted himself to his great History of Italy from 1490 to 1532, a translation of which into English by A. P. Goddard was published in ten volumes, 1755-59; with all its defects, one of the most valuable histories ever written. Guicciardini's other writings include a series of political aphorisms, described as "corruption codified and elevated to a rule of life." He died May 23, 1540. *Pron.* Gwitchardeenee.

Guiccioli, TERESA, COUNTESS (1802-73). Italian mistress of Lord Byron (*q.v.*). Daughter of Count Gamba of Ravenna, she was married in her 17th year to a man of 60. She was introduced to Byron in April, 1820, and became infatuated with him. Thenceforward, thanks to an alternately complacent and jealous husband (from whom she was subsequently separated), she was associated with the poet to the end of his life. She later married the Marquis Rouillé de Boissy. In 1868 she published her intimate study of Byron. *Consult* The Last Attachment, I. Origo, 1949.

Guided Missiles. *See* N.V.

Guides, CORPS OF. Former unit of the Indian army. Sir Henry Lawrence decided, 1846, to raise for

Corps of Guides.
Private of infantry company

service on the frontiers a body of troops more mobile than the regulars. The name had been borne by a unit in Napoleon's army. A small force, but including both horse and foot soldiers, it saw active service almost at once and was constantly engaged in border warfare thereafter. Among the many incidents in the history of the Guides are the march to Delhi during the Mutiny, the massacre at Kabul in 1879, a share in the Afghan War of 1878-80, and services at the relief of Chitral, 1895. The corps grew from a troop of cavalry and two companies of infantry to a strength of 27 officers and 1,400 men. It wore khaki uniform from the first. In 1922 the cavalry and infantry were separated, the former becoming The Guides Cavalry (10th Queen Victoria's Own Frontier Force), mechanised in 1940; the latter, two battalions of the 12th Frontier Force Regiment.

Guidon (Fr.). Crimson silk colours of dragoon regiments of the British army. The lance is 8 ft. 6 ins. long, including the royal crest on top. The flag is 3 ft. 5 ins. to the ends of the points of the swallow tails, exclusive of fringe, and 2 ft. 3 ins. on the lance; the width of the slit at the points of the swallow tail is 13½ ins.; it bears the badge, devices, and mottoes conferred by royal authority for services in the field. *See* Colours; Eagle; Standard.

Guienne. Prov. of old France. It was at first a part of Aquitaine, obtaining a separate existence in the 13th century. Its capital was Bordeaux. From 1154 to 1451 it was an English possession. Thereafter it was part of France, and with Gascony formed one of the governments of the *ancien régime*. Since the Revolution it has been divided between the departments of Gironde, Lot, Lot-et-Garonne, Dordogne, and Tarn-et-Garonne. *See* Aquitaine; France; History.

Guilbert, YVETTE (1869-1944). French singer and actress. Born in

Paris, she worked in millinery and dressmaking establishments, but her gifts of witty impersonation and her skill as a singer of piquant songs led to café-concert engagements, beginning in 1888 at the Variétés and, in 1890, to successful appearances at the Eldorado and Ambassadeurs, Paris. She was enthusiastically received in London, Rome, Vienna, Berlin, and elsewhere. She toured the U.S.A. several times and opened a school of dramatic diction in New York. She reappeared in London in 1928-29. Her memoirs, *La*

Yvette Guilbert. French singer and actress, long a favourite artist on both sides of the Atlantic

Chanson de Ma Vie, were published in 1927. She died Feb. 3, 1944.

GUILD OR **GILD** (A.S. *gild*, payment). Primarily, an association of some kind. Before the Norman Conquest, English and other European people were accustomed to form themselves for social and religious purposes into associations, artificial families of brethren and sisters, called guilds or gilds, from the geld or payment out of which the feasts and masses for the souls of the departed were provided. Such guilds existed side by side with the commercial and industrial guilds of the Middle Ages, in which the religious side was always insisted on. In the 12th century, dealers and the few men engaged in handicraft, who were now making their appearance in the towns, formed themselves into associations to supervise and regulate local trade. No privilege was more coveted in a town charter than the recognition of such an association of merchants.

The merchant guild laid down rules for the honest conduct of trade, managed the markets, but

above all secured for its members freedom from tolls, and the right of keeping much of the buying and selling within the borough in their own hands. Most of the merchant guild were commonly also members of the municipal government; but only gradually did guildship and burghership become identical.

In England the craft guild appears to have developed from the natural grouping together of men engaged in the same kind of work and living in the same part of the town. The purpose may have been at first largely religious, but as industry expanded and highly specialised trades sprang up a need for more detailed supervision in the interest of seller and buyer alike led to the regular formation, under the municipal authority, of responsible organizations of men engaged in a particular trade.

Responsibility of the Wardens

It was the duty of wardens and aldermen of the new craft guilds to keep the trade in good repute, making "reasonable ordinances" for the observance of proper standards, providing for skilled workmanship, and perhaps settling prices. Everyone believed there was a just price, which depended on the cost of materials, and on a reasonable wage which would enable the worker to support himself and his family according to the standard of his class. When markets were small, and industry was comparatively simple, such prices and wages were really easy to determine, and general regulations as to methods of work, hours of labour, etc., comparatively easy to enforce, but it was necessary to insist that all who worked at a particular trade should be members of the guild.

Guarantees of character and skill were provided in the system of apprenticeship, which, beginning in the 13th century, soon became an integral part of social and economic life (*see* Apprenticeship). A few years were then spent as a journeyman, paid originally by the day.

As time went on it became increasingly difficult for the journeyman to become a master. Evidence soon appears of a cleavage between the wealthy members, the traders and shopkeepers who were accumulating capital and ceasing to follow their trade in the workshop itself, and the actual producers—hired men, with a new sense of class consciousness, who began to found yeoman guilds, antagonistic to the masters, and using from time to

time the weapon of the strike. Four stages are recognized in the history of English industry. The second stage, that of the guild, which had replaced the family system, was to be slowly superseded by the domestic system in which, before the era of machinery and the factory, capitalists put out work to be done in the homes of the people. Trade was expanding, old towns were decaying, industry was shifting to new centres; the expenses of those still working in guilds were heavy, while the value of membership decreased. In the 15th century, men wanted greater freedom to acquire wealth for themselves, while with the new ideas of individualism in the 16th century the general welfare of the community was forgotten. In the confiscation of the property of the religious guilds under Edward VI, the craft guilds, or companies, also suffered by the loss at least of those funds which had accumulated for purposes now officially regarded as superstitions.

GUILD SOCIALISM. The medieval use of the term guild was revived c. 1911 by a school of Socialists who proposed the reconstruction of society on a democratic basis through industrial self-government in the form of guilds. This conception of the guild is on a wider basis than that of the trade union: first, as including all workers without distinction; second, as not merely looking after the economic welfare of its members, but actually carrying on the industry. To coordinate the functions of all individual guilds, a central government of the community should be elected for specific or functional purposes. Consult *Guild Socialism* Restated, G. D. H. Cole, 1920.

GUILDER OR GULDEN. Originally a gold, later a silver, coin widespread over Europe. First

same value until the end of the First Great War. In Holland the guilder continues to be the main coin; in Danzig, during the period of the free state, there was a guilder based upon 25 to the £.

Guildford. Bor., co. constituency, and former co. tn. of Surrey, England. It stands on the London-

Guildford arms

Portsmouth road, 30 m. by rly. S.W. of London, and formerly guarded the ford over the Wey. A by-pass road now skirts the town centre. The steep and picturesque High Street has a fine view of the Hog's Back. The Hospital of the Holy Trinity, founded by Archbishop Abbott in 1619, is a beautiful building in the style of St. James's Palace, and the royal grammar school with its chained library was founded about 1536. The guildhall dates from about 1561, though its façade is 17th century; corporation treasures housed within include a 15th century mace and a mayoral staff presented by Queen Elizabeth, who also gave the town a set of bronze measures, bushel, gallon, quart, and pint. The square Norman keep dates from the early 12th century; and the oldest church, S. Mary's, is of Saxon origin. Holy Trinity Church, an 18th century building replacing an earlier one, served as cathedral for the Guildford diocese formed in 1927. The new cathedral church on Stag Hill is in cruciform style, and will seat 2,000 people; building, begun in 1936, was suspended during the Second Great War, but was resumed in 1949.

Guildford's prosperity once depended on the woollen industry. It now lies in light industry, brewing, and its importance as an agricultural market centre. Guildford supports a repertory theatre and municipal orchestra. The corporation owns 1,200 acres of open spaces. There are a technical college, and many independent schools in the neighbourhood. Market days, Tues. and Fri. Pop. est. 43,000.

Guildford. Town of Western Australia, in Swan district. It is situated on the rly. 9 m. N.E. of Perth, and was one of the earliest settlements in the original Swan River Colony.

Guildhall. In medieval architecture, a hall for the meeting of the guild merchants. Its origin was a roofed booth for collecting market tolls. As the local merchant organizations developed, a room for business purposes was added, generally built over the toll booth, and the practice of placing the council chamber of the guildhall on an upper floor, with access to the market place, was retained long after the original toll booth had become a structure of stone or brick.

The guild system was developed earlier in Flanders and N. Germany than elsewhere. Hence the large number of historic guildhalls in the chief cities and towns of these territories, each identified with the staple trade of the locality.

Guildford, Surrey. The High Street looking south-west with the Guildhall on the right and a glimpse of the famous Hog's Back in the distance

In London, the halls of the separate guilds were and are known as company halls. On the Continent, the guild gradually extended its authority to the affairs of the town itself, and the guildhall became the town hall. Owing doubtless to the London example, the municipal buildings of York, Bristol, and other large towns are commonly called guildhalls.

Guildhall, LONDON. The home of the City Corporation. Situated at the end of King St. between Aldermanbury and Basinghall St., it was built, 1411-35, approximately on the site of an earlier structure. Most of the medieval timber was destroyed by the Great Fire (*q.v.*) of 1666. Wren replaced the open roof with a flat ceiling. The S. front was restored, with George Dance, jun.

Guilder. Obverse and reverse of Dutch coin of 1773. Diameter, 3 in.

coined in Florence, and therefore called fiorino, or florin, it bore at first an impression of S. John the Baptist with a lily. From about 1500 an inferior variety, called a silver guilder, appeared; this remained in circulation in an Austrian as well as a Dutch variety of approximately the

as architect, 1789; complete restoration was not undertaken until 1864, when Sir Horace Jones modelled the open oak roof on that destroyed in 1666, and crowned

the structure with a metal spire. The E. half of the crypt had fine shafts of Purbeck marble and stone vaulting, and when parts of the brick arches of the W. half, put up by Wren, were removed in 1909-10, it appeared that this section was identical with the E. part. The great hall, 152 ft. by 49½ ft., and 89 ft. in height, saw the annual election of the lord mayor and sheriffs and M.P.s for the city, and the state banquets and entertainments of the corporation. The lord mayor's annual banquet began to be held here in 1501.

Guildhall was almost destroyed by fire during the German air raid on London on Dec. 29, 1940. The great hall was left a blackened shell, but was later temporarily roofed and brought into use. While the giant figures of Gog and Magog (*g.v.*) perished, most of the statues and monuments survived. The library was in use again by 1946, but many books were lost. The art gallery of the Corporation of London, founded 1885, was destroyed, as also was the museum, though its exhibits were saved. Consult The Guildhall, J. J. Badderley, 1899.

The Guildhall School of Music was established by the City Corporation in 1880, its building in John Carpenter Street, E.C.4, being opened in 1887.

Guilford, EARL OF. English title borne by the family of North since 1752. Francis North (1637-1685), a son of the 3rd Lord North, was made Baron Guilford in 1683. He was a prominent lawyer in the time of Charles II, ending with the position of lord keeper of the privy seal. His grandson, Francis, inherited both the barony of Guilford and that of North, and was made an earl in 1752. His son Frederick was Lord North, prime minister of George III, who became earl of Guilford two years before his death in 1792. Frederick, the 5th earl, a great lover of Greece, had much to do with the founding of the university of Corfu. Edward Francis, the 9th earl (born Sept. 22, 1933) suc-

ceeded in 1949. The family seat is at Waldershare Park, Dover, and the title of an eldest son is Lord North. See North, Lord.

Guillaumat, MARIE LOUIS ADOLPHE (1863-1940). A French soldier. Born at Bourgneuf, Jan. 4, 1863, he joined the army in 1884 and saw active service in Algeria, Tunisia, Tongking, and China. In the Boxer outbreak in 1900 he commanded the French troops

and measures at Sèvres, near Paris, in 1883. His research work concerned thermophysics, especially heat-resisting alloys, among which "Invar" was his creation. He published a standard work on thermometry in 1889, and improved small-expansion alloys for clocks, scientific instruments, measuring rods, etc. He was made head of the bureau, and in 1920 received the Nobel prize for physics.

Guillaume d'Orange. Hero of an old French romance. Also known as Guillaume au Court Nez, or William of the Short Nose, his story is set forth in one of the old *chansons de geste*. The story is

Guildhall, London. The fire-scarred Great Hall, scene of many great civic occasions. The picture shows the scene on May 15, 1947, when the city gave official welcome to the royal family on their return from their South African tour. Top: Exterior of Guildhall, from King Street, before the destructive fire caused by German bombs, Dec. 29, 1940

in Tientsin. Director of infantry under the minister of war in Oct., 1913, he was appointed chief of the cabinet of that minister in June, 1914. He commanded an infantry division in 1914 and the 1st army corps in 1915. As general he took part in the Verdun fighting and was appointed head of the 2nd army, 1916. He succeeded Sarraill as commander-in-chief at Salonica, became military governor of Paris, June, 1918, and commander of the 5th army in Oct. He was at the head of the army of occupation on the Rhine, 1924-30. He died May 19, 1940.

Guillaume, CHARLES ÉDOUARD (1861-1938). A Swiss physicist. Born Feb. 15, 1861, at Fleurier, Swiss Jura, descended from generations of watchmakers, he studied physics at Neuchâtel and Zürich, and became a member of the international bureau of weights

blended with that of S. William of Orange, count of Toulouse (d. 812).

Guillemot (*Uria*). Genus of seabirds related to the auk and razorbill. The guillemot is common around the British coasts, but is rarely seen on the rocks except in the nesting season, as it is nearly always at sea. The plumage is white on the under parts, with dark head, back, and wings. No nest is made, the single large egg being laid on a bare cliff-edge.

Guillet's Equivalent. Term used in metallurgy. Elements may be added to brasses, which

Guillemot. Specimen of *Uria troile*

are simple binary alloys of copper and zinc, to improve the properties, such as resistance to corrosion, toughness, or strength. Guillet suggested that the added elements could be classified by recording the percentage of zinc that would have to be added to produce the same effect on the structure of the alloy as seen under the microscope. Aluminium is said to have a zinc equivalent of 6, silicon of 10, iron of 0.9, and nickel of -1.2. So 1 p.c. aluminium added to an alloy will produce a similar effect to 6 p.c. zinc; while 1 p.c. nickel added will be similar to a reduction of 1.2 p.c. zinc or an increase of 1.2 p.c. copper. Although the addition of these elements produces similar microstructures to the straight brasses, it does not follow that the same mechanical properties are achieved.

Guillotine. An instrument for the painless decapitation of criminals. It consists of two upright

Guillotine used by the French revolutionists in the days of the Terror
From a contemporary print

grooved posts between which a heavy knife is mounted with its blade set obliquely. When a cord is released the blade falls swiftly on to the block on which the victim's head lies. Similar contrivances existed in Scotland, where the "Maiden" was in use by 1581, and at Halifax, Yorks, before 1650. The present name comes from that of a French doctor,

Joseph Ignace Guillotin (1738-1814), who recommended the use of the instrument to the assembly in 1789, and saw it officially adopted by the penal code, 1792. It is still the means of capital punishment in France. The Dr. Guillotine who was beheaded was a different person from the advocate of the instrument.

The name is applied in English printing offices, paper warehouses, and bookbinding establishments to a machine for cutting, squaring, and trimming paper.

Guillotine is also used as a political term to indicate the procedure by which the discussion of a measure in parliament is cut short by fixing a day or hour at which the discussion must end.

Guimaraes. Town of Portugal, in the district of Braga. It is 36 m. by branch rly. N.E. of Oporto. Its 11th century castle was the birthplace of Alfonso (1094), the first king of Portugal. The 14th century church of Santa Maria da Oliveira is built on the site of an older edifice, traditionally connected with King Wamba (672-680). It has an arcaded town hall. The sulphur springs near the town were the Roman Aquae Laevae. In the neighbourhood is Mons Citania, a prehistoric Iberian city, some ruins of which are still extant. Pop. 9,023.

Guimard, MARIE MADELEINE (1743-1816). A French dancer. Born Oct. 10, 1743, in Paris, she became première danseuse at the opera for some 25 years, making her début in 1762 as Terpsichore in *Les Caractères de la Danse*. Her private life was notorious for its extravagance, her liaison with the prince de Soubise lasting many years. In 1772 she opened in Paris the Temple of Terpsichore, notorious for licentious behaviour.

Guinea. Obsolete gold coin of the English currency. It was first struck in 1663, deriving its name from the fact that the gold used was imported by a chartered company trading with Guinea, W. Africa. Its nominal value was 20 shillings, but through the rapid depreciation of the silver coinage during the latter part of the 17th century, it rose to be worth as much as 30 shillings by 1694. It sank, however, and in 1717 its value was fixed at 21 shillings. Pieces of 1, 2, and 5 guineas were also struck, and in 1718 a 1-guinea

Guinea of George III, known as the spade guinea, from the shield.
Actual diameter, 1 inch

was coined. The last issue was that of 1813, and in 1817 its place as the standard gold coin was taken by the sovereign (q.v.). As a monetary unit, the guinea has survived, and

certain payments, e.g. professional fees, are customarily reckoned in guineas.

Guinea. Name applied to a large portion of W. Africa. It covers the territory from the mouth of the Senegal to the S. portion of Angola, and came into general use in the 15th century.

Guinea, FRENCH. A French colony on the coast of W. Africa. It lies between Portuguese Guinea and the British colony of Sierra Leone, by which it is bounded on the N.W. and S.E. respectively. On the N. the French colonies of Senegal and Sudan, on the S. Liberia, and on the E. the French colony of the Ivory Coast form the boundaries.

The area is 89,436 sq. m. and the est. pop. 2,124,972. The colony may be divided into three geographical zones: (1) the flat coastal districts varying in width from 25 m. to 65 m.; (2) a succession of high plateaux culminating in (3) Fouta-Djallon (Futa-Jallon), a mountainous region forming the watershed of the rivers Gambia, Senegal, and Niger. The inhabitants of these regions are generally of mixed origin. The principal tribes are the Diallonkes or Sous-sous, amongst whom Mahomedanism is making rapid progress; the Timenes; and the Foulahs.

The colony is administered by a lieutenant-governor responsible to the governor-general of French W. Africa, and an administrative council. On Aug. 29, 1940, it declared in favour of Gen. de Gaulle.

Principal products are ground-nuts, palm oil, fruits, gum, timber, rubber, rice, coffee, and there is a large trade in skins and hides, the country being specially rich in cattle, sheep, and goats. The chief towns are Konakry (pop. 25,000), the capital and a port; Kouroussa and Siguri on the Niger; Kankan, Dubreka, Boko, on the Nunez. Konakry is in touch with the Niger by means of the railway at Kouroussa (366 m.) and Kankan (49 m. farther), and thence by waterway to Bamako and the Senegal rly.

Guinea, PORTUGUESE. Colony in W. Africa, with an area of about 13,944 sq. m., completely sur-

rounded by French territory, except where it faces the Atlantic. On the N. is Senegal, on the S. French Guinea. The country is well watered and fertile. Five rivers, the Geba, Mansoa, Cacheo, Buba, and Cachine, are of commercial importance. The population consists of Foulahs, Mandingoes, Mamjaks, and other races, and numbers 351,089. The principal products are rice, wax, palm oil, and hides. Hard timbers, such as mahogany, camwood, and ebony, are plentiful. Cattle are numerous. Bissao is the capital and chief port; Bolama and Cacheu are other places. The territory was discovered c. 1446 and became a colony in 1879.

Guinea, SPANISH, OR RIO MUNI. African colony of Spain. It has French territory to N. (Camerouns) and S. (Gabun) and borders the Gulf of Guinea to W. By a decree of April 16, 1935, it was divided into the districts of Fernando Pó and Continental Guinea. The latter includes the islands of Great and Little Elobey, Annobon, and Corisco. Under a governor-general are ten territorial administrators in Continental Guinea and three in Fernando Pó. Bata is the chief town. The tribesmen include Bengas, Bubis, and Pambes. Cocoa, coffee, fruits, vegetables, and wood are exported. Area, 10,852 sq. m. Pop. 167,505.

Guinea, GULF OF. Important gulf in the W. coast of Africa, stretching from Liberia to Cape Lopez in French Equatorial Africa. It is broken by several bays, including the Bight of Benin, the Bight of Biafra, Corisco Bay, and Nazareth Bay, and receives the waters of the Volta, Niger, Ogowe, and other rivers.

Guinea Fowl (*Numida meleagris*). Member of the pheasant tribe, of which it is the only repre-

Guinea Fowl, a member of the pheasant tribe

sentative in Africa. In general appearance it is more suggestive of a small turkey than a pheasant. In its wild state the guinea fowl is well distributed over S. and Central Africa, but is absent from the northern countries. The birds live in large flocks and run with

great swiftness, seldom flying unless compelled. They are fond of roosting in low trees.

The guinea fowl has been domesticated from early days and was highly appreciated by the Greeks and Romans. Now it is not greatly in favour with poultry breeders, as it is somewhat delicate, and very quarrelsome.

Guinea Grass (*Panicum maximum*). Large perennial grass of the family Gramineae. A native of the W. Indies, it grows from 5 ft. to 10 ft. high.

Guinea Pepper (*Xylopia aethiopica*). Tall shrub, member of the family Anonaceae. It is a native of W. Africa. It has egg-shaped leaves, covered on the underside with white down, and flowers consisting of three sepals and three petals. The long cylindrical pods have an aromatic odour and a pungent taste, and are used as substitutes for pepper.

Guinea Fig. Small domesticated rodent belonging to the cavy tribe, and nearly related to the pacas and

Guinea Fig. Specimens of the rodents often kept as pets

agutis. Its origin is doubtful, but it is believed to have descended from the black Cutler's cavy of Peru, long ago domesticated by the Incas. These cavyes were usually self-coloured, the tortoiseshell coat of the modern guinea pig and the long hair of certain varieties being the result of selective breeding. The guinea pig first appeared in Europe in the 16th century, when it was introduced into Holland not long after the discovery of America, the name Guinea being probably a corruption of Guiana. It is easily kept in

captivity, provided it is protected from cold and damp; it will eat most roots and corn; is extremely prolific; and makes good eating.

Guinea Plum (*Parinarium excelsum*). Tree belonging to the family Rosaceae, native of W.

Africa. It has leathery, oblong leaves, downy beneath, and sprays of white flowers, followed by plum-like fruits with coarse, grey skin, dry, mealy flesh, and a large stone. It is the grey plum of Sierra Leone.

Guinegate OR GUINEGATTE. A village of France sometimes known as Enguinegate. In the dept. of Pas-de-Calais, it is known for two battles fought here 1479 and 1513. In the former the French were beaten by Maximilian of Austria on Aug. 7, 1479; the latter is known as the battle of the Spurs (*q.v.*).

Guines. Town of France. In the dept. of Pas-de-Calais, it is 5½ m. from Calais, with which it is connected by rail, tram, and canal. Formerly an important place, it had a castle and was a fortified town and the capital of a county to which it gave its name. It is now chiefly a market for agricultural produce. The English held it from the time of Edward III to that of Mary. It was the headquarters of Henry VIII at the Field of the Cloth of Gold (*q.v.*). Pop. 4,160.

Guinevere. Character in the Morte d'Arthur. The daughter of Leodegrance, king of Camelord, she married King Arthur. She fell in love with Sir Lancelot, and he with her, and their relations brought about the last great battle and the death of Arthur. She retired to a nunnery at Amesbury and there died. See Arthur; Morte d'Arthur.

Guingamp. Town of Brittany, France. In the dept. of Côtes du Nord, it stands on the river Trieux, 82 m. W.N.W. of Rennes. A statue of the Virgin in the church of Notre Dame de Bon Secours is the object of an annual pilgrimage in July. In the Middle Ages Guingamp was the chief town of the duchy of

Guingamp, France. View of the square, showing the parish church

Penthièvre. Near the town is Grâces, a village with a 16th century Gothic chapel. See Gingham.

Guinness. Name of an Irish stout brewed by the firm of Dublin brewers of this name. The soft Dublin water is particularly suit-

able for brewing stout. The firm has a bottling plant at Park Royal, London, N.W.10. *See* Stout.

Guinness. Name of an Irish family famous as brewers. Arthur Guinness, in the 18th century, had a brewery at Leixlip. He transferred his business to Dublin and became famed for his porter, as it was then called. By his son and grandson the business was continued, and under the latter, Benjamin Lee Guinness (1798-1868), it was much enlarged. It was known as Arthur Guinness, Sons & Co. In 1886, it was made a limited company, but the Guinness family retained a major interest in it. Benjamin Lee Guinness, made a baronet in 1867, was an M.P. and a great benefactor to Dublin. His eldest son became Baron Ardilaun, 1880, and died without sons in 1915. The other, Edward Cecil, was made baronet in 1885, Baron Iveagh in 1891, viscount in 1905, and earl in 1919. *See* Iveagh, Earl.

Guinness Trust. Fund established by 1st Earl Iveagh in 1889 for the provision of houses for the poorer classes in London and Dublin. The sum set aside was £250,000, afterwards increased; and blocks of dwellings were erected. The offices of the trust are 5, Victoria St., London, S.W.

Guipure. Lace-making term. The word comes from Fr. *guiper*, to whip, or cover, a thread, and originally denoted the silk-whipped cord or wire used in lace-making. It was also applied to the cartisane of parchment lace, i.e. to the small pieces of parchment or vellum whipped round with gold or silver thread. Gradually lace made with guipure

came to be known itself as guipure, and the name was also used of imitation parchment lace. The term is now applied generally to lace with no mesh ground, with the patterns tied with brides or large stitches, as in modern Honiton and Maltese lace; to lace made with gimp; and to some kinds of gimp. *See* Lace.

Guipúzcoa. Maritime province of N. Spain. The Bay of Biscay washes its N. shores, and the river Bidassoa separates it from France on the N.E. One of the Basque provinces, it is the smallest in the country but nearly the most densely populated; its area is 728 sq. m. and pop. 349,140, giving 480 persons to the sq. m. There are pine,

oak, and chestnut forests, and fruit orchards. Mineral springs abound; cod, tunny, and sardine fisheries are important, and oysters are bred. Guipúzcoa is inhabited mainly by Basques, who retain their language and customs. The capital is San Sebastian.

Guiraut de Borneil (c. 1138-1220). Provençal troubadour. He was born at Excideuil, Dordogne, and accompanied Richard Coeur de Lion on the third crusade. Though known as "master of the troubadours," he has received but scant attention from students, only a portion of the eighty of his poems which survive having been edited, by A. Kolsen, 1894.

Guisborough. A market town and urban district of the North Riding of Yorkshire, England. It is 9 m. E.S.E. of Middlesbrough, on the railway, and stands in a valley beneath the Cleveland Hills. The chief buildings are the church of S. Nicholas, a Perpendicular edifice, the town hall, and the grammar school. Here was an Augustinian priory, some few remains of which still exist; it is said to have been founded c. 1109 by one of the Bruce family. The industries are connected with iron found in the Cleveland district. Market day, Tues. Pop. 6,306.

Guiscard, ROBERT (c. 1020-85). Norman warrior. Born near Coutances, he was a younger son of Tancred de Hauteville. About 1046 he went to Italy, whither his

July 17, 1085. The name Guiscard means resourceful.

Guise. Town of France, in the dept. of Aisne. It stands on the Oise, 30 m. N. of Laon. The castle dates in part from the 16th century. Stoves and similar goods are manufactured in works conducted on the cooperative principle; in connexion with them is a large building where the workmen live on a communistic plan. This was founded about 1850 by J. B. Godin, after the principles advocated by Fourier. Camille Desmoulins was a native of Guise. The French dukes of Guise took their name from the town, which in the Middle Ages was the capital of a county. The battle of Guise or of St. Quentin was fought in the First Great War, Aug. 29-30, 1914. The French 5th army, under Lanrezac was preparing an offensive against St. Quentin when it was itself attacked in some strength by Germans on the right flank. Two corps were diverted to deal with the attack, and the Germans were driven back across the Oise; but on Aug. 30 Lanrezac, his flanks unsecured, had to break off the engagement. Guise fell to the Germans the next day, and was not recovered until the final Allied advance in Oct. 1918. Pop. 7,370.

Guise, DUKE OF. French title held by a cadet branch of the ruling family of Lorraine. The earldom of Guise, with Aumale, Elbeuf, and other possessions, was brought to Rudolph of Lorraine by his wife Marie of Blois in 1333. In the hands of his grandson Claude it was converted into a duchy. Mary of Guise, also known as Mary of Lorraine (1515-60), was wife of James V of Scotland and mother of Mary Queen of Scots. The last duke died in 1675, and the title lapsed on the death of his great-aunt Marie. It was revived for Jean, son of Robert, duke of Chartres (1874-1940), who on the death in 1926 of the duke of Orleans, became pretender to the throne of France. Exiled under republican law, he lived for many years near Brussels. He died Aug. 25, 1940, and was succeeded by his son, the Count of Paris (b. 1908).

Guise, CHARLES DE (1525-74). French prelate, known as the cardinal of Lorraine. The 2nd son of Claude, duke of Guise, he was made titular archbishop of Reims, 1538, and cardinal in 1547. Immoral and unscrupulous, but skilled in statecraft, he shared for many years the power of his brother François, 2nd

Guipure. Example of the lace of this name

elder brothers had preceded him, they being among the Normans who had just taken Apulia from the Greeks. Three of them were chosen in turn count of Apulia, and to this office, in 1057, Robert, who had also made a name as a warrior, succeeded. He continued the Norman work of conquest and was recognized as a duke by the pope. In 1081 he led an army to Greece, and defeated the Byzantine emperor's troops at Durazzo, returning to Italy to help Pope Gregory VII, then at war with the emperor Henry IV. Guiscard drove Henry's troops from before Rome, to which he restored Pope Gregory. He renewed war against Byzantium, but died at Cephalonia,

duke of Guise. He helped to negotiate the treaty of Cateau-Cambrésis, 1559, and, as a bitter foe of the Huguenots, strove to intensify the Inquisition in France. Forced to leave court by Catherine de' Medici, he died in disgrace Dec. 26, 1574. He is sometimes confused with his dissolute younger brother Louis, also a cardinal, known as "cardinal of the bottles."

Guise, CLAUDE, 1ST DUKE OF (1496-1550). A French soldier. Second son of René II, duke of

1st Duke of Guise
From a portrait in the
Pitt Palace, Florence

Lorraine (d. 1508), he was born Oct. 20, 1496. He inherited his father's French duchy of Aumale, his brother Anthony succeeding to the dukedom of Lorraine. In 1513 he married Antoinette of Bourbon, thus linking himself with the French court, where he became an official of the household. He fought with great gallantry at Marignano, 1515, and at Fuenterrabia, 1521. In 1525 he shattered the Anabaptist forces in Lorraine. Francis I of France made Claude governor of Champagne, and converted his fief of Guise into a duchy, 1526. He was thus a peer of France, and by Angevin descent and his Lorraine duchy took precedence over the Bourbon princes themselves. He died April 12, 1550.

Guise, FRANÇOIS, 2ND DUKE OF (1519-63). French soldier and statesman. He was born at Bar, Feb. 17, 1519, and saw war at Montmédy, in 1542; Landrecies, in 1543; and at the siege of Boulogne, in 1545, his wounds in these campaigns giving him the sobriquet of Le Balafre, the scarred. His defence of Metz against the emperor Charles V, 1552, made him famous as a general, and he commanded the French troops sent to aid Pope Paul III against Spain, 1556. In 1558 he recovered Calais and other places from the English.

Under Francis II the duke was virtually supreme ruler of France. With relentless cruelty he suppressed the conspiracy of Amboise formed by the lesser nobility against the rule of the Guises and their ally the cardinal Granvella, 1560. Under the regency of Catherine de' Medici he formed, with the duke of Montmorency and the marshal de S. André, the "triumvirate" who opposed her attempts to reconcile the Catholic

and Protestant parties. In the religious wars which broke out in 1562, François again took the field, winning victories at Rouen and Dreux, 1562, but while laying siege to Orléans was shot at St. Mesmin by a Protestant fanatic, Feb. 19, 1563, and died five days later.

Guise, HENRI, 3RD DUKE OF (1550-88). Son of François of Guise. Born Dec. 31, 1550, he inherited his father's courage but not his ability. He fought against the Turkish invaders of Hungary, was prominent in the massacre of S. Bartholomew, 1572, and defeated the Huguenots at Dormans, 1575. He set out in 1585 to use his great popularity to seize the crown from the discredited Henry III.

Defeating the German mercenaries at Vimory, and the Huguenots at Auneau, 1587, Guise entered Paris and, the Parisian mob favouring his attempt, laid siege to the king in the Louvre. After the Day of the Barricades, May 12, 1588, he might with more resolution have grasped the crown. But Henry III left Paris for Blois, where he invited Guise to attend the states-general which he convoked. The duke followed the king to Blois, but was assassinated there by the king's arrangement, and almost in his presence, Dec. 23. Like his father, Henri was called Le Balafre, from a wound received at Dormans.

Guise, HENRI, 5TH DUKE OF (1614-64). Born at Blois, April 4, 1614, son of Charles of Lorraine, 4th duke of Guise, he became archbishop of Reims. On his father's death, 1640, he renounced his orders and took the title. He conspired with the count of Soissons against Louis XIII, 1641, and with Masaniello in 1647 to seize the crown of Naples. Taken prisoner in the attempt, he was confined in Spain, 1648-52, but then joined the Frondeurs in Paris.

Guitar (Greek *kithara*, Lat. *cithara*). Stringed instrument, with a neck and fretted finger-board. The true Spanish guitar has six strings, played by plucking with the fingers, usually tuned :-

Many other forms and sizes, tried during the last three centuries, may be seen in museums.

Guitry, LUCIEN (1860-1925). A French actor. Born in Paris, Dec. 13, 1860, he first appeared

Lucien Guitry,
French actor
Gerschel

at the Gymnase in La Dame aux Camélias, 1878. He spent some years at St. Petersburg (Leningrad), was producer at the Comédie Française, but became best known by his successful management of the Théâtre de la Renaissance, 1902-09. Among his most successful performances there were in Anatole France's Crainquebille and Le Mannequin d'Osier, Zola's L'Assommoir, and in L'Emigré and Le Juif Polonais. The death of Constant Coquelin in 1909 left Guitry the foremost French actor. He appeared in London in 1902, 1909, 1920 and died June 1, 1925.

Guitry, SACHA (b. 1885). A French actor and dramatist. Son of Lucien Guitry, he was born at St. Petersburg

(Leningrad), Feb. 21, 1885, and educated in Paris. He wrote over 100 plays—mostly witty, sophisticated comedies, in some of which his father appeared, e.g. Nono, 1905; La Prise de Berg-op-Zoom; Pasteur; Jacqueline; Le Grand Duc; Un Sujet de Roman; Quadrille, 1938. He was manager of famous Parisian theatres: Edouard VII, Variétés, Sarah Bernhardt, Bouffes-Parisiens. With his wife Yvonne Printemps (q.v.) he acted continuously until

Sacha Guitry,
French actor
and dramatist

their separation in 1932. In films from 1935, he played in and directed brilliant satires, e.g. Le Roman d'un Tricheur, Les Perles de la Couronne. After the liberation of France in 1944 a charge against Guitry of collaboration with Germans was withdrawn for lack of evidence.

Guittone di Arezzo (c. 1235-94). Italian poet. One of the most influential fore-

Guitar. Andalusian model

runners of Dante, he is credited with having first given the sonnet its enduring form, and with being the author of the first known Italian epistolary writings. He is frequently referred to as Fra Guittone, having joined the military and religious order of the Cavalieri de Santa Maria.

Guizot, FRANÇOIS PIERRE GUILAUME (1787-1874). French statesman and historian. Born at Nîmes, Oct. 4, 1787, of Huguenot parentage and brought up as a Protestant at Geneva, he went to Paris in 1805 to study law. While there he attracted attention by journalistic writings, and in 1812 was appointed professor of modern history in the university of France. Under Louis XVIII he held several administrative offices and became leader of the moderate Liberals; but the reactionary policy of Charles X drove him into opposition, and for some time his lectures were interdicted.

F. P. G. Guizot, French statesman

Under Louis Philippe from 1830 Guizot was almost continually in office. He moved towards a rigid Conservatism, but it was his law which in 1833 established primary education. In 1840 he was sent as French ambassador to London, but remained in England only a few months, being recalled by the king to take Thiers's place as foreign minister. His pacific policy maintained good relations with England, but at home—in 1847 he became prime minister—his refusal to yield to popular demands brought about the revolution of Feb. 23, 1848, which virtually closed his political career. The rest of his life was devoted to literature. He died at Val-Richer, Normandy, Oct. 12, 1874.

Guizot's *Histoire de la Révolution d'Angleterre*, *Histoire de la Civilisation en Europe*, and *Histoire de la Civilisation en France*, are carefully written, philosophical in character, and impregnated with his own political ideas. His life was written by G. Bardoux, 1894. *Pron.* Ghee-zo.

Gujarat. A region of the Bombay province of India, lying N. of the Narbada river and E. of Kathiawar and the Rann of Cutch. It is a fertile plain, with plentiful rainfall. The Gujarat States political agency comprised Bala-

sinor, Bansda, Baria, Cambay, Chota Udaipur, Dharampur, Jahwar, Lunawada, Rajpipla, Sachin, Sant Jambughoda, Surgana, the Dangs, and the estates of Vatrak Kantha Thana. They came under the govt. of India in 1933, when the Baroda and Gujarat States agency was formed. This was amalgamated with the Western Indian States agency in 1944, the combined agency maintaining a resident for the Gujarat states at Bulsar. During 1947-48 all the states were merged in Bombay. The area of Gujarat is 7,352 sq. m., and the pop. 1,458,702. This is to be distinguished from Gujarat (*v.i.*) in Pakistan.

Gujarat. District, subdivision, and town of the Rawalpindi division of W. Punjab, Pakistan. The district lies between the Jhelum and Chenab rivers and is irrigated from the Jhelum canals. Wheat is the principal crop, most of the area being under cultivation. Gujarat town makes furniture. District: 2,051 sq. m., pop. 745,364. Subdivision: 569 sq. m., pop. 304,778. Town, pop. 30,899, mostly Muslims.

Gujarat, BATTLE OF. Fought between the British and the Sikhs, Feb. 21, 1849. The second Sikh War had begun with the British check at Chillianwalla, in Jan. In Feb. Lord Gough, the British commander, fought an army of Sikhs, estimated at 60,000, drawn up before the fortified town of Gujarat. He attacked them with his artillery, in which he was greatly superior, allowing this to play upon them for 2½ hrs. An advance was then made, and the Sikh ranks broke into flight. The British cavalry pursued them for many miles, and the result was the annihilation of the Sikh army and the capture of its guns. The British army of 24,000 lost about 800. Gujarat was taken and the Punjab surrendered. *See* Sikh Wars.

Gujranwala. Dist., subdivision, and town of W. Punjab, Pakistan, in the Lahore division. The area of the dist., which was awarded to the dominion of Pakistan by the boundary commission in 1947, is 2,311 sq. m., of which about two-thirds is under cultivation, one-third of this being devoted to wheat; other crops are gram, barley, cotton, and millet. The district owes much of its prosperity to the two Chenab irrigation canals. The manufacture of cotton cloth is an industry. Gujranwala town is an important commercial centre; its manufactures include cotton cloth and brass vessels. Jats are the most numerous tribes-

men. Pop., dist., 912,234; sub-division, about 200,000; town, 84,545.

Gulbarga. District and town of India, in Hyderabad state. Area of district, 6,719 sq. m. The cultivated area is considerable, millet being the chief crop. Limestone occurs; cotton goods are made, and millet, hides, and cotton exported. Imports include salt, cotton, woollens, and hardware. In Gulbarga city, a trading centre, linked by rly. with Sholapur, is the Jama Masjid in the old fort, a mosque constructed in the time of Ferozshah. Pop., dist., 1,312,055; town, 53,551.

Gulden. Dutch name for a silver coin described in this Encyclopedia under Guilder.

Gules. One of the seven heraldic tinctures, red. It is represented

Gules as represented in heraldry

in drawings by a series of thin vertical lines close together. The word is derived from either Fr. *gueules*, pl. of *gueule* (Lat. *gula*), throat, red skin, or Persian *gyul*, rose.

Gulf (Gr. *kolpos*, bay). Large indentation of the coast-line of a country or continent, and the sea contained within it. The name of bay is generally given to an indentation whose mouth is broad compared with its depth, while gulf is more appropriate to a long narrow indentation. Examples are the gulfs of Suez, Aden, California, Mexico, Finland, and Bothnia.

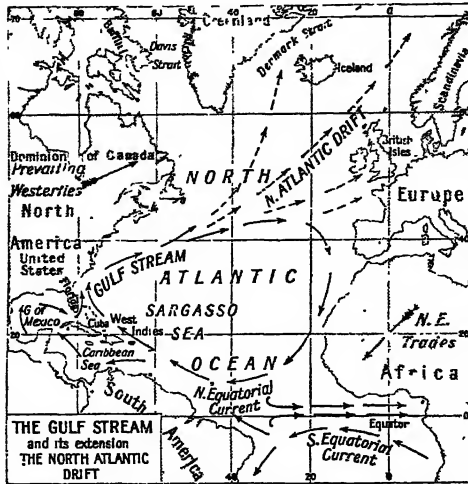

Gulf Stream. Warm ocean current flowing from the Gulf of Mexico along the S.E. coast of the U.S.A. The N.E. trades cause a great drift of waters—the N. Equatorial current, from E. to W. across the Atlantic Ocean N. of the equator. Part of this current skirts the outer shores of the W. Indies, but the greater portion enters the Caribbean Sea and thence passes to the Gulf of Mexico. Here the piling up of waters causes a stream current to issue from the Gulf of Mexico between Florida and Cuba. This current unites with the branch which keeps outside the W. Indies to form the Gulf Stream.

The combined current follows the direction of the coast; it decreases steadily in rate of flow, depth, and temperature, but increases in width. On reaching the latitudes of the prevailing westerlies the Gulf Stream loses its character and becomes a great

drift. Its waters are spread out like a fan, and, instead of there being a broad ocean river, there is a general movement of the whole surface waters of the ocean which, pushed by the winds, drift towards the coasts of N.W. Europe. This drift current is called the Gulf Stream drift or the N. Atlantic drift.

Off the American continent the Gulf Stream is strongest in spring and summer, flowing at 30 m. a day; the trans-Atlantic current is only about one-seventh as fast. The amelioration of the climate of W. Europe is due to the prevailing W. and S.W. winds, not directly to the Gulf Stream, although an extension of the latter across the Atlantic is caused at the same time.

Gulfweed (*Sargassum bacciferum*). A seaweed of the class Phaeophyceae. It has narrow, stalked leaves, with stalked airbladders at their base. It floats on the sea, forming vast fields that impede shipping. Detached pieces are often deposited on distant shores by the Gulf Stream. Its celebrated headquarters is in the Atlantic, where it is estimated to cover an area of 200,000 sq. m., known as the Sargasso Sea, and almost unaltered since the days when Columbus encountered it about 400 leagues to the W. of the Canaries, to the great alarm of his

Gulf Stream. Chart of the North Atlantic Ocean showing the origin and directions of the current

men, who imagined it to be attached to submerged rocks.

Gull. Sub-order (*Lari*) of seabirds, comprising about 50 species. It includes the various genera commonly known as gulls, terns, kittiwakes, and skuas. Most are grey and white in colour, have long and powerful wings, and are web-footed. All are fine swimmers and fliers, and many of them divers. The majority haunt the coasts,

usually in flocks, but are frequently found far inland during severe weather. Gulls are often seen following the plough in search of grubs, and the assemblage of vast flocks of black-headed gulls is a common sight in London during winter. When at sea they feed on

fishes and small crustaceans

Gulls are all migratory, either wholly or partially. Their large eggs, of which they lay usually two or three a season, are in many places collected for the table.

Most gulls nest on the cliffs; some, as the black-headed gulls, in the marshes. Voracious feeders, eating almost anything, to break mussels they will carry them aloft to drop them on the rocks.

Among the more familiar species are the common gull, which is really less common than many others, and visits England only in winter; the black-headed gull, which is common around the coasts, has a red beak, and develops a dark-brown head and neck in summer; and the herring gull, a large bird measuring nearly 2 ft. in length, which has a yellow beak, red legs, and yellow rings round the eyes. See Bird.

Gullet (Lat. *gula*, throat). Tube leading from the pharynx to the stomach through which food passes. See Oesophagus.

Gulliver's Travels. Satiric work of fiction by Jonathan Swift, parts of which have gained later popularity as a children's story. It was first published pseudonymously in 1726 as *Travels into Several Remote Nations of the World by Lemuel Gulliver*. It is divided into four parts, telling of as many voyages; to Lilliput and to Brobdingnag, in both of which the satire is political; to Laputa, satirising philosophers and men of science; and to the Houyhnhnms, where the satire degenerates into misanthropy. Apart from the satire, this work is one of the most original and convincing works of extravagant fiction. The idea is borrowed from the *Vera Historia*, or *True History*, of Lucian (*q.v.*), which also inspired Cyrano de Bergerac's *Voyage à la Lune*. See Brobdingnag; Lilliput; Houyhnhnms; Swift, Jonathan.

Gullstrand, ALVAR (1862-1930). Swedish physician. Born at Landskrona, June 5, 1862, he became professor of diseases of the eye, 1894, and of physiological and physical optics, 1913, in the university of Uppsala, where he engaged in valuable researches on dioptrics. He died July 28, 1930.

Gull. 1. Black-headed gull, common around the coasts, has a red beak. 2. Herring gull, large bird with yellow beak, a typical British coastal species. 3. Black-backed gull, a highly predacious bird, also seen on the coasts of Great Britain

Gully, JOHN (1783-1863). British sportsman. Born at the Crown Inn, Wick, of which his father was the proprietor, Aug. 21, 1783, he was brought up as a butcher. While imprisoned for debt in the Marshalsea he made the acquaintance of the Game Chicken, the prize-fighter, who obtained his release by interesting some patrons of the ring. Gully fought in the ring till 1808, then became a professional betting man and amassed a large fortune, which he invested in collieries. He won the St. Leger with Margrave in 1832, pulled off the double at Epsom in 1846 with Pyrrhus I (Derby) and Mendicant (Oaks) and in 1854 won the 2,000 Guineas with Hermit (not the Derby winner of 1867) and the Derby with Andover. Gully represented Pontefract in parliament, 1832-37. He died March 9, 1863. *Consult Life and Times, B. Darwin, 1935.*

Gum (*Eucalyptus*). Large genus of tall evergreen trees of the family Myrtaceae. With few exceptions they are natives of Australia, where they are the dominant trees of the forests. They have undivided, leathery, and usually alternate leaves. The upper part of the calyx and the corolla are shed when the flower opens, so that the great number of stamens form the most conspicuous feature of the expanded blossom. *Eucalyptus* oil is obtained from the leaves of *E. globulus*, the blue gum.

Some species rapidly attain enormous proportions, the height frequently exceeding those of the giant sequoias of California. *E. amygdalina* has been recorded of the height of 522 ft. The girth of these big trees at 5 ft. from the ground averages from 40 ft. to 50 ft., though they have been 88 ft. Planks over 200 ft. long have been cut from them. Some species shed the outer bark in long thin strips; but the under bark is deliberately stripped for roofing houses and many trees are killed by this process. Fallen timber rapidly decays. Among other products of the gum trees is a kind of kino, which exudes from the tree as a resinous juice, and has great astringent properties. The timber is valuable for many purposes, especially where beams of great length are required.

Gum (Lat. *gummi*). Substance which with water yields a sticky adhesive solution or a thick mucilage. Most natural gums are spontaneous exudations from trees, and are insoluble in organic solvents, e.g. turpentine, alcohol.

Chemically they are related to the carbohydrates (sugars). The chief is gum arabic, obtained from various species of *Acacia*, by far the most important being *A. senegal*, which grows in Africa from Nigeria to the Nile and as far S. as Natal. The chief resin collecting areas are French Senegal and the Sudan, where the trade is well organized and the trees are tapped systematically. Gum has been obtained from Sudan since very early times and records of its collection and use are found in The Book of the Dead (*q.v.*). Other species of tree yield similar but generally inferior gums. The best

Gum arabic, flowers of *Acacia Senegal*

grade of gum arabic is known as Kordofan. Gum arabic dissolves in water, giving clear viscous solutions used as adhesives, and also in confectionery and the finishing of textiles. Gum tragacanth (gum dragon) is typical of the gums which swell up and yield thick mucilages with water. It is obtained from various species of *Astragalus*, the chief being *A. gummifer*, a shrub which grows in Asia Minor, Turkey, and the uplands of Persia. When the stem is cut, the gum exudes and dries in the form of thin flakes. Gum tragacanth is used in medicine, in the manufacture of sauces, chutneys, etc., and in textile finishing. Various other gums are obtained and sometimes appear mixed, either intentionally or accidentally, with arabic and tragacanth. Some of these, e.g. gum karaya, one of the Sterculin gums, are not regarded as adulterants; others are, e.g. gum ghatti, which is less soluble than arabic, and hog tragacanth, an inferior type of tragacanth. Hog tragacanth comes from a species of *Prunus*. Many trees of the Sterculia species yield a gum somewhat resembling tragacanth, but of inferior quality.

In addition to gums collected as exudations from trees, an important gum, gum tragasol, is extracted from the seeds of the carob or locust tree, *Ceratonia siliqua*; it resembles tragacanth and is used in textile dyeing and finishing.

Of manufactured gums, dextrin or British gum is the most important. It is in some respects superior to gum arabic as an adhesive, especially where mechanical application, e.g. in the case of

postage stamps, is necessary. In commerce, the term gum is often incorrectly used to include resins. *See Resin.*

Gum OR GINGIVA. Name for the fleshy tissue which surrounds the margin of the upper and lower jaws. The gums are covered by mucous membrane which is continuous with that of the mouth. Inflammation of the gums may arise from neglect of the teeth, allowing of invasion by micro-organisms. It is also seen in scurvy and when there is a lack of Vitamin C. The presence of tartar and red swollen gums indicates that of infection, the source of which may need to be determined by dental X-rays. Chronic inflammation of the gum may eventually lead to loosening and falling out of the teeth. An abscess at the root of a tooth may break through on the surface of the gum, the condition being known as a gumboil.

Pyorrhoea alveolaris is an inflammatory state of the gums associated with the formation of pus between the teeth and the gum. The condition is apt to affect the general health, being associated with anaemia, disorders of digestion, and rheumatism. In chronic cases the teeth often become loose. Reflex salivation may be present and much mucus is secreted by the glands of the mouth. Bad breath and an unpleasant taste in the mouth result from decomposing food and the pockets of pus. Treatment, to be carried out under expert advice, consists in high vitamin intake, stimulation of the gums, and strict oral hygiene; penicillin has also been found helpful in some cases. If the condition is severe, removal of the teeth may be necessary.

Gumbo OR OKRA (*Hibiscus esculentus*). Annual herb of the family Malvaceae. It is a native of the W. Indies, and has yellow flowers. The unripe fruits contain much mucilage, and are used in cookery for thickening soups, and for other purposes.

Gumboil. Small abscess on the gum, arising usually from decay of a tooth. *See Gum.*

Gumma (Plural gummata). Lesion which may form in almost any organ or tissue of the body during the later course of syphilis, yaws, and tubercle.

Gummidge, Mrs. Character in Dickens's *David Copperfield*. She is the widow of Daniel Peggotty's partner, and, given a home by that generous man, takes the most

comfortable place and querulously complains that she is a "lone, lorn creature, and everythink goes contrary with her."

Gumming. Disease or affection of fruit trees usually due to excessive richness in the soil. It manifests itself by exudations of a yellowish-brown transparent substance upon the stems or joint branches of the trees. Trees so affected should either be transplanted into a less fertile soil or rigorously root-pruned. As a rule, gummy trees run to an excess of foliage without making much fruit. The condition may also be a response to disease, such as silver leaf of plum trees, where it is a protective device to isolate diseased tissues.

Gumti. River of India, in the United Provinces. It rises east of Pilibhit, and after a course of about 500 m. enters the Ganges at Saidpur, in Ghazipur district. The Gumti is the only left bank tributary of the Ganges which does not issue from the Himalayas; it depends for its water entirely upon the rains. Lucknow is the chief town on its banks.

Gumurdjina, GUMURZHINA, OR GUMULJINA. Town of Greece, in Thrace. Known chiefly for its large annual cattle market, it is situated on the Karaga, about 70 m. S.W. of Adrianople, and 12 m. from the Aegean Sea. The district produces good wine.

Gun (A.S. *gonne*, machine for throwing missiles). Term loosely employed to describe several widely different varieties of firearms and, more particularly, relatively long-barrelled varieties. Among smaller firearms, the term gun is chiefly confined to long-barrelled, smooth-bore sporting weapons and the automatically operated rifles termed machine-guns. Among larger firearms, gun is the designation of the long-barrelled rifled weapons, which, on account of their stronger construction, permitting higher chamber pressures, and consequently greater muzzle velocity of the projectile, are able to throw the latter a greater distance with a comparatively flat trajectory in contradistinction to the more lightly constructed howitzers, which, though they may throw a projectile of equal or greater weight for similar calibres, work at a lower pressure, have a shorter range, and attain this by a steep or high trajectory. Howitzers are usually rifled, but many introduced to aid trench fighting in the First Great War were smooth bored.

The early history and development of the sporting gun is the same as that of the military weapon, and it was not until it was recognized, towards the middle of the 19th century, that a rifled weapon was essential for military purposes, that the two classes became distinctive. Modern sporting guns throw a charge of small shot to an effective range of 50 to 90 yards, the barrels being smooth bored. If the bore is parallel throughout it is known as cylinder, but if it is constricted towards the muzzle in order to increase the effective range and prevent the shot spreading so widely it is termed choke (half or full). Most guns are double barrelled, and except for special purposes it is usual for the right barrel to be cylinder and the left choke bored. The size of the bore is designated by a number, this being a survival from the days of the musket and founded on the weight of the single lead bullet which the barrel was designed to use. The most usual size is 12 bore, but 8 or 4 bore guns are employed for duck shooting, and 16, 20, and 28 bore guns when an exceptionally light weapon is desired.

The question of weight has always been important in the manufacture of sporting weapons, it being essential to attain the maximum strength with the minimum weight. Barrels were for years constructed of strands of wrought iron and steel twisted and then welded together (Damascus barrels); but the type is now chiefly valued for the beauty of the etched surface, as modern alloy steels provide ample strength and toughness.

All modern weapons are breech-loading and employ central fire cartridges. In some guns the striking mechanism is external (hammer guns), while in others the striking mechanism is enclosed in the lock, giving a neater appearance (hammerless). Some of the latter class, known as ejectors, automatically throw out the empty cartridge case after a shot has been fired, and a further development is the single trigger gun in which one trigger controls both barrels. Single-barrel repeating and automatic guns carrying five to eight cartridges in a magazine have also been introduced, but are too heavy to be popular. To give some measure of safety where it is necessary to carry the weapons loaded, hammer guns can be placed at half cock, and the hammerless variety have a safety catch.

In the highest-class guns specially well-figured walnut is employed for the stocks, and the greatest skill is lavished on elaborate engraving of the lock plates and breech block. English guns have the highest reputation for beauty and accuracy of workmanship, while Belgian guns supply a more popular demand. After 1918 the Birmingham Small Arms co. instituted a policy of mass production of plain finished, reliable guns at a competitive price. Before any gun is purchased it should be submitted to a firing proof for strength as evidenced by a proof mark stamped on the barrels, while smokeless powder cartridges should not be used in any gun which has not been tested for the higher pressures involved and does not bear the stamp "nitro proof." See Artillery; Bore; Bullet; Calibre; Firearms; Guns and Gunners; Naval; Machine-Gun; Rifle.

Gunboat. Term usually applied to small craft capable of operating in shallow waters and limited areas, and in which the gun assumes an importance disproportionate to the size of the vessel. In the days of sail, a gunboat was usually a small coast defence vessel, often furnished with sweeps to enable her to take advantage of an opponent becalmed in sight of land.

In the British Navy recently there have been three types of gunboat: (1) River gunboats, originally designed for service on the Yang-tse and other Chinese waterways; in size these have varied from 700 tons, with an armament of two 4-in. guns, one 3.7-in. howitzer, and a dozen smaller weapons, to 185 tons, armed with one 3.7-in. howitzer and nine smaller pieces. (2) Motor gunboats, employed during the Second Great War against enemy coastal traffic in the North Sea and English Channel; ultimately there were two main types, of 72 and 60 tons respectively, with speeds of 25-26.5 knots, and armaments of 40-mm., 20-mm., and machine-guns. (3) Steam gunboats, with the same purpose but of greater size and speed (250 tons and over 30 knots).

In the U.S. and Netherlands navies the term gunboat has been applied to a vessel which would be classified as a sloop in the Royal Navy. The Brazilian navy possesses specially designed gunboats for duty on the Amazon, varying in size from 620 to 190 tons.

Guncotton. Nitrocellulose of a high degree of nitration, containing 13-13½ p.c. of nitrogen. Cotton

waste is the raw material generally employed in the manufacture of guncotton. It is given a drastic treatment with alkali to remove all grease, boiled with several changes of water, dried, picked over by hand to remove impurities, opened out by a teasing machine, and then desiccated. The nitrating acid contains about 75 p.c. sulphuric acid, 17 p.c. nitric acid, and 8 p.c. water, the proportions varying according to the process. When nitration is complete the guncotton is immersed in water and thoroughly washed to remove the bulk of the acids, and then undergoes stabilisation to remove products, which, if left in, would have a deleterious effect on its keeping properties.

Stabilisation implies boiling the guncotton in about 10 series of waters, a trace of alkali being sometimes added, the total boiling lasting about 50 hours. Passing the guncotton through a pulping machine reduces it to a fine state of division; it is then passed over a trap to remove foreign matter, and then washed again in a poacher, a small percentage of calcium carbonate added, and then the water content reduced to about 25 p.c., and the pulp moulded into blocks by hydraulic pressure.

Wet guncotton is insensitive and a satisfactory blasting explosive if primed with dry guncotton initiated with a fulminate detonator. At one time it found extensive use for filling mines, torpedoes, etc., but has been displaced by trinitrotoluene, and at present is only employed for military blasting, being pressed into 15 oz. slabs. In the dry state guncotton is sensitive to friction and percussion, and must be handled with great care. In this condition it is used for priming wet guncotton. It also makes smokeless powders. *See Explosives; Nitrocellulose; Smokeless Powder.*

Gundulph (c. 1024-1108). A Norman bishop and architect. Born near Rouen, he was educated there and became a clerk of the cathedral. He then accompanied William, archdeacon and later archbishop of Rouen, on a pilgrimage to Jerusalem, and on his return in 1060 became a monk of Bec. When the prior of Bec, Lanfranc, was appointed abbot at Caen, Gundulph went with him, and in 1070 followed Lanfranc to the see of Canterbury as his steward. From 1077 to 1108 Gundulph was bishop of Rochester. He reestablished the chapter as a monastic body, and rebuilt the cathedral. He was also the

architect of the White Tower, in the Tower of London, and of S. Leonard's Tower, W. Malling, and other buildings. In 1089 he acted temporarily as archbishop of Canterbury between the death of Lanfranc and the appointment of Anselm. He died March 7, 1108, and was buried at Rochester.

Gunjah or GANJA. Dried flowering tops of the female plants of Indian hemp. *See Ganja.*

Gun Licence. Permit necessary for the possession of firearms. In Great Britain the licence, which is administered by the county councils and is rigidly enforced, permits the owner to carry firearms. It costs 10s. a year, and expires on July 31. Soldiers carrying rifles or revolvers in the performance of duty, are exempt, as are also holders of game licences. The possession of a gun licence does not absolve the owner from the necessity of applying for a police permit to possess firearms. *See Firearms.*

Gunmakers' Company. London city livery company. It was granted a charter in 1637 for the purpose of compelling the proof and marking by the company of the barrels of certain small arms before sale. By the Gun Barrel Proof Act, 1868, the charter was recognized and it was made obligatory for the barrels of small arms (with certain exceptions) to be proved and marked either by the company or by the guardians of the Birmingham proof house. The offices are at 7-11, Moorgate, E.C.2.

Gunmakers' Company arms

Gunmetal. An alloy of copper and tin, with smaller amounts of zinc and lead, containing 85-90 p.c. copper. It thus belongs to that class of alloys known as bronzes. It was long the chief metal used in the making of cannon, its place now being taken by steel. Possibly the Chinese prepared gunmetal and used it in making ordnance long before any other people; the Arabs prepared such cannon at the beginning of the 12th century; and cannon used by the Turks at the siege of Constantinople in 1394 may have been of this alloy. Gunmetal makes parts of machinery which require great strength but for which steel or iron cannot be employed, as in certain classes of pumps, and for the bearings of heavy shafts. *See Alloys; Bronze.*

Gunn. Name of a family of English cricketers. They all played

for Nottinghamshire, where William (1858-1921) was born. A model batsman and superb fieldsmen, he made 24,899 runs in 25 seasons, 1880-1904, and had an innings of 228 in a test match against Australia in 1890. Also a footballer who represented Notts County and England, he died Jan. 29, 1921. Two of his nephews, John and George, played cricket for their county and country, George scoring 119 at Sydney on his first appearance against Australia in 1907, and heading the English batting averages in 1919. The latter's son, George Vernon (b. 1905), was a regular member of the Notts eleven 1932-39.

Gunner. One who operates a gun. A gunner in the Royal Artillery is a private soldier, though he does not necessarily serve a gun in action, but may be a driver, signaller, etc. The actual gun crew are called gun numbers. The rank of master gunner is peculiar to coast artillery units and is held by a warrant officer.

In the Royal Navy a gunner is a warrant officer engaged in duties connected with the gun armament and ammunition of ships and shore establishments. Naval and Royal Marine ratings actually serving are called gunnery ratings; there are also Royal Marine gunner, commissioned Royal Marine gunner, commissioned gunner, gunner (T), and gunner's mate.

Gunners in the R.A.F. are members of air crew and operate the defensive armament of aircraft, ranking as gunner I, II, III, or IV. In the R.A.F. Regiment all personnel below the rank of corporal are rated as gunners, irrespective of their duties.

The office of master gunner, St. James's Park, is an honorary rank awarded by the king. Selected from among the colonels commandant, R.A., the holder deputises for the king at R.A. ceremonies. The first master gunner was appointed in 1263: Viscount Alanbrooke in 1946.

Gunnersbury. District of Middlesex, England, part of the bor. of Brentford and Chiswick. It has Ealing and Acton to the N. and is served by suburban electric railways. An estate here, which includes a park, was purchased in 1761 for Princess Amelia, daughter of George II, whose parties at Gunnersbury House were famous. It was sold in 1786, pulled down in 1801, rebuilt on a smaller scale, and superseded in turn by a mansion belonging to the Rothschild family. Pop. 5,655. *See Brentford.*

Gunnery School. Specialist gunnery training establishments exist for all British fighting services. Instructors' and other higher courses for the artillery are held at the school of artillery, Larkhill, the school of A.A. artillery, Manorbier, and the coast defence gunnery school, Plymouth. (See Artillery Schools.) The principal naval gunnery school is H.M.S. Excellent (*q.v.*), on Whale Island. The practical application of naval gunnery is carried out at sea on exercises. The R.A.F. trains large numbers in both air gunnery and ground gunnery, the central gunnery school being at Leconfield. The qualified air gunner, whose course includes air firing on the range and at towed targets, is entitled to wear the brevet AG.

Gunning, ELIZABETH (1734-90). Duchess of Hamilton and of Argyll. She was the second of three

Elizabeth Gunning, Duchess of Hamilton and of Argyll
From a print in the British Museum

daughters of an Irish squire, John Gunning of Castle Coote, co. Roscommon. With her elder sister Maria, she came to London in 1751, with the intention of going on the stage, but there the beauty of the pair made an extraordinary impression in society and among the populace. They were fêted everywhere, while crowds followed them in the streets. In 1752 Elizabeth married the 6th duke of Hamilton (d. 1758). After being engaged to the 3rd duke of Bridgewater, she married in 1759 the marquess of Lorne, who, in 1770, succeeded his father as 5th duke of Argyll. In 1776 she was created Baroness Hamilton, with remainder to her male issue as baron. She died May 20, 1790. Two of her sons became dukes of Hamilton, and two dukes of Argyll; she also had three daughters. There are several portraits of her in existence.

Gunning, MARIA (1733-60). Countess of Coventry. Elder sister of Elizabeth Gunning, she married the 6th earl of Coventry in 1752, less than three weeks after Elizabeth's marriage to the duke of Hamilton. She was generally regarded as being more beautiful than Elizabeth, and the loveliest woman at the court. In 1759 she was mobbed by an admiring crowd in Hyde Park, and was afterwards provided by the king

Maria Gunning, Countess of Coventry
From a painting by F. Cotes

with a military escort. She died of consumption, Oct. 1, 1760, perhaps from the use of white lead for her complexion.

Gunnison. River of Colorado, U.S.A. Rising in the S.W. part of the state, it flows W. and N.W. for 200 m., and joins the Grand, a main headstream of the Colorado. It has cut deep cañons, one, of granite, 40 ft. long and 2,500 ft. deep.

Gun Pit. Protected and camouflaged site for artillery. For guns engaging land targets, the pit is shallow, so that the gun may have maximum depression. Walls of sandbags protect the gun crews from blast, and the gun itself is concealed by a camouflage of netting or branches. A subsidiary pit is provided near each gun for the storage of ammunition. Gun pits to accommodate A.A. artillery are generally circular, so that the gun may traverse a complete circle. The development of mobile warfare has limited the use of gun pits for field and heavy artillery, and the entrenchment is now generally confined to A.A. guns not exceeding a calibre of 3·7 ins. Permanently sited guns are protected by emplacements. Anti-tank guns are sometimes put in pits when covering the line of a probable armoured advance.

Gunpowder. Oldest known explosive. It was first used for blasting about the 17th century and until the introduction of nitroglycerine into industry in 1867 was the only blasting explosive available. The constituents of modern gunpowder are saltpetre, charcoal, and sulphur. Early mixtures, the first of which was described c. 1250 by Roger Bacon, contained much more charcoal and sulphur than is used today.

Ordinary charcoal is unsuitable for gunpowder, and at present dogwood, alder, or willow is cut in

spring, stored $1\frac{1}{2}$ to 3 years, then cut into pieces about an inch thick, packed into iron cylinders having holes at one end through which volatile constituents escape, and heated in a furnace for four hours. Air is excluded from the charcoal by allowing the cylinder to cool in a larger closed tank. Military gunpowder generally approximates to: saltpetre, 75 p.c.; charcoal, 15 p.c.; and sulphur, 10 p.c.; but for blasting the variations of composition are considerable. The ingredients are separately weighed out and roughly ground. It is usual to add some of the saltpetre to the sulphur to prevent the latter becoming electrified and igniting, the remainder being ground with the charcoal to prevent clogging.

After preliminary mixing by hand or in rotating drums, the ingredients are incorporated. The rollers are suspended so that they cannot approach within $\frac{1}{2}$ in. of the bed, this minimising the risk of friction on a thin layer of powder. Ploughs constantly push the mass under the rollers, thoroughly grinding and mixing the ingredients, which are moistened with water, 80 lb. being milled at a time for 3 to 8 hours. One shaft drives six mills, which are separated by strong walls, water tanks being arranged so that an explosion in any mill floods them all. The caked powder is next broken up, the fragments arranged in layers between plates and pressed to high density.

The mass is broken down by passing between toothed bronze rollers, and automatic sieves grade the powder as to size, large fragments being recrushed and dust rejected. Gunpowder has been largely displaced as a sporting and military propellant by smokeless powder (*q.v.*), but finds considerable use for blasting, in certain types of shell and cheap sporting cartridges, and as an igniter for smokeless powder in cannon. See Explosives.

Gunpowder Plot. Conspiracy to blow up King James I and both houses of parliament on the day fixed for the opening of parliament, Nov. 5, 1605. Several Roman Catholic gentry, out of patience with the penal laws against the practising of their faith, were in the plot, and it was betrayed to the authorities because one of them wrote to warn his brother-in-law not to attend the opening. On Nov. 4 the buildings were searched and Guy Fawkes (*q.v.*) was discovered with gunpowder in a cellar under the house of lords. Fawkes was tortured and most of the conspirators, even

those who had escaped to the Midlands, were chased, slain, or captured. The ceremony of searching the vaults before the annual opening of parliament, and the small boys' "guy" which is burnt together with fireworks on Nov. 5, are legacies of the plot.

It has occasioned much controversial literature. A form of service for Nov. 5 was excised from the book of Common Prayer in 1859.

Gun-room. Room in warships so called because it was formerly situated at the end of the gun-deck. It was used in large ships by the gunner, in small ones by the lieutenants as a common living-room. The modern gun-room is a mess shared by sub-lieutenants, engineer sub-lieutenants, officers of the accountant branch junior to assistant paymasters of four years' seniority, and midshipmen. Senior officers mess in the ward-room (*q.v.*).

Gun Running. The smuggling of arms into places where their import is forbidden or strictly con-

Gunpowder Plot. Contemporary print of the conspirators: left to right, Bates, Robert Winter, Chris. Wright, John Wright, Percy, Guy Fawkes, Catesby, Thos. Winter

trolled, especially for political purposes. Governments which fear the armed resistance of subject peoples have to keep a look-out for gun-running, which may be a lucrative undertaking for the unscrupulous. The Persian Gulf and the Malay Archipelago have been regions associated with gun running; another was the W. Mediterranean during the Carlist intrigues in Spain. In 1914 came the Ulstermen's feat in Belfast Lough and that of the Irish Nationalists at Howth. There was an organized system between the mainland and Cuba during the rebellion in that island in 1898. Gun running in the Second Great War was one means by which the Allies helped partisans in occupied countries.

GUNS AND GUNNERY IN THE NAVY

Francis McMurtrie, Editor, *Jane's Fighting Ships*

The special types of gun used at sea, and the special problems of naval gunnery are here described. Land gunnery is described under Artillery, air gunnery under Air Fighting

Naval guns are those engines on board fighting ships from which projectiles are discharged by explosive force. Edward III had iron and brass guns in his ships, and through subsequent centuries the mechanisms increased in number and variety. In Elizabeth's time ships carried the double cannon or cannon-royal, firing a 64-lb. projectile, and the demi-cannon, which was a 30-pounder. Smaller guns were the culverins, which were longer in proportion to bore, and fired shots ranging from 17 lb. to one pound. They comprised whole and demi-culverins, serpentes, sakers, minions, falcons, robinets, and basers.

Petards and Murderers

Other guns, something like the modern howitzer, were called perriers. They were intended to discharge stone balls, carcass or case shot, fire-balls, and the like. There were also mortar pieces called petards and murderers, the latter being breech-loaders, like

usually sought to engage, i.e. 400 to 600 yards. Guns of this character continued to be made until 1830, at which date a more effective model of 32-pounder, weighing 56 cwt., replaced them; it was followed within ten years by a 68-pounder, weighing 95 cwt.

Shells were introduced into the French navy by Colonel Paixhans in 1824, and by the time of the Crimean war an 8-in. gun firing 56-lb. shells had replaced the 32-pounder as the lower deck armament of British line-of-battle ships. In 1856 W. G. (afterwards Lord) Armstrong produced guns on the "built-up" system, formed of wrought iron with steel for the inner tube. So superior was this to the former mode of construction that it soon superseded it. In the same period, rifled guns firing elongated projectiles were invented; these were used experimentally in the Crimean War. Here also it was Lord Armstrong who perfected the invention.

Breech-loading Gun Introduced

In 1831 the first all-steel guns were manufactured. About the same time the breech-loading gun which had some time previously been adopted by foreign navies, was finally accepted in the Royal Navy, a more satisfactory type of breech mechanism having been evolved. Advantages of the new type of gun were manifold, not the least being that worn guns could easily be repaired by renewing the inner tube or lining when the rifling became eroded by the action of deleterious gases.

Guns increased enormously in size and weight, up to the 16-25-in. guns of the Benbow (1885), Sanspareil and Victoria (1897), which weighed 110½ tons. These guns were not mounted in any other ships, as it was found more advantageous to mount four guns of more moderate size rather than a pair of the larger weapons, since the former could not only be fired more rapidly, but could ultimately discharge a greater weight of metal. From 1896 to 1912 the standard calibre of big gun in the R.N. was the 12-in. It then became for a time the 13-5-in., which gave place in 1915 to the 15-in.

In the Russo-Japanese War of 1904-05 the effective range was about 6,000 yds.; it increased within ten years to nearly double this figure. At Jutland, in spite of low visibility, fire was opened at a range of nearly 19,000 yds., a range since appreciably exceeded.

Enormous strength is required to withstand the pressure of cordite

some other types of the time. Early guns were made of bronze and iron bars hooped together. The Sovereign of the Seas, launched in the reign of Charles I, mounted about 100 brass guns. Cast iron guns were made in England as early as 1545, and this construction continued for 300 years or more.

In the Napoleonic Wars

All these guns were smooth-bores, firing round shot. In the French Revolutionary and Napoleonic Wars, the largest line-of-battle ships usually carried 32-pounders or 42-pounders as the lower deck armament; 24-pounders on the middle (or main) deck; and 18-pounders on the upper deck supplemented by shorter and lighter pieces known as carronades, from Carron in Scotland where they were first made. These fired shot of from six to 68 lb. in weight, and were designed to fire large calibre projectiles with accuracy to the distance at which ships in those days

and other propellant charges, and steel of perfect homogeneity, elasticity, and break-resisting strength is used. The breech block must combine the smallest possible weight consistent with complete resistance to the back pressure of the gases. The mechanism must ensure the most rapid opening of the breech, charging of the gun, closing the breech, and firing the gun. The mounting and carriage of the guns, which are usually placed in pairs, must provide for the easiest and smoothest working in elevation and in training on the roller-path, in order to find the target and attain immediate accuracy of aim. The whole of the weights of the gun and gunhouse are distributed over a large area, and are perfectly balanced for ease of rotation.

The 15-in. gun, with a length 42 times its calibre, weighs over 97 tons without the breech mechanism, and fires a projectile of 1,920 lb. with a cordite charge of 428 lb. The muzzle velocity is 2,450 ft. per sec., and the muzzle energy 84,070 foot-tons. Complete gear for working a pair of guns of this calibre is enclosed in a barbette mounting, surmounted by a gunhouse, the whole structure being commonly referred to as a turret. Ammunition hoists are centrally situated, trolleys from the magazines or running gear loading the projectiles and charges on the platform below, whence by hydraulic mechanism they are rapidly raised to a point behind the breech of the gun and rammed home.

Process of Manufacture

In the manufacture of big guns the operation begins with the casting of the steel ingot and the forging of it under pressure in some cases of 5,000 tons. The ingot is bored by means of a trepanning machine, and forged upon a mandrel into the form of a tube at a red heat under a powerful press which has a downward force of 3,500 tons or more, the tube being turned continuously during the operation. Having thus been forged approximately to the required dimensions, the gun tube is next turned by lathes, and bored by long machines, working usually from both ends at the same time, hardening or tempering being carried out in rape-seed oil.

In the British 16-in. and 16-in. guns, the tube is next wound with steel ribbon, about a quarter of an inch wide and a tenth of an inch thick. On a 12-in. gun there is usually a length of 120 m. of steel ribbon with 14 layers at the

muzzle and 75 at the breech. Then comes the shrinking on of the outer jacket, at a very high temperature. When it is cooled, this jacket becomes an integral part of the gun. After these operations the gun is internally rifled by special plant, and externally machined.

The 14-in. gun, of more recent design, is of the "built-up" type, strengthened by the shrinking on of successive outer tubes. This gives greater girder strength, a quality in which the wire-wound type of gun was found to be deficient, the general effect being to provide a lighter weapon with equal strength. Any tendency for the gun to droop at the muzzle is thus obviated.

Radar Fire Control

The naval gun of the Second Great War and after, with its breech and intricate fittings, its complex mounting, and its control and firing gear, represented one of the greatest achievements of human ingenuity. The application of radar to fire control had the effect of revolutionising both low angle and A.A. gunnery by giving increased accuracy of fire. The 15-in. gun, which was first installed in ships of the Queen Elizabeth class, was selected as the main armament for the battleship Vanguard, completed 1946.

During the First Great War an 18-in. gun was mounted in H.M.S. Furious and in certain monitors, but otherwise the largest gun in the British service was the 16-in. mounted in the battleships Nelson and Rodney (1925). Owing to treaty limitation of the size of battleships, these guns were arranged in triple mountings. In the King George V class, launched in 1939-40, there was a reduction in the calibre of the main armament to 14-in. with the weight-saving expedient of quadruple mountings, again dictated by treaty restrictions.

In the U.S. navy the standard heavy gun is the 16-in. This calibre was also mounted in ships of the Japanese navy which took part in the Second Great War; two Japanese battleships of exceptional size, the Musashi and the Yamato, were armed with 18-in. guns. German battleships in that conflict were armed with 16-in. and 11-in. guns, and those of Italy with 15-in. and 12.6-in.

Secondary guns in the Royal Navy comprise the 8-in., constituting the main armament of a few heavy cruisers built during 1923-30; the 6-in., which forms the

main armament of the majority of cruisers; the 5.25-in., main armament of the smallest class of cruisers and secondary armament of some battleships; the 4.7-in., main armament of the majority of destroyers; the 4.5-in., secondary armament of older battleships and main armament of some destroyers; the 4-in., main armament of certain destroyers and of sloops, frigates, minesweepers, etc.; the 3-in., mounted in corvettes and minesweepers; and numerous small A.A. pieces, of which the 40-mm. Bofors is the most popular. The 5.25-in. and 4.5-in. and some 4-in. are "combined purpose" guns, capable of firing at either high or low angles. All are semi-automatic in their operation. In the U.S. navy, following the Second Great War, the automatic principle was extended to even heavier guns, up to and including those of 8-in. calibre.

NAVAL GUNNERY is based upon knowledge of internal ballistics, by which is meant the behaviour of the gun and its projectile under the pressure of the gases generated, and of external ballistics, which are concerned with the flight of the projectile at various ranges and in varying conditions. An understanding of external ballistics, together with necessary allowances for movement of the firing ship and target, constitutes the first condition of accurate fire.

Large Ships Sunk by Gunfire

In the Second Great War, large ships sunk entirely or mainly by gunfire included H.M.S. Hood and Glorious, the German battleships Bismarck and Scharnhorst, the Japanese battleships Kirishima and Yamashiro, and the French battleship Bretagne. In the case of the two German ships, torpedoes finished them off, but they were already in a sinking condition as the result of the battering they had received from the guns of their British opponents. Other conditions being equal, the biggest gun is likely to prevail. Combined with speed, it may enable a ship to select her own distance for attacking, opening fire outside the range of her adversary.

The tendency to increase the firing range has been accomplished mainly by adding to the propelling energy within the gun, and elevating the angle of fire. Scientific naval gunnery therefore requires the utmost continuous accuracy, as the opposing ships are moving at high speed, and the range is constantly changing at a rate that is not constant. Fleets or

squadrons do not normally move on parallel courses, since to do so would assist the aim of the opponent. Difficulties arise also from the mist and the condition of the atmosphere, wind, temperature, and other factors. At long ranges the trajectory—that is, the curve of flight of the projectile—is necessarily very high, its fall very steep, and the danger zone correspondingly narrow.

When ships are moving swiftly, the position of the target relatively to the firing gun changes during the flight of the projectile, which may occupy a period of several seconds, varying according to the range. Therefore the gun must be aimed, not at the ship in the position she occupies at the instant of firing, but at the position she will occupy when the projectile arrives. Some guide to this position is provided by the knowledge of the course she has previously pursued, whether direct or pursuing a curve under helm. To deal with the problem thus presented, observing and reckoning instruments of the finest and most ingenious character have been developed, such as the devices with which the names of Dreyer and Dumaesque are associated. First it is necessary to ascertain the range, bearing, and speed of the enemy, next to integrate these factors with the speed and changing curves of the firing ship, and then to transmit the result instantaneously to the guns.

Naval Gunnery Schools

Thus the system of training at the British naval gunnery school at Whale Island, Portsmouth, and instructional establishments at other ports, is of a highly scientific character. It is no longer sufficient, as in the early 20th century, merely to concentrate on teaching gunlayers individual accuracy in keeping their sights on the target. Instead of acting merely as a pointer, the director exercises remote control over the gun and its mounting.

The use of radar during 1939–45 ousted the earlier large range-finders with their maximum diameter at the base of 40 ft. Not only did radar make the gun increasingly accurate, it enabled it to get on to the target more quickly, so that it was no uncommon thing for the first shot to score a hit. It eliminated the use of searchlights in this connexion. By giving earlier warning of the proximity of an enemy, radar also makes possible a higher degree of preparedness of the armament.

H.M.S. Duke of York's successful engagement of the Scharnhorst in the dark of an Arctic night is an excellent example of the skilful use of radar in gunnery.

Gunter, ARCHIBALD CLAVERING (1847–1907). Anglo-American novelist. Born at Liverpool Oct. 25, 1847, he went with his parents to California. Having been a civil engineer and a stockbroker, he went to New York in 1879. He wrote 29 novels. The first, *Mr. Barnes of New York*, 1887, was printed at his own expense, and circulated by a news company; over a million copies were sold before the author's death, and he successfully dramatised it and its successor, *Mr. Potter of Texas*, 1888. Gunter's success was due to his insistence on plot, movement, and incident, avoidance of the past tense, and creation of the illusion that the author himself did not know what was coming. In 1905 he edited *Gunter's Magazine*. He died Feb. 23, 1907.

Gunter, EDMUND (1581–1626). English mathematician. Educated at Westminster School and Christ Church, Oxford, he was ordained, and in 1615 was appointed vicar of S. George's, Southwark. His interests, however, were scientific, and in 1619 he was made professor of astronomy at Gresham College, London. He died Dec. 10, 1626. Gunter was the first to observe the variation of the compass. Several inventions still bear his name.

Gunter's Chain. Chain used in surveying. Its introduction was due to Edmund Gunter. It is 22 yds. long, divided into 100 links, and it allows of easy calculations of measurements, since an acre contains 10 sq. chains, or 100,000 sq. links. *See* Surveying.

Gunther, JOHN (b. 1901). An American journalist. Born at Chicago, Aug. 30, 1901, he was educated at its university, and was with the *Chicago Daily News* from 1922, being assistant London correspondent 1924–26. In Europe, the Balkans, and the Near East, he gained intimate knowledge of social and political life, and after his resignation from the paper in 1936 he travelled in the Far East and every S. American republic. He was attached to Gen. Eisenhower's H.Q. in 1943, and was radio commentator in New York on international affairs, 1942–45. Gunther made an outstanding reputation with *Inside Europe*, 1936. Later books were *Inside Asia*, 1939; *Inside Latin America*, 1941; *Inside U.S.A.*, 1947.

Guntur. Town and district of Madras, India. The town stands on the Grand Trunk road, 47 m. W. of Masulipatam. The French obtained it from Muzaffar Jang in 1753, and in 1778 it became British. The district was formed in 1904 from territory taken from Nellore and Kistna districts. Most of the district is a fertile plain; irrigation is by canals from the Kistna river, which forms boundaries N. and E. The Gundlakamma marks most of the W. boundary. There is trade in cotton and cereals, and the cultivation of Virginian tobacco, introduced in 1923, has made prosperous what was earlier a distressed population. The dist. has an area of 5,795 sq. m. and a pop. of 2,277,283. Pop. of town, 83,599.

Gupta. Name given to an empire that flourished in India c. A.D. 300–500. It was founded by Chandragupta and enlarged by his successor Samudragupta. The real Gupta empire was in N. India, where was its capital Pataliputra, but Samudragupta conquered almost the whole of the peninsula. After 450 it was attacked by the Huns, and when Skandagupta died about 480, it came to an end, although princes of the family ruled, under the overlordship of others, for some 350 years longer over a smaller area, known as Magadha. The Gupta era, long used in Indian chronology, dated from Feb. 26, 320. In the later 19th century the discovery of Gupta inscriptions added to our knowledge of this empire. *See* India: History.

Gurdāspur. Former district, subdivision, and town in the Lahore division of the Punjab. It was divided in 1947 between the dominions of Pakistan and India, the subdivision and town of Gurdāspur going to the E. Punjab prov. of India. Of the other subdivisions of Gurdāspur district, one went to W. Punjab, Pakistan, and three to India. *See* Punjab.

Gurgaon. District, subdivision, and town of the Ambala division of E. Punjab, India. The district lies between the Delhi district and Rajputana, and is bounded on the E. by the river Jumna. Close to the river the plain is irrigated by the Agra-Delhi Canal; here the Jats are good cultivators. Elsewhere the soil is sandy and the low hills are bare. Owing to the unreliable rainfall crops fail frequently. It is crossed by two main rlys. Rewari is the most important town. The Gurgaon experiment was a scheme of village welfare work carried out in the district.

Gurgaon town stands on the Rajputana state rly., 20 m. S.W. of Delhi, in a fertile plantation, and is the administrative headquarters. District: 2,234 sq. m., pop. 851,458. Subdivision: 411 sq. m., pop. 150,000. Town: pop. 9,935.

Guriev. Seaport of Kazakh S.S.R. It stands on the Caspian shore of Uralsk province, at the mouth of the Ural river, some 200 m. E.N.E. of Astrakhan. The port, which is frozen from Nov. to mid-March, is available only to ships of fairly shallow draught, and the river is navigable only during the spring floods. An oil pipe-line, the second longest in the U.S.S.R., runs from Guriev to Orsk, 525 m. N.E. Road and canal connect Guriev with Uralsk. Pop. 11,000.

Gurjun Balsam or WOOD OIL. Oleo-resin prepared from several species of Dipterocarpus, chiefly *D. turbinatus*, in India, Burma, and the Malacca States. The distilled oil is used in place of balsam of copaiba in cases of leprosy. It is also used as a protection against the attacks of white ants, and as a varnish.

Gurkha. Name usually applied to those tribes in Nepal from which the Gurkha regiments of the army of British India were recruited. Recruits were chiefly from five tribes, Mangar, Gurung, Thapa, Rana, and Kha, though Limbus and Rais also enlisted. They are of mixed Mongol origin; and the two principal religions are Buddhism and Hinduism, though

the former is scarcely recognizable from the latter.

A loose observance of caste rules and customary good humour permitted Gurkhas to mix freely with British troops, especially Highland regiments. Their characteristic weapon is a heavy, curved knife (kukri). Faithful, fearless, self-reliant, and possessing an inborn love of soldiering, they make first-class troops and rendered invaluable services to the British Commonwealth during both Great Wars, during which, besides the regular units of the Indian army, the Nepalese government placed contingents of their own army at the disposal of the Indian government. Between 1939 and 1945 the ten Gurkha regiments won 12 V.Cs. They saw fighting in N. Africa, Italy, Burma, and on the N.W. Frontier, and with the Chindits and parachute regts. in Burma.

With the granting of dominion status to India and Pakistan, Aug., 1947, an agreement was reached between the governments of the U.K., Nepal, and India by which eight Gurkha battalions were allotted for service under the British government, the other battalions (at that time 12 regular and seven temporary in number) for service with the army of the dominion of India, subject to satisfactory arrangements on terms and conditions of service. One difficulty arose from the fact that the Gurkhas while in British service had always been commanded by British officers. *Pron.* Goorka.

Gurnard. 1. Grey gurnard, *Trigla gurnardus*. 2. Red, *T. cuculus*. 3. Sapphire, *T. hirundo*.

Gurnard (*Trigla*). Fish of a genus which includes about 40 species. Gurnards are distinguished by their large, ugly heads, which are covered with angular plates. The three front rays of each pectoral fin are modified into feelers, somewhat resembling fingers, which are used not only in finding prey but in creeping on the sea bottom. Most gurnards make good table fish.

Seven species are found around the British coasts, the red gurnard (*T. cuculus*) being most frequently seen in the markets. It is bright red in colour, tinged in parts with silvery white, and the pink colour of its flesh is attributed to its feeding upon crustaceans. The grey gurnard (*T. gurnardus*) is also common, and is larger in size, being less esteemed for the table. The sapphire gurnard (*T. hirundo*) is often 2 ft. in length, and is brown with beautiful blue pectoral fins. The piper (*T. lyra*) is a large red species with prominent snout and formidable spines. The gurnard generally makes a grunting noise when first captured, whence the name (Fr. *grogner*, to grunt).

Gurney. Name of an English family, known for its association with banking and Quakerism. Hugh le Gourney obtained land in Norfolk soon after the Norman Conquest, and there his descendants lived for centuries. In the 17th century some joined the Society of Friends. John and Henry Gurney, in 1770, set up a bank in Norwich; this became the firm of Gurney & Co., of which, towards the end of the century, another

Gurkha. Troops of a Gurkha regiment advancing through the Malayan jungle, one of the areas in which these magnificent fighters from Nepal distinguished themselves in the Second Great War

John became the head. He was the father of Elizabeth Fry and Samuel, Joseph and Daniel Gurney.

Joseph (v.i.) and Daniel entered the Norwich business, but Samuel (1786-1856), also a philanthropist interested in humanitarian movements, went to London and served in the business of his brother-in-law, Joseph Fry. In 1807 he became a partner in the firm of Richardson, Overend & Co., which under him became known as Overend, Gurney & Co. His sons carried on his business until 1865, when it was made into a joint stock company. On Black Friday, May 11, 1866, it failed with liabilities of over £11,000,000. The Norwich bank continued to flourish until absorbed by Barclays 1896. Earlam Hall, near Norwich, was long the family residence.

Gurney. Name of a family of shorthand writers. Thomas Gurney (1705-1770) was born at Woburn, March 7, 1705, his father being a miller. He himself became a clockmaker and then a schoolmaster. About 1740 he was made official shorthand writer at the Old Bailey, the first appointment of its kind. He was shorthand writer in other courts of justice and in the house of commons. He died June 22, 1770. His system was published as *Brachygraphy*.

His son Joseph (1744-1815) succeeded to the positions. He published reports of state trials and further editions of *Brachygraphy*. The business of shorthand writer was carried on by Joseph's son, William (1777-1855), and then by the latter's son, Joseph (1804-79). William, in 1813, was recognized as official shorthand writer to the two houses of parliament, and Joseph held the post from his father's resignation in 1849 until his own in 1872, when the office passed to a nephew, W. H. Gurney Salter. Joseph died Aug. 12, 1879. Salter issued a text book of the Gurney system of shorthand, 1884.

Gurney, Sir Goldsworthy (1793-1875). An English inventor. Born at Padstow, Feb. 14, 1793, he became a surgeon, but gave up practice in 1820 to devote himself to scientific experiments. In 1823 he published a series of lectures on chemistry, to which Faraday acknowledged his indebtedness. Gurney's first invention was the oxy-hydrogen blowpipe; soon afterwards he patented the Drummond light (limelight obtained by the fusion of magnesia and lime). His high-pressure steam jet was adapted to Stephenson's locomotive, increasing its speed to

30 m.p.h. When the jet was applied to blast furnaces it greatly expedited the making of iron. Gurney introduced steam stage-coaches between Bath and London, which proved efficient and profitable until their suppression as a result of heavy tolls. The system of lighting and ventilation in the houses of parliament was designed by Gurney. He died Feb. 28, 1875.

Gurney, Joseph John (1788-1847). A British philanthropist.

Born Aug. 2, 1788, a son of John Gurney of Earlam Hall, Norfolk, he studied at Oxford, though not in the university. He became a partner in the bank of Gurney & Co., but his real work was

Joseph John Gurney, British philanthropist

done as a minister of the Society of Friends, and as an advocate, with his sister, Elizabeth Fry, of the abolition of slavery and of prison reform. To promote these causes he travelled in America and elsewhere. He died Jan. 4, 1847.

Gusev, Feodor Tarasovitch (b. 1905). Russian diplomatist. He was born in what is now Leningrad region, April 29, 1905, and educated at Leningrad university, graduating in law in 1931. He worked in the people's commissariat for foreign affairs, 1937-1942, being chief of the second European dept., 1939-42. Gusev was Soviet minister to Canada, 1942-43, and then ambassador to Great Britain, 1943-46. He was one of the members of the Soviet delegation to the Paris peace conference in 1946, and became deputy minister of foreign affairs.

Gusher (Icelandic *geyser*, to gush). Literally, anything that rushes out violently, like water from a geyser. The term is applied to an oil well flowing out of control and spouting a column of oil high into the air. Drilling methods and well-head fittings have made this a rare event.

Gusset. Triangular piece of material let into a garment or other object. The word comes from Old French *gousset*, a flexible piece of armour which filled a gap between two other pieces in a coat of mail. A gusset plate is a usually triangular piece of steel plate used to connect the joints in a steel or iron structure, and is often used in pairs, one at each face of the

members to be bolted or riveted together, e.g. for riveting together a bridge girder boom and its web

Gusset. Examples of gussets, (A): 1, a lattice girder; 2, Lancashire steam boiler

bracing members. It is also a plate connecting two parts of a structure with the object of providing additional rigidity, e.g. connecting the trough flooring of a bridge to the main girders. See Bridge.

Gustav Line. German defence system of the Second Great War, in central Italy. It ran just N. of the river Garigliano and its tributary, the Rapido, from the Gulf of Gaeta to Monte Cassino, and guarded the one practicable route from Naples to Rome along which the Allies must pass. A strong line naturally, it had been heavily fortified, and was powerfully defended by picked troops. Units of the U.S. 5th army reached the town of Cassino on Feb. 2, 1944; but not until a combined attack was made by the British 8th and the U.S. 5th armies, May 12-18, was Monte Cassino taken and the line breached and overrun. See Cassino.

Gustavus I, called Vasa (1496-1560). King of Sweden 1523-60 and founder of the Vasa dynasty. His real name was Gustav Eriksson, his familiar surname, which he himself never employed, being derived from the fascine resembling a vase in his family arms. Born at Lindholmen, Upland, May 12, 1496, son of a Swedish noble, he was educated at Uppsala, and joined the army. In 1518 he carried the Swedish standard at the battle of Brännkyrka, when his cousin, Sten Sture, defeated the Danes. He was carried off by the Danes and imprisoned, but escaped.

After the Blood Bath of Stockholm, 1520, in which his father was one of the victims, Gustavus succeeded in rousing the people to revolt, and drove out the Danes. In 1523 he was proclaimed king by the Swedish diet, captured Stockholm, and was crowned, thus bringing to an end the somewhat turbulent union of Scandinavia. In 1524 he effected a treaty of peace with Denmark. An encourager of Lutheranism, in 1527 he definitely

broke with Rome and established the reformed religion in his dominions. He encouraged trade and commerce and the establishing of schools and laid the foundations of a navy. In 1544 the crown was made hereditary in his family. He died Sept. 29, 1560, and was buried in Uppsala cathedral.

Gustavus II OR **GUSTAVUS ADOLPHUS** (1594–1632). King of Sweden. Born at Stockholm, Dec. 9, 1594, he was the son of Charles IX and the grandson of Gustavus Vasa. He is said to have been familiar with five languages when only a boy, while he was also trained in the art of government. His father made him his assistant, and as duke of Vestmanland he had some authority of his own.

Gustavus Adolphus
After Van Dyck

Gustavus succeeded his father in 1611 on the throne, which he had to hold against the claims of Sigismund of Poland, who was of a rival older branch of the family. He soon reorganized the government and waged successful wars with Denmark and Russia for the recovery of Swedish provinces on the Baltic. Then turning against Poland, he seized Riga in 1621, won a resounding victory at Walhof in 1626, and made a statesmanlike peace in 1629. His disciplined troops had become the best instrument of war in Europe, and he himself the greatest living master of the art of war.

Meanwhile in the Thirty Years' War the Catholic and Imperial party had established their ascendancy. Gustavus intervened partly as the champion of the Protestant cause, but also as an empire-builder who saw the security of his dominions threatened. He landed in Pomerania in 1630, and having frightened or persuaded Brandenburg and Saxony into cooperation, opened those brilliant campaigns which swept back the Catholic tide and established his position among the greatest captains of history. His victory over Tilly at Breitenfeld, Sept. 7 (O.S.), 1631, and his triumphal march through W. and S. Germany amazed all Europe. But Wallenstein placed himself between the Swedish king and his base in Saxony, and after a period of strategic marches and with-

drawals battle was joined. Gustavus fell by an unknown hand in the hour of victory at Lützen, Nov. 6 (O.S.), 1632.

Gustavus married Marie Eleonora, a member of the Hohenzollern family, and had one daughter, his successor, Christina. The greatest soldier and king his country has produced, his character shows attractive traits usually lacking in the protagonists of the times. He was not without compassion, was loyal to his allies, and did not overdrive his own people, though he taxed them excessively. Among a mass of literature may be mentioned *Lives*, by J. L. Stevens, 1885; C. R. L. Fletcher, new ed. 1923. See *Thirty Years' War*.

Gustavus III (1746–92). King of Sweden 1771–92. Born at Stockholm, Jan. 24, 1746, he was the first ruler of the native-born Holstein-Gottorp line. He was in Paris when the death of his father, Adolphus Frederick, recalled him to Sweden. In 1772 he effected a *coup d'état* against the nobles.

Gustavus was so devoted to all things French that he sought to copy the luxury of Versailles, and increased taxation to such an extent as to alienate his people. But he strengthened the administration and the navy, set up a measure of free trade, and encouraged a national costume and drama. In 1788 he was responsible for an ineffective and unpopular war with Russia. A conspiracy of nobles was formed, and Gustavus was shot in Stockholm, and died thirteen days later, March 29, 1792.

Gustavus IV (1778–1837). King of Sweden 1792–1809. He was born at Stockholm, Nov. 1, 1778, the son of Gustavus III. For the first five years of his reign the kingdom was under the regency of his uncle. Obstinate and unbalanced, Gustavus allied himself with England, lost Finland to the Russians, and Stralsund and Rügen to the French. In 1809 his army and nobles combined to dethrone him. He died Feb. 7, 1837, at St. Gall, Switzerland.

Gustavus V (b. 1858). King of Sweden. Born at Drottningholm, June 16, 1858, he studied at Uppsala university and in 1875

entered the army. His marriage in 1881 with Victoria (1862–1930), daughter of the grand duke of Baden, united the new Bernadotte (*q.v.*) dynasty with the ancient line of Vasa. He succeeded his father, Oscar II, Dec. 8, 1907. During the First Great War his sympathies

Gustavus V,
King of Sweden

were pro-German, but he was unable to persuade his ministers to adopt a militant policy. In the Second Great War he adopted an attitude of strict neutrality. Under the pseudonym of Mr. G., the king was long a popular figure on lawn tennis courts of the Riviera.

Güstrow. Town of East Germany in Mecklenburg. It stands on the Nebel, 23 m. by rly. S. of Rostock. It has a 13th century cathedral (restored 1868); a 16th century town hall; a Renaissance castle; and a fine late Gothic parish church with paintings and carvings. It is an industrial centre, holding an annual wool fair. Güstrow was founded 1226; a princely residence from 1316; the headquarters of Wallenstein in 1628–29. Pop. 19,620.

Gut. Animal intestines which when removed and prepared are used for various commercial purposes. The entrails from freshly-killed sheep or other animals are removed, thoroughly washed, trimmed, and scraped free of the softer surface layers, and are then sold for sausage coverings, being preserved in salt until required. The process of gut-spinning is used where the gut is to be made into strings for musical instruments or cords for rackets, etc., various lengths of scraped gut being sewn together, and twisted on a spinning wheel. The spun gut is then dried in the open air. Silkworm gut as used for fishing tackle is made from silkworms. Surgical catgut is made from the submucous cellular coat of the intestines of sheep.

Gutenberg OR **GENSFLEISCH, JOHANN** (c. 1400—c. 1468). German inventor of printing from movable types. Born at Mainz, he lived during 1420–26 at Strasbourg, where he perfected his invention. He returned c. 1444 to Mainz, where he was assisted financially by a partnership with J. Fust, a goldsmith, who foreclosed on a mortgage; and technically by

Gustavus IV,
King of Sweden

Fust's son-in-law, Peter Schoffer, an engraver, who is credited with the invention of punches and matrices. Gutenberg died at Mainz, probably in 1468.

An astronomical calendar, a fragment of which was discovered in 1901, a Latin Bible, and a Latin dictionary, approximately dated 1447, 1458, and 1460 respectively, and two or three other works, are attributed to Gutenberg alone, but no book bears his name. A Gutenberg museum was founded in 1901 at Mainz, where a statue was

The true figure of John Gutenberg delineated from the original painting at Mentz in Germany.

Johann Gutenberg, the German inventor of movable type printing
From an old engraving

erected in 1837, and where festivals were held in 1837, 1840, and 1900. See Coster, L. J.; Typography.

Gütersloh. Town of Germany. It is in Westphalia, 11 m. S.W. of Bielefeld. It has textile, iron, wood, brewing, and other industries, and an extensive trade in Westphalian ham and sausage. The regional rye-bread, *pumpernickel*, is famous for its nutritive value. Pop. 25,879.

Guthrie. City of Oklahoma, U.S.A., the co. seat of Logan co. It stands on the Cottonwood and Cimarron rivers, 30 m. N. of Oklahoma City, and is served by rlys. Notable buildings include the federal building, the city hall, a county courthouse, a Carnegie library, and the marble masonic cathedral. There are cotton and flour mills, foundries, machine and rly. shops, and steel and concrete manufactures. Mineral springs attract many visitors. Founded in 1889, the year Oklahoma was thrown open to white settlement, Guthrie was the capital of the territory from

1890 until 1907, but it was superseded by Oklahoma City as state capital in 1911. Pop. 10,018.

Guthrie, Sir James (1859-1930). Scottish painter. Born at Greenock, June 10, 1859, he was educated at the university of Glasgow and studied art in London and Paris. He became prominently identified with the Glasgow school (*q.v.*), though his work is 'cos-

Sir James Guthrie,
Scottish painter
Russell

metropolitan and, in its later aspect, akin in style to that of Sargent.

Elected A.R.S.A. in 1888, and R.S.A. four years afterwards, he was chosen president of the Scottish Academy in 1902. He was knighted 1903. Died Sept. 6, 1930.

Guthrie, Thomas (1803-73). Scottish divine. Born at Brechin, July 12, 1803, he was educated at Edinburgh and Paris.

After managing his father's bank, 1827-29, he became minister of Arbirlot, 1830; Old Greyfriars, 1837; S.

John's, Edinburgh, 1840-43; and, after the disruption, of Free S. John's, 1843-64. A powerful preacher, he took a leading part in the promotion of a national system of education, of ragged schools, temperance, and social work among the poor. In 1845-46 he raised £116,000 for the Free Church.

He was moderator of the Free Church general assembly, 1862; and first editor of *The Sunday Magazine*, 1864-73. He died at St. Leonards, Feb. 24, 1873. A voluminous writer, whose works had a wide circulation in the U.S.A., he wrote *Pleas for Ragged Schools*, 1847-62; *A Plea for Drunkards*, 1850; *The City, its Sins and Sorrows*, 1857. His son, Charles John, Lord Guthrie (1849-1920), was a judge of the court of session.

Guthrie, Thomas Anstey. English novelist and playwright who wrote as F. Anstey (*q.v.*).

Guthrum (d. 890). Danish king of E. Anglia. He gained a victory over Ethelred and his brother Alfred at Reading in 871, and after Ethelred's death marched

with two other kings to Cambridge in 875, occupied Wareham in 876, and in 877 was bought off by a treaty. In 878 he was defeated by Alfred at Ethandune (Edington), Wilts, and surrendered in his camp at Chippenham. By the peace of Wedmore he agreed to become a Christian, to give hostages, and to leave Wessex to Alfred. He was baptized under the name of Athelstan, Alfred standing godfather. In 885 he failed to renew his hostages and permitted an attack on Wessex, but was defeated and concluded the treaty known as Alfred and Guthrum's peace. See Wedmore, Treaty of.

Gutierrez, Juan Maria (1809-78). Argentine poet and writer. Born at Buenos Aires, he was for some time an exile in Chile, but after the downfall of the dictator Rosas he returned and became rector of the university in his native place, where he died Feb. 26, 1878. An ardent patriot, his hatred of Spanish rule is exemplified in his ode *To the May Revolution*, 1841, and in *This Year and That*. He is at his best in his shorter poems, which are distinguished by correct and elegant style. He was the author of a South American anthology, *America Poetica*.

Gutta-percha (Malay *getah*, gum; *percha*, name of tree). Substance resembling rubber prepared from the juice (latex) of various plants. It is collected from the tree *Palaquium gutta*, and a number of other *Palaquium* species yield similar but inferior products. The tree is a large one growing up to 60 ft. high and 4-5 ft. in diameter. The latex occurs in isolated sacs in the bark and in the leaves. The yield obtained by tapping the bark is

Gutta-percha. Leaves and flowers of *Palaquium gutta*

small, and native gatherers therefore fell the tree and cut rings round the bark. To avoid wholesale destruction of the trees, in Java the leaves are collected at time of maximum latex content, cut up, ground with water, and allowed to ferment. The gutta separates and floats to the surface. It is washed and moulded into blocks containing 80 to 90 p.c. pure gutta. Extraction with petrol removes resins and yields a product containing only 1 p.c. resin. This purified product is used for the outer covering of golf balls. Gutta-percha is a good electrical insulator and is suitable for use in submarine cables.

The essential ingredient of gutta-percha, balata, and rubber is a hydrocarbon, caoutchouc, the properties differing through differences in the arrangement of the atoms in the molecule in the respective products. At ordinary temperatures gutta and balata are harder and less elastic than rubber, but they soften on heating and can be moulded in boiling water. On the other hand, though, like rubber, they can be vulcanised, the product is not so good. See Balata; Rubber.

Gutter (Lat. *gutta*, a drop). A trough or channel for carrying away water or other liquid. The term is used for similarly shaped formations with other uses, e.g. the narrow rectangular blank space separating adjacent pages of type in a printer's forme. Gutters at the sides of roads are termed channelling, and are stone or concrete, with gullies at intervals to collect the run-off from the road surface and convey it to the sewer.

Roof gutters deal with rain-water which falls on a building; eaves gutters, made of zinc or steel or asbestos-cement, catch the water from the roof and take it to down pipes which terminate over a gully or drain, whence the water runs by gravity to a surface-water sewer. Box gutters or valley gutters, formed behind a parapet wall or at the meeting of two intersecting pitched roofs, are constructed of lead sheet laid over a suitably shaped wooden base. A fall must be provided in gutters of all types, so that the water flows down towards the discharge point by gravity. In eaves gutters this is arranged by fixing the guttering at an angle from the horizontal; in box and valley gutters the floor of the gutter itself is constructed with a suitable fall. See Drainage; Road; Roof; Sewer.

Guttiferae. Family of trees and shrubs, natives of humid regions in S. America, India, and Africa. They have undivided, leathery, opposite leaves, and white, yellow, or pink flowers, often imperfect. They exude a yellow gum-resin, that obtained from *Garcinia morella* and other species forming the gamboge of commerce. Mangosteen is the fruit of *Garcinia mangostana*; and the mamee-apple that of *Mammea americana*.

Gutzkow, KARL FERDINAND (1811–78). German dramatist and novelist. Born in Berlin, March 17, 1811, after studying at several universities, in 1835 he published *Wally, die Zweiflerin* (*Wally, the Septic*), an attack on marriage and divine revelation, for which he was sentenced to three months' imprisonment. He became one of the "Young Germany" writers, publication of whose future work was forbidden by a special edict of the federal diet. In 1847, however, he was appointed dramatic adviser to the Dresden court theatre. He had already won distinction on the stage with his *Richard Savage*, 1839; *Zopf und Schwert* (*The Queue and the Sword*), 1844; and other plays. He died at Frankfurt-on-Main, Dec. 16, 1878.

Guy. Rope or chain used to support or steady a part of a structure, or to hold it against movement. Tents are kept firm after erection by guys which support the tent poles and are secured at the lower ends to stakes or pegs driven into the ground. Masts or flagstaffs are similarly fastened down. Guys may hold temporarily a part of a structure which is being erected or lifted into place. The jib of a crane is steadied and supported by a guy often consisting of a chain or a wire rope. The function of a stay (*q.v.*) is similar, but this term is used for a permanent rope, or for a wood or metal member having the same function.

Guy, THOMAS (c. 1645–1724). English bookseller, printer, and founder of Guy's Hospital (*q.v.*), London. Born in Southwark, and educated at Tamworth, he was apprenticed to a London bookseller, 1660–68. Becoming a freeman of the Stationers' Company, he set up in business at the corner of Lombard Street and Cornhill, and made a feature of cheap Bibles, imported from Holland; he became a printer to Oxford university, 1679–92. He was M.P. for Tamworth, 1695–1707. He lived sparsely, acquiring a large fortune, partly in South Sea stock,

and is best remembered by his benefactions.

He founded almshouses and built the town hall at Tamworth:

Thomas Guy, founder of Guy's Hospital

became a governor of S. Thomas's Hospital, for which he built and furnished three wards; spent £18,793 in founding in Southwark the hospital known by his name, and left £200,000 for its endowment. He also gave £400 a year to Christ's Hospital. Many of his benefactions were made known only after his death, Dec. 27, 1724.

Guy de Lusignan (d. 1195). French crusader and king of Jerusalem and Cyprus. Younger son of Hugh the Brown of Lusignan, of a great French feudal family, he married in 1180 Sybilla, daughter of the king of Jerusalem and received the title of count of Jaffa and Ascalon. On the death of Baldwin V, Guy became king of Jerusalem, 1186. He was captured at Tiberias by Saladin, 1187, but set free on condition that he ceased to fight against Islam, which promise he soon afterwards broke.

His title to the throne was challenged by Henry of Champagne who was called to the throne by election in 1192, whereupon Guy purchased Cyprus from the Knights Templars, and established a new principality on the island. His brother, Amauric, succeeded him in 1195, became king of Jerusalem, 1197, and founded the Lusignan kings of Cyprus.

Guy Mannering; OR, THE ASTROLOGER. Second novel by Scott. Written in six weeks, founded on old Galloway and Ayrshire traditions, and published in Feb., 1815, it formed a notable departure from its predecessor, *Waverley*. Its descriptions of coast scenery are a prominent feature; the chief characters include the partly autobiographical Colonel Mannering; Dominie Sampson, whose exclamation "Prodigious!" has become proverbial; Dandie Dinmont, the Liddesdale farmer; Meg Merrilies; Gilbert Glossin, the wily attorney, and his smuggler accomplice Dirk Hatteraick. The work was dramatised by D. Terry with Scott's aid.

Guy of Warwick. Mythical hero of an Anglo-Norman metrical romance. Sir Guy, son of a steward of the earl of Warwick, to gain the hand of the earl's daughter Felice or Phillis goes

through knightly adventures at home and abroad, is then married, but, in remorse for the blood he has shed, becomes a pilgrim to the Holy Land. He returns, and, after killing the Danish giant, Colbran, in a duel to decide the issue between Athelstan and the Danes, retires unknown to a hermitage at Guy's Cliffe (*q.v.*), near Warwick, but reveals himself to his wife Felice by sending her a ring when he is on the point of death. The poem, of great length, and supposed to have been written about the 13th century, in couplets and romance stanzas, was once enormously popular. A MS. copy is at Caius College, Cambridge; there are fragments in the Auchinleck MSS. at Edinburgh, and the text was edited by J. Zupitza, 1883-87.

Guyon, MADAME (1648-1717). French mystical writer whose maiden name was Jeanne Marie Bouvier de la Motte. She was born at Montargis, April 13, 1648, and came under the influence of Father Lacombe, a quietist teacher. After her husband's death she began in 1676 to advocate quietism in Savoy and later at Paris. In 1688 and 1695 she suffered imprisonment for teaching the heresies of Molinos, though she had the support of Fénelon. She taught that the essence of religion consisted in the contemplation of God, and that good deeds were of less moment. She died at Blois, June 9, 1717. Her writings were edited by D. Macfayden, 1902-04. *See* Mysticism.

Guyon, RICHARD DEBAUFFRE (1803-56). British soldier. Born at Walcot, near Bath, March 31,

Richard Guyon,
British soldier

1803, he entered the Austrian army, and reached the rank of captain. He retired in 1839, and settled in Pest, but when the Hungarian rising broke out in 1848 he commanded the Landsturm. After the victory of Schwechat in Oct., he was put in command of a division. He succeeded in raising the siege of Komorn in April, 1849, but when the Hungarians collapsed Guyon escaped with Kossuth to Turkey. Joining the Turkish army in 1852, he fought against the Russians in Anatolia during the Crimean War, but died suddenly at Scutari, Oct. 12, 1856.

Guy's Cliffe. English estate, on the bank of the Avon, 1½ m. N. of Warwick. In the grounds are

the cave said to have been hewn for himself by Guy of Warwick (*v.s.*) and the chapel of S. Mary Magdalen, founded to his memory by Richard, earl of Warwick (d. 1439), and containing a mutilated statue of the hero.

There were hermit residents at Guy's Cliffe during the reigns of Edward III and Henry IV. and another occupant of the hermitage was John Rous the antiquary (d. 1491), who was its chantry priest. The house dates mainly from the 18th century. Mrs. Siddons lived here in 1773 as a companion. A recent owner was Lord Algernon Percy (1851-1933).

Guy's Hospital. Site of 12 acres nr. London Bridge, with hospital founded by Thos. Guy (*q.v.*) 1721.

Guy's Hospital
arms

Normally it has 738 beds, including private accommodation for 70 patients in Nuffield House (1935) and 43 beds for private psychiatric patients in York Clinic (1939). The surgical block is the original Guy's House (1729), seriously damaged by bombs in 1941; other buildings are the medical block (Hunt's House, 1825, extended 1871); physiotherapy department (Shepherd's House, 1922); Bernhard Baron dispensary (1939); Henriette Raphael nurses' home (1899), extended by Nuffield block (1939); medical school with Wills library (1902) and Gordon museum (1905). The dental school (1889) is the largest in the country. Distinguished teachers at the hospital have been Astley Cooper, Richard Bright, Thomas Addison, and William Gull. Hodgkin was a lecturer, and Keats a student.

Guzman Blanco, ANTONIO (1828-99). Venezuelan statesman. Born at Caracas, Feb. 29, 1828, he became a lawyer and then a soldier, fighting in the civil disturbances of the time. During 1863-68 he was vice-president of Venezuela, and in 1870, as the result of a revolution, became dictator of the country. He was deposed in 1889, whilst he was in Europe serving as envoy to the Powers, one reason for his fall being his corrupt methods of making money. On the other hand he did something for education and trade. He died in Paris, July 29, 1899.

Gwalior. Formerly the largest state in central India, now the principal part of Madhya Bharat. It was recognized as an independent state by the British government in 1782. It has an area

Gwalior City. The palace, begun in the early 16th century, a magnificent example of Hindu architecture

of 26,008 sq. m., and about 25 per cent of the land under state control is devoted to millet, gram, and wheat. Recently an intensive irrigation scheme brought over 500 sq. m. into cultivation. There are extensive forests, and deposits of mica, iron, limestone, and sandstone. The chief industry is the manufacture of cotton goods, and the main exports are agricultural products.

The prevailing religion is Hindu. The people are a martial type, and the army was always among the best of the Indian state forces. It played a prominent part in the Burma Campaign (*q.v.*) of 1941-45, and Gwalior was the area in which Wingate's Chindits (*q.v.*) underwent their jungle training. In 1945 the foundation stone of a medical college was laid at Gwalior in celebration of the birth of a son to the ruler, who was a maharaja. Pop. 4,006,519.

Gwalior. Chief city of Gwalior, central India. The town occupies the site of the old city of Gwalior, and 2 m. to the S. is the capital of the state, Lashkar. It contains Jain and early Hindu antiquities and the palace of Man Singh. The fort of Gwalior stands on an isolated hill above the town. Pop. 80,500.

Gwelo. Town of Southern Rhodesia. It is 198 m. S.W. of Salisbury and 113 m. N.E. of Bulawayo, with which towns it is connected by rly. It is a goldmining district. European pop. 2,047.

Gwent. The Welsh name for Monmouthshire (*q.v.*).

Gwinner, ARTHUR VON (1856-1931). German banker. Born at Frankfurt-on-Main, April 6, 1856, he was the son of the biographer of Schopenhauer. He was for a time consul at Madrid. In 1888 he founded in Berlin a banking

company bearing his own name; in 1894 he joined the board of the Deutsche Bank, and from 1901 to 1929 was its virtual head. His interests included the Bagdad rly., Bavarian nitrogen, and the international petroleum trade. A member of the upper house 1909-18, he died Dec. 29, 1931.

Gwyniad. Small fish belonging to the genus *Coregonus*. Found in Lake Bala, Wales, it belongs to the salmonoid group, and much resembles a small herring. It is probably only a local race of the powan, common in the Lake District and in Loch Lomond.

Gwynn, GWYN, OR GWIN, NELL OR ELEANOR (1650-87). English actress, mistress of Charles II.

Nell Gwynn, actress and favourite of Charles II
After Sir Peter Lely

Born Feb. 2, 1650, either in an alley in Drury Lane or at Hereford, she attracted notice as an orange-seller at the Theatre Royal, Drury Lane, where in

1665 she made her first stage appearance as Cydaria in Dryden's Indian Emperor. Until 1682, when she left the stage, she was specially successful in broad comedy and in daring prologues and epilogues, though Pepys thought her a failure as a serious actress.

Nell became the king's mistress about 1669, and retained his affection until his death, 1685, his dying words being "Let not poor Nelly starve." She died in London of apoplexy, and was buried in St. Martin-in-the-Fields. Of her two sons by Charles, the elder was created duke of St. Albans in 1684. Her sprightliness and frank good nature, want of snobbery and ambition, and her rivalry with the unpopular duchess of Portsmouth, made her a universal favourite. See Charles II; *consult also* Lives: C. Chesterton, 1912; L. Melville, 1923; A. I. Dasent, 1924; Pretty Witty Nell, C. Bax, 1932.

Gwynn, STEPHEN LUCIUS (b. 1864). Irish author. Born Feb. 13, 1864, he was educated at S. Columba's College, Rathfarnham, and Brasenose College, Oxford. In 1896 he became a journalist in London, but returned in 1904 to Ireland, where he was Nationalist M.P. for Galway, 1906-18, and from 1932 president of the Irish Literary Society. His many works comprise poems, biographies, es-

says, and Irish studies; e.g. *The Decay of Sensibility*, 1900; *Irish Books and Irish People*, 1919; *Collected Poems*, 1923; *Experiences of a Literary Man*, 1926; *Life and Friendships of Dean Swift*, 1933; *Life of Goldsmith*, 1935; *Fond Opinions*, 1938.

Gwynne, HOWELL ARTHUR (b. 1866). British journalist. Born at Kilvey, he went to Swansea grammar school. As *Reuter's* correspondent, 1893-1904, he travelled in Rumania, Ashanti, China, and followed the Boer War. Editor of the *Evening Standard*, 1904-11, he was then appointed editor of the *Morning Post*, a position he held with outstanding success until the merging of that paper with the *Daily Telegraph*, 1937. He was made C.H. in 1938.

Gwynne-Vaughan, DAME HELEN CHARLOTTE ISABELLA (born 1879). British botanist and administrator. Born Jan. 21, 1879, Helen Fraser was educated at Cheltenham Ladies' College and King's College, London, and married in 1911. She was head of the department of botany at Birkbeck College, 1909-17, and held the same post, as a professor, 1921-39 and 1941-44. She wrote on the structure and development of fungi. She acted as chief controller of Queen Mary's Army Auxiliary Corps, 1917-18, for which work she was created D.B.E. in 1919. During the Second Great War she was director of the A.T.S. until 1941.

Gyantse. Town of Tibet, 125 m. N.E. of the Chumbi Valley. It stands, at an alt. of 13,200 ft., at the foot of a long or fortress which, with a fortified lamasery, occupies two rocky eminences commanding a wide plain. Gyantse was held by the Younghusband Expedition, and opened to foreign trade by the Lhasa convention, 1904. It is connected with Lhasa, 144 m. N.E., by telegraph.

Gyaro, GYAROS, OR GHIURA. Island of the Aegean Sea. One of the Cyclades, it is a mountainous island, about 10 m. N.W. of the island of Syra. Triangular in shape, its length is 10 m., and greatest breadth about 3 m. In Roman imperial times it was a place of banishment for criminals.

Gybe. Nautical term for the swinging over of the mainsail boom or spanker when the wind is aft. With the wind dead aft and variable there is often a strong tendency of the mainsail to gybe, and if the operation is not carried out carefully the vessel may capsize or the mast or boom be broken.

Gyers' Kiln. Metallurgical furnace used for the calcining of iron ores. Designed by John Gyers, an engineer of Middlesbrough, it consists of an inner lining, about 18 ins. in thickness, of firebrick enclosed in an iron casing. The upper part is cylindrical, 20 ft. to 35 ft. in diameter, while the lower part is conical, tapering inwards to the bottom. In the centre, on the bottom, is a double cone which helps to spread the ore and fuel evenly in the kiln. Air is introduced through passages in the sides of the tapering part of the kiln and also through the spreader cone. See *Furnace*; *Iron*.

Gyges (7th century B.C.). King of Lydia. As a young man he became a favourite of the reigning Lydian Sadyattes Candaules, but having seized the bride of his master, and anticipating punishment, he assassinated him and seized the throne. Under Gyges Lydia became a powerful kingdom. He ultimately fell in battle against the barbarian Cimmerii (c. 650 B.C.).

Gylippus. Spartan general. During the Peloponnesian War he was sent to Sicily with 3,000 men to assist the Syracusans in 414 B.C. Assuming the chief command, he helped the Syracusans to destroy the Athenian besieging force. The Athenian ships were defeated in the harbour of Syracuse, while their land forces were compelled to surrender with their generals Nicias and Demosthenes. Gylippus later fell into disgrace for abstracting some of the treasure taken at the capture of Athens in 404.

Gymkhana (Pers. *gandkhana*, ball house). Name for a mixed sports and athletic meeting. It originated about 1860 in India, where horse and pony races were introduced as a means of recreation and amusement for British soldiers and officials. Further interest was given by including athletic events, such as tug-of-war, and military sports such as tent-pegging, as well as competitions of an amusing and less strenuous character. See *Athletics*.

Gymnastics (Greek, *gymnastikē*, training). Art of developing the body by suitable exercises. The Greek fully understood the value of all-round physical culture, and in the gymnasium the youth of Athens strove to approach the ideal of finely proportioned beauty as revealed in marble by their famous sculptors. From Greece the cult of gymnastics spread to Rome, where in the *Thermae* to which gymnasia were attached athletic exercises were practised.

While active sports have always been universally popular, the science of gymnastics proper was neglected in medieval Europe, and its serious revival in modern times may be said to date from the dark days of Jena, 1806, when Prussia began to fit herself for the final struggle against Napoleon. Her example was followed by other European countries, including Great Britain.

Before long two opposing theories of gymnastics were developed. The first, based upon German practice, regarded free movements merely as preliminary to the more strenuous exercises performed with the help of apparatus, such as the horizontal bar, parallel bar, ladder and rings, weights, etc., involving feats of strength as well as of agility. The Swedish system, on the other hand, not unjustly claims that elaborate and costly apparatus, and, indeed, apparatus of any kind, is a luxury that may be dispensed with by those who desire full and all-round bodily development with the sense of physical well-being which this involves. In the 20th century Swedish methods, with adaptations, became popular in Great Britain, especially after the system of training in the British army was altered in the same direction, this resulting in a higher standard of fitness among recruits. See Drill; Dumb-bell; Eurhythmics; Indian Club; Physical Training; Swedish Drill.

Gymnophiona (Greek, naked snake-like ones). Group of amphibians in which the limbs have been almost completely lost so that the animals resemble worms. They are also sometimes called the Coecilia. They are found in Central and S. America, tropical Africa, and the Orient.

Gymnosophists (Gr. *gymnos*, naked; *sophistes*, wise man). Indian philosophical sect, remarkable for their austere method of life and indifference to pain. To purify the soul they mortified the body. They went naked, were vowed to celibacy, and believed in the transmigration of souls.

Gymnospermae (Gr. *gymnos*, naked; *sperma*, seed). Large class of flowering plants distinguished by having the ovules and seeds naked—not enclosed in a chamber (ovary or seed-vessel). It consists of the various families of coniferous trees—yews, pines, firs, cycads, cedars, cypresses, etc. They usually have needle-like evergreen leaves, and the seed has normally two cotyledons with a

store of food for the seedling in each of them.

Gympie. Town of Queensland, Australia. It is 90 m. N. of Brisbane, and 40 m. S. of Maryborough, its port, with both of which it is joined by rly. It is the centre of a goldfield which also produces silver, nickel, bismuth, antimony, and coal. Pop. 8,500.

Gynaecology (Greek *gynē*, a woman). The subdivision of medicine which deals with diseases peculiar to women by reason of their anatomical structure. Closely related, and indeed indivisible, is the kindred subject of obstetrics, the art of midwifery. The earliest gynaecologists certainly would be the women of a primitive tribe practising midwifery, for they

Gymnastics. Statue of Greek athlete using bronze scraper to cleanse his skin after exercise. It is regarded as typifying the ancient Greek ideal of physical fitness
Vatican, Rome

would be most conversant with the phenomenon of menstruation and with miscarriage and delivery.

The first real facts about gynaecological medicine are found in old Egyptian papyri. The Kahun papyrus, c. 2000 B.C., deals with gynaecology and veterinary medicine. As in all early documents, surgery is not mentioned. The Ebers papyrus, supposed to have been found in the necropolis at Thebes, dates from 1550 B.C. and shows much advance in knowledge and in skill, although interlarded with superstition and magic. In Babylonian-Assyrian times no further advance is noted. The Hindus excelled in surgical technique, and we have evidence of the large

variety of instruments used by them. The O.T. has many references to gynaecological and obstetric conditions.

Before the time of Hippocrates ignorance of physiology and anatomy retarded the growth of medicine, and as late as the 2nd century A.D. a text-book on gynaecology makes no mention of female structure. Until the 19th century little progress in knowledge was made and very little new treatment introduced, but with the striding forward of medicine and surgery, the specialised study of gynaecology was to flourish. See Caesarian Section; Obstetrics.

Gynandromorphism (Greek, woman-man in form). Term used in biology. The recognizable maleness or femaleness of an animal may depend on the responses of parts of the body to the presence of sex hormones. Which hormone is produced—male-determining or female-determining—depends upon the genetic make-up of the individual concerned, i.e. whether it carries one or two of a particular kind of chromosome (X chromosome). In other forms, notably the insects, this is not so. In these the recognizable maleness or femaleness of the individual depends upon the different results of direct gene action in the cells of different parts of the body, though all the cells have the same gene outfit in the normal condition.

It sometimes happens in insects that during a division of the cells early in the development of an individual from an egg, there is abnormality in the distribution of X chromosomes: early cells have too many, too few, or no X chromosomes. In the parts of an individual in which this mishap has occurred, there will be a difference in those qualities we use to diagnose the sex of the individual. The creature will be a sex-mosaic in space. For this condition the name gynandromorph should be reserved. Artificial gynandromorphs can be made in those forms in which the appearance of maleness and femaleness is due to the hormones, by injecting or implanting small doses of the relevant hormone which act only near the site of injection. Gynandromorphs should be sharply distinguished from intersexes. See Intersex.

Gyöngyös. Town of Hungary, in the co. of Heves. It is on the Gyöngyös river. 45 m. N.E. of Budapest. The town is noted for its Franciscan monastery. A thriving trade is carried on in

1. The horse: front rest position. 2. Flank vault, left. 3. Rear vault, left. 4. Right double feint; from the rest the gymnast swings both legs clear over croup, returns without pause, and vaults left. 5. Horizontal bar; left, bent arm rest; right, front lever position, a

difficult exercise. 6. Parallel bars: left, upper arm rest; right, double shoulder-stand. 7. Left, bent arm handstand; right, front lever in rest. 8. From right shoulder-stand, on right, to position on left. 9. Handstand and, in front, right elbow lever

GYMNASTICS: EXERCISES ON VAULTING HORSE, HORIZONTAL AND PARALLEL BARS

cereals and a choice wine is made. Manufactures include copper goods, bricks, and tiles. Pop. 21,281.

Győr. City and county of Hungary, previously also known by the German name of Raab. The city, formerly a royal Hungarian free city, stands 67 m. W.N.W. of Budapest, at the confluence of the river Raab with the Little Danube, on the site of the ancient Roman Arrabona. Its chief buildings are the handsome town hall, the 15th century bishop's palace, and the cathedral, dating from the 12th century but rebuilt in the 17th. Pop. of city, 56,577; county, about 120,000.

Gyp. Pseudonym of the French writer Sybille Gabrielle Marie Antoinette de Riquetti de Mirabeau, comtesse de Martel de Janville. See Martel, Comtesse de.

Gyp. Name given to a male servant of resident members of a Cambridge college. The counterpart at Oxford is scout. The gyp is assisted by a woman, usually his wife, who is called a bedmaker. The name has been humorously derived from Greek *gyps* (vulture), with reference to a supposed voracity in snapping up perquisites. *Pron.* Jip.

Gypsies. The people known in the U.K. as Gypsies, or Gipsies, and elsewhere by a variety of names (Gitanos, Zigeuner, Tchinghianés, Zingari), call themselves *Romá* men. Large bands of these nomads appeared in Western Europe about 1417, though there is evidence that smaller parties wandered W. before that date. They came from the Balkan peninsula, where their tribes are still met with in considerable numbers. Rüdiger in

Gypsies. Group of Serbian Gypsy children. Top, typical family from Rumania

1777 and Jacob Bryant in 1785 announced the discovery of their ultimate origin from India.

Interest in Gypsies was fostered by the writings of George Borrow, but the serious study of the problem of their origin was first undertaken on the Continent. A. F. Pott, of Halle, published in 1844 his *Die Zigeuner in Europa und Asien*, in which he displayed the grammar and vocabulary of Romani, tracing the bulk of the words of Indian origin by means of parallels from Sanskrit and modern Indian tongues. At the same time he noted a number of words borrowed from Greek, Hungarian, German, and other languages, picked up by the Gypsies in their wanderings. F. Miklosich extended and corrected Pott's work in his *Über die Mundarten und die Wanderungen der Zigeuner Europas* (On the Dialects and Wanderings of the Gypsies of Europe), 1880. He proved conclusively that the route taken by the Gypsies after

leaving India lay through Armenia and across Asia Minor to the Balkans, where they must have remained for some centuries. On reaching the west they professed to be pilgrims from Egypt, hence the name by which they are known. The story was pure fiction, but it secured for them a freedom to travel which they soon abused, bringing upon themselves much savage persecution.

Gypsies in England

England perhaps has the cleanest record in this respect, but it is still sometimes believed that Gypsies commit the crime of stealing children. No case of this has ever been proved with evidence sufficient to satisfy an impartial mind. They are thought to be a distinctly criminal element in the population, yet an analysis of charges brought against Gypsies (including other vagrants alleged to have been Gypsies) in England during four years showed that out of 1,682 prosecutions only 18 were for crimes such as murder, abduction, or attempted suicide, 216 for theft, burglary, and receiving stolen property, 349 for assaults, drunkenness, obscenity, and using threats, and 76 for cruelty to horses, to children, desertion of wife, and begging. The remaining charges were for poaching, fortune-telling, and stealing wood, and for minor offences such as damaging turf, making fires too near the road, driving without lights, hawking without licence, etc., many of which are incidental to the Gypsies' manner of life. The comparative absence of serious crime among a class of the community variously estimated to number anything between 15,000 and 45,000, proves the baselessness of popular opinion on the subject.

In the matter of cleanliness Gypsies are often confused with other caravan-dwellers. The true Gypsy is, as a rule, more scrupulously cleanly than the average English peasant. This may to some extent be attributed to superstition. A plate from which a dog has eaten will not again be used for the preparation of human food. It has become *mokhadi* (defiled). This ceremonial defilement attaches to vessels used by a woman in child-birth, and to female underclothing, though these customary ideas vary from one family to another. A strange custom is that of burning the van and all the belongings of a deceased Gypsy. The idea behind this may be the fear of ghosts, a fear prevalent among Gypsies.

Gypsies are hospitable, and full of humorous and quaint sayings. The fortune-telling, the so-called Gypsy kings and queens, and the assumption of ancient lineage from the Pharaohs are all pretence for the bewilderment of the too credulous *gadzho*, "non-gypsy." To what particular section of the population of North India Gypsies are most nearly related, as well as the occasion and date of their emigration from that country, are problems that remain to be solved.

F. G. Ackerley
Bibliography. Dialect of the English Gypsies, B. G. Smart and H. T. Crofton, 1875; Dissertation on the Gypsies, H. M. G. Grellmann, 1807; The English Gypsies and Their Language, C. G. Leland, 1874; In Gypsy Tents, F. H. Groome, 1880; Gypsy Folk Tales, F. H. Groome, 1899; The Story of the Gypsies, K. Bercovici, 1929; the works of George Borrow; Aylwin, a Welsh romance, T. Watts-Dunton.

Gypsophila (Gr., chalk-loving). Hardy perennial plants of the family Caryophyllaceae. Natives of India and Asia, they thrive well if given the ordinary treatment for annual plants. The tiny flowers are white or pink in colour. The plants prefer a dry and well-drained soil, and will not succeed in damp or sunless situations. They are chiefly grown for the use of their foliage in blending bouquets, and were introduced into England in 1759.

Gypsum. Mineral, a hydrous calcium sulphate, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, containing 32.5 p.c. lime, 46.6 p.c. sulphur trioxide, and 20.9 p.c. of water. It occurs in nature as a soft, white rock, usually associated with rock salt. Gypsum beds in sedimentary rocks have often been formed by evaporation of enclosed sea basins.

Selenite is the variety of gypsum which occurs in distinct crystals, occasionally three to four feet in length. The crystals belong to the monoclinic system, have a pearly, shining, lustrous surface, and can readily be split into thin, transparent sheets. Satin spar is the name given to a fine fibrous variety of gypsum having usually a pearly, opalescent appearance. Red or yellow tinted satin spar is coloured by ferruginous impurities. Alabaster is a fine-grained, compact variety of gypsum, resembling marble in appearance.

Gypsum is found in England, notably near Derby and Carlisle and in Notts and Cheshire; in France, near Paris; in numerous places in the U.S.A.—one of the largest deposits being in the Great

Salt Lake, Utah; and in smaller deposits in Europe and Africa.

When heated to 115°C . gypsum loses more than half its water and is converted to a white powder, plaster of Paris. This is used for plasters, plasterboard, and mould making in pottery works. Alabaster, the most celebrated variety of which comes from Volterra in Tuscany, is used for decorative work, vases, statuettes, etc. Quantities of gypsum are used in the preparation of cements, fertilisers, as a basis of paints, and for making imitation marble; as a flux in smelting nickel ores; and for improving water for beer.

Gypsy-wort (*Lycopus europaeus*). Perennial herb of the family Labiatae. It is a native of

Gypsy-wort. Stem with flower whorls situated above each pair of leaves

Europe, and N. Africa, of Asia, Australia, and of N. America. It possesses a creeping rootstock, tough, four-angled stem, and pairs of opposite and elliptical leaves with margins deeply cut into coarse teeth. The small bluish-white flowers, dotted with purple, are crowded in whorls round the stem, just above each pair of leaves. It grows on banks of streams and ditches, and the juice makes a rich brown stain.

Gyrfalcon. This is another spelling of Jer-falcon (q.v.).

Gyron (Fr.). In heraldry, a wedge, formed by a diagonal line from the dexter chief meeting a horizontal line in the fess point. It is one of the sub-ordinaries (q.v.). When a shield is divided by a series of wedges it is said to be gyronny. Usually there are eight gyrons, but there may be only six, or as many as sixteen. Such irregularities should always be specified.

Gyroplane OR ROTAPLANE. Heavier-than-air flying machine supported in flight by the reaction of the air on one or more freely rotating rotor blades. This class of aircraft, of which the Autogiro (q.v.) is an example, is distinct from the helicopter (q.v.), in which the rotor blades are power-driven while the machine is in flight.

Gyroscope (Gr. *gyros*, ring, circle; *skopein*, to look). Rotatable wheel supported on a balanced

Gyroscope in its simplest form. While spinning, the top remains steady on the string

frame which can rotate freely about any axis. A working gyroscope consists of a heavy flywheel spinning at high speed and supported in a ring with an axis at right angles to the plane of the wheel. The inner ring is then set in a second ring which has an axis at right angles to it. The whole instrument is supported on a stand which allows the outer ring to move in its axis. The flywheel and rings are so arranged that the three axes of rotation in any position pass through a fixed point, which is the centre of gravity of the wheel. Thus the wheel can rotate about three mutually perpendicular axes.

The property of the gyroscope depends upon the fact that if a body, symmetrical about an axis of greatest or least moment of inertia, is set rotating about that axis, then the direction of the latter remains unchanged in space unless external forces are applied. Spinning the wheel at high speed imparts to it great angular momentum, so giving to the wheel a much greater apparent inertia to changes in direction of its axis of spin than when stationary.

In the absence of any external forces, the rotating axis will preserve a fixed direction in space. If a torque is applied to the frame which tends to alter the plane of spin of the wheel, the latter turns about an axis at right angles to that about which the torque is applied, until the plane direction of spin of the wheel coincides with the plane and direction of the torque. This phenomenon is known as precession. If the torque rotates with the precession, the latter becomes continuous. Should the base of the gyroscope be tilted in any position out of the

Gyron in heraldry

perpendicular, the wheel continues to revolve on an axis at right angles to the vertical plane of the perpendicular.

The gyroscope was first put to practical use by Léon Foucault to demonstrate the rotation of the earth. If the axis of a gyroscope is initially pointed to some star and the flywheel kept rotating rapidly, the axis remains pointed at the star irrespective of the earth's rotation.

Foucault's gyro-telescope developed into the gyro-compass. So long as the rotation of the wheel of the gyro-compass is maintained, the axis, if originally pointed to the Pole star, will

when firing at a target. Torpedoes are fitted with gyroscopes to keep them on a steady course after they have been fired; for this purpose the gyroscope is connected to the rudder and elevators, coming into operation as the torpedo leaves its tube.

Gyroscopic track recorders on railways record automatically the condition of the rails. A pendulum is connected to a gyroscope, which remains unaffected by the train's movement when rounding curves or altering speed. Attached to the pendulum is a needle, and as the pendulum seeks to remain vertical, the latter traces on a graph divergences of the rails,

or heavy-oil tractor mounted on two caterpillar tracks at the rear with a single broad wheel in front for steering. The plough and harrow are carried at the rear of the tractor. The plough is of the rotary type and has four shares; the harrow is mounted behind, and plough and harrow can be raised above ground level when the tractor is moving by road. The gyro-tiller can complete an acre in one hour, and is provided with lights which enable it to work as quickly and efficiently at night as by day.

Gythium. Ancient Greek city, in Peloponnesus. It stood at the mouth of the river Gythius, on the

Gyroscope. Diagram illustrating the mechanism and construction of the Brennan monorail, which owes its stability on the rail to the use of gyroscopes

remain in that direction, and, unlike the magnetic compass, is unaffected by variations due to steel in a ship's hull or cargo. A gyro-compass on a liner has a wheel weighing over 50 lb. and is driven by an electric motor at 5,000 r.p.m. Another application of the gyroscope to navigation is the automatic pilot (*q.v.*) used on aircraft. The gyroscope, connected with the controls, automatically keeps the aircraft on its pre-set course. A similar but larger device keeps a ship on her course and corrects any tendency to yaw.

Gyro-stabilisers, which weigh up to 100 tons, with wheels revolving at 1,400 m.p.h., reduce the rolling of ships in a seaway; the natural tendency of the spinning wheel to maintain its revolutions in the original plane partially counters the ship's alternate list to starboard and to port. Gyro-stabilisers keep warships steady

inequalities in the bed of the track, and differences in the level of the rails.

The gyroscope enables the monorail vehicle to remain upright. Pendulums on each side of the gyroscope cause a ratchet to engage with a cog-wheel on the gyroscope's axle immediately the car leans to one side or the other. This restores the car to the vertical position by accelerating the precession of the gyroscope to the vertical. The first monorail was built by Louis Brennan and the device exhibited before the Royal Society in 1907.

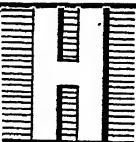

Gyroscopes kept the German flying bombs of the Second Great War on their course, and provide the stabilising factor in unmanned aircraft and tanks.

Gyro-Tiller. A power-driven agricultural machine for ploughing and harrowing in one operation. The power unit consists of a petrol

N.W. shore of the Bay of Laconia, 27 m. S.E. of Sparta, whose port it was. As the headquarters of the Spartan fleet it was often attacked; the Athenians burned it in 455 B.C. It was a member of the Achaean League (*q.v.*) from 195 B.C. until 146 B.C. Excavations have brought to light the remains of a Greek theatre and Roman ruins, but much of the ancient city lies beneath the sea. Marathonisi is the modern town.

Gyula. Town of Hungary, the capital of the co. of Békés. It stands on the White Körös river, which bisects the town, and is 36 m. N.N.W. of Arad. Formerly strongly fortified, it has a museum containing antiquarian relics, the ruins of an old castle, and a château. There is trade in wine, oil, flour, and spirits, while cattle are reared in the neighbourhood. Turtles are caught in the surrounding swamps. Pop. 25,221.

THE letter H has altered little in its form since the Phoenicians first adopted an Eastern Mediterranean pictograph, consisting of two uprights connected by two or three transverse bars, , as their letter *cheth*, meaning  fence, and symbolising a sound similar to the guttural *ch* of the German or Scotsman. The earliest Greek form was , and this same form is seen in the earliest Latin period, c. 800 B.C. Later the top and bottom crossbars were omitted, and at the same time the *hēta*, as it was originally

 called, resembling our own H in form, also ceased to represent a guttural and became an aspirate. The eastern Greeks, however, lost this aspirate, and thereafter utilized the letter to represent the long *e* sound, calling it *ēta* instead of *hēta*. The classic Greek *eta* is . The western Greeks retained the aspirate  for a longer period, and the Romans took it over, though as a very weak sound. In vulgar Latin the aspirate soon vanished altogether. This explains why the *h* is unaspirated in the Latin languages, French, Italian, and Spanish.

H Eighth letter of the English and Latin alphabets.

By some it is regarded as a consonant, by others as a mere aspiration. In English, initial *h* is silent in some words, *honest*, *honour*, *hour*; in *herb*, *humble*, custom varies. In certain words, generally of foreign origin, after *c* and *g*, it is used to indicate the hard sound of those letters, as in *chemistry*, *chimaera*, *ghetto*, *Ghibelline*. In *what*, *when*, *which*, the digraph *wh* is in Scotland and Ireland often pronounced *hw*. *H* is silent after a vowel, which it generally lengthens. See Alphabet.

H. In music, the German name for B natural. Thus, Schubert's famous Unfinished Symphony in B minor is called in Germany the symphony in H moll; and Liszt wrote a fugue on the notes in the name Bach. This use of an eighth letter arose from the resemblance of the sign for a natural to the Gothic "h."

Haakon. Masculine Christian name. Of Teutonic origin, it means high kin and is chiefly known as the name of seven Norwegian kings. The name is sometimes spelled Haco. Pron. Hawkon.

Haakon I (915-961). King of Norway, c. 938-961, known as Haakon the Good. Youngest son of Harold Haarfager (Fair-Hair), he was brought up in England as a foster-son of King Athelstan. After his father's death he was furnished with ships by the English king and sailed for Norway. Having defeated his half-brother, Eric Blood-Axe, Haakon was proclaimed king. He was killed in 961, whilst repelling an invasion by the sons of Eric.

Haakon IV (1204-63). King of Norway, 1223-63, known as The Old. He brought Iceland and

Greenland under the Norwegian crown. He was defeated by Alexander III of Scotland at Largs in 1263 and died at Kirkwall, Orkney.

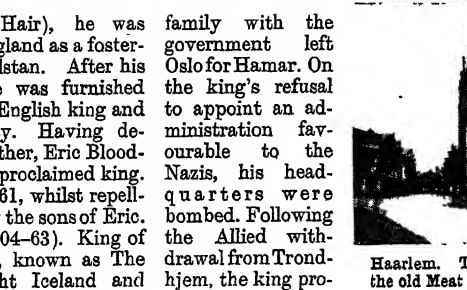

Haakon VII (b. 1872). King of Norway from 1905. Second son of Frederick VIII of Denmark,

Haakon VII,
King of Norway

he was born Aug. 3, 1872, and christened Carl. In 1896 he married Maud (1869-1938), youngest daughter of the prince of Wales (Edward VII). On the separation of Norway from Sweden in 1905, he was chosen king by the Storting of the former country, accepting the crown Nov. 18. His son, the crown prince Olaf, had been born July 2, 1903.

On April 9, 1940, when the Germans invaded Norway, the royal

claimed that he would not treat with the Germans before their complete evacuation. He sailed in a British warship to London on June 10. In 1941 he approved his government's decision to restore the death penalty for crimes against the state, a measure aimed at the Quisling government. On June 7, 1945, King Haakon received a tumultuous welcome on his return to Oslo.

Haarlem. Town of the Netherlands, capital of the prov. of North Holland. It is about 14 m. W. of Amsterdam, on the river Spaarne.

Haarlem arms

The town is well served by rlys. to The Hague and Amsterdam. The industries of Haarlem are small, those of cotton manufacture, bleaching and dyeing, printing, and type-founding being the chief; but the town is famous as the centre of a bulb growing region which supports a large exporting industry.

Haarlem possesses many architectural and artistic treasures. Its chief features are the Groote Kerk, on the market place, a large cruciform church of the late 15th century, with a tower over 250 ft. high; the town hall, a 13th century castle many times restored, lastly in 1630; a museum occupying a hospice built 1608 and containing a superb collection of paintings by

Haarlem. The Groote Kerk or Great Church, with the old Meat Market on right. Top, left, the Town Hall

Frans Hals; the Teyler museum, antiquarian, geological, and artistic; the old meat market, one of the most beautiful buildings in Holland, built 1602, now used for the archives; and small museums of colonial industries and of industrial art. In the market place is a statue to L. J. Coster (*q.v.*).

Haarlem was the seat of William, 1st count of Holland, and suffered a terrible massacre after vainly resisting the seven months' siege of Frederick of Toledo, 1572-73. Retaken by William of Orange in 1577, it knew great prosperity in the 17th century. Pop. 150,464.

Haarlemmermeer OR HAARLEM LAKE. Commune of Holland, in the prov. of N. Holland. Lying to the S. of Haarlem, this district is among the largest of the Dutch *polders*, or reclaimed lakes or morasses. It was formed by pumping away the water of a large lake formerly covering over 42,000 acres. Work was carried out by the state between 1840 and 1853, the greater part of the cost being met by the sale of reclaimed land. The district thus saved covers about 72 sq. m., and is fertile and well tilled. The chief places are Aalsmeer, Nieuw Vennep and Abennes, and the railway runs along the western edge. Pop. 34,576.

Habakkuk. One of the minor prophets of the O.T. His work was contemporaneous with that of Jeremiah. He lived at the time when Judah was invaded by the Chaldeans, and taught that they were the instruments of God to punish the Jews for lawlessness. His book consists of two chapters of prophecy and a lyrical hymn.

Habbaniyah. An R.A.F. aerodrome in Iraq, about 60 m. W. of Bagdad. During the Iraqi rebellion led by Rashid Ali, troops opened fire on the aerodrome and cantonment on May 2, 1941, destroying several aircraft. R.A.F. bombers attacked the rebel positions and frustrated an attempt by the Iraqi air force to raid the aerodrome; but the British station was besieged until May 6. The aerodrome remained in operation throughout the brief campaign despite slight damage caused by German aircraft from Syria.

Habeas Corpus (Lat., have the body). Term of English law. It forms the opening words of various writs, e.g. *Habeas Corpus ad faciendum et recipiendum*, to remove a cause from a lower court; *Habeas Corpus ad prosequendum*, to remove a prisoner to the proper jurisdiction. But the most famous, the safeguard against arbitrary im-

prisonment, is the high prerogative writ of *Habeas Corpus ad subjiciendum*. It is addressed to one who detains or imprisons another, and commands him to "have the body" of the person in the court of king's bench on a certain day, together with the cause of his detention. If the court decides that the cause shown does not justify the detention it orders a release.

The writ is as old as the common law itself; but in 1679 it was thought proper to pass the Habeas Corpus Act, to prevent certain evasions of the law which had sprung up under the arbitrary Stuart kings; e.g. after the receipt of the writ by one gaoler, the government would remove the prisoner to another gaol, and then the first gaoler would make answer that he no longer had the body of the prisoner, and therefore could not produce it in court. Again, judges sometimes refused to hear applications for the writ. These and other evasions were made punishable; but the Act applies only to criminal cases. In addition, the writ is used where, for instance, a child is detained from its father or mother or other lawful guardian; and was used by the friends of Mrs. Jackson in the celebrated case where it was decided that a husband has no power to detain his wife against her will. In times of national emergency the Habeas Corpus Act may be suspended by a special Act. It is also suspended automatically where martial law (*q.v.*) obtains.

Haber, FRITZ (1868-1934). A German chemist. Born at Breslau, Dec. 9, 1868, he studied chemistry at Heidelberg and Berlin, and worked as an unpaid clerk in laboratories in Zürich and Jena before becoming a lecturer at the Karlsruhe polytechnic in 1894. His work on electro-chemistry, thermo-dynamics, and the chemistry of gases earned him a professorship there in 1898, and the chair of physical chemistry in 1906. Between 1908 and 1910 he evolved the extremely important process for the synthesis of ammonia from atmospheric nitrogen which bears his name, and which was exploited on a commercial scale by the German dye trust at Ludwigshafen and Leuna. Haber became director of the Kaiser Wilhelm institute of physical chemistry at Berlin in 1911, and in 1918 received the Nobel prize for chemistry. Forced to resign in 1933 on account of his Jewish blood, he emigrated to Zürich, where he died Feb. 1, 1934. See Ammonia.

Haberdasher. Word used for a retail trader who sells articles such as pins and needles, buttons, and other accessories of dress, i.e. what are known as small wares. Today haberdashery is merely a branch of the drapery trade. The word is an old one, and its origin and early meaning are uncertain.

Haberdashers' Company. The eighth of the twelve chief London city livery companies. Incorporated 1447, it was originally a branch of the Mercers', with S. Catherine the Virgin and S. Nicholas as patron saints. Haberdashers' Hall in Gresham Street, E.C., was

Haberdashers' Company arms

built on a site bequeathed in 1478 by William Bacon. The first hall was burnt with the archives in 1666; the second, by Wren, was partly burnt in 1864, and completely destroyed by fire after the German air raid of Dec. 29, 1940. The company manages several almshouses and schools.

Habibullah Khan (1871-1919). Ameer of Afghanistan. Son of Abd-ur-Rahman, he succeeded him on the throne Oct. 3, 1901. He reduced taxes, set up a council of state for tribal affairs, and tried to associate tribal chiefs with provincial governors in justice. Although loyally observing the agreement with the government of India regarding foreign affairs, he jealously preserved Afghanistan's right to manage her own trade. Having paid a state visit to India in 1907, he accelerated his programme of westernising Afghanistan; and against the conservative majority, introduced motor cars, telephones, newspapers, and hydro-electric power, and established a high school at Kabul. In the First Great War Habibullah maintained neutrality and was a loyal friend of Great Britain despite the arrival of a German mission with gold and promises. Equally unsuccessful were the efforts of the Turks to persuade him to join a crusade for Islam. He was assassinated Feb. 20, 1919, by the anti-British party, and succeeded by his brother Nasrullah Khan, who six days later was deposed by Amanullah Khan (*q.v.*).

Habit (Fr. *habill*, Lat. *habitus*, dress). Outer garment, such as the riding dress of a woman or the frock of a monk, that is distinctive of special occasions or avocations. See Costume.

Habit (Lat. *habitus*, state, manner). A fixed disposition or condition of mind or body resulting from frequent repetition of the same behaviour, so that the accustomed sequence of actions tends to be performed automatically upon experience of its usual stimulus. Most ordinary actions of daily life are partly habitual. Habit is beneficial to the individual in so far as it relieves him from concentrating his attention at each performance of an activity, but its mechanical nature is likely to hamper initiative. The first result of habit is that it enables repeated acts to be carried out with greater facility and promptitude; secondly, as the effort needed grows less, the consciousness of these acts is weakened; thirdly, the repetition brings about an inclination to reproduce them which in obsessive types becomes a compulsion. Ability to form fixed habits varies greatly in individuals. The tendency to cling to them increases with age. Habits are often confused with conditional reflexes, but differ because (1) they start as ordinary conscious behaviour; (2) except where compulsive, they can be controlled once attention is directed to them.

Habit and Repute. Term used in Scots law. In Scotland, if a man and a woman live together openly, i.e. by habit and repute, the courts of law will, if desired, give a declaration that they are legally married. The term is also applied to what are known as habitual criminals.

Habitant (Lat. *habitare*, to inhabit). Name given to the original settlers at Quebec and still applied to farmers. They have a marked individuality, speak a patois of their original French, and have their own literature, the principal authors being Fréchette, De Gaspé, and the Abbé Casgrain.

Habitual Criminal. As defined by the Prevention of Crimes Act, 1908, one who, after attaining the age of sixteen, was at least three times convicted of crime, and who was leading persistently a dishonest or criminal life. Such persons, if again convicted of a serious offence and sent to penal servitude, might also be sentenced to preventive detention for 5-10 years. Under the Criminal Justice Act, 1948, the term was changed to persistent offender, and the methods of punishment extensively altered. See Persistent Offender; also Borstal System.

Haboob. Name applied to a dense whirling dust-storm typical of N. and N.E. Sudan. Haboobs

may occur at any time of the year, but are most frequent in the neighbourhood of Khartum during afternoon and evening between May and Sept. The dust is often carried up to several thousand feet, darkening the sky. A strengthening of wind and a drop in temperature usually accompany the passage of a haboob. The storm is believed to be due to currents of comparatively cold air undercutting warm air. See Dust-storm.

Habsburg. Alternative spelling of the name of the Austrian house of Hapsburg (*q.v.*).

Hacha, Emil (1872-1945). A Czech lawyer and politician. Born July 12, 1872, at Trhove Sviny, Bohemia, he attended the Charles university of Prague and became a lawyer. He was legal adviser to the land committee of Bohemia, 1898-1916, and a counsellor of the Austrian court of administration, 1916-18. At one time a judge at The Hague, he was president of the senate of the supreme court of administration at Prague, 1925-38. After the Munich agreement he was elected president of Czechoslovakia, Nov. 30, 1938. When the Germans virtually annexed the country next year, Hacha was appointed by them a puppet president of Bohemia and Moravia, in which post he advised cooperation by the Czechs with Nazi officials. On May 5, 1945, the defeat of Germany in the Second Great War being imminent, he was arrested by patriots in Prague and ordered to stand trial as a war criminal, but before this took place he died in a prison hospital on June 27. See Czechoslovakia. Pron. ha-ha.

Hachette. Name of a firm of publishers and booksellers. Founded in Paris in 1826 by Louis Christophe François Hachette (d. 1864), primarily for the publication of classical works, the house now issues general literature and the Joanne series of French and English guide-books. The firm has over 1,500 rly. bookstalls in France and branches in the French colonies, Egypt, Turkey, Rumania, and S. America. The London branch, established 1859, has produced a series of works for the study of French, German, Spanish, Italian, and other European languages. The Paris house is at 79, Boulevard Saint-Germain, and the chief London house at 16-17, William IV Street, W.C.2.

Hachioji. Town of Japan. In the island of Honshu, it is 25 m. W. of Tokyo. Silk-worm rearing and silk-weaving are the principal industries. Pop. 62,279.

Hackberry. Name of the fruit of a tree, *Celtis occidentalis*, one of the Ulmaceae, also known as nettle-tree (*q.v.*).

Hackensack. A city of New Jersey, U.S.A., the county seat of Bergen co. It stands on the Hackensack river, 12 m. N. of Jersey City, and is served by rlys. and an airport. It makes aeroplane parts, clothing, chemicals, bricks, and cement. Founded as a Dutch trading post in 1647, it played a part in the War of Independence, both armies having camped on its green and Washington having led hence his retreat across New Jersey in 1776. Notable buildings include a Dutch church (1696) and the county court house. Incorporated in 1868, Hackensack was chartered as a city in 1933. Pop. 26,279.

Hackenschmidt, Georges (b. 1878). Russian wrestler. After a successful career on the Continent he came to England about 1901, and appeared at the Tivoli and other music-halls, where his immense strength and magnificent physique made him extremely popular. In 1901 he beat Jenkins at the Albert Hall, and in 1906 won the championship from Madrali, the Terrible Turk, at Olympia. Hackenschmidt's measurements were: height, 5 ft. 8 ins.; weight, 14 st. 10 lb.; neck, 22 ins.; chest, 52 ins.; biceps, 18 ins.; calf, 17 ins. In 1903 he lost the championship to Frank Gotch, at Chicago.

Hackett, Walter (1876-1944). Anglo-American dramatist, born at Oakland, Calif., Nov. 10, 1876. In London he produced his own comedies, in most of which his wife Marion Lorne played leading parts. They included *It Pays to Advertise*, 1914; *Ambrose Applejohn's Adventure*, 1921; 77, Park Lane, 1928; *Road House*, 1932; *Espionage*, 1935; *London After Dark*, 1937; *Toss of a Coin*, 1938. In 1930 he entered into management of the Duke of York's Theatre, then opened the Whitehall Theatre the same year. He was a lessee of the Apollo Theatre, 1934-37. He died Jan. 22, 1944.

Hackle, Red. Plume worn in the feather bonnets of the Black Watch (42nd Highland Regiment of Foot) since 1795. During the campaign of that year in Flanders, the 11th Light Dragoons were driven back by the French. The Black Watch retrieved the position. For this exploit the Red Hackle worn by the 11th Dragoons was given by General Dundas, the British commander, to the 42nd.

Hackney. Breed of horse originating from a cross between the race-horse and the cart-horse, used for riding, and now bred for driving also. From the practice of hiring them out, the word acquired its application to motor or horse-drawn vehicles plying for hire. A more popular form is hack, with hacking as a term applied to hiring horses for riding. By analogy, a literary hack is a writer who will drudge for any employer. *See* Cab; Horse.

Hackney. Parish and municipal borough of N.E. London. Covering an area of 5½ sq. m., it is served by railways, and by the various forms of London Transport road services. It is bounded by Walthamstow and Leyton, N.; Poplar and Bethnal Green, E.; Shore-ditch, S.; and Tottenham, Stoke Newington, and Islington, W. It has developed rapidly since the middle of the 19th century around Mare St., Church St., Grove St., and Well St. There are

a town hall, 1936, and technical institute. Electricity works were inaugurated in 1901. Hackney includes part of Victoria Park (q.v.), London Fields, Hackney Marshes, 339 acres, opened 1894, and Hackney Downs, 41½ acres.

The manor belonged to the Knights Templars, then to the Knights of S. John of Jerusalem, and members of noble families once had country seats here. Of the ancient church of S. Augustine, supplanted by the parish church of S. John, only the tower, and chapel of Sir Henry Rowe, 1614, remain. The district preserves memories of Archbishop Sancroft, Milton, Defoe, Gilbert Wakefield, and John Howard. Parl. representation was reduced in 1945 from 3 to 2, in 1950 to 1 (S. Hackney). Hackney suffered severely from air raids in the Second Great War, but model housing estates were built later. Pop. 177,000.

Hackney Carriage. The term originally applied to horse-drawn vehicles other than stage-coaches—e.g. omnibuses—standing or plying for passengers to be carried for hire in any street. Motor vehicles used for this purpose are covered by the same laws. Cabs and taxi-

cabs are thus hackney carriages. Outside London the borough or urban district council (sometimes the rural district council) grants licences to vehicles and drivers. Licences are normally for one year. In the metropolitan police district and City of London licences are issued by the commissioner of the metropolitan police, acting for the Home secretary. Horse and motor vehicles are governed by a London cab order made by the Home secretary.

Hackston, DAVID (d. 1680). A Scottish Covenanter. A member of a Fife family, he was present

Haddington, East Lothian. Ruins of the 13th century abbey church of S. Mary
Courtesy of L.N.E.R.

at the murder of Archbishop Sharp, May 3, 1679. He was one of the Covenanters' leaders at the battles of Drumclog and Bothwell Bridge. On July 22, 1680, he was captured after a skirmish at Airdsmoss, Ayrshire, and executed at Edinburgh, July 30.

Hadad. Name of certain Edomite kings or princes in the O.T. (1) A king of Edom, who succeeded Husham and defeated the Midianites (1 Chron. 1, v. 46). (2) An Edomite of royal blood who was taken to Egypt as a child to escape massacre at the hands of Joab, David's commander-in-chief, and later married Pharaoh's sister-in-law. At the death of David, he returned to Edom and became a troublesome enemy to Solomon (1 Kings 11, v. 14). Hadad or Adad was also the name of a Syrian deity.

Haddington. Royal and mun. burgh and co. town of East Lothian (formerly Haddingtonshire), Scotland. It stands on the Tyne, 17 m. by rly. E. of Edinburgh. The ruins of the 13th-century abbey church of S. Mary, the nave of which serves as the parish church, are surmounted by a square tower, 90 ft. high, and the choir

Haddington arms

contains the tomb of Jane Welsh, a native, the wife of Thomas Carlyle. At one time a royal residence, Haddington was the birthplace of Alexander II. John Knox and Samuel Smiles were also born here. It has one of the principal grain markets in Scotland, and manufactures woollens, agricultural implements, and other commodities. Market day, Fri. Pop. 4,405.

Haddington, EARL OF. Scottish title borne since 1627 by the family of Hamilton. Sir Thomas Hamilton (d. 1637) who, under James VI, was secretary of state, keeper of the privy seal, and president of the court of session, was made a baron in 1616 and earl of Melrose in 1619. In 1627 he exchanged his title of Melrose for that of Haddington. Charles (d. 1681), the 5th earl, married in 1674 Margaret Leslie, who became countess of Rothes. By arrangement her title passed to their eldest son, while the second, Thomas (1680-1735), became earl of Haddington. He was made hereditary keeper of Holyrood, a position which the 9th earl surrendered in 1843 in return for £40,000. This 9th earl was made a peer of the U.K. in 1827. He left no sons, so his Scottish titles passed to a cousin, George Baillie (1802-70), who took the additional name of Hamilton. In 1917 George (b. 1894) succeeded his grandfather, becoming 12th earl. The eldest son bears the courtesy title of Lord Binning.

Haddingtonshire. Name until 1921 of the Scottish county now known as East Lothian. *See* East Lothian.

Haddock (*Gadus aeglefinus*.) Common British fish of the same genus as the cod, which it generally resembles. It may be distinguished by the black line running along each side, and the black patch on either side of the body.

Haddock, a common British fish

Haddon Hall, Derbyshire. Left, part of terrace, with Dorothy Vernon steps. Right, Long Gallery or Ballroom

The haddock is usually less than 2 ft. in length, though 3 ft. is occasionally reached. Haddocks are found in shoals, and feed mainly on molluscs, small crustaceans, and the spawn and fry of other fish. They are taken in the trawl net and also on lines baited with mussels. They spawn in winter near the coast, and it is estimated that a large specimen will lay 1,500,000 eggs in the season. Economically the haddock is a most important food fish. It is largely eaten fresh, but is also split and smoked, the best qualities being known as finnon haddocks from Finnon or Findon, Kincardineshire. See Fish.

Haddon, ALFRED CORT (1855-1940). British anthropologist and zoologist. Born in London, May 24, 1855, he studied at Christ's College, Cambridge. He was professor of zoology in the Royal College of Science, Dublin, 1880-1901, lecturer in ethnology at Cambridge, 1900-09, and London, 1904-09, thence until 1926 reader in ethnology at Cambridge. He was president of the Royal Anthropological Institute, 1901-02. His works include *Evolution in Art*, 1895; *Study of Man*, 1898; *Head-hunters*, 1901; *Races of Man*, 1909; *History of Anthropology*, 1910. Died April 20, 1940.

Haddon Hall. Ancient baronial mansion in Derbyshire, England. Picturesquely environed and situated on a limestone foundation above the left bank of the Wye, 2 m. S.E. of Bakewell, on the road to Derby, it passed from the Norman family of Peveril or Peverel to that of Avenell, and then, in the 12th century, to the Vernons. Towards the close of the 16th century, by the marriage of Dorothy Vernon to Sir John Manners, it passed to the Rutlands.

Maintained in a state of careful preservation by the Rutlands, though not used by them as a dwelling since the early part of the 18th century, Haddon consists of two quadrangles on different levels.

Features are the 12th-15th century chapel, 14th-17th century banqueting hall, tapestried drawing-room, Elizabethan Long Gallery or ballroom—Haddon's special glory—ante-room with steps to the winter garden, tapestried state bedroom, kitchen, dining-room, Eagle or Peveril's Tower and terrace.

With the terrace steps is associated the legend of Dorothy Vernon's elopement with Sir John Manners, first mentioned in print about 1820, fostered by Eliza Meteyard and other writers of fiction, and revived by Sir Arthur Sullivan's opera, *Haddon Hall*, 1892. With Wingfield, Haddon supplied Walter Scott with materials for his picture of Martindale Hall in *Peveril of the Peak*. See Gallery: Rutland, Earl and Duke of; consult Haddon Hall, S. C. Hall, 1871; Haddon, G. Le Blanc Smith, 1906.

Haden, SIR FRANCIS SEYMOUR (1818-1910). British etcher and surgeon. Born in London, and

half-sister he had married in 1847. In 1880 he founded the Society of Painter Etchers. He retired from surgical practice, 1887, was knighted in 1894, and died June 1, 1910.

F. Seymour Haden

Hadendoa. Tribe of Hamitic pastoral nomads in the Nubian desert between Suakin and the Abyssinian frontier. Their mop-like hair earned for them and the Baggara the name Fuzzy-Wuzzies during the Mahdist revolt (1882-98). Osman Digna was of this tribe. See Mahdi.

Hades (Gr., the invisible). In Greek mythology, properly the name of the god who ruled the underworld, also called Pluto. He was the son of Cronos and Rhea, and brother of Zeus and Poseidon. His wife was Proserpine or Persephonē (q.v.), daughter of Demeter. Hades is represented as wearing a helmet, which had the power of rendering him invisible. He is the Roman Dis or Orcus.

In later mythology, the name Hades

Sir F. Seymour Haden. Kilgaren Castle on the Teifi, a typical etching by the artist

educated at University College, he studied surgery at the Sorbonne, Paris, and at Grenoble, and settled in private practice in London in 1847. While in Paris, he spent his evenings at the art schools, but did not take up etching seriously till 1858, when he made the acquaintance of Whistler, whose

came to be used for the realms of the god. These were regarded as being somewhere inside the earth. The river Styx was the boundary, and over it the dead were ferried by Charon. On the opposite shore was the three-headed dog Cerberus, the vicious guardian of Pluto's realm. Three judges judged the dead,

namely Minos, Rhadamanthus, and Aeacus. The virtuous were sent to dwell in Elysium (*q.v.*), which is generally regarded as a separate place; in Virgil, however, it is in Hades. The place of punishment and torture was Tartarus; here were confined such malefactors as Ixion, and the Giants who rebelled against Zeus. *Prom. Haydeez. See Hell.*

Hadfield. This Derbyshire village is part of the borough of Glossop (*q.v.*).

Hadfield, SIR ROBERT ABBOTT (1858-1940). British metallurgist. Son of a steel manufacturer, he was educated in Sheffield before becoming a research metallurgist in his father's firm. He was chairman and managing director of the company before he was 30 and held both posts until his death. As the result of his experiments on the microstructure of steels and alloys, great advances were made in steel processes. He invented the especially tough manganese steel in 1882; in 1889 came silicon steel, which with its low hysteresis makes the cores of electrical transformers. Hadfield made the first transformer with a silicon steel core in 1903.

Knighted in 1908, he became F.R.S. the next year, and a baronet in 1917. He received high honours in metallurgical science from many countries, being an honorary member of the Royal Swedish Academy, the American National Academy of Sciences, and the Academy of Science of the U.S.S.R. He died Sept. 30, 1940.

Hadham. Two parishes of Hertfordshire, England. Great or Much Hadham is near the river Ash, 4 m. S.W. of Bishop's Stortford, and has a railway station. The manor was given by King Edgar to the bishop of London. The old palace was built about 1400; the existing mansion dates from 1780; the Early English church of S. Andrew, much restored, was erected in 1300. Pop. 1,668.

Little Hadham, formerly Hadham Parva, $\frac{3}{4}$ m. N.W. of Bishop's Stortford, has a 12th century church, with a timbered porch, Perp. tower, and a chancel restored in 1885, and is associated with the

Capel family. Near by is Hadham Hall, an Elizabethan structure. Brickmaking is a local industry.

Hadhramaut. A district of Arabia. Extending from the Yemen to Oman, this little-known region lies along the Gulf of Aden and the Arabian Sea, and is bounded on the N. by the Great Arabian Desert. From Aden the British exercise a certain political control over it, and it is part of the Eastern Aden protectorate, itself containing the state of Shihir and Makalla and the state of Seiyun. Its chief natural features are the Jebel Tsahura (alt. 8,000 ft.) and the great, usually dry, Wadi Hadhramaut. Some of its valleys are fertile, but it is a poor country. Shibam is its chief town, and its port is Makalla, which does a fair amount of trade. The pop. of the

Hadleigh, Essex. Ruins of 13th century castle, looking east
By courtesy of The Salvation Army

region is estimated at 500,000, mostly Beduin. The five Kuria Muria Islands, lying off the coast towards Oman, are British, the sultan of Muscat ceding them to provide a landing for the Red Sea cable in 1854. *See Aden; Arabia.*

Hading, JANE (1859-1933). The stage name of Jeanne Alfrédine Tréfouret, French actress, born Nov. 25, 1859.

Jane Hading,
French actress

was engaged by Victor Karing, whom she married, at the Gymnase. Her greatest success was in *Frou Frou*, 1886, and she toured America with Coquelin in 1888. Associated with the Comédie Française, in 1896 she acted the

title rôle in Sardou's *Marcelle*. She retired in 1920, and died on Dec. 31, 1933.

Hadjj OR HADJJI. Arabic term applied to a Muslim on his return from the pilgrimage (*hadjj*) to Mecca and Mount Arafat which is incumbent, where it is possible, on every devout Mahomedan once in his lifetime. One who has made the pilgrimage has the title *el-hadjj*, i.e. the pilgrim, prefixed to his name, and the right to wear a green turban. *See Ka'aba; Mecca.*

Hadjin OR HAJJIN. Town of Asiatic Turkey in the vilayet of Adana. Dating from the 14th century, it lay 80 m. N. of Adana, situated at an alt. of 3,200 ft., on the southern slopes of the Anti-Taurus. Most of its pop., about 10,000, were Armenians, and a Protestant mission was established there. In 1920 the Armenians defended the town for several months against Turkish Nationalists, but at the end of Oct. it fell to the Turks, who massacred most of the inhabitants and destroyed the town.

Hadleigh. Parish and village of Essex, England. It is 5 m. W.N.W. of Southend-on-Sea. Fragmentary ruins remain of Hadleigh Castle, built by Hubert de Burgh, earl of Kent, in the 13th century, given by Henry VIII to Anne of Cleves, and abandoned in the 16th century. The church of S. James is Norman, with a wooden tower. The Salvation Army founded a farm colony at Hadleigh in 1891.

Hadleigh. Urban district and market town of Suffolk, England, situated on the Brett, 9 m. W. of Ipswich. Its railway station is a branch terminus. Hadleigh was once the centre of the woollen trade. Here Guthrum the Dane is said to have been buried. Malting and corn-milling are local industries. Market day, Mon. Pop. 2,952.

Hadley Wood. District of Barnet, Hertfordshire, England, partly within the urban district of Enfield, Middlesex. Its woodland area covers about 250 acres. The cruciform Perp. church of S. Mary, with ivied and turreted tower containing an old iron beacon, dates from the 15th century, and was restored in 1848-52. Part of Hadley Common was the scene of the battle of Barnet, 1471, the spot where Warwick is supposed to have fallen being marked by an obelisk, Hadley High Stone. There is a railway station. *See Barnet.*

Hadrow, SIR WILLIAM HENRY (1859-1937). British educationist. Born at Ebrington, Glos,

Sir Henry Hadow,
British educationist
Russell

Dec. 27, 1859, he was educated at Malvern and Worcester College, Oxford, where he remained on the teaching staff until 1909. He then became principal of Newcastle college of science. Knighted in 1918, he was assistant director of educational staff duties at the War office. He was vice-chancellor of Sheffield university, 1919-30. In 1925 he delivered the Sidgwick lecture at Cambridge, and in 1933 the Romanes lecture at Oxford. An authority on music, Hadow was a member of the R.C.M. council. He edited the Oxford History of Music in 7 vols., himself contributing the 5th vol., 1904. His other books included *Studies in Modern Music*, 1894; *Oxford Treasury of English Literature*, 1906-08; *Church Music*, 1926. He died April 9, 1937.

Hadrian (76-138). Roman emperor, 117-138. Full name, Publius Aelius Hadrianus. Born Jan. 24, 76, at Rome or at Italica in Spain, he was brought up, adopted, and designated successor by the emperor Trajan. Hadrian believed that the Roman empire had reached its limits, and that the policy of conquest must give place to a policy of consolidation. He made peace with the Parthians, Trajan's campaign against whom had ended so disastrously, and is said to have contemplated retirement from Dacia. The greater part of Hadrian's reign was spent in travel.

Hadrian, Roman Emperor
From the bust in the Uffizi
Gallery, Florence

There was scarcely a province of the empire which he did not visit.

Though a voluptuary, Hadrian worked strenuously to promote the welfare of his subjects. One of his most notable reforms was the substitution of direct collection of taxes for the iniquitous system of tax-farming; he also inaugurated legal reforms, and organized for the administration of the empire a regular civil service.

Outward deference was shown to the senate, but to all intents and purposes Hadrian was an

Hadrian's Wall. Map indicating the course of the Roman wall and the camps established to defend the northern frontier of Roman Britain. Top right, part of the wall near Haydon Bridge, 7 miles west of Corbridge. See text below

absolute ruler. He was a man of wide culture, and was a leader in the antiquarian movement, which sought its literary models in the past. During the last years of Hadrian's reign occurred the last revolt of the Jews which ended with their virtual extermination in Judaea. Shortly before his death, Jan. 1, 138, Hadrian composed the well-known poem to his soul, of which more than 100 English versions exist. Consult Lives, F. Gregorovius, 1898; B. W. Henderson, 1923.

Hadrian's Villa (Ital. *Villa Adriana*). Country seat of the Roman emperor Hadrian. It is 2 m. S.W. of Tivoli, the ancient Tibur, and 15½ m. by tramway

E.N.E. of Rome. The grounds, covering an area of several sq. m., and the ruins some 170 acres, are a marvel of landscape gardening, and contain the remains of Hadrian's palace, of temples, baths, theatre, a stadium, colonnaded gardens, and imitations of other famous buildings seen in his travels. Excavations were begun in the 16th century.

Hadrian's Wall. Roman rampart, 73½ m. long, between Bowness on Solway Firth and Wallsend-on-Tyne, England. Erected by Hadrian about 122, and repaired by Severus about 208, it was mainly of freestone blocks with a rubble core, perhaps 18 ft. high and 6 ft. to 9½ ft. thick, flanked by a ditch averaging 36 ft. by 15 ft. A military road ran more or less parallel on the S. side, with an outer ditch and earthen mound—the vallum. At intervals of a

Hadrian's Villa, Tivoli. Remains of the swimming bath or Natatorium. Right, interior of the Philosophers' Hall, at the north-east corner of the square

Roman mile were about 80 smaller castella or mile-castles, averaging 80 ft. by 70 ft., whereof 52 are traceable. Between them were 160 recessed watchtowers. The wall ranks as an ancient monument. See Britain.

Haeckel, ERNST HEINRICH (1834-1919). German scientist. Born at Potsdam, Feb. 16, 1834, he studied medicine at Würzburg, Berlin, and Vienna. For a short time he practised as a physician, but devoting himself to natural history became professor of comparative anatomy and director of the zoological institute at Jena in 1862. Three years later he was appointed professor of zoology, and he remained at Jena for the rest of his life.

Ernst Haeckel,
German scientist

On the publication of Darwin's *Origin of Species*, Haeckel at once became an enthusiastic convert to the Darwinian theory of evolution. In his *Natural History of Creation*, 1868, he traced the descent of man from protoplasm to the chimpanzee in 26 stages, and declared human remains found in Java to be the missing link between man and the manlike apes.

With Darwin, he maintained the hereditary transmission of acquired characters, against the views of Weismann and later biologists, and held that the most elementary forms of substance, matter, and ether possessed sensation and will. His other books, *General Morphology of Organisms*, 1866; *The Last Link*, 1898; and *The Riddle of the Universe*, 1901, all expositions of evolution, have been translated into many languages, and the last-named is accepted as a popular text-book of rationalism. In it Haeckel claimed to have demonstrated by his theory of monism the non-existence of a personal God, of free will, and of the soul of man after death. In Oct., 1914, he signed the letter of the German scientists declaring Germany to be free of any blame for the outbreak of war. He died Aug. 8, 1919. A biography by W. Bülsche was trans. by J. McCabe, 1906. See *Evolution*; *Pithecanthropus*.

Haematite or **HEMATITE** (Gr. *haimatitēs*, blood-like), **SPECULAR IRON**, OR **KIDNEY ORE**. Important ore mineral of iron, one of the most widely distributed accessory minerals in the earth's crust. Haematite is ferric oxide (Fe_2O_3 ;

70 p.c. iron) crystallising in the hexagonal-rhombohedral system; H_2O may be present in the fibrous and earthy varieties. It may occur as steel-grey tabular or rhombohedral crystals with a metallic lustre, often splendent (specular iron); foliated and micaceous (micaceous haematite); as brownish-red to black radiating fibrous masses, often with a smooth mamillated surface (kidney ore); as a red, earthy, or ochreous variety often mixed with clay (reddle or red chalk), sand, or other impurities and grading into clay ironstone or argillaceous haematite. All varieties give a characteristic cherry-red to reddish-brown powder and streak.

Haematite has an almost universal distribution. It forms by the alteration and weathering of other iron bearing minerals such as siderite, limonite, magnetite (see Gossan); haematite (and limonite) in small quantities are the common pigmenting agent in sedimentary and other rocks, and in many red-brown minerals. It is deposited as a primary mineral in igneous rocks; in hydrothermal veins; as a sublimate due to volcanic activity (Vesuvius); and in metamorphosed rocks often associated with magnetite.

Concentrations in commercial quantities are formed as replacements of limestone by haematite, probably derived from overlying sediments (Cumberland, Lancashire, Spain, Utah); from the alteration and concentration of iron silicates and carbonate of sedimentary origin (Lake Superior district); as sedimentary beds (Alabama); in metamorphosed rocks (Brazil, Elba); and in residual deposits by weathering (Cuba, eastern U.S.A.). Apart from its use as an iron ore, haematite has more limited applications as a pigment, polishing abrasive, gemstone, in the manufacture of crayons, etc. See *Iron Ores*.

Haematoxilin. Colourless crystalline compound present in freshly chipped logwood (*Haematoxylon campechianum*). It is converted into the colouring matter haematein, naturally in the wood, on lengthy exposure to the air, and artificially by the addition of an alkali. Haematoxilin is prepared by combining fresh logwood extract with ether. It is employed in dyeing textiles. Logwood was formerly used in medicine as a mild astringent.

Haemocoel. The great cavity in the Arthropoda (*q.v.*) in which is found the fluid serving the func-

tion performed by blood in other creatures. It is probably to be understood as a huge enlargement of the blood-vascular system which, by enlarging, has obliterated the true coelom.

Haemoglobin (Gr. *haima*, blood; Lat. *globus*, ball). The colouring matter of the blood and the means by which the gaseous exchange of carbon dioxide and oxygen is carried out. It is readily attacked by certain gases, e.g. carbon monoxide and sulphuretted hydrogen. In the vegetable kingdom it is replaced by chlorophyll, one or other being present in any multicellular organism which respire.

Haemophilia. Congenital tendency to bleeding. For its cause, see *Blood Clotting*. It occurs in the male only, while being transmitted by the female of the line. The deficiency in the blood stream can be restored in a test tube by adding some very dilute Russell viper venom, whereupon haemophilic blood clots quite normally. This fact is made use of by local application of Russell viper venom to the wound of a bleeding haemophilic. The poison of this snake kills its victim by coagulating the blood in the vessels.

Haemoptysis (Gr. *haima*, blood; *ptysis*, spitting). Bleeding from the larynx, trachea, or lungs. It is bright red and frothy in character. The spitting of blood demands medical aid without delay, as the condition may be associated with serious disease, often tuberculosis.

Haemorrhage (Gr. *haimorrhagia*, bloody flux). Internal or external discharge of blood from a blood-vessel. Internal haemorrhage, when the bleeding occurs into the cavity of the chest or abdomen, may be recognized by the onset of faintness, pallor, air-hunger, failing pulse, and collapse. The patient should be laid flat, fresh air should be provided, ice given to suck, and cold dressings, preferably in the form of ice, applied to the seat of the haemorrhage if known. If collapse occurs, the limbs should be raised and bandaged firmly from end to end. No stimulant should be given, as this tends to cause a continuance of the trouble. Bleeding from the lungs, when bright and frothy blood is expectorated, should be treated similarly; and also bleeding from the stomach when blood, dark in colour, and often resembling coffee-grounds, is vomited.

External haemorrhage may be arterial, venous, or capillary. Arterial haemorrhage occurs when an artery, i.e. a blood-vessel

conveying blood from the heart, is injured. It is recognized by the bright red colour of the blood, which, unless the wound is very deep, is seen to escape from the end of the artery nearer the heart in pulsating jets, corresponding in rhythm to the heart-beat. Venous haemorrhage occurs when a vein, i.e. a blood-vessel conveying blood to the heart, is injured. The blood either wells up from the depth of the wound, or is seen to flow from the side of the wound farther away from the heart. It is dark in colour, and escapes in a steady stream. Capillary haemorrhage, i.e. bleeding from the capillaries, which are very fine blood-vessels found in the skin and almost universally throughout the body, occurs in all wounds to a greater or less extent. It is recognized by the steady oozing of bright red blood from all parts of the wound.

In some cases a tourniquet is essential, and this may be extemporised by lightly bandaging a hard pad on the pressure-point, and then twisting the bandage with a stick so as to tighten the bandage. Bleeding from a vein can usually be stopped by pressure upon the wound, but if this fails pressure should be exerted on the side of the wound farthest away from the heart. In bleeding from a varicose vein, pressure should be applied on both sides of the wound. Bleeding from capillaries can always be stopped by pressure upon the wound, or by the application of hot (not warm) or cold water. *See* Blood; First Aid; Tourniquet.

Haemorrhoids (Gr. *haima*, blood; *rhein*, to flow) or **PILES**. Varicose veins in the anus and lower part of the rectum. The most frequent causes are a sedentary life, chronic constipation or loose motions, and any disease which retards the circulation through the veins, such as congestion of the liver. Women suffer less than men, but pregnancy and diseases causing enlargement of the uterus sometimes bring on the condition. When the enlarged veins protrude from the anus and are covered with skin, they are known as external piles, those within the anus in the lower rectum being referred to as internal piles.

Treatment consists in rest, simple food, and the maintaining of soft-formed stools. Cure, not always permanent, is by operation or by injection of a sclerosing substance.

Haemostatic. Substance used to check bleeding. Some of these substances are given internally,

such as adrenalin, which acts by contracting the oozing vessels, as does ergot in bleeding from the uterus. Calcium has a powerful rôle in the clotting of blood, while serum from a bled horse, applied or injected, supplies missing substances in the human blood stream; but the best haemostatic in obstinate cases of bleeding is a blood transfusion, restoring for the patient the intricate mechanism of coagulation which has become disorganized. Simple haemostatic applications are adrenalin, which shrinks the vessels, and the astringent group represented by tannic acid, alum, etc. Of all local applications, Russell viper venom has perhaps the greatest value. The venom of this snake kills its victim by coagulating the blood in the vessels, so that its use as an applied haemostatic is logical. Troublesome bleeding tends to occur when the vessel walls degenerate with damage done by streptococcal infection, or deficiency of Vitamin C. *See* Blood; Haemorrhage.

Haff. Name given to the lagoons on the Baltic coast of Prussia. They are due to the gradual formation of an alluvial bar, or *Nehrung*, across the mouth of an estuary where the outward silt-laden current of a river is checked by the different direction of the currents farther out to sea. The haff, or lagoon, within the bar, is steadily being silted up since the bar interferes with the free outflow of the river floods. *See* Lagoon.

Haffkine, WALDEMAR MORDECAI WOLFF (1860-1930). Russian bacteriologist. Born of Jewish parents at Odessa, he was educated at the university there and engaged in research work at the zoological museum, 1883-88. He was assistant to Pasteur in Paris, 1889-93. Employed by the British government in India, he invented a vaccine which greatly reduced mortality from plague. He was also in the forefront in fighting the cholera scourge by protective inoculation. The research laboratory, now the Haffkine Institute, at Bombay was founded by Haffkine, who died Oct. 26, 1930.

Haffner Symphony. Popular title of the symphony no. 35 in D by Mozart. This was originally written as a serenade for the Haffner family of Salzburg. It was later orchestrated in its present form by the composer, being completed at Vienna in 1782.

Hafid, MULAI (b. 1873). Sultan of Morocco. Son of Mulai Hassan II, he was educated at Al Azhar university, Cairo, and on his return

to Morocco was appointed viceroy to the southern part of the kingdom. The policy of his half-brother, Abd-el-Aziz, led Mulai Hafid to rebel, and in 1907 he proclaimed himself sultan and drove Abd-el-Aziz from the throne. In 1912 he was deposed by his brother Mulai Yussuf.

Hafiz (d. c. 1388). Name used by the Persian poet Shams-ud-din Mohammed. He was born at Shiraz, capital of Fars, where he appears to have spent most of his life. His fame as a poet, philosopher, and student of the Koran was such that a college was specially established for him, where he taught for many years. Hafiz, though his personal life earned the censure of the more austere, was a member of a devotional order of Islam.

His great work was the *Diwan*, a collection of short lyrical poems in the form known as the *ghazal*, in expression sensuous and mellifluous, but inspired by the mystical creed of the Sufi. He is regarded as the most finished of the Persian lyricists, and exercised a lasting influence on the forms of Persian verses in later generations. His tomb, a little N. of Shiraz, is still visited by pilgrims. A prose Eng. trans. of the *Diwan*, by H. W. Clarke, was published in 1891; and *Fifty Poems*, by different translators, ed. A. J. Arberry, appeared in 1947.

Hafnium. Chemical element, symbol Hf, atomic number 72, atomic weight 178.6. A metallic element, it was discovered by Coster and de Hevesy in 1922. Hafnium compounds are found in association with zirconium compounds and are separated from the latter by fractional crystallisation of the double fluorides K_2ZrF_6 and K_2HfF_6 , or by fractional precipitation of the phosphates. The metal resembles zirconium; it melts at $2,220^\circ\text{C}$, and has a density about 12-13; it is ductile and has been used as a constituent of tungsten filaments. The oxide HfO_2 is a white refractory solid; phosphates of hafnium have been prepared; the chloride $HfCl_4$ is volatile at 250°C .

Hagana (Hebrew, defence). National army of the state of Israel. Originally formed illegally in 1936-39 to resist the violence of Arabs during the Arab revolt, it supported, and had the support of, the Jewish agency (*q.v.*). During the Second Great War a large number of the Palestinian Jews who served against the Axis were recruited by the British

from its ranks ; but it was still not recognized officially, and the possession of arms by its members remained illegal. Members did useful work in commando operations and military intelligence ; the Palmach, so-called striking force of the Hagana, was formed on the initiative of G.H.Q., M.E.F., and trained by British instructors. In 1943, when it became clear that the Jewish community through the Hagana was building up stores of arms in Palestine, measures of disarmament were taken, Jews being imprisoned for illegal possession of arms. When the cleavage between the British and the Jews became acute in 1946, the Hagana was responsible for certain acts of violence in Palestine. With the end of the British mandate and the formation of the independent state of Israel, Hagana came into conflict with Irgun (*q.v.*). Recognized by the Israeli govt. as its regular army, it fought well in the Arab-Jewish war that followed. All men from 18 to 40 were mobilised. *See* Palestine.

Hagar. Egyptian handmaid to Sarai, by whom Abraham became the father of Ishmael (Gen. 16). Sarai's jealousy caused her to flee with her son to the wilderness, where, in a vision, she learnt the future of Ishmael. She returned to Abraham, but at a later date was finally sent away, and afterwards married her son to an Egyptian woman (Gen. 21). *See* Abraham.

Hagen. Town of Germany, 30 m. N.E. of Düsseldorf, in Westphalia. It lies just S. of the river Ruhr, on a main rly. and two motor highways, and in 1929 absorbed the former town of Haspe. Before the Second Great War, in which it suffered immense damage mostly as the result of air raids, it was the centre of Germany's small machinery and tool industries. The town, which stands in pleasant wooded surroundings, is almost entirely modern, though there is a church dating from 1748. Pop. (1946) 124,777.

Hagen, WALTER (b. 1892). An American golfer. Born at Rochester, N.Y., Dec. 21, 1892, he won the open championship of his country in 1914 and 1919, the championship of France in 1920, and that of Belgium in 1924. He became the only foreigner to win the British open title four times, in 1922-24-28-29, the last victory being remarkable for a round of 67 in a thunderstorm. A member of the original Ryder Cup side of 1919, he was captain of teams visiting England in 1929 and

1933, and non-playing captain in 1937. Once he beat R. T. Jones (*q.v.*) by 12 and 11. Hagen could be erratic in his long game, but redeemed errors by his putting.

Hagenbeck, CARL (1844-1913). German dealer in wild animals. Born in Hamburg, June 10, 1844, he succeeded his father, who had developed a menagerie from a fishmonger's shop. He organized expeditions for catching animals, especially in Africa ; devised methods for the "training by kindness" of wild animals, succeeding with allegedly untamable Polar bears ; and introduced the outdoor zoo without cages. That built by him in 1897 at Stellingen, near Hamburg—severely bombed during the Second Great War—served as prototype for zoos the world over, *e.g.* Whipsnade. Two sons succeeded Hagenbeck on his death, April 14, 1913, and after the interruption of the First Great War became once more the world's leading suppliers of wild animals. *See* Zoological Gardens.

Hagerman Pass. Lofty mountain track over the Rocky Mts. of Colorado, U.S.A. It is on the line of the Colorado Midland rly., and reaches an alt. of 11,535 ft.

Hag-fish OR **HAG** (*Myxine glutinosa*). Order of marine animals belonging to the lamprey group.

Hag-fish, species of lamprey found on the coasts of Britain

In appearance they resemble small round eels, but have no side fins and no lips. They have teeth on the tongue and palate, and tentacles on the head, which seem to assist them in boring their way into the bodies of the fishes on which they feed. Their eyes are much reduced. They secrete a remarkable amount of thick slime. The common hag-fish is found on the British coasts, and is occasionally 2 ft. long. These animals are not true fish, and are separately classed by zoologists as Cyclostomata, round-mouthed.

Haggai. Tenth of the minor prophets of the O.T. He returned from the Babylonian captivity with Zerubbabel, and began to prophesy in his old age. His book in two chapters is homely in style and contains four prophecies, all belonging to the same year, and designed to encourage the people

in rebuilding the temple. It was written, according to his own statement, in the second year of the reign of Darius Hystaspis (520 B.C.).

Haggard, SIR HENRY RIDER (1856-1925). British novelist. He was born at Bradenham, Nor-

H. Rider Haggard
Russell

folk, June 22, 1856, and educated at Ipswich grammar school. He held official posts in S. Africa, 1875-79, and was then called to the bar at Lincoln's Inn. A first work, *Cetewayo and His White Neighbours*, was published in 1882. South Africa figures prominently in his novels, the success of which is due to Haggard's exceptional narrative and descriptive powers.

In addition to *King Solomon's Mines*, 1885, his most successful adventure story, and *Jess*, 1887, perhaps his best work, his novels include *Dawn*, 1884 ; *She*, 1887, in which mystery is blended with adventure ; *Allan Quatermain*, 1887 ; *Colonel Quaritch, V.C.*, 1888 ; *Cleopatra*, 1889 ; *Allan's Wife*, 1890 ; *Nada the Lily*, 1892 ; *Montezuma's Daughter*, 1893 ; *The Heart of the World*, 1896 ; *Ayesha*, 1905 ; *Fair Margaret*, 1907 ; *Red Eve*, 1911. In 1891, with Andrew Lang, he wrote *The World's Desire*.

Haggard, who was knighted in 1912, became prominent as a practical farmer and an agricultural economist. His journeyings through England in 1896-98 to investigate rural conditions resulted in a valuable work, *Rural England*, 1902. After the First Great War he visited every part of the British Empire in connexion with settlement of ex-servicemen. He died May 14, 1925.

Haggerston. Suburb of N.E. London. Mentioned in Domesday as Hergotestane, and once a hamlet in the parish of S. Leonard's, Shoreditch, it is covered with factories and artisan dwellings, and stretches from the N. side of Hackney Road to Dalston, and from Kingsland Road on the W. to London Fields. There were several almshouses founded by city companies. Near Hackney Road is the Queen Elizabeth hospital for children, built 1868. Of the churches, S. Augustine's dates from 1867 ; S. Columba's from

1868; S. Chad's from 1869. S. Mary's was destroyed by German bombs in 1941. Halley, the astronomer, was born in Haggerston.

Haggis. Ancient Scottish dish, supposed to have been adapted from the French. The stomach of a sheep, having been thoroughly washed and allowed to soak for several hours in cold salt water, scalded in boiling water, and then scraped with a knife, is used as a bag into which the ingredients are placed, chiefly the heart, liver, and lungs (pluck) of a sheep.

For a meal intended for eight persons there are added 1 lb. of finely shredded suet, two chopped onions, half a pint of oatmeal or $\frac{1}{2}$ lb. of toasted and crumbled oatcakes, two teaspoonfuls of salt and one of pepper, half a nutmeg (grated), a grain of cayenne, half a pint of good gravy, and the juice of a small lemon. Having been drained, boiled, and trimmed, half the liver is grated and the rest of the ingredients are finely minced. All the ingredients are then put into the prepared bag—care being taken that no thin parts of the bag are left, and that allowance is made for swelling—carefully sewn up, plunged into boiling water and boiled gently for three hours, being pricked with a needle occasionally during the first half-hour, and then served hot without sauce or gravy. Burns, in his poem, *To a Haggis*, describes the dish as "great chieftain o' the puddin' race."

Hagi. Town of Japan, on the island of Honshu. Situated near the S.W. extremity of the island, 50 m. W. of Hiroshima, it is notable as the seat of the daimos of Chosu, who were largely instrumental in crushing feudalism. Pop. 32,270.

Hagiography (Gr. *hagios*, holy; *graphein*, to write). General term for sacred writings, or for biographies of saints. Of related words hagiographia, of frequent use in the early Church, was applied by the Jews to the Psalms, Proverbs, Job, Ezra, Esther, Chronicles, Solomon's Song, Ruth, Ecclesiastes, Nehemiah, Lamentations, and Daniel, books not read publicly in the synagogues. Hagiocracy means a priestly hierarchy, hagiolatry the worship or invocation of saints. See Saint.

Hagiology (Gr. *hagia*, holy things; *logos*, account). Term applied to literature dealing with the saints of the Christian Church. It includes all the martyrologies and biographies of saints and martyrs. The Roman martyro-

logy contains about 3,000 names. The Eastern lists are also lengthy, and to these must be added the long list of local saints whose memory is preserved only in their native country. Cornwall and Brittany, for example, commemorate early saints of whom hardly anything is known.

The earliest attempt at a hagiology is that of Eusebius. The Assembly of the Ancient Martyrs. In the Greek

Church, the hagiologies or menologies date from the 9th century. The first attempt at a criticism and revision of the hagiologies of the Western Church was made by the Flemish Father Rosveyde (d. 1629). His researches led to the compilation of the *Acta Sanctorum* and the establishment of the Bollandists (q.v.). See Martyrology; Saint.

Hagion Oros, GULF OF. Opening of the Aegean Sea. It lies between the peninsula of the same name and that of Longos, the easternmost and central prongs of the Chalcidic peninsula in Macedonia. It is also called the gulf of Monte Santo, and is about 20 m. in length, and 15 m. in breadth at its widest. The peninsula of Hagion Oros is also named the Athos peninsula, because Mt. Athos stands on it.

Hagioscope (Gr. *hagios*, holy; *skopein*, to look at). Oblique opening in the internal walls of a church, usually running from the transept into the chancel and affording a view of the altar. Its purpose was to enable the congregation in the transept to see the elevation of the Host at mass. The term was figuratively applied to the leper's squint, an opening in the wall of the church whereby lepers could watch the service without coming in contact with the congregation.

Hague, THE (Dutch, Den Haag or 's Gravenhage). Seat of the Netherlands government and capital of the prov. of S. Holland. It lies in flat country, in parts sandy, but pleasant and well tilled, about 14 m. N.W. of Rotterdam and $2\frac{1}{2}$ m. from the

North Sea at Scheveningen. The city is attractively laid out, with broad streets and pleasant squares, in orderly

The Hague. The Palace of Peace opened in 1913 as a seat for The Hague Tribunal and for peace conferences

but not monotonous arrangement. There are two large rly. stations and good tramway services. The Hague is the residence of the royal family, and the seat of the legislative and central judicial bodies of the country. Its chief industries are printing works, distilleries, furniture, and earthenware works. Pop. 476,308.

The central point of the city is the Plein, near which stand the buildings of the supreme court, the ministries of war, justice, and overseas territories, and the Mauritshuis, erected 1633-44 and rebuilt 1704-18, in which is housed the famous collection of pictures made by successive princes of Orange. Close by is the Binnenhof, a group of buildings round a square, where are the Hall of the Knights, used by the chambers in joint session, and the halls in which the first and second chambers sit. The Gevangenpoort, overlooking the ornamental water known as the Vijver, is a medieval tower formerly used as a prison.

The town hall, originally built about 1565 and restored in the 17th century, is a highly characteristic Dutch building of its period. The most notable churches are the Nieuwe Kerk, dating from the mid-17th century, where lie the remains of the de Witts (q.v.) and formerly lay those of Spinosa; and the Grote Kerk, a 15th century Gothic building, with a lofty tower and ironwork spire and a carved 16th century pulpit.

The royal palace, an 18th century edifice enlarged 1816-17, stands on the Noordeinde and has extensive private gardens behind. To the N. lies the pleasant open space of the Willem's park, the heart of the fashionable quarter of the city, with the large monument erected in 1869 to commemorate the achievement of national independence in 1813.

The Hague. 1. The Vijver, an ornamental water in the centre of the city, with part of the Binnenhof on left. 2. The Palace of the Queen, with statue of William the Silent, by Count Nieuwekerke, 1845. 3. The Huis ten Bosch, the royal villa in the woods, built 1645. 4. The Mauritshuis, rebuilt 1704-18, containing the famous picture galleries. 5. The Hall of the Knights in the Binnenhof, meeting place of the Dutch chambers

Other places of interest are the Steengracht gallery, the municipal museum, the royal library, the Mesdag museum, and the museum of industrial art.

To the N.E. of the town lie the zoological gardens. The beautiful Haagsche Bosch, a large wooded park, in parts quite wild, contained the royal villa known as the Huis ten Bosch, built about 1645, in which the first international peace conference met in 1899; but the Bosch was laid waste by the Germans in the Second Great War. The palace of peace, built largely at the expense of Andrew Carnegie to the designs of the French architect Cordonnier, to house the international peace conferences and the court of arbitration, was opened in 1913. (See Hague Tribunal.)

In history The Hague has enjoyed the advantages of its isolated position in the Low Countries, and comparative tranquillity. Its origins are traced to a hunting seat of the counts of Holland, c. 1250, which gradually became their regular residence towards 1280. From the last decade of the 16th century The Hague was the political centre of the states

general of Holland, which gave it increased importance. The murder of the de Witts in 1672 was a terrible episode.

In 1795 the French revolutionary armies captured the city, and the Batavian republic was set up. It remained in French possession until 1813. Even as late as 1806 The Hague held the status of a village, but Louis Bonaparte then raised it to a town.

The Hague has long been a centre of diplomacy, and has given its name to several treaties. Among them are the alliance of England, Sweden, and the Netherlands, 1668; and the treaty between England, France, and Holland in 1717. The old-standing tradition of The Hague as a peace-making centre of the nations led many to support its claims to be the seat of the League of Nations, but Geneva was selected.

German parachute troops landed near The Hague on May 10, 1940, during the invasion of Holland, but most were destroyed by Dutch troops. Airborne units landing at various points along the coast advanced on The Hague with the object of seizing Queen Wilhelmina and the government, all of whom,

however, escaped to England. The city was considerably damaged by air raids; and there was fighting in the city between Dutch troops and fifth columnists, before the Germans entered on May 15. A brilliant low-level attack was carried out by R.A.F. Mosquitoes on a house in the Scheveningsch Weg on May 3, 1944; the building, with documents belonging to the Gestapo, was completely destroyed. On March 3, 1945, the R.A.F., attacking V2 sites, unintentionally destroyed instead a residential area. The Hague was occupied by the Germans until May 8, 1945.

Hague, CAP DE LA. Promontory of the Cotentin peninsula, France, in the dept. of Manche. It is at the N.W. extremity of the dept. and juts out into the English Channel, 12 m. N.W. of Cherbourg. Alderney is 10 m. W. of the point, and about 35 m. E.S.E. is the roadstead of La Hogue or La Hougue.

Hague Agreements. Agreements signed on May 28, 1937, for the fostering of mutual trade between the "Oslo states"—Belgium, Denmark, Finland, Luxembourg, the Netherlands, Norway, and Sweden, the signatories to the

Osló protocol of Dec. 22, 1930. The duration of the Hague agreements was to be one year. They were not renewed, owing to the unfavourable development of the world trade cycle, although the signatories placed on record their desire to continue economic collaboration.

Hague Conference. An international conference held at The Hague in the interests of peace. The suggestion for a conference of this kind came from Tsar Nicholas II, and in 1899 there met representatives from European countries and the U.S.A. The members signed three conventions. The first concerned the establishment of an international court of arbitration, long known as The Hague tribunal; the second dealt with the laws and customs of war; and the third with naval warfare. In addition it was declared that throwing missiles from balloons, and the use of poison gases and of expanding bullets, were illegal.

A second conference met in 1907, when a proposal put forward by the British government for the reduction of armaments was rejected; but in other directions much was done. The conventions of 1899 were revised, and conclusions were reached on such matters as the rights and duties of neutral states in naval warfare, the conversion of merchant vessels into warships, the laying of automatic submarine contact mines, the bombardment of undefended towns by warships, etc. A resolution was passed on the strength of which a conference on prize law met in London in 1908 and drew up the Declaration of London. Conferences of many European powers were held at The Hague in 1893, 1894, 1900, and 1904 to deal with matters of private international law—for instance, marriage. See Hague Tribunal; International Law; United Nations.

Haguénau. Town of France, in Bas-Rhin dept. (Alsace). It stands on the Moder, 18 m. N. of Strasbourg. It was fortified by Barbarossa in the 12th century, and the palace which he built there remained until destroyed by the French in 1678. The centre of a hop-growing dist., the town engages in wool-spinning and makes porcelain stoves. It became a free imperial city in 1257. The principal church, that of S. George, dated from the 12th century, and contained a great wooden figure of Christ (1488). Haguénau passed to France by the treaty of Westphalia (1648), became German in

1871, and once more was transferred to France in 1919. It suffered severely in the three weeks' heavy fighting which preceded its liberation, Dec. 11, 1944, in the Second Great War. Pop. 17,337.

Hague Tribunal. International court of arbitration established in 1899 for the settlement of disputes between one country and another. Its home was at The Hague, in the Palace of Peace, opened 1913. It arose out of the peace conference held there in 1899, when it was decided to form a permanent international court of arbitration. Up to the Second Great War a number of cases were referred to the tribunal, among them being that of Great Britain, Germany, and Italy against Venezuela. The permanent court of arbitration was merged into the scheme of the International Court of Justice (with headquarters at The Hague), set up by the United Nations. This met for the first time in Feb., 1946. See International Court of Justice.

Haha (O.E. *haw*, hedge). Sunken fence or ditch. Fences are erected in this manner in order not to spoil the view. Usually they take the form of an ornamental sunken hedge concealing a fence.

Hahn, Otto (b. 1879). German chemist and physicist. Born at Frankfurt, March 8, 1879, he discovered the substance radiothorium in 1905, mesothorium in 1906, and in 1918, with Lise Meitner, protactinium. As director from 1924 of the Kaiser Wilhelm institute of chemistry at Berlin, Hahn played an outstanding part in atomic research. He gave up his work in Germany during the final phase of the Hitler regime, and went to the U.S.A., returning after the Second Great War to a professorship at Göttingen, W. Germany. He was awarded the Nobel chemistry prize in 1944.

Hahnemann, Samuel Christian Friedreich (1755-1843). German physician. Born at Meissen,

Samuel Hahnemann.
German physician

April 10, 1755, he became a doctor after studying at Leipzig and Vienna. He practised in Dresden and Leipzig, but his reputation rests upon the system of homeopathy which he founded. His theory was first put forward in an article in 1796 and was afterwards worked out more deliberately in books, especially his chief one, The

Organism of Rational Health. He practised at Köthen and later in Paris, after he left Leipzig owing to the unpopularity of his theories among those whose business was affected thereby, but he had the satisfaction of seeing them widely accepted. He died July 2, 1843. See Homeopathy; consult also Life and Letters, T. L. Bradford, 1895; Life, R. Hachl, 2 vols., Eng. trans., 1927.

Hai-cheng. A town of Manchuria, in the prov. of Liaoning. It stands on the S. Manchurian rly., and is a centre of the Manchurian silk trade. Pop. 681,500.

Haida (men). North American Indian tribe in Queen Charlotte Islands, British Columbia, and Prince of Wales Island, Alaska. They are divided into two matrilineal clans, Eagle and Raven; each individual has a personatōtem (animal-helper). Their skill fully carved ceremonial rattles, masks, and totem poles betray Polynesian influence.

Haider Ali or **Hyder Ali** (c. 1722-82). Ruler of Mysore. A Mahomedan of insignificant parentage, he entered in 1749 the service of the raja of Mysore, where his strong personality soon placed him at the head of affairs. In 1763 he conquered Kanara, and the wealth thus attained completely turned his head. In alliance with the nizām of Madras he fought the British at Chengam, 1767, and was signally defeated. Persisting in hostilities, he succeeded in 1769 in effecting a treaty with his victors, but was unable to induce them to help him in his campaign against the Mah-rattas in 1772. In revenge for this he took advantage of the war with France to march on Madras, 1779, but after some initial successes was routed by Sir Eyre Coote in an engagement near Porto Novo. He died at Chittore.

Haiduk. Hungarian word given to a certain class of outlaws in Turkey and other Balkan countries, e.g. Serbia. It meant originally robber, but in Hungary it came to refer to mercenary soldiers. Early in the 17th century these received a grant of land on the left bank of the Theiss, which was then called the Haiduk district. It was also used for the retainers of the Hungarian landowners. One theory is that the word was first given to some Turkish outlaws who took refuge in Hungary.

Haifa. Town and principal port of Palestine. Lying in the bay of Acre, under Mt. Carmel, it has a roadstead free from reefs, and is

the only good harbour in Palestine, with a depth of 30 ft. alongside the main quay. It is the terminus of the 620-mile pipe-line from the Iraq oilfields, and has extensive refineries. The pipe-line pumps two million gallons of crude oil per annum to the port. Between its completion in 1930 and 1946, the pop. of Haifa increased from 50,000 to 145,230, of which number 74,230 were Jews.

A standard gauge rly. runs N. from Haifa into Syria, and S. to Egypt. A narrow gauge rly. runs to Nablus, and there is a branch line via Deraa in Syria to Amman and Ma'an in Transjordan. Good motor roads lead to the principal towns of Palestine, and Haifa is the terminus of the road route to Bagdad. There is an airport. The town is handsome and spacious.

During the First Great War Haifa was occupied by advancing British troops on September 23, 1918. During the Second Great War, it was one of the two contraband control bases for the Mediterranean area and an important refuelling base for Allied warships. While the Axis armies were threatening Egypt, the port was frequently raided by German and Italian aircraft, the first attack being on July 15, 1940, and the last in Dec. 1942. Haifa was the scene of many acts of terrorism during the Arab and Jewish conflicts with the British administration. It was a trans-shipment port for illegal Jewish immigrants apprehended by the R.N. See N.V.

Haig, DOUGLAS HAIG, 1ST EARL, 29TH LAIRD OF BEMERSYDE (1861-1928). British soldier, c.-in-c. of the British forces in France for the greater part of the First Great War. Born in Edinburgh,

June 19, 1861, youngest son of an ancient Fife family, he was educated at Clifton and Brasenose College, Oxford, whence he went to Sandhurst, and was gazetted in 1885 to the 7th Hussars. After passing through the Staff College, he served in the Khartum campaign of 1898. During the S. African war he acted as chief of staff to Sir J. French at Colesberg in 1900, and in 1901-02 commanded a group of columns under Kitchener. From 1903 to 1906 and again from 1909 to 1912 he served in India, becoming chief of staff to the Indian army. Returning to Europe he was appointed to the Aldershot command.

At the outbreak of the First Great War in Aug., 1914, he went to France in command of the 1st corps, and took part in all the earlier battles, becoming in Jan., 1915, commander of the 1st army. In Dec., 1915, he succeeded French

Haig. J.H.

as c.-in-c., and held the position until the end of the war, being promoted field-marshal Jan. 1, 1917. In the Somme offensive of 1916 his thoroughness of organization was seen in the completeness of preparations for the attack, which involved very great engineering work. In 1917 he was required to act under Nivelle's direction, but he gained two brilliant victories at Arras and Messines, though his arrangements were upset by the necessity for prolonging the Arras attack in order to relieve the pressure on Nivelle, whose offensive on the Aisne had failed. Thus the 3rd battle of Ypres did not open until July 31, when the good weather had gone. This involved fearful sacrifices without giving complete victory. The 1st battle of Cambrai was a remarkable success, but again it could not be exploited. In the early part of 1918 Haig's reserves were greatly weakened,

Haifa. The harbour, opened in 1933. Top, Mount Carmel from the east, showing the monastery, parent-house of the Carmelite order, founded here in the 12th century: outskirts of Haifa are seen on the right

and when the great German offensive was opened on March 21, disastrous initial loss was inflicted by the rapidity and overwhelming weight of the advance; but the British dispositions were generally justified and the attack was not fatal. On the other hand, when Haig took the offensive on Aug. 8, he handled his troops with great skill, pressed the Germans firmly and relentlessly, and won a series of victories against forces not inferior in strength such as no general had previously gained in the war. The greatest feat in his career was his assault on the Hindenburg line (Sept. 27-Oct. 1), undertaken against the judgement of the British war cabinet, and Foch.

Haig's leadership has been the subject of much criticism. It is

said that through lack of imagination and his habitual caution he lost opportunities, and that his stonewall tactics in the war of attrition too often led to disaster. But he led, in the most terrible war in history up to that time, by far the largest British forces which had ever taken the field; and by sheer strength of character and determination he played the leading part in the 100 days of almost continuous battle which ended the war. His armies seldom saw him in person, never heard his voice, for he was shy of public appearances; yet they trusted him, and responded magnificently to the implicit appeal of his famous "backs to the wall" order of April 11, 1918.

In 1919, Haig was awarded an earldom, and received the O.M. and a grant of £100,000. His remaining years were devoted to improving the lot of the men who had served under him, uniting the various efforts on their behalf into the British Legion, of which he became president. Almost alone among the military and other leading figures of the war, he retained a dignified silence amid the various controversies which followed the war, and made no attempt to justify or apologise for his war record. He died suddenly in London, Jan. 29, 1928, and was buried in Dryburgh Abbey, ancient burial place of the Haig family. An equestrian statue by A. E. Hardiman was unveiled in Whitehall, London, 1937 (*See* Hardiman illus.). His only son George Alexander Eugene Douglas Haig (b. 1918) succeeded to the title.

Hail. Pellets of ice which fall from thunder clouds (cumulonimbus) or large cumulus clouds. They are of various sizes and shapes, complex in structure, and transparent. Hailstones as big as grapefruit and weighing over 2 lb. have been observed. They result from the growth of ice crystals at the expense of water drops lower in the same cloud. These crystals, condensed directly out of the rising air in the higher regions, increase to pellets sufficiently heavy to overcome the resistance of rising air currents. They fall through the

cloud; strike supercooled water drops supported by the ascending air; and freezing occurs, the water uniting with the ice. When the air can no longer support the hailstone it falls to the ground as a mass of ice. Hail does great damage to fruit trees and glass.

Hail. Town of Saudi Arabia, in the prov. of Nejd. It lies on the N. slopes of the Jebel Shammar, 240 m. N.E. of the holy city of Medina, and was the capital of the Ibn Rashid dynasty before the advent to power of Ibn Saud, who captured it in 1920. Hail is a station on the motor route opened in 1935 for the convenience of pilgrims between Medina and Iraq. Pop. about 15,000.

Hailes, DAVID DALRYMPLE, LORD (1726–92). Scottish lawyer and historian. Born in Edinburgh,

Lord Hailes,
Scottish lawyer
After Seton

Oct. 28, 1726, he was the eldest son of Sir James Dalrymple and a descendant of Viscount Stair. Educated at Eton and Utrecht, he had a successful career as an advocate and was made a judge in 1766 as Lord Hailes. He died Nov. 29, 1792. His baronetcy passed to his nephew, and his estates to the family of Ferguson, into which his daughter married. Lord Hailes was friendly with Johnson, Burke, and Horace Walpole. He replied to Gibbon's strictures on Christianity and wrote on antiquarian subjects. His *Annals of Scotland*, a chronological outline, 1057–1371, is scrupulously fair and accurate.

HAILES is a village in East Lothian; it stands on the Tyne, and has a ruined castle.

Haile Selassie I (b. 1891). Emperor of Ethiopia (Abyssinia), his national title being Negus

Negesti Lion of the tribe of Judah, Elect of God. Born at Harar, July 23, 1891, he was the son of Ras Makonnen, descendant of a king of Shoa. Named Lij Tafari, he was made governor of Harar prov. at the age of 14, and in 1916, his aunt Zauditu being empress, heir to the throne and

regent. He virtually held supreme authority long before he was crowned emperor on Nov. 2, 1930.

He had promulgated a law in 1924 for the gradual abolition of slavery, all future children of slaves to be free. He now granted a constitution, July 16, 1931, with a parliament of two chambers, and encouraged reforms in law and education.

When fascist Italy invaded Abyssinia in Oct., 1935, Haile Selassie made a brave and dignified stand, but after the defeat of May, 1936, took refuge in Great Britain and tried to mobilise the moral force of the world against the aggressor, e.g. by a personal appeal to the League of Nations. He succeeded only after Mussolini's attack on France in 1940. Flying to Khartum, he re-entered his country, Jan. 20, 1941, and his capital, Addis Ababa, May 5. He started at once far-reaching reforms; a decree of Aug. 26, 1942, abolished slavery and serfdom completely. Haile Selassie lost three sons during the war with Italy and the partisan struggle. A daughter died while nursing in Addis Ababa. Three sons and one daughter survived, Prince Asfa Wassen (b. 1916) being crown prince and heir apparent. Haile Selassie was granted representation at the Paris conference in 1946, presenting a claim against Italy for the recovery of Eritrea.

Haileybury and Imperial Service College. English public school. Haileybury College was founded in 1862 and took over the college near Hertford maintained by the East India Company from 1806 until its dissolution. It is a Church of England school and is

Haile Selassie I,
Emperor of Ethiopia

governed by a council. C. R. Atlee was educated here. The Imperial Service College, Windsor, was founded in 1912. The amalgamation of the two schools took place in 1942 under a supplemental charter. It aims at maintaining the connexions and traditions of both schools.

Haileybury College, famous public school founded in 1862

Hailsham. Market town and parish of Sussex, England. It is $\frac{7}{8}$ m. N. of Eastbourne, and has a rly. station (Southern region). The chief building is S. Mary's church, in Perp. style. The town has a trade in agricultural produce, cattle and sheep markets, and one or two manufactures. Near is Michelham, a residence which was once a monastic house. Market day, Wed. (alternate). Pop. 5,420.

Hailsham, DOUGLAS MCGAREL HOGG, 1st Viscount (b. 1872). British statesman. Born Feb. 28,

1st Viscount
Hailsham,
British statesman

1872, he was eldest son of Quintin Hogg (q.v.). An Etonian, called to the bar in 1902, he became one of the leading counsel of his day, and was made K.C. in 1917. He became Conservative M.P. for St. Marylebone in 1922, in which year he was made attorney-general and was knighted. He was appointed lord chancellor in 1928 and created a baron, being made a viscount on his retirement in 1929. He became secretary of state for war in 1931, and leader of the house of lords; and went as British delegate to the Ottawa conference, 1932, and the world economic conference, 1933. Hailsham was lord chancellor again from 1935 to March, 1938, then lord president May-Nov. His son and heir, also named Quintin Hogg (b. Oct. 9, 1907), was Conservative M.P. for the city of Oxford from 1938.

Hainan. Island S. of China, separated from Kwangtung prov. by a narrow strait. Kiungchowfu is the capital, and Hoihow the chief port. The centre of the island is mountainous, with peaks rising to 7,000 ft. Chinese inhabit mainly the coast line; in the interior aboriginal tribes, known as Sai or Li, maintain a semi-independent existence. Rubber is produced and tin normally exported, but the mine is still worked by native methods.

During the China-Japan conflict Hainan was occupied by Japanese forces on Feb. 10, 1939. The Japanese admiralty declared the seizure necessary to strengthen the blockade and check the influx of arms to the Chinese nationalists from Indo-China. Before Japan's entry into the Second Great War there were strong concentrations of aircraft and troops on Hainan

in readiness for the assault on Hong Kong. Occupation lasted until the unconditional surrender of Japan in 1945. Area, 13,900 sq. m. Pop. est. 1,500,000.

Hainault or **HAINAUT.** Prov. of Belgium, formerly the county of Hainault. It is bounded by the irregular line of the French frontier, and by the provinces of W. and E. Flanders, Brabant, and Namur. The prov. is hilly in parts, especially round Renaix, and in the district known as the Borinage, round Mons. The Schelde, Sambre, Dendre, and Haine are the chief rivers. The seat of the provincial administration is Mons, and other important towns are Charleroi, Tournai, Thuin, Lessines, Ath, Leuze, Enghien, Jumet, La Louvière, Soignies, and Jemappes.

Hainault contains one of the chief industrial areas of Belgium, the rich coal and steel districts centring on Mons and Charleroi. In the N. it is mainly agricultural, cereals and beetroots being important crops; quarries and glassworks are also notable. There are numerous rly. lines in all directions, and the artificial waterways, the Mons-Condé canal and the canalised Sambre with its water connexion to Brussels from Charleroi, are the main outlets to France. The prov. is intimately connected with the coalfields and industries of N.E. France. The inhabitants are almost entirely French-speaking Walloons. Area, 1,436 sq. m. Pop. est. 1,190,975.

As an independent county, Hainault was early important. The first of the long line of counts of Hainault was Reginar I (d. 916), who took part in the acquisition of Lorraine by Charles III of France. His descendant, the countess Rachilda, married Baldwin VI of Flanders, c. 1040, which brought Hainault into close relationship with its northern neighbour. At the end of the 13th century Count Jean d'Avesnes (1279-1304) inherited also the county of Holland, which was united with that of Hainault, until the latter fell to Burgundy, after which its history is knit with that of the Netherlands. Hainault was occupied by the French revolutionary armies in 1794, amalgamated with the Netherlands in 1814, and finally incorporated with the kingdom of Belgium in 1830. See Belgium: Netherlands.

Hainault Forest. Open space in Essex, England. Lying to the S.E. of Epping Forest (q.v.), it formed part of the ancient Forest of Waltham, of which all of the 4,000

acres remaining, except Crabtree Wood, near Chigwell Row, were disafforested in 1851-52. The name Hainault Forest is applied to 805 acres (551 arable land and 245 acres forest) acquired for the public in 1903 at a cost of £21,830, and opened 1906. It is the largest open space under the control of the L.C.C. Fairlop Fair, held in July, 1725-1852, in its day as well known as the Easter Monday stag-hunt of Epping, took place about 1 m. E. of Chigwell Row under or near a famous oak known as Fairlop Oak, destroyed by a gale in 1820. From this tree were made the pulpit and reading desk in S. Pancras Church, Euston Road, London.

Hainburg or **WEISSES LAMM.** Town of Austria. It stands on the right bank of the Danube, 27 m. E.S.E. of Vienna, and near the Hungarian frontier. It is a picturesque place surrounded by old walls, and on the top of the Schlossberg (950 ft.) are the remains of a castle mentioned in the Nibelungenlied. On the Wiener Tor is a statue which is traditionally said to represent Attila.

Hainisch, MICHAEL (1858-1940). First president of the Austrian republic. Born at Aue, Lower Austria, Aug. 15, 1858, he was a lawyer, from 1881 to 1890 a higher civil servant, then mainly a farmer in Styria who also wrote on agrarian and social problems. From 1898 he was an adviser to the ministry of commerce. On Dec. 9, 1920, after the constitution of the republic had been settled, Hainisch was elected president for four years, and was chosen again in 1924. When obliged to resign after two terms, he accepted the portfolio of agriculture, serving under Schober in 1929-30. A personality of great distinction and of a scholarly mind, Hainisch exercised a moderating influence upon the bitterly opposed, numerically equal forces of Right and Left. The annexation of his country by Hitler was a blow to the previously pro-German Austrian patriot, who died March 1, 1940.

Haiphong or **HAI-FONG.** Seaport of Tong-king, republic of Vietnam. It stands on the right bank of the Kua-Kam, a tributary of the Song-ka, 60 m. E.S.E. of Hanoi, its port. The new French residential quarter is well laid out, with broad streets and boulevards. Cotton milling is one of the leading occupations. Haiphong was before 1939 a French naval station, having rly. communication with Hanoi and Yunnanfu, and a brisk trade with Hong Kong. There was

fighting here in Nov., 1946, between French parachute troops and Vietnam forces.

Hair. Outgrowth or development of the skin characteristic of all mammals. It includes not only

Hair. Left, of stinging nettle; A large hair; B smaller hairs with broken tips, growing from veins. Right, human hair; 1, epidermis; 2, mouth of hair follicle; 3, sebaceous follicle; 4, arrector pili muscle; 5, papilla of hair; 6, adipose tissue

fur and hair like that of the human body, but also the bristles of the pig, the vibrissae or whiskers of the cat, and the spines of the hedgehog and porcupine. Its object is to keep the body warm, mammals like the whales, which have little hair, being provided with a thick layer of fat beneath the skin.

Each hair is developed in a little follicle or pit in the skin, and grows from a papilla or small bulb at the base of the follicle. When the hair falls off, or is pulled out, another is developed from the papilla. Permanent baldness is due to the atrophy or destruction of these papillae. The body of the hair is covered with minute scales, and forms a kind of tube containing pigment or colouring matter. The white or grey hair of old age is due to the failure of pigment.

Each hair follicle is provided with sebaceous glands, which secrete an oily liquid for the purpose of lubricating the hair. It has also a tiny muscle by which the hair can be erected. This is efficient in such animals as the common cat, but in the human species it acts but feebly, the phenomenon of the hair "standing on end" being rare. The curious sensation known as "goose skin" is due to the contraction of these small muscles. The hair is constantly being shed and regrown, and it is believed that the entire hair of the human head is renewed every 3-4 years. Baldness may be due to actual disease, want of tone in the skin, or hereditary tendency. In men it is reckoned as a secondary sexual manifestation. Bald patches often accompany nervous exhaustion. Local stimulation may or may not result in the fresh growth of hair.

Unwanted hair in women is a cause of much unnecessary misery. It should be persistently removed either by plucking or by a depilatory. Contrary to popular belief, this does not conduce to further growth. Where the growth of such hair is strong, a glandular imbalance may be present and the need for removal of an adrenal gland indicated.

Most mammalia are entirely covered with hair. This is true of the human species, the only absolutely hairless regions being the palms of the hands and the soles of the feet. In some forms hair is a secondary sexual characteristic—the beard of man, the mane of lion and male baboon. Colour of the hair in many animals serves a protective purpose in making the creature resemble its surroundings; this is well seen in the arctic fox, mountain hare, and ermine, which turn white in winter to match the snow, and in the stripes and spots in many animals.

Differences of quality in the hair are characteristic of local varieties of the human species. The hair of Negroes is crisp or woolly; of

Mongolians coarse and lank; of the Australian aborigines curiously crinkled; of the Caucasian races usually glossy and wavy. Speaking broadly, the Latin races have black hair, while the Teutonic races tend to be fair.

Hairdressing. The arranging and ornamenting of the hair. Human hair has been the object of such special attention in all ages and among all nations, savage and civilized. Among savages have been found the styles of frizzing so that the hair stands out from the head in a great ball; of gathering into lumps or horns on the top and at the sides with grease; of plaiting into hundreds of cords as is done in the New Hebrides; and of wearing it lank and adorned with a circlet of coloured feathers as among the American Indians. Flowers, bones, shells, kernels, beads, and quills are also used as ornaments.

The Chinese have gradually abandoned their former custom of shaving the head except on the crown, from which hung a long pigtail, in favour of short hair. Some Muslims still shave

Hairdressing. Classic styles for women, from which subsequent fashions have developed. Top two rows, Greek; 3rd row, first head Greek, remainder Etruscan; 4th row, Roman

From *Costumes of the Ancients*, Thomas Hope

their heads excepting for a tuft on top which, as a handle, is to help them into paradise after death. Japanese ladies make their hair very satiny and draw it over cushions to a knot at the back. Ancient Britons and Saxons wore long hair, and Saxon ladies twisted their locks and curled them with irons.

The Normans introduced into England the short cut for men, but since that time hair fashions for both sexes have swung between one extreme and another in the Western world. Sometimes they have led both men and women to cover their own hair with enormous wigs—as in the late 17th and the 18th centuries; sometimes the hair has been excessively dressed with pomatums as in the early 19th century. The flowing locks of the early Victorians contrast with the close crop of the typical Prussian officer.

False hair and dyes of various colours have been in use through the ages, sometimes as a concession to fashion, sometimes for individual decorative effect, and very frequently to preserve the appearance of youth. Roman ladies scattered gold dust on their heads; Mary Queen of Scots ordered false additions to her hair while in prison; Pepys' wife adopted flaxen hair.

Modern Modes of Hairdressing

The feminine fashion of "bobbed" hair in its various forms, dating from the period of the First Great War, was something of a revolution in style, and led to a remarkable increase in the number of professional hairdressing establishments. Modern applied science came to the aid of hairdressing with the introduction of the so-called "permanent wave," which replaced the earlier use of artificial curls. From plain bobbing, the more severe "shingle" and "bingle" were evolved—hair cut in the nape of the neck like a man's, but left longer at the sides. This trend reached the extreme with the "Eton crop" or boyish cut.

From this stage hair was gradually worn longer again, although few women allowed their hair to grow to its full natural length. Permanent waving then became steadily more popular; but waving with irons remained the most extensively used method of waving and curling until the mid-1930s when hairdressers began to introduce "stand-up" curls and fan-shaped effects with the

hair swept to the top of the head. At the same time the "page-boy" style—longish hair brought straight down and curled under low in the neck—and variations of loose tresses falling to the shoulders and curled under also became popular. Water colour tints which could be washed out were introduced, mainly for evening wear—pinks, blues, and even variegated coiffures being worn.

The successful hairdresser of today must have far more technical knowledge and training than his predecessor. Before the First Great War, his business comprised cutting, washing, dyeing, brushing, and crimping hair only. Today his work involves the use of electrical machinery—hair drying apparatus, permanent waving machines, high frequency and vibro machines—and at least a basic knowledge of chemicals, as they are used in dye processes, permanent wave reagents, setting lotions, etc., which many master hairdressers make up for themselves. See Barber.

Hair Grass (*Deschampsia caespitosa*). Perennial grass of the family Graminae.

Widely distributed in temperate and cold climates, it has flat, rough, tough leaves, and shining brown or purplish flower spikelets. Its stems attain a height of 4 ft. or 5 ft., and the plant forms thick tussocks in wet places. The herbage is too coarse for agricultural or grazing purposes.

Hair Moss (*Polytrichum commune*). Large moss of the family Bryaceae. A native of all temperate regions, it has awl-shaped leaves with toothed edges, set

Hair Moss. Stems and spore-capsules rising from the foliage

closely around the stiff, pliant stem, which ends in the so-called flower (sexual organs), or in the long-stalked spore-capsule (sporangium) covered by its thatch-like cap (calyptra). The dried plants are used for stuffing pillows, and for making dusting brushes.

Hair Trigger. Delicately adjusted rifle trigger which releases the hair, a spring mechanism on the tumbler catch or sear. Only the slightest pressure is necessary to release a hair trigger, which is sometimes fitted in addition to the normal one on firearms.

Hairy Tongue. Condition in which the papillae at the back of the tongue become prolonged and hairlike. The cause is unknown. See Blacktongue.

Haiti, HAYTI, OR SANTO DOMINGO. Island in the W. Indies, one of the Greater Antilles, second in size to Cuba. The Mona Passage

Haiti. Map of the West Indian island containing the republic of Haiti and the Dominican Republic

separates it from Puerto Rico on the E. and the Windward Passage from Cuba on the W. The Atlantic washes its N. shores and the Caribbean Sea its S. Haiti is 400 m. long and from 60 m. to 160 m. broad; its area is 29,536 sq. m., nearly the size of Ireland. It is politically divided into two republics—Haiti on the W. and the Dominican Republic on the E.

Haiti is extremely fertile, lofty, and heavily forested, mountain ranges alternating with rich valleys, watered by numerous rivers, and diversified by plains and extensive lakes. Several mountain ranges traverse the island longitudinally, the loftiest peak being Loma Tina in the N.W. (alt. 10,300 ft.). Between the mountains of the N.W. is a broad, fertile tableland called the Vega Real or royal garden, intersected by large streams. The principal rivers are the Artibonite, rising in the mountains of the N.W. and discharging into the Bay of Gonaïves; the Yuna, flowing E.; the Yaqui del Norte, flowing N.W.; and the Yaqui del Sur, flowing S. The largest lakes

lie in the S. and S.W. portions of the island. In the E. is a series of *llanos* or *praderias*, valleys or plains.

The climate is hot and humid, especially on the plains, and is unsuited to Europeans. The rainy season begins in May and lasts generally until the end of Oct., sometimes well into Nov.; the pleasantest months are April to June. Occasionally hurricanes occur during the wet season.

The chief products are coffee, cocoa, cotton, tobacco, hides and skins, gum, honey, sugar, molasses, bananas, rum, sisal, logwood. Cattle-breeding is encouraged. In the dense forests of the mountainous regions valuable woods are obtained, notably mahogany, lignum-vitæ, and dye woods. The minerals include gold, silver, copper, tin, iron, nickel, antimony, sulphur, gypsum, kaolin, porphyry, and limestone.

Haiti was first touched by Europeans on Dec. 6, 1492, when Columbus landed on its shores. He named it Hispaniola, and four years later colonists from Spain founded the city of Santo Domingo. A succession of sanguinary conflicts led to the extermination of the aborigines, and within a generation scarcely any survived. Thousands of negro slaves were shipped from Africa to take their place. In the 17th century French buccaneers, who had made the island of Tortuga their haunt, settled on the shores of the Bay of Gonaïves, and in 1697, at the peace of Ryswick, the W. portion, amounting to nearly one-third of the island, was ceded to them. In 1791 the negroes, who had largely increased in numbers, revolted and overthrew their cruel taskmasters, the result being that two years later the emancipation of negroes was decreed by the French convention.

Independence Declared, 1804

Under Toussaint l'Ouverture (q.v.), who had been made military chief, the negroes captured the remaining Spanish portion of the island, and expelled the Europeans. In 1801 an expedition was sent by France to recover her lost possession, but although they captured l'Ouverture and deported him, they could not maintain their position, and relinquished the island in 1803. The independence of Haiti was proclaimed on Jan. 1, 1804, and during 1804-06 Dessalines ruled as emperor. In 1809-21 the Spaniards recovered possession of the E. end of the island, but the negroes again revolted, and the E.

and W. portions were joined together as the republic of Haiti until 1844, when the Dominican Republic was established. Since that time the history of Haiti, with its two little republics, has been marked largely by political confusion and a succession of revolutions among negroes and half-breeds. See Christophe; Dessalines; Dominican Republic.

Haiti. Republic embracing the W. portion of the island of Haiti, in the W. Indies. Area 10,204

Haiti, arms of the republic

sq. m. Though it is smaller in area, it is more important than the Dominican Republic on the E. The coastline is greatly indented on the W. by the Bay of Gonaïves, lying between two mountainous peninsulas, and at the head of the bay lies Port au Prince, the capital. Several islands lying off the coast are subject to this republic—the chief being La Gonave, facing the capital; Tortuga, off the N.W.; and La Vache, off the S.W. coast. The largest rivers are the Artibonite, navigable for nearly 100 m., the Grand Anse, and the Trois Rivières. The most extensive inland sheet of water is the Étang Saumâtre in the S.E., which is 60 m. long N.W. to S.E. and 22 m. wide. Mountains comprise about 80 p.c. of the area.

Ports, besides the capital, are Port de la Paix, Gonaïves, Jacmel, St. Marc, Cap Haïtien, Jérémie, Aux Cayes, and Miragoane. Torrid heat prevails on the lowlands, but the climate is more equable in the higher regions. The flora is profuse, but the fauna is limited, the largest mammal being the agouti. Mineral resources are scarcely worked, although several concessions have been granted; among minerals known to exist are gold, silver, copper, tin, nickel, anti-

mony, sulphur, iron, gypsum, kaolin, limestone, and porphyry. Agriculture is the chief industry, and more varied crops are exported than from anywhere else in the W. Indies. Haiti grows coffee, cocoa, cotton, sisal, tobacco, bananas, sugar, and molasses.

Haiti is governed under a constitution of 1935, amended 1939 and 1944. A national assembly of 37 deputies and 21 senators is popularly elected by male suffrage; deputies sit for four years, senators for six, and together they choose a president for seven years. D. Estime took office Aug. 16, 1946. Women over 30 may hold public offices. Elementary education is free and compulsory; in 1946 some 87,000 pupils attended 1,060 schools. Religion is Roman Catholicism. Wages are lower than elsewhere in the W. Indies, and agricultural produce cheaper. There are only 158 m. of rlys. and 975 m. of motor road. Weights and measures follow the metric system. Pop. est. 3,000,000.

In 1915 the U.S.A. landed a naval force and formally undertook to restore law and order. Until 1936 there were American advisers to the Haitian government appointed under treaty. An armed constabulary put down lawless bands which had ranged the hills and burnt peaceful villages. Yellow fever and smallpox disappeared, malaria became less rampant with advances in education and sanitation; many new roads were constructed; hospitals were erected; prisons cleansed. In 1941 Haiti declared war on Japan, Dec. 8; on Germany and Italy, Dec. 12; on Bulgaria, Hungary and Rumania, Dec. 24. Consult Black Democracy, H. P. Davis, 1936; The Haitian People, J. G. Leyburn, 1941.

Hai-Yang-Tao, BATTLE OF. Naval engagement in the Chino-Japanese War, Sept. 17, 1894. The Chinese admiral, Ting, fell in with the Japanese fleet under Ito off the Yalu river. Although stronger in point of armament, Ting was unable to cope with the mobility of the Japanese fast cruisers, and was utterly defeated, being forced to take refuge under the guns of Port Arthur (q.v.).

Haiti. Presidential palace at Port au Prince, the capital of this West Indies republic

Hajdú-Szoboszló. Town of Hungary, in the co. of Hajdú. It stands in a pastoral region, 12 m. S.W. of Debreczen, and the inhabitants are engaged in cattle-rearing and agricultural pursuits.

Hajipur. Subdivision and town of Bihar prov., India, in Muzaffarpur district. Area of the subdivision, 798 sq. m. It is a fertile tract and is extensively cultivated. Hajipur town is on the Gandak, close to its junction with the Ganges at Patna, and is on the main line of the Bengal and N.W. rly. The town contains an ancient mosque and Hindu temples, and has commercial importance. Pop. 21,963.

Hake (*Merluccius vulgaris*). Large fish of the cod family. It is fairly common around the British

Hake, one of the cod family, caught off the British coasts

coasts, especially off Cornwall, where it preys upon the pilchards. It is rarely over 3 ft. in length, and is dark grey on the back and lighter below. The head is somewhat flattened, and there is an absence of the barbels seen in some species of the group. It is an important food fish, as its flesh is white and of good flavour.

Hake, THOMAS GORDON (1809-95). British poet. He was born at Leeds, March 10, 1809, and educated at Christ's Hospital and Glasgow university. His first poem, *The Piromides*, was published in 1839, but most of his writing was done after the age of 50, when he had retired from medical practice. Among his poems are *Madeleine*, 1871; *Parables and Tales*, 1872; *New Symbols*, 1876; *Maiden Ecstasy*, 1883. They won the enthusiastic praise of his friends the Rossettis. Hake died Jan. 11, 1895.

Hakim. Title given among various Mahomedan peoples to persons holding judiciary offices, e.g. the chief administrators of certain districts in Persia. The meaning of the word is "one who commands." *Pron.* hah-kim.

Hakka (Chinese, strangers). People of mixed Chinese and aboriginal stock, mostly in S. China. Issuing from Shantung before 250 B.C., they now number several millions in Kwangtung, Kwangsi, and Fukien, with 500,000 in Formosa, and virile colonies in Tong-king, the islands of Indonesia, and the

Straits Settlements, besides many emigrants to Australia, S. Africa, and California. They are thrifty husbandmen and labourers, forming separate communities, with distinctive dialects.

Hakkōichiu. Political principle originating in China, signifying "eight corners of the world under one roof," and designed to express the concept of the equality and brotherhood of all races in an ordered world. It was borrowed and perverted by Japanese political philosophers in the 1930s, and was used both in Japan and abroad to spread the conception of an ordered world under Japanese domination. From this point of view, the "Greater East Asia co-prosperity sphere" was simply the first instalment of a Japanese system of world domination. When in July, 1940, Prince Konoye formed his second cabinet, he announced a programme of social reconstruction and external expansion in which *hakkōichiu* played a prominent part.

Hakluyt, RICHARD (c. 1552-1616). English geographer. Of remote Dutch extraction, he was born in Herefordshire and educated at Christ Church, Oxford. Having taken orders he became chaplain to the embassy at Paris, 1583, where he collected all available material about French and Spanish voyages to all parts of the world. In 1588 he returned to England, and the following year published *The Principall Navigations, Voiages, and Discoveries of the English Nation*, enlarged ed. in 3 vols., 1598-1600. In 1590 Hakluyt became rector of Wetheringsett, Suffolk, and in 1604 archdeacon of Westminster. He used his influence to encourage the colonisation of Virginia. In addition to his published works, he left MSS., many of which were printed by the Hakluyt Society. He died Nov. 23, 1616, and is buried in Westminster Abbey.

A cousin Richard, of whose life little is known, was one of the men chiefly responsible for sending Frobisher on his voyages, and a correspondent of practically all the ocean navigators of his period. *Pron.* Hakloot. *Consult* *Life*, F. Watson, 1924; R. H. and

the English Voyages, G. B. Parks, 1929; R. H. and His Successors, ed. E. Lynam, 1946.

Hakluyt Society. British society for printing hitherto unpublished works of early travel. Named after Richard Hakluyt, it was founded in 1846 to print "the most rare and valuable voyages, travels, and geographical records... to the circumnavigation of Dampier." Narratives as late as the 19th century are now published. By 1946 the Society had issued 227 vols., including Raleigh's *Guiana* and Columbus's *Journal*. The offices are at the British Museum.

Hakodate or **HAkodADI.** A former treaty port of Japan, at the S. extremity of the island of Hokkaido. It stands on a peninsula in the strait of Tsuguru, 18 m. N. of Omasaki on the neighbouring island of Honshu, and was opened to foreign commerce in 1859. It stands picturesquely at the foot of a rocky height, 1,150 ft. The deep and commodious harbour is almost landlocked, fully equipped with docks and quays. Exports normally include beans, peas, pulse, sulphur, charcoal, furs, lumber, and the

Hakodate, Japan. The harbour and town of the former treaty port

produce of the extensive fisheries. There is steamer connexion with other Japanese ports. The town was rebuilt after a disastrous fire in 1907. Pop., pre-war, 207,480.

Hakone. Watering-place and small lake of Japan, on the island of Honshu. Its thermal springs, pure, sulphurous, and saline, range between 98° and 168° F. The lake, which lies to the N.W. of the resort at an alt. of 2,427 ft., is about 3 m. in length by 1 m. broad. The town is near Suruga Bay in the S.E. of the island.

Hal. A town of Belgium. It stands on the Senne, 9 m. S.S.W. of Brussels, in the province of Brabant. The chief building is the Gothic church of Notre Dame, built in the 14th century, and a

popular shrine for pilgrims. It is famous for its miracle-working image of the Virgin, its alabaster altar, the work of Jan Mone, bronze font, monuments, and other treasures, the gifts of kings and princes. There is a 17th cent. hôtel de ville, and the place has several manufactures, including sugar and paper. Pop. 16,000.

Hal, Belgium. Hôtel de Ville, and statue of A. F. Servais, the violoncellist

Halation. Spreading of the light in a photograph when a brightly illuminated portion of a subject is surrounded by deep shadow or vice versa. It is commonly seen when windows and lights are included in interiors or branches of trees, etc., against a bright sky in landscapes. It is caused by the oblique reflection of light from the back surface of the plate or film and is minimised by backing with an anti-halo non-reflective coating which dissolves during development.

Halberd or **HALBERT** (old Fr. *halebarde*). Late medieval weapon consisting of a combined pick and

Halberd. 1. Swiss, 14th century. 2. German, 16th century

axe with a pike-head, attached to a shaft 5 ft. or 6 ft. long. The bearers of halberds were known as halberdiers, and came to be employed chiefly on ceremonial occasions. The weapon, in a somewhat modified form, is still carried by the English yeomen of the guard. The phrase to send anyone to the halberds, i.e. to punish him, arose from the fact that at one time soldiers were flogged while tied to halberds fixed in the ground. See Arms; Pike.

Halberstadt. Town of East Germany, E. of the Harz Mts. in the Land of Saxony-Anhalt. On the Holzemme, it is 30 m. S.W. of Magdeburg. Until severely damaged during the Second Great War it was famous for well preserved medieval architecture. Within the framework of a whole inner town on the Gothic plan

stood a cathedral of the 13th-15th centuries; the churches of Our Lady and S. Martin, both 12th century; a Gothic town hall with Renaissance additions (1381); and remarkable timbered houses, especially the Ratskeller, the old banqueting hall of the town council. Halberstadt, seat of a bishopric from 814, became a market town in 989. The bishopric was eliminated in 1648, and a secular principality, with seat and vote in the Reichstag, created under Brandenburg, embodied with Prussia in 1813. Industries were concerned with sausages, sugar, chocolate, agricultural machinery, leather goods, and textiles. Pop. (pre-war) 50,372.

Halcyonē. Incorrect transliteration of Alcyonē (*q.v.*), due to a fanciful connexion with the Greek word *hals*, salt. *Pron.* Hal-si-onee.

Haldane, RICHARD BURDON HALDANE, VISCOUNT (1856-1928). British statesman. Born July 30, 1856, the son of a Scottish lawyer, he was educated at Edinburgh academy and university and at Göttingen. His remarkable gifts won him distinctions in philosophy, but he chose the bar for a

career, and became an English barrister in 1879 and Q.C. in 1890.

In 1885 Haldane was returned to parliament for Haddingtonshire (East Lothian). He became generally known as a Liberal Imperialist during the S. African War. Liberals were not unanimous in approving his appointment as secretary for war in 1905, but he held that position until 1912, just after he had been raised to the peerage as Viscount Haldane of Cloan, and during his term of office founded the Territorial Army and created an imperial general staff. He was next lord chancellor, but was forced to retire in 1915 when public opinion turned against him for his avowed admiration of German scholarship and false assumptions about an official visit to Germany, 1912. In 1924 he returned to the wool-sack in the first Labour government, and later led the Labour party in the lords.

Haldane, who died unmarried, Aug. 19, 1928, was awarded the O.M. in 1915. He had been

1st Visct. Haldane. British politician Russell

F.R.S. since 1906. His work as a philosopher is inseparable from his interest in education. He was president of the royal commission on London university which reported in 1913, and helped on the establishment of several universities (including Bristol, of which he became chancellor); while his support of the Workers' Educational Association increased its prestige.

The basis of his work as statesman, adviser, lawyer, or teacher, lay in his broad philosophy. He was a Hegelian and strove, with some success, to interpret the findings of modern science in terms of neo-idealism. His Gifford lectures, published in 1903 as *Pathway to Reality*, combine metaphysical speculation with an acute perception of scientific tendencies. Other notable works were *The Reign of Relativity*, 1921, and *The Philosophy of Humanism*, 1922. By many he is considered the finest minister for war Great Britain ever had. To him goes the credit for the efficiency of the B.E.F. in 1914. Only a man of great character could have endured with such dignity the injustice of which he was the victim. His *Autobiography* appeared in 1929. Consult *Life*, Sir F. Maurice, 1937.

Halberstadt, Germany. The Gothic Ratskeller, built in 1461, a fine example of woodwork

Haldane, JAMES ALEXANDER (1768-1851). A Scottish preacher. Born at Dundee, July 14, 1768,

J. A. Haldane

and educated at the grammar school and Edinburgh university, he made four voyages to the East as a midshipman, then a series of evangelistic tours in 1797. He founded the Society for Propagating the Gospel at Home. Leaving the Church of Scotland, he became pastor of the first Congregational church in Scotland, taking no salary and devoting the income to his society. In 1808 he joined the Baptists, and from that time was engaged in theological controversies. His many writings include *The Duty of Christian Forbearance in Regard to Points of Church Order*, 1811. Haldane was assisted in his work by his brother Robert, and died in Edinburgh, Feb. 8, 1851.

Haldane, JOHN BURDON SANDERSON (b. 1892). A British scientist. Son of J. S. Haldane (v.i.), he was born Nov. 5, 1892, went to Eton and New College, Oxford, and was trained as a biologist. After service in the Black Watch in the First Great War he was reader in biochemistry at Cambridge for ten years. In 1932 he was elected F.R.S. and president of the genetical society. Professor of genetics at University College, London, 1933-37, he then accepted the chair in bio-chemistry. In 1940 he became also chairman of the board of the Daily Worker.

Haldane combined exceptional ability as a research worker with a penetrating intellect and a readiness to experiment upon himself. After the loss of the British submarine *Thetis* in 1939, he conducted dangerous experiments to test the effects of various gases on the human system. He worked similarly with war gases with a view to improving respirators. He belonged to several foreign scientific organizations, and wrote provocative essays and speculative works on biology and kindred

sciences. With Julian Huxley he led a school which insisted on the importance of environment. Among his books are *Daedalus*, 1924; *Callinicus*, 1925; *Possible Worlds*, 1927; *The Inequality of Man*, 1932; *the Causes of Evolution*, 1933; *Heredity and Politics*, 1938; *New Paths in Genetics*, 1941; *Science Advances*, 1947.

Haldane, JOHN SCOTT (1860-1936). A British scientist. Born May 2, 1860, the younger brother of Viscount Haldane, he was educated at Edinburgh Academy and the universities of Edinburgh and Jena, graduating in medicine. He made a special study of the respiratory functions, particularly in relation to industrial occupation. In 1905 he published, with Priestley, researches showing that the regulation of the breathing is determined by the tension of carbon dioxide in the respiratory centre of the brain, which in turn is highly sensitive to the tension of carbon dioxide in the blood reaching it.

Haldane was made F.R.S. in 1897, and was reader in physiology at Oxford, 1907-13. Before the First Great War his investigations led to a radical alteration in the army's active service rations. During the war he worked on anti-gas measures. He served on government inquiries into industrial physiology, and delivered the Silliman lectures at Yale, the Gifford lectures at Glasgow, and the Donnellan lectures at Dublin. He was created C.H. in 1928. His books include *Mechanism, Life and Personality*, 1913; *Organism and Environment*, 1917; *Materialism*, 1932; *The Philosophy of a Biologist*, 1935. He died at midnight, March 14-15, 1936. His son was the scientist, J. B. S. Haldane, and his daughter Naomi Mitchison, the novelist.

Hale. Urban dist. of Cheshire, England. On the river Bollin, overlooking the plain of Cheshire, it is a residential suburb on the S. side of Manchester. It was created an urban dist. in 1900, and has its own railway station. Pop. approx. 12,000.

Hale. Stage name of a British theatrical family. Robert Hale-Monro (1874-1940) was born at Newton Abbot, March 25, 1874, and first appeared on the London stage in 1891. He made his reputation as a comedian in George Edwardes's musical shows at the Gaiety Theatre, e.g. *The Girls of Gottenburg*, 1907; *Our Miss Gibbs*, 1909; and played in pantomime for years. He was

seen in *Sons o' Guns*, 1930; *Bow Bells*, 1932; and died April 18, 1940.

His daughter Beatrice Mary (born at Liverpool, May 22, 1899) became a musical comedy star under the name Binnie Hale, in *No, No, Nanette*! 1925; *Sunny*, 1926; *Mr. Cinders*, 1928, etc. His son John Robert (born in London, May 1, 1902), known as Sonnie Hale, was a popular comedian in revue and on the radio.

Hale, EDWARD EVERETT (1822-1909). An American author. Born at Boston, Mass., April 3, 1822, nephew of the orator Everett, he was educated at Harvard. He held various pastorates, and was founder and editor of *Old and New*, a magazine finally merged in *Scribner's Monthly*. His *Ten Times One is Ten*, 1870, contributed to the establishment of charitable clubs: but he is best known by *The Man without a Country*, a story which, appearing anonymously in *The Atlantic Monthly* in 1863, did much to maintain a spirit of loyalty to the union. He died June 10, 1909.

Hale, GEORGE ELLERY (1868-1938). An American astronomer. Born at Chicago, June 29, 1868, he was educated at Cambridge, Mass., and established the private Kenwood Observatory where in 1890 he invented the spectroheliograph for studying the sun in monochromatic light. Hale was appointed first director of the Yerkes Observatory in 1897 and of the Mt. Wilson Observatory in 1904. Here in 1908 he discovered the magnetic field of sunspots, and in 1913 indications of the general magnetic field of the sun; and here under his direction were erected the 60-in. and then the 100-in. telescopes, with which many of the major astronomical discoveries of the first half of the 20th century were made. His enthusiasm led to the inception in 1928 of the 200-in. telescope, and he saw much of the design and construction completed before his death. Hale was awarded the gold medal of the royal astronomical society in 1904 and the Copley medal of the royal society in 1932. He founded the *Astrophysical Journal* in 1895, remaining editor till 1933. He wrote *The New Heavens*, 1923; *The Depths of the Universe*, 1924; *Beyond the Milky Way*, 1926; *Signals from the Stars*, 1932. Hale died at Pasadena on Feb. 21, 1938.

Hale, JOHN PARKER (1806-73). An American statesman. Born at Rochester, New Hampshire.

J. B. S. Haldane, British scientist

March 31, 1806, he was admitted to the bar in 1830. During 1834-41 he was district attorney for his state. In 1842 he entered congress as a democrat and soon showed strong anti-slavery principles, which met with violent opposition from his constituents, but by a campaign known as the Hale Storm of 1845 he won New Hampshire to his cause. In 1847 he entered the senate and with Chase, Seward, and Sumner organized a weighty opposition to slavery. In 1847 and in 1852 he was nominated for the presidency, but withdrew in favour of Van Buren in the former year, and was defeated in the latter. A staunch supporter of Lincoln, Hale served in the senate until 1865, when he retired and became minister to Spain for four years. He died Nov. 19, 1873, at Dover, N.H.

Hale, Sir Matthew (1609-76). An English lawyer. Born Nov. 1, 1609, at Alderley, Glos, the son of a lawyer, he was educated at Magdalen Hall, Oxford, and after studying for the Church turned to the law. In 1637 he became a barrister and was soon engaged in great cases, appearing on behalf of Laud. Never a partisan, he accepted the dominance of the parliamentarians, and his prosperity continued after the death of Charles I: in 1653 he was the first judge appointed by Cromwell, and in 1655 was elected to parliament. In 1660 Charles II made him chief baron of the exchequer and in 1671 chief justice of the common pleas. He died Dec. 25, 1676. A man of great learning and industry, Hale wrote books on religion and mathematics, as well as histories of the common law and pleas of the crown. *Consult* Fourteen English Judges, Lord Birkenhead, 1926.

Hales, Stephen (1677-1761). British botanist. Born at Bekebourne, Kent, Sept. 7, 1677, he was educated at Cam-

bridge. Having been ordained, he became perpetual curate of Teddington, where he passed his days from 1709, although he held other livings. He introduced the methods of weighing and measuring into his experiments on living plants, and so laid the solid foundations upon which modern botany has been built. His two books, *Vegetable Staticks*, 1727, and *Haemostaticks*, 1733, consist of the memoirs in which he communicated his discoveries to the Royal Society. He was a founder member of the Society of Arts. Hales died at Teddington Jan. 4, 1761. A biography by A. E. Clarke-Kennedy appeared in 1929.

Halesowen. Market town and parl. bor. of Worcestershire, England, sharing an M.P. with Oldbury. It is 9 m. by rly. W. of Birmingham, on the Stour and under the Lickey Hills. There are excellent canal facilities. William Shenstone, who was born at the Leasowes, is buried in the churchyard of the ruined abbey of SS. Mary and John the Baptist. Caslon the printer, Attwood the reformer, and F. Brett Young the novelist were born here. There is an old grammar school. The chief industries are the making of iron and steel goods. Cradley, a centre of nail and chain manufacture, is in Halesowen, which became a borough in 1936. Market day, Sat. Pop. est. 37,000.

Halévy, Élie (1870-1937). A French historian. Born at Étretat, Sept. 6, 1870, the son of Ludovic Halévy (*q.v.*), he became a professor at the École Libre des Sciences Politiques in Paris. He is chiefly known for a masterly *History of the English People in the 19th Century*, Eng. trans. 1924-27. He died Aug. 21, 1937.

Halfaya Pass, North Africa. Air view taken Nov., 1942, showing Rommel's armoured vehicles retreating over the escarpment after the battle of Alamein
British official. Crown copyright reserved

Halévy, Jacques François Fromental Élie (1799-1862). French composer. Born in Paris of Jewish

Fromental Halévy, French composer

parentage, May 27, 1799, his real name was Levi. He studied at the Conservatoire, then under Cherubini, and, after going to Italy with the *grand prix*, returned to France to devote himself to the composition of operas. His best work is in *The Jewess*, and *The Lightning*, both 1835. Professor at the Conservatoire from 1827, he trained Gounod and Bizet. Halévy was secretary of the Academy of Fine Arts and chevalier of the Legion of Honour. He died March 17, 1862.

Halévy, Ludovic (1834-1908). A French dramatist and novelist. He was born in Paris, Jan. 1, 1834, and started early to write for the stage, operettas, vaudeville pieces, and comedies, many in collaboration with Henri Meilhac (1831-97). *Note.* *See* *Halévy*

worthy are *Orphée aux Enfers*, 1861; *La Belle Hélène*, 1864; *Froufrou*, 1869; the first two set to music by Offenbach, the last a more serious piece. Halévy published volumes of his collected short stories, notably *Monsieur et Madame Cardinal*, 1873, and several novels, of which the best is *L'Abbé Constantin*, 1882. He was elected to the French Academy in 1884, and died in Paris, May 8, 1908.

Halfaya. A locality on the Egyptian-Libyan border, close to Sollum, the scene of fierce fighting during the N. Africa campaigns of the Second Great War. The coastal road here climbs the escarpment through Halfaya Pass. Halfaya was occupied by Italians during their advance into Egypt in Sept., 1940, and recaptured by the British Dec. 15. In April, 1941, a combined German-Italian force entered. The position was heavily fortified, and although isolated in Nov. when Rommel retreated W., the defenders held out until Jan. 17, 1942. In June the Germans and Italians regained possession of Halfaya Pass when

Gen. Auchinleck's forces withdrew to Alamein. After the victory of Alamein the pass was taken, Nov. 10, by N.Z. and British troops.

Half Blood. Relationship between persons deriving from the same father or mother, but not from the same father and mother. Whole blood is relationship between persons deriving from the same couple of ancestors. Under the old English feudal law regulating title by descent, the basic principle of collateral inheritance was that the heir to a *feudum antiquum* must be of the whole blood of the first feodatory or purchaser. Actual proof of such lineal descent gradually becoming impossible, the law substituted reasonable proof, requiring only that the claimant should be next of the whole blood to the person last in possession. A distant kinsman of the whole blood was admitted, or an estate even allowed to escheat to the lord, rather than that the half blood should inherit.

Obvious hardships inevitably resulted. Thus, if a father had two sons by different wives, these half brothers could not inherit from each other, so that if the elder succeeded his father in the estate and died without issue, the younger was deprived of inheritance as being only of half blood to the person last seised. Whereas had the elder brother predeceased the father, the younger could have inherited, not as heir to his half brother but as heir to their common father who was the person last actually seised. In England this, with other hardships, was abolished in 1833. Under the present law, brothers and sisters and uncles and aunts of the half blood are entitled to succeed to the property of an intestate immediately after whole blood relatives in the same degree.

In the U.S.A. the laws affecting the half blood vary in different states. In some, relatives of the half blood inherit equally with those of the whole blood in the same degree; in others they inherit only if none of whole blood exist. In Louisiana natural children, if acknowledged, may inherit from both parents if no lawful issue exists. See Family; Inheritance; Kinship.

Half Cock. Position of the bolt of a rifle when it is pulled back to half its full extent and retained in that position by the sear. This prevents the firing of the weapon.

Half Pay. Rate of pay issued to officers of the navy and army

who have for some reason ceased to do duty, have been removed from their corps, appointment, or command, but remain on the active list and are thus still eligible for employment.

Half-Timber. Building term to denote heavy timber framing, usually in oak, with the spaces between filled with materials, the timbering being left exposed. Half-timbering was introduced into England in the Middle Ages and reached its highest development there in the well wooded districts of Gloucestershire, Herefordshire, Cheshire, Shropshire, and S. Lancashire.

In earlier forms the walls were actually half of timber and consisted of posts and panels of equal width. The space between the timbers was filled with a mixture of clay and straw, called pugging, in which stakes were embedded. The pugging was covered inside and out with a coating of plaster. Brick was later used instead of pugging for the panels, which were left unplastered; and the timbering was elaborately carved, while the panels were divided into squares containing devices formed by variously cut strips of wood. Half-timber work fell into disuse towards the close of the 18th century. See Holborn illus.

Half-Timer. Name given to a child who attended school for roughly half the normal hours and went to work during the others. The arrangement was common in the textile industry. The earliest cotton mills relied principally on child labour, poor law authorities "apprenticing" pauper children to the mill owners. Peel's Factory Act, 1802, required employers to provide adequate instruction in reading, writing, and arithmetic during working hours. The Factory and Workshops Act, 1878, forbade the employment of children under 10, but allowed those under 14 to be employed half-time. The Factory and Workshop (Consolidation) Act, 1901, prohibited the employment of children under 12, but permitted employment half-time of other children under 14, provided that the employer obtained weekly a certificate of school attendance. The Education Act, 1870, authorised local authorities to pass by-laws permitting children to become half-timers provided they had attained a certain educational standard. In 1911-12 there were more than 70,000 recognized half-timers.

Public opinion gradually hardened against the practice, and the

Education Act, 1918, prohibited such half-time attendance at school. From 1921, local authorities could not grant exemption from school to any child under 14. The Employment of Women, Young Persons, and Children Act, 1921, made illegal the employment in industry of any child under 14. The Education Act, 1944, imposed on local authorities the duty of enforcing the attendance at school of every pupil.

Half-tone. Photo-mechanical process of making typographic printing blocks and photolithographic plates from full-tone originals, such as photographs or wash-drawings, as distinguished from those in line. While the making of line blocks by photo-etching became commercially practicable as early as 1860-70, some years passed before a satisfactory method was devised for breaking up full-tone originals into a form printable with type. No one inventor of half-tone can be claimed. In the earlier processes of Pretsch, Dallas, and Negre a gelatine relief was made from a negative of the original. This relief was rendered conductive with graphite and an electrolyte made from it.

Other inventors broke up the image by placing a ruled or irregular screen in front of the sensitive plate when photographing the original, with the object of replacing the continuous tone by a fine pattern of dots or other form. This method is now commercially used in making half-tone blocks, but the present process, which is purely optical and is carried out with great rapidity, was evolved directly from a mechanical and tedious method independently worked out by Petit in France and Ives in America in 1878. These experimenters, the first to produce successful half-tone engravings, made a plaster cast from a gelatine relief of the original, the highlights forming the raised parts and the shadows the hollows. The cast was blackened on the surface and ruled through, line by line, with a V-shaped tool, the action of the cutting V on the black relief causing the highlights of the picture to be formed by fine black lines where the white ground of the plaster is most deeply cut; the shadows by fine white lines cut away by the point of the V; and intermediate tones by corresponding portions of white and black lines. The excised relief was then photographed, a resist-image printed from the negative on to metal, and the latter etched. Ives per-

ceived that this translation of the original into minute units of black and white, in correspondence throughout with the tones from highlight to shadow, could be simply done by photographing the original on to a sensitive plate having a fine ruled screen of crossing opaque lines placed at the requisite distance close in front. Cross-line screens for this purpose were made by Levy of Philadelphia about 1891, and half-tones speedily came into general use, first for magazine and book illustration, later in newspapers.

In the practical making of half-tone blocks, the original is photographed with a screen of fineness corresponding with the quality required in the print and the smoothness of the paper. For magazine illustration a screen of 120 or 133 lines per inch is commonly used; for newspaper half-tones, one of 65 to 100 lines; and for the finest catalogues and book illustrations, 150 to 175 lines. The action of the screen at a short distance from the photographic plate or film consists in the formation on the latter of a dot from every aperture produced by the crossing of the lines of the screen, these dots automatically ranging in size from mere separate points in the highlights of the negative—which correspond to the shadows of the original—to larger units which unite to form a honeycomb pattern in the middle tones, and an almost solid black in the areas of the negative corresponding to the high-lights of the original. From this screen-negative a resist-image is printed on metal, usually copper, although zinc is used. The metal is usually sensitised by the enameline process, i.e. by coating with a solution of fish-glue and ammonium bichromate, which is flowed on and thinly and evenly distributed by whirling the plate.

After drying and printing under the negative, whereby the light-affected parts are rendered insoluble, the plate is rinsed, and usually is then dipped in a dye bath of methyl violet to render the thin image plainly visible. The soluble parts of the coating are removed in running water, and the plate, after drying, is "burnt in," i.e. heated to a temperature at which it scorches wood, whereby the fish-glue image is converted into a hard enamel-like substance which is an effective resist of the etching solution. The latter is ferric chloride for copper, nitric acid for zinc. As with line blocks, half-tones are now mostly etched

Half-tone. The same subject as reproduced through six different screens. (1), 150 lines per inch; (2), 135; (3), 120, the screen used for the New Universal Encyclopedia blocks; (4), 100; (5), 80; (6), 64; 5 and 6 being commonly used for newspaper illustrations. See text

by the corrosive spray of a machine, or electrolytically.

The next operation is "fine" etching or re-etching, called "staging" in America. The plate up to this point is said to have been "flat-etched." Fine etching consists in lightening parts of the plate by further treatment in the etching bath or machine, the other portion of the plate being covered with etch-proof varnish. This artist's work is carried out to improve the quality of a block, e.g. making an object stand out against its background by lightening the tone of the latter, but it also improves tonal gradation and contrast of the reproduction.

The half-tone process, unaided by fine etching or other retouching,

does not yield correct gradation. Lighter and darker tones tend to be flattened, while middle tones are too light. Fine etching overcomes this lack of brilliancy. A plate may also be improved by mechanical means. Parts can be made to print darker by rubbing with a burnisher, a highly polished steel blade with rounded edges; or parts may be lightened with a roulette, a milled steel tool which can impress minute holes.

The last stages in making a half-tone plate are routing, lining, mounting, and piercing, for all of which special machines have been devised. Routing is cutting away the metal of the plate by a high-speed tool like a drill. It is used for blocks where, for example, a

head or a machine is required to print without a background. Lining is putting round the rectangular picture a line or rule, or a series of line borders. This is done, as a rule, also by the machine which bevells the plate. The plate is next mounted type-high on hard wood, and the whole, wood as well as metal, may be "pierced" again by a high-speed cutting tool, if it is required to provide space for type among several pictures on a single block.

Although the making of a half-tone block involves so many separate operations, this branch of photo-engraving has become so highly organized and accelerated by mechanical appliances that the whole process can be done in a few minutes.

The preparation of a half-tone photo-lithographic printing plate involves operations fairly similar to those described for the production of half-tone letterpress blocks up to the etching. The planographic image obtained on the metal at this stage is then printed by the lithographic process. Fine etching is replaced by retouching on the half-tone photographic plates. See Colour Printing; Intaglio; Photogravure; Photo-lithography.

Haliartus. Town of ancient Greece, in Boeotia, situated on the S. shore of Lake Copais. Said to have been destroyed by Xerxes during his invasion of Greece, it was rebuilt and became important. The site and ruins of Haliartus are near the modern village of Mazi. In 171 B.C. it was besieged by the Romans, and its territory handed over to Athens, 167.

Haliburton, THOMAS CHANDLER (1796-1865). Canadian judge and author. Born at Windsor, N.S., son of a justice, and educated at the grammar school and King's College, he was called to the bar in 1820, became chief justice of common pleas, 1828-40, and judge of the supreme court, 1842-56, after

which settled in England. He was M.P. for Launceston, 1859-65, and died at Isleworth, Aug. 27, 1865.

T. C. Haliburton,
Canadian judge

Founder of the American school of dialect humour, he is famous as the creator of Sam Slick, Yankee clockmaker and pedlar, whose drolleries and wit first found expression in The Nova Scotian newspaper in 1835.

In addition to The Clockmaker, or Sayings and Doings of Sam Slick of Slickville, 1837-40, he wrote The Attaché, or Sam Slick in England, 1843-44; Sam Slick's Wise Saws and Modern Instances, 1853. To encourage Canadian literature a Haliburton Society was founded at Windsor, N.S. A Life, by V. L. O. Chittick, appeared in 1925.

Halibut (*Hippoglossus hippoglossus*). Largest of the flat fishes. It occasionally attains a length of

Halibut, the largest flat fish

over 7 ft., but is usually between 4 ft. and 5 ft. The body is thick and narrow, and brown on the upper side. Generally found at some distance from the shores to a depth of 100 fathoms, it is taken by trawling. Its food consists of fish and the smaller crustaceans. It is extremely prolific and an important food fish.

Halibut Liver Oil. Oil expressed from the liver of halibut. It is extremely rich in vitamin A. The quantity of the vitamin present varying considerably, the oil is let down by the addition of vegetable oils to ensure standardisation. Vitamin D is then added to a concentration 60 times that in cod liver oil. Halibut liver oil conveys constituents to the body without excess of fat, and is often happily taken where cod liver oil is not.

Halicarnassus. Ancient Greek city of Caria in Asia Minor, opposite the island of Cos. A Dorian colony from Troezen, like other Greek cities of Asia Minor, it became subject to Persia in the 6th century B.C. In the 4th century B.C. it was the seat of a dynasty which ruled in Caria. On the death of Mausolus, one of the dynasty, his widow Artemisia raised a magnificent monument to his memory known as the Mausoleum (*q.v.*), considered one of the seven wonders of the ancient world. In 334 B.C. the city was taken after a siege by Alexander the Great. The historians Herodotus and Dionysius of Halicarnassus were natives. It is the modern Budrum.

Halicz or Galicz. Town of S.E. Europe, lying E. of the Curzon Line, in Galicia. It stands on the Dniester, 60 m. S.S.E. of

Lwow, and is noted for the brine springs in the vicinity. Salt and soap are normally manufactured, and there is some trade in timber. The medieval fortress of the princes of Halicz, which stands on an eminence, is now in ruins.

At the partition of Poland in 1773 the town was included in Austrian Galicia. On Aug. 27, 1914, Halicz was captured by the Russians during their advance into Galicia, but was retaken by the Austrians in a counter-offensive at the end of June, 1915. Halicz was the scene of bitter fighting in July, 1917, and changed hands several times, the Russians being forced to withdraw in the end. Halicz became a town of Poland when that nation was reconstituted in 1919. With the Russo-German partition of 1939 it passed into the German zone. It was liberated by the Red Army during the advance into Galicia in Jan., 1945, and remained in Ukraine S.S.R.

Halidon Hill. Battlefield in Scotland, 2 m. N.W. of Berwick-on-Tweed where, on July 19, 1333, a battle was fought between the English and the Scots. The English, under Edward III, were nearly all dismounted, and were divided into three divisions or battles, each composed of men-at-arms, with archers on their flanks. The Scots, under Sir Archibald Douglas, came up the hill in dense columns. Their attack was repulsed by the showers of arrows, only their left reaching the English, while the rest were driven down the hill, pursued by the English on horseback. The forces engaged were not large, and the losses of the English were light. The battle was fought by the Scots to save Berwick, but on their defeat the town was promptly surrendered to Edward.

Halifax. A type of bombing aircraft used by the R.A.F. in the Second Great War. Designed by Handley Page, Ltd., the Halifax was a four-engined mid-wing monoplane with twin fins and rudders; outstanding characteristics were the bomb capacity of over 5 tons, the extreme range of over 3,000 m., and the defensive armament housed in power-operated turrets. It first flew in Oct., 1939, and quickly proved its value. By the end of the war the various marks of Halifax had equipped over 40 p.c. of all heavy bomber squadrons and were used on most night raids on German industry. Special Halifaxes were adapted for airborne forces,

and saw service as glider tugs, troop transports, etc. The same design was perpetuated in the Halton, a civil conversion, of which several were delivered to B.O.A.C. See Aeroplane illus. p. 129.

Halifax. Co., mun., and par. bor. of Yorkshire (W. Riding), England. It stands at the junction of the Hebble and Calder rivers,

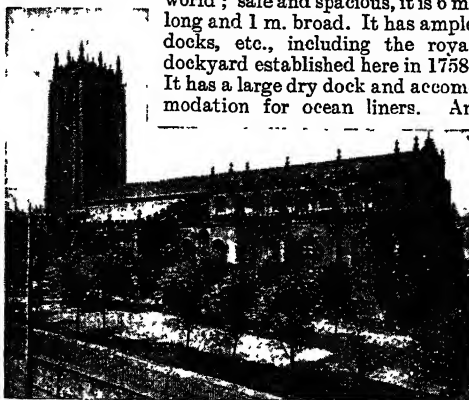

7 m. S.W. of Bradford, and has two railway stations of the N.E. region. Here exist engineering works making machine tools and boilers, printing and electrical machinery, etc. The town is also a centre for the manufacture of carpets and woollen goods, while other factories there produce paint, wire, bricks and tiles, and confectionery. Halifax building society is the largest organization of its kind in the world, having assets of £136,000,000.

Halifax town hall, built in the Italian style, is the work of Sir Charles Barry. The Piece Hall, originally a cloth market, is a unique building in the form of a square amphitheatre, and dates from 1799; it is scheduled as an ancient monument. An ancient gibbet, a primitive form of guillotine known as the Maiden, is preserved in Gibbet Street. The parish church of S. John the Baptist was begun in 1450, and is an excellent example of Perpendicular style. The Rokeby chapel was completed in the 15th century; there are records of a church on the site before 1066. All Souls' Church was designed by Sir Gilbert Scott. There are nearly 300 acres of public parks and playing fields, among which the formally laid out People's Park is particularly attractive. The Heath grammar school was founded in 1585, and in addition there are the Crossley and Porter school, Princess Mary high school, the modern school, and the technical school.

The growth of the town, which lies among steep and craggy hills, dates from the introduction of the cloth trade about 1500. It became a mun. bor. in 1848. It re-

turns one member to parliament. Market days, Wed. and Sat. Pop. est. 96,760.

Halifax. City of Nova Scotia, Canada, a seaport and the capital of the prov. It stands on a hill overlooking Chebucto Bay, also named Halifax harbour, and owes its importance to its position. The harbour is one of the finest in the world; safe and spacious, it is 6 m. long and 1 m. broad. It has ample docks, etc., including the royal dockyard established here in 1758. It has a large dry dock and accommodation for ocean liners. An

Halifax, Yorks. The parish church of S. John, a 15th century building with a tall west tower

extensive scheme of improvements was retarded by a terrible explosion on Dec. 6, 1917, when a munition ship collided in the harbour with another vessel. Immense damage was done, especially at Richmond and the N. end of the city where streets were laid in ruins. Over 1,000 persons were killed, and 3,000 houses damaged, the loss being estimated at a sum approaching £5,000,000.

Halifax is 747 m. E. of Montreal, and is the terminus of two trans-continental lines of rly., the C.P.R. and C.N.R., as also of those confined to the province. Steamers sail regularly for Europe, the U.S.A., the West Indies, and elsewhere. It is Canada's chief winter port, the headquarters of the Atlantic section of the Canadian navy, and since its foundation has been a garrison town, strongly fortified. In 1906 the dominion became

responsible for its defence, and has spent over 30 million dollars on construction. Its exports are fish, lumber, etc., and its many industries include ship-building, iron founding, sugar and oil refining, and the manufacture of furniture, soap, paint, tobacco, cotton and woollen goods, agricultural implements, etc.

Halifax, N.S., arms

Founded in 1749, and named after the earl of Halifax (1716-71), the city has still some wooden houses. It was made the provincial capital in 1750. In appearance it is somewhat English, a reminder of the time when it was the main gateway into Canada and a military and social centre relatively more important than it is now. Its chief buildings are those erected for official uses, e.g. the house of the Nova Scotia legislature and the residence of the lieutenant-governor. The Roman Catholics have a cathedral, while S. Paul's is the oldest Anglican church. A more conspicuous feature is the Citadel. There are hospitals and several schools and colleges, the chief of which is Dalhousie university. Amenities include 16 acres of public gardens, Point Pleasant Park, and boating and fishing on an arm of the harbour. Dartmouth, across the harbour (pop. 10,847), is connected by ferry with Halifax, of which the pop. is 70,488.

Halifax, Nova Scotia. Plan of this Canadian city, showing the principal quays and dockyards

Halifax, Nova Scotia. The town and harbour seen from the citadel

Halifax, EARL OF, English title borne by the Savile, Montague, and Wood families. Its first holder was the statesman George Savile, who was made Viscount Halifax in 1667, and earl of Halifax in 1679. In 1682 he was advanced to a marquessate, but when his son William died in 1700 all the titles, save an old baronetcy, became extinct. At once, however, the Whig statesman, Charles Montague, was made Baron Halifax, and in 1714 he became an earl. On his death in 1715 the earldom became extinct, but the barony passed to his nephew George, who in the same year was made earl of Halifax. He was succeeded in 1739 by his son George, on whose death, 1771, the titles became extinct. The earldom was revived for Edward Wood in 1944.

Halifax, GEORGE SAVILE, 1st MARQUESS OF (1633-95). British statesman and author. The son of

1st Marquess of Halifax, British statesman
From a print

Sir William Savile, a Yorkshire baronet, he was born to wealth and station, his relatives including Shaftesbury and other prominent men. He was well educated, and learnt much from his uncle, Sir W. Coventry. In 1660 he sat in Parliament, but his political career only began about 1667, when, his uncommon abilities having been recognized, he was made Viscount Halifax. He was employed on diplomatic work, and was an active member of the privy council and the House of Lords; about 1679 he became one of the king's chief advisers, and he was the leader of the opposition to the exclusion of James from the throne, the rejection of the Exclusion Bill being largely due to his efforts. He

was not, however, friendly to James. His policy as a leading member of the executive was throughout a moderating, though not always a successful one. He objected to the execution of Russell and Sidney; he tried to reconcile the king with Monmouth after the Rye House plot, and to establish more friendly relations between Charles and William of Orange. In 1679 he was made an earl, and in 1682 a marquess.

On the accession of James, Halifax lost his power, although for a while he was lord president. He spoke against nearly all the unconstitutional acts of the king, and his Letter to a Dissenter was instrumental in defeating the Declaration of Indulgence. He did not, however, join William of Orange on his landing; instead, he acted as a mediator, after which, to the chagrin of his Tory associates, he joined William and acted mainly with the Whigs. For a few critical days he was the acting head of the government; it was he who presided over the council that, after the flight of James, took steps to keep order, while as speaker of the House of Lords he had a large share in arranging the settlement of 1689. As the nation's spokesman he formally offered the crown to William and Mary. Made lord privy seal, Halifax was one of the new king's chief advisers, but he had many enemies, and in 1690 he retired from the cabinet. He continued, however, active, mainly as a critic, until his death, April 5, 1695. He is buried in Henry VII's chapel, Westminster Abbey. He was twice married, and left a family. One grandson was the great earl of Chesterfield.

Halifax was a statesman and an orator, but his fame rests more upon his work as a thinker. The name of the trimmer, coined by himself, expresses his political ideas if the word is taken without the

more sinister associations that have grown up around it. He thought too clearly, and knew too much to be a mere party politician, while he anticipated many of the ideas of a later day. Unlike some theorists, he was never afraid to carry his moderating, if unpopular, precepts into practice. His wit was the admiration of all save those who winced under his sarcasms. Halifax's great work is *The Character of a Trimmer*, written in 1684. *Maxims of State* is another, while he wrote *The Character of Charles II*, *Some Political, Moral, and Miscellaneous Thoughts and Reflections*, and the *Anatomy of an Equivalent*. In his treatises on statecraft he put forward his idea of the state and its functions; unlike Hobbes, it was no appeal to first principles, but a guide to practical politics. *Consult Life and Letters*, H. C. Foxcroft, 1898.

Halifax, CHARLES MONTAGUE, EARL OF (1661-1715). British statesman. Born at Horton,

Earl of Halifax, British statesman
From a print

Northamptonshire, April 16, 1661, he was a grandson of the 1st earl of Manchester. Both at Westminster School and Trinity College, Cambridge, he made his mark as a scholar; he was associated with Sir Isaac Newton, wrote verses, and studied philosophy. In 1689 as a Whig he entered Parliament as M.P. for Maldon, owing this and other favours to his friend the "magnificent" earl of Dorset. In the Commons he won an early reputation, and in 1692 was made a lord of the treasury, being advanced in 1694 to the post of chancellor of the exchequer.

In these years Montague introduced the important financial reforms which place him in the first rank of English financiers. He helped to found the Bank of England, was the leading spirit in reforming the coinage, and initiated the National Debt and the first issue of exchequer bills. In 1697 he was made first lord of the treasury. In 1698 Montague was accused of fraud; the charge was not proved, but his honesty was not equal to his talents, while his vanity brought him further enemies. In 1699 he resigned, taking the rich sinecure office of auditor of the exchequer which he had carefully provided for himself. In 1701 he was made a peer, taking the title of Baron Halifax.

Two unsuccessful attempts were made by the Tories to impeach him. He was employed on public affairs during Anne's reign, but political office came again only when George I became king. In 1714 he was made first lord of the treasury and created earl of Halifax, but he died May 19, 1715, leaving no children. Halifax loved the society of men of letters, who were entertained and rewarded by him; among his friends were Addison, Pope, and Prior, with the last of whom he collaborated in a parody of Dryden's *The Hind and the Panther*.

Halifax, GEORGE MONTAGU DUNK, 2ND EARL OF (1716-71). British politician. The son of

2nd Earl of Halifax,
British politician

George Montagu, earl of Halifax, he was educated at Eton and Trinity College, Cambridge, succeeding to the earldom in 1739. He assumed the

name of Dunk on his marriage. In political life from 1748, he was in turn president of the board of trade, lord lieutenant of Ireland, and first lord of the admiralty; in 1762 he was made secretary of state, and later lord privy seal, serving in the ministries of Bute, Grenville, and North. He died June 8, 1771, leaving no son.

Halifax, EDWARD FREDERICK LINDLEY WOOD, 1ST EARL OF (b. 1881). British statesman. He was born April 16, 1881, fourth son of the 2nd viscount, whom he succeeded in the title in 1934. Educated at Eton and Christ Church, Oxford, he was elected in 1910 as Unionist M.P. for Ripon, and served successively as under-secretary for the colonies, president

Edward Wood, Earl of Halifax,
British statesman

of the board of education, and minister of agriculture, 1921-25. Then he was appointed viceroy of India and created Lord Irwin. He favoured the gradual development of India towards dominion status, and by firmness, tact, and sympathy for five critical years won the admiration even of political extremists. He was known in India as "the tall Christian."

Irwin retired in 1931 and was made K.G. Returning to home politics, he was successively president of the board of education, secretary for War, lord privy seal, and lord president of the council. In 1937 he visited Hitler to sound possibilities of agreement with Germany. On the resignation of Anthony Eden in 1938, Halifax was appointed foreign secretary, in which office he reluctantly supported the policy of appeasement towards Germany. From Dec., 1940, he was ambassador to the U.S.A. throughout the Second Great War, a successful and popular British visitor who did much to foster good understanding between the two peoples. He retired in 1946 and received the O.M.; he had been made an earl in 1944, this being the fourth creation. His book on *Indian Problems* appeared in 1932; *Speeches on Foreign Policy*, 1940.

Halifax, CHARLES WOOD, 1ST VISCOUNT (1800-85). An English politician. Born Dec. 20, 1800, he was the eldest son of a Yorkshire landowner, whom he succeeded in the baronetcy in 1846. He was educated at Eton and Oriel College, Oxford, and married a daughter of the 2nd Earl Grey. Having entered parliament as a Whig, he was joint secretary to the treasury 1832-34, and secretary to the admiralty, 1835-39. In 1846 he took office as chancellor of the exchequer, remaining there until transferred to the presidency of the board of control in 1852.

He was first lord of the admiralty, 1855-58, and secretary for India, 1859-66, seven difficult years. In 1866 he left office and was created Viscount Halifax, having represented that town in parliament since 1832. In 1870 he became lord privy seal, and when he left office with the Liberals in 1874 his long official life ended. He died at Hickleton, Yorks, Aug. 8, 1885.

1st Viscount Halifax,

2nd Viscount Halifax,
English Churchman
Lafayette

Union. Born in London, June 7, 1839, and educated at Eton and Christ Church, Oxford, he succeeded his father in the peerage in

1885. During 1862-70 he was groom of the bedchamber to the prince of Wales, and in 1886 became an ecclesiastical commissioner. For 50 years he was a recognized leader of the High Church party, and from 1867 to 1919 was president of the English Church Union. He opposed disestablishment and divorce laws, and was an ardent advocate of the reunion of Christendom. He died Jan. 19, 1934.

Halitosis. Offensive breath, which is nearly always accompanied by a bad taste in the mouth. It may arise from septic tonsils and unhealthy conditions of the mucous membranes of the upper respiratory tract. The odours of certain drugs and foods are exhaled with the breath, while characteristic breath smells are present in uraemia, alcoholism, some forms of diabetic coma, etc. The common causes are an unclean mouth associated with dental decay or pyorrhoea; or a liver disfunction. Treatment is that of the underlying cause.

Halkett, HUGH HALKETT, BARON VON (1783-1863). British soldier. He was born at Musselburgh, Aug. 30, 1783, entered the army, and saw service in India. In 1803 he took a commission under his brother Colin in the German legion, a body of Germans in the pay and service of England. He went with the legion to Portugal in 1808, won fame at Albuera, and for the rest of his life was an officer of the Hanoverian army. He was made a noble and appointed inspector-general of infantry, led some Hanoverians at Waterloo and had a high command in the war of 1848 against the Danes. He died July 26, 1863. His brother, Sir Colin Halkett (1774-1856), was first in the service of Holland. Having commanded a battalion of the German legion in the Peninsular War, he led a brigade at Waterloo.

Hall. Word used originally for a large room. It was specially applied to the room in which kings and others in authority received

suppliants, hence the phrase, the hall of justice. The same room was also used for feasts and ceremonies and in castles and other large residences as a dining-room for the household, a use which persists in the halls of colleges, public schools, and similar institutions. The hall was the place where burgesses of a town or members of a guild met, hence town hall and guildhall. A further use, arising out of the first, was for a manor house. This was the hall in which justice was dispensed, and so in time the house itself became known as the hall. The large residence in many English villages is consequently known as the hall. The use of the word for the entrance to a suburban house was a piece of Victorian gentility. Notable halls, using the word for a room, are Westminster Hall, the hall of Christ Church, Oxford, those of several London livery companies, and the banqueting hall, Whitehall.

Hall or **SCHWÄBISCH-HALL**. A town of Germany, in Württemberg. It lies in the deep valley of the Kocher on both banks of the river, 35 m. N.E. of Stuttgart, and still retains an old-world appearance. There are two important churches, S. Catharine and S. Michael, both 15th century Gothic, the latter having replaced a Romanesque building. The rococo town hall is a remarkable building of the period. The fountain in the market place with sculptures dates from 1509. Salt-works are important, and there are saline baths on an island in the river. There are metal and textile industries. Mentioned first in 1037, Hall was a free city of the empire from the 13th century down to 1802, when it was taken over by Württemberg. The coins called Heller (Häller) were first struck at the mint here. To the S. of the town is the 11th century Benedictine abbey of Komburg. Pop. 11,235.

Hall, Sir ALFRED DANIEL (1864-1942). British agriculturist. Born at Rochdale, he was educated at Manchester grammar school and Balliol College, Oxford. In 1894, he founded Wye College as a training school for agricultural specialists and in 1902 transferred to Rothamsted as director. A member of the development commission, from 1909, he became its permanent adviser in 1912, and organized a system of agricultural education. Hall was knighted in 1918. His publications included *The Rothamsted Experiment*; *A Pilgrimage of British Farming*; and with W. B. Crane he produced

a standard work on the apple. He died July 4, 1942.

Hall, ASAPH (1829-1907). An American astronomer, of humble birth, Oct. 15, 1829. In 1857 he obtained a position in the Cambridge observatory, and after five years was professor of mathematics in the U.S. naval observatory. He was sent on expeditions to Bering Straits, Sicily, Vladivostok, and elsewhere to observe eclipses and transits, and in 1877 made his name by the discovery of the two satellites of Mars. Retiring from the observatory in 1891, he was professor of astronomy at Harvard, 1895-1901. He died Nov. 22, 1907.

Hall, CHARLES FRANCIS (1821-71). American explorer. Born at Rochester, New Hampshire, he

began his career as a journalist, and, in the service of the American Geographical Society, in 1860 accompanied the expedition sent to search for Sir John Franklin, and passed two years amongst

the Eskimos. In 1864 he made another Arctic voyage, meeting in 1866 some Eskimos who gave him authentic details of the fate of Franklin and his party. From them he received Franklin's watch and other relics which put the fate of the explorer beyond all doubt. On this occasion he spent five years in the Arctic regions. In 1871 he was sent on another expedition by the U.S. government, and reached 82° 11' N., the farthest north any vessel had yet attained. After a sledging expedition he was taken ill and died, Nov. 8, 1871. After many dangers his party returned to New York in 1873.

Hall, CHARLES MARTIN (1863-1914). American chemist. He was born in Ohio, Dec. 6, 1863, and educated at Oberlin College. He patented a method of preparing aluminium by dissolving alumina in a fused bath composed of the fluorides of aluminium and a metal more electro-positive than aluminium. By this invention aluminium became available at a cheap price. He died Dec. 27, 1914.

Hall, CHRISTOPHER NEWMAN (1816-1902). A British Nonconformist. Born at Maidstone, May 22, 1816, son of John Vine Hall (1774-1860), proprietor of The

Maidstone Journal and author of *The Sinner's Friend*, he was educated at Rochester and Totteridge. At the age of 14 he entered his father's printing office, becoming compositor, reader, and reporter. Then came conversion, lay preaching, and study for the ministry. He studied at Highbury College, and London University, 1837-42; was pastor of Albion Congregational Church, Hull, 1842-54; of Surrey Chapel, London, 1854-76; and of the same congregation at Christ Church, Lambeth, built at cost of £64,000 in perpetuation of Surrey Chapel, 1876-82.

He was chairman of the Congregational Union, 1866, laboured incessantly as an evangelical preacher, visited Canada and the U.S.A. in 1867, was an eloquent vindicator of the North during the American Civil War, and wrote many devotional works. Of his tract, *Come to Jesus*, 1848, translated into various languages, 4,000,000 copies were sold. He died Feb. 17, 1902.

Hall, EDWARD (c. 1500-1547). English chronicler. A Shropshire man, he was educated at Eton and King's College, Cambridge. He became a barrister and M.P. for Bridgnorth in 1542, while he also held official positions in the city of London. Hall is known solely as the author of a Chronicle published in 1548. This, called in full *The Union of the noble and illustrious families of Lancaster and York*, gives an account of the history of England from 1399 to 1547, when Henry VIII died. It is a valuable source, while it is also interesting because of Shakespeare's debt to it. Hall was a Protestant, a royalist, a hater of priests, and a lover of pageants. His Chronicle was continued by other hands; the part dealing with Hall's own lifetime was edited by C. Whibley, 1904.

Hall, JOSEPH (1574-1656). English prelate and author. Born at Bristow Park, Ashby-de-la-Zouch,

Joseph Hall, English prelate. From a picture in Emmanuel Coll., Camb.

July 1, 1574, and educated at Emmanuel College, Cambridge, of which he became fellow, he held livings at Halstead and Waltham, was dean of Worcester, 1616, bishop of Exeter, 1627-41, and bishop of Norwich, 1641-47. He accompanied Sir Edmund Bacon to Spa, 1605; was chaplain to Henry

prince of Wales, 1608; and was deputy at the synod of Dort, 1618.

Though devoted to the Church of England, he was accused by Laud of puritanical leanings, and his defence of episcopacy, 1640, caused an attack by five Puritans whose initials formed the joint pseudonym of Smeectymnuus, and involved him in controversy with Milton. Impeached and imprisoned 1642, his estate was sequestered and his house plundered. He described his trials in *Hard Measure*, 1647. He died in poverty at Higham, near Norwich, Sept. 8, 1656.

He wrote in couplets a series of epigrammatical satires, after the manner of Martial and Juvenal, entitled *Virgideiarius* (gathering of rods), 1597-98. The first of their kind in English, they attacked current poetical taste, neglect of polite learning, and contemporary manners and fashions. Felicitous in phrasing, racy in their wit and humour, and intrepid in invective, they over-emphasised human frailty, but are valuable for their portraiture of men and manners of the time. Author of devotional works generally known as his *Contemplations*, Hall anticipated Earle and Overbury in the writing of *Characters*. Wotton calls him *Our English Seneca*. See *Works*, ed. P. Wynter, 1863; *Poems*, ed. A. B. Grosart, 1879; *Meditations*, ed. C. Sayle, 1902; *Life*, G. Lewis, 1886.

Hall, MARGARET RADCLYFFE (d. 1943). A British novelist. Born at Bournemouth, she was educated at London university and in Germany. Her verses were set to music by Coleridge-Taylor and other composers, her most popular ballad, *The Blind Ploughman*, by Coningsby Clarke. A novel, *The Unlit Lamp*, was published in 1924. *Adam's Breed*, in 1926, was awarded the *Femina Vie Heureuse* and *Tait Black* prizes. Two years later *The Well of Loneliness*, which dealt with lesbianism, aroused controversy; it was not allowed to circulate in Great Britain and was suppressed in the U.S.A., though later vindicated in the courts of law. Radclyffe Hall also wrote *The Master of the House*, 1932; *The Sixth Beatitude*, 1936. She died Oct. 7, 1943.

Hall, MARIE (b. 1884). British violinist. Born at Newcastle-upon-Tyne, April 8, 1884, she was the daughter of a harpist, and as a child showed exceptional gifts as a violinist. After studying with

Sevcik, at Prague, under whom she developed wonderful technique. Returning to England in 1903, she took her place in the front rank of violinists, and made tours in almost all parts of the world. She gave the first performance of *The Lark Ascending*, by Vaughan Williams. In 1911 she married Edward Baring.

Hall, OLIVER (b. 1869). A British painter, born in London. He became a landscape painter in the traditional style, with clear colours, exhibiting regularly at Burlington House. He was elected R.A. in 1927, and is represented at the Tate Gallery by pictures of *Shap Moors* and *Avignon*. Many of his works were purchased for provincial and foreign galleries.

Hall, ROBERT (1764-1831). A British Baptist preacher. Born at Arnesby, Leics, May 2, 1764, son of a Baptist pastor, he was educated at Bristol and King's College, Aberdeen. He was pastor at Cambridge, 1791-1806, and after periods of mental failure, held a ministry at Harvey Lane, Leicester, 1807-25. He died at Bristol, Feb. 21, 1831. A Calvinist after the type of Andrew Fuller, though opposed to him on the subject of communion, and an ardent supporter of missions, Hall gave sermons which remain among the classics of the modern pulpit. He was the author of *Christianity Consistent with a Love of Freedom*, 1791; *Apology for the Freedom of the Press*, 1793; *The Advantage of Knowledge to the Lower Classes*, 1810. His *Works* were edited by O. Gregory, 11th ed. 1853.

Hall, SAMUEL CARTER (1800-89). A British author and editor. He was born at Geneva barracks, Waterford, May 9, 1800. He came to London in 1822, was called to the bar at the Inner Temple, was gallery reporter for *The New Times*, and established and edited *The Amulet Annual*, 1826-37. He edited *The New Monthly*, 1830-36; founded and edited *The Art Journal*, 1839-80; wrote, with his wife Anna Maria, née Fielding (1800-81), Ireland, *Its Scenery, Character, etc.*, 1841-43; and was the author of *Memories of Great Men* and *Women*, 1871, and *Retrospect of a*

Long Life, 1883. He died March 16, 1889.

Mrs. S. C. Hall, who died Jan. 30, 1881, wrote sketches and stories of the Irish peasantry.

Hall, SIR WILLIAM REGINALD (1870-1943). British sailor, born June 28, 1870. He entered the *Britannia* in 1883, was appointed inspecting captain of mechanical training establishments, 1905, and was naval assistant to the controller of the navy, 1911-13. As commander of the battle cruiser *Queen Mary*, he introduced modern disciplinary methods and the three-watch system afterwards adopted throughout the service. During the First Great War he was director of intelligence of the war staff at the Admiralty. He was knighted in 1918 and promoted admiral in 1926. As Conservative M.P. he represented West Derby, 1919-23, was chief party agent, 1923, and sat for Eastbourne, 1925-29. He died Oct. 22, 1943.

Hallam, ARTHUR HENRY (1811-33). A British essayist. Born in London, Feb. 1, 1811, the eldest son of Henry Hallam, the historian, he was educated at Eton and Trinity College, Cambridge, where he became intimate with Tennyson. His early death at Vienna, Sept. 15, 1833, which inspired Tennyson's elegiac poem, *In Memoriam*, cut short a career of remarkable promise. See *In Memoriam*; Tennyson, 1st Baron.

Hallam, HENRY, (1777-1859). A British historian. The son of John Hallam, dean of Bristol, he was born at Windsor, July 9, 1777, and educated at Eton and Christ Church, Oxford. He became a barrister, but his private income, together with an easy post in the civil service, enabled him to devote his life to literary work. He died at Hayes, Kent, Jan. 21, 1859.

A strong Whig, Hallam wrote much for *The Edinburgh Review*. He is remembered chiefly by two monumental works. His *View of the State of Europe during the*

After J. Flowers

Arthur Henry Hallam
From a bust by Chantrey

Henry Hallam

Middle Ages, 1818, is a general sketch of the various institutions and influences, and is still of value in spite of much light thrown by recent research upon feudalism. This is less true of his Constitutional History of England, which deals with the period 1485-1760. It is a clear and impartial account, to some extent superseded by later scholarship, written by one who believed firmly in the principles of the revolution of 1688 as the high tide of constitutional liberty. Hallam also wrote an Introduction to the Literature of Europe in the 15th, 16th, and 17th centuries, 1838-39; and edited the Remains in Prose and Verse of his son Arthur, 1834.

Hallamshire. Name given to a district around Sheffield, England. Hallam is mentioned in Domesday Book, when it belonged to Earl Waltheof. Nether Hallam is the centre of the district, which has no exact limits.

Halland. Län or government of S.W. Sweden. On the coast, it is bounded W. by the Kattegat. Area, 1,901 sq. m. Halmstad (*q.v.*) is the capital and chief port. The exports include timber, granite, fish, oats, and butter. Of the rivers the most important are the Atran and the Nissa. Pop. 155,189.

Halle City of Saxony-Anhalt, E. Germany, 22 m. N.W. of Leipzig. On the Saale, it is an important rail and road centre, with an airport close by at Schkeuditz. The university of Halle was founded in 1694; suppressed by Napoleon, it was re-established in 1815 and combined with that of Wittenberg. The city is at the centre of Germany's lignite fields, and before the Second Great War was an important manufacturing town, with factories making machinery, tools, chemicals, paper, and confectionery. To the S. is the Leuna works (heavily bombed by the Allies during the Second Great War) for the fixation of atmospheric nitrogen and the production of petrol from coal.

Halle was the birthplace of Handel. The charity institution and orphanage founded by A. H. Francke in 1698 gained international reputation. The salt-working craftsmen, known as Halloren, preserved quaint customs. Halle claimed many fine old buildings, including a Gothic cathedral and the ruins of the Moritzburg castle; but bombing and street fighting caused damage during the Second Great War.

Captured April 19, 1945, by troops of the U.S. 1st Army, it was subsequently included in the Russian zone of occupation. The pop. in 1939 was 220,364.

Hallé, Sir Charles (1819-95). British musician. Born at Hagen, Westphalia, April 11, 1819, he received his musical education in Germany and in France. He settled in 1836 in Paris, where he instituted a series of concerts devoted to chamber music, but

Sir Charles Hallé,
British musician

in 1848 came to England. In Manchester, 1893, he founded the Royal College of Music, of which he was first principal. He was knighted in 1888, having become a naturalised British subject. He died Oct. 25, 1895. Hallé was highly gifted as both pianist and conductor, and the performances of his Manchester orchestra reached a high standard. His recitals in London were long a feature of the musical season. See Hallé Orchestra.

Hallé, Wilma Normann-Neruda, Lady (1839-1911). British violinist. Born at Brünn (Brno), Austria, March 29, 1839, daughter of Joseph Neruda, organist of the cathedral, she became a pupil of Leopold Jansa and made her first appearance at Vienna. She rapidly won a position among the greatest violinists. In 1864 she married Ludwig Normann, a Swedish musician, and in 1888 Sir Charles Hallé. She thus became a British subject, and in 1901 was made violinist to Queen Alexandra. Lady Hallé died April 15, 1911.

Hallefinta. Rock of exceedingly compact texture. It varies in colour from grey to black, sometimes tinged yellow, red, or green. It is composed of minute particles of quartz and feldspar, and is derived by metamorphism from acid lavas or tuffs.

Hallelujah OR ALLELUIA (Heb., Praise the Lord or Praise to the Lord). An ascription of praise in the Psalms and Jewish hymns. In the N.T. it occurs only in Rev. 19. In the R.C. Church, in which formerly it was used only on Easter Sunday, it is now used at Mass, between the Epistle and Gospel, except at certain times (*e.g.* from Septuagesima to Holy Saturday, and in ferial Masses during Advent), when it is omitted as a sign of mourning. In the

First Prayer Book of Edward VI Hallelujah was sung after Praise ye the Lord, from Easter to Trinity Sunday. The response, The Lord's Name be praised, was substituted in 1662.

Hallelujah Chorus. The name specially applied to the concluding chorus of Part II of Handel's oratorio Messiah. At the first performance in London, March 23, 1743, the whole audience, with George II, rose to their feet at the beginning of the Hallelujah Chorus and remained standing throughout, establishing a custom which remains to this day. Handel is reported to have said of his experience when composing the chorus: "I did think I did see all heaven before me, and the great God Himself." Three felicitous quotations appear in the chorus: (1) The theme of "For the Lord God Omnipotent reigneth" is a plainsong melody of great age; (2) The theme of "The Kingdom of this World" is from the chorale, "Sleepers, wake"; and (3) "For He shall reign for ever and ever" is an adaptation of the last line of the same chorale.

Hallé Orchestra. Founded by Sir Charles Hallé at Manchester in 1858, this orchestra became famous in Great Britain and abroad during its founder's lifetime. On his death in 1895, the Hallé Concerts Society became responsible for it and its permanent conductors included Cowan, 1896-99; Richter, 1899-1911; Baling, 1911-14; Beecham, 1914-20; Hamilton Harty, 1920-33. On Harty's death no permanent conductor was appointed, the programmes being mainly sustained by Beecham and Sargent until 1943, when the orchestra was first established on a full-time basis, John Barbirolli being appointed its permanent conductor.

Halley, Edmund (1656-1742). English astronomer. Born in London, Nov. 8, 1656, the son of a

Edm. Halley
From portrait belonging
to the Royal Society

soap boiler, he was educated at S. Paul's School, and distinguished himself in both mathematics and classics. At the age of 16 he proceeded to Queen's College, Oxford, and at 20 sailed for St. Helena to determine the positions of the fixed stars of the S. hemisphere.

Completing his map in 1677, he was made F.R.S. He travelled extensively on the Continent, and in Paris in 1682 made the first observations of the comet named after him, the return of which he afterwards predicted.

In 1684 Halley discussed with Newton the latter's investigations on gravitation into which Halley himself had independently made research. The astronomer at once realized the great importance of Newton's work, and took a leading part in the publication of the Principia. He next carried out important investigations on trade winds and on the magnetism of the earth. His ideas on the latter were so greatly in advance of his time that it was not until 1811 that they were properly appreciated.

In 1705 Halley published his results on the movements of comets. Appointed astronomer royal at Greenwich on the death of Flamsteed, 1719, he studied the motion of the moon through 18 years, advocated the method of calculating the distance of the sun by measurements of the transit of Venus, and detected inequalities in the motions of Saturn and Jupiter. He died at Greenwich, Jan. 14, 1742. His Correspondence and Papers were edited by E. F. MacPike, 1932.

Halley's Comet. The most notable of all the comets whose periods are known. It takes 76 years (approximately) to travel round its orbit, which is a very elongated ellipse with one extremity beyond the path of the planet Neptune. At its return, in 1682, it was observed by Flamsteed, Halley, and Hevelius. Halley computed its orbit and found that it was identical with the comet that had appeared in 1607 and before that in 1531; and he predicted its return in 1759. He did not live to see his prediction fulfilled. Its next return in 1835 was computed by a number of astronomers. In 1910 its reappearance was chiefly remarkable for the accuracy of the calculations of Cowell and Crommelin of Greenwich Observatory for the dates of the comet's appearance, path, and perihelion passage. The last was computed as likely to occur on April 17. The actual date was April 19. It is probable that the earth grazed the tail on May 21.

Crommelin in a detailed study of previous appearances of the comet carried back its history with definiteness to 240 B.C. Each appearance from 87 B.C. has been recorded in Europe, China, or Japan. After 1066, in which connexion it is de-

picted on the Bayeux Tapestry, the comet came in 1145, 1223, 1301, 1378, 1456, 1531, 1607, 1682, 1759, 1835, and 1910. See Comet.

Halliwell-Phillipps, JAMES ORCHARD (1820-89). A British Shakespearean scholar. He was born at Chelsea, June 21, 1820, and educated at Jesus College, Cambridge. The name Phillipps (that of his first wife) was added in 1872. At first devoting himself to earlier English literature generally, he eventually confined himself to Shakespeare, editing and annotating the texts in 16 folio volumes, and in 1881 publishing his Outlines of the Life of Shakespeare. He died near Brighton, Jan. 3, 1889.

Hall Land. A division of N.W. Greenland. It lies N. of Washington Land and S.W. of Peary Channel. On the N. it faces Lincoln Sea, and on the W. Robeson Channel separates it from Grant Land. It lies about lat. 82° N.

Hall Mark. The set of marks stamped upon gold and silver articles at the Goldsmiths' Hall, London, or assay offices, to attest the genuineness of the metal and the date of its testing. The series consists usually of five marks: (1) the standard mark, indicating the standard of the metal, e.g. 18 for gold of 18 carats; (2) the hall mark, indicating the town where the assaying has been done, e.g. a leopard's head for London.

Hall Marks. On silverware these consist of the maker's initials, the standard marks of the assay office, and date stamp. Until 1890, the duty stamp was also added. Date stamps run in cycles of 20, 25, or 26 years, represented by the first 20 letters of the alphabet, less j. Standard marks of the provincial offices, both closed and active, are given above, in addition to the London hall marks. In the series 1736-55, the date shield was changed after 1737

Most of the above reproduced from *The Silver and Sheffield Plate Collector*, published by Herbert Jenkins, Ltd., York Street, St. James's, London.

an anchor for Birmingham; (3) the duty mark (used 1784-1890), showing that the necessary duty had been paid; (4) the date mark, a letter of the alphabet for each year, varying in design in cycles; (5) the maker's mark, now his initial letters, though early pieces have sometimes emblems like a rose or a star. The assay offices are at London, Birmingham, Chester, Sheffield, Edinburgh, Glasgow, and Dublin. The York office was closed in 1856, Exeter in 1882, and Newcastle in 1886.

One of the earliest ordinances in connexion with testing the amount of alloy in gold and silver was that of Henry III in 1238. The privilege of assaying was granted to the Goldsmiths' Company by Edward I in 1300; Edward III in 1327 enjoined them to place on the tested metal a "stamp of a puncheon of a lion's head." Other orders, regulations, etc., include those of Henry VII, 1504, Elizabeth, 1597, and William III, 1697-98. The first Scottish edict on such marks is that of James II, 1457; in Ireland a charter of Charles I gave the rights to the Corporation of Goldsmiths of Dublin in 1638. Counterfeiting, etc., of hall marks is a felony. *See* Assaying; Goldsmiths' Company; *consult also* Hall Marks on Plate, W. Chaffers, 7th ed. 1891; Old English Plate, W. Cripps, new ed. 1901; English Goldsmiths and their Marks, C. J. Jackson, 1905.

Hall of Fame. National shrine to perpetuate the memory of famous Americans. It stands on the campus of New York university overlooking Harlem, where it was erected in 1900 through a fund of \$250,000 contributed by Mrs. Finley J. Shepard. Its colonnade contains places for 150 bronze tablets surmounted by busts; these are given by associations or individual donors. Each panel records the name of a notable American, with an appropriate quotation. Names may be added every five years, and by 1945 the total had reached 77. No one may be commemorated who has not been dead at least 25 years. The quinquennial selection is made by about 100 persons representing literature, arts, education, science, law, and public services. A vote of 60 p.c. is necessary for selection of a name.

Hallow-e'en. Popular Scottish name for Oct. 31, the eve of All Saints' Day. Also called All-Hallows Eve, Holy Eve, Cake Night (in Yorkshire), and, in the N. of England, Nutcrack Night, from

early times it has been associated with many superstitions and customs, a number of which are referred to in Burns's poem of this name. Hallow-e'en is supposed to be a survival from the ancient festival of Pomona, the Roman goddess of fruit trees. Apples and nuts play a large part in the pastimes indulged in, the nuts being used for purposes of divination. There still lingers a belief that children born on Hallow-e'en possess supernatural gifts.

Hall Peninsula. Projection on the S.E. of Baffin Island, Canada, between Cumberland and Meta Incognita peninsulas, divided from the latter by Frobisher Bay.

Hall Process. Process used in America for the preparation of pure alumina as a first stage in the production of aluminium. The impure ore, bauxite, is ground and sintered with coal dust. The sinter is then melted in an electric arc furnace with coke, and alumina is blown over from the top. Ferro-silicon and ferro-titanium may be tapped off as by-products. The product is not as pure as that obtained by the Bayer process and there is little economic gain. *See* Aluminium.

Hallsands. Village of Devon, England, 1½ m. from Start Point. The coast there is constantly being eroded by the sea, and in 1917 the greater part of the village was destroyed by a high tide, though many of the ruins remain. The village was rebuilt at a higher level. Hallsands has a good bathing beach. The hotel was built by its joint proprietresses, largely with their own hands, after their house had been destroyed by the sea. One of them, Ella Trout, was decorated in the First Great War when with her ten-year-old cousin she went in an open boat to the rescue of a ship torpedoed off Start Point.

Hallstatt. Village of Austria, in Upper Austria. It lies at the S. end of Hallstätter See, at a height of over 1,600 ft., 37 m. S.E. of Salzburg. It is famous for its salt mine. The church has a 15th century altar of carved wood, and there is a museum with Celtic and other antiquities. Pop. 800.

In the vicinity a cemetery of 3,000 graves, discovered 1846, contained the human re-

mains and grave-goods of prehistoric settlers. They worked the neighbouring salt deposits, tended cattle, practised agriculture, and benefited by the commercial intercourse along the amber route between the Baltic and the Adriatic. The presence 40 m. away of the famous Noricum mines enabled them to develop the use of iron instead of bronze. The settlement accordingly gives its name to the first period of Iron Age culture, divisible into early Hallstattian (850-600 B.C.), with a gradual transition from bronze; and late Hallstattian (600-400 B.C.), with a fuller use of iron.

Among 5,816 objects from the earlier excavations (1847-64), 64 were gold, 3,574 bronze, 593 iron, 270 amber. The Noric iron needed no tempering; its exploitation was effected in four stages—for ornamenting bronze, edging bronze tools and weapons, imitating bronze types, and developing new types in iron. Bronze buckets, painted pottery, Phoenician glass, ivory, and fibulae mark a high standard of luxury and taste.

Hallström, PER AUGUST LEONARD (b. 1866). Swedish author born in Stockholm, Sept. 29, 1866. After finishing his training as a civil engineer in 1886, he spent a couple of years in America doing chemical work. His first publication was a book of poems, 1891, but his happiest medium was prose, and he wrote a number of novels and short stories of great charm, among them *Wild Birds*, 1894; *Purple*, 1895; *An Old Story*, 1895; *The Diamond Ornament*, 1896. He also wrote plays. A member of the Swedish academy from 1908, he was its secretary 1931-41. From 1922 he was president of the Nobel Prize literature committee. His style is somewhat involved, but he possessed rich imagination and insight into social problems.

Hallstatt, Austria. The village on the shore of the Hallstätter See

Hallucination (Lat. *hallucinari*, to wander in mind). Mental impression of sensory vividness which occurs without any external cause. It must be distinguished from an illusion, which is a similar impression based on misinterpretation of an external stimulus. Thus, seeing a ghost when nothing is there is hallucination; but mistaking a tombstone in the dusk for a ghost is an illusion.

Hallucinations may be physiogenic (due to drugs, tumours of the brain, disease toxins) or psychogenic, when they are projections of repressed material on to the external world. They may occur in any of the sensory fields (e.g. seeing visions, hearing voices). They are symptoms of schizophrenia and paranoia, and occur in delirium, under gas, etc. They are also, though rarely, met with in healthy people. In pseudo-hallucination the patient has the vivid sensory experience but is aware that it has no external foundation. See Apparition; Repression.

Halluin. Town of France. It stands on the Lys, 13 m. N. of Lille, in the dept. of Nord, being on the Belgian frontier. An old place, it was once the seat of a noted family. It has an interesting church. The chief industries are the manufacture of textiles, and there are also distilleries and iron-foundries. Pop. 12,935.

Halma (Gr., leap). Game played by two or four persons on a board divided into 256 squares, with men in the form of chess pawns. The men are placed in four spaces, termed yards, one at each corner of the board, and the object of the player is to get his own men into his adversary's yard, the player or side first accomplishing this winning the game. Moves are made by the step, a move of one square in any direction; and by the-hop, any one piece may jump over any other piece of its own or any other colour in any direction, vertically, horizontally, or diagonally, and may continue so doing, provided there is a vacant square for it next to the piece hopped over. With two players, each has 19 men coloured black and white respectively. In the four-handed game, each player has 13 men only, the colours being white, black, red, and green. Sometimes four persons play in partnerships of two; or two players take two colours each.

Halmahera or **GILOLO.** Island of the Malay Archipelago, one of the Moluccas or Spice Islands. It consists of four peninsulas, two

in the N., one E., and one S. The Molucca passage separates it from Celebes in the W., and Pitt Passage divides it from Ceram on the S., while Gilolo Passage flows along the E. shores. The equator passes through the S. limb of the island. Mountainous and heavily forested, it has several active volcanoes, the chief of which are Tolo and Gama-kora. Its length from N. to S. is about 130 m., while maximum breadth in any of its peninsulas does not exceed 45 m.; its estimated area, including several small islands, is 6,900 sq. m.

The largest bays are Bolollo, Weda, Wossa, and Kian. In the cultivated areas, spices, fruits, sago, coconuts, and edible birds' nests are produced. Horses, cattle, and sheep are reared, and precious gems are found. The principal towns are Gilolo, the capital Galela, and Patani. Subdivided into several petty states, the coastal districts are inhabited by Malays, while in the interior exists a race of inoffensive people called Alfuras. Up to the Second Great War Halmahera ranked as a colonial possession of the Netherlands. The Japanese after their invasion turned it into their chief base in the Moluccas. Pop. est. 140,322.

Halmstad. Seaport town of Sweden, capital of the govt. of Halland. It stands on the Kattegat, 76 m. S.S.E. of Gothenburg, with two harbours and a roadstead. An important rly. junction, it has steamer communication with Copenhagen, Lübeck, and other ports. The 15th century castle is the residence of the provincial governor, and there are a 15th century church (restored) and a museum. Granite, timber, paper, fish, butter, oats, and potatoes from the S. of Sweden are exported. There are shipbuilding yards, cloth, flour, jute and saw mills, sugar refineries, and breweries. In the vicinity are mineral and sea-water baths. Here, in 1676, Charles XI defeated the Danes. Pop. 31,525.

Halo. Luminous ring round the sun or moon. Halos, when clearly defined, are seen to be coloured red on the inside and blue on the outside, but the latter colour is always faint so that the ring may appear white on its outer edge.

Halo round the sun caused by ice crystals in high clouds

Usually about 22° in radius, a halo is due to the sun or moon being seen through a thin sheet of cirro stratus clouds, which owing to their elevation are composed of tiny ice crystals. It is the bending or refraction of the light when passing through these ice crystals that causes the halo. A halo of 46° is occasionally visible but rarely complete. In polar regions, where ice crystals are usually present in the air, brilliant halos are common. Halos are features of warm fronts, but are too common (being visible one day in

Halo with mock suns on each rim of the circle, a phenomenon seen in 1924

three, in England) to be useful as weather signs. Mock suns are related phenomena. The word is derived from Gr. *halōs*, threshing-floor, space circular in form, round which the oxen trod.

Halo or **NIMBUS.** In art, a disk or circle of light surrounding the head in representations of divine personages and saints in sacred and legendary art. The nimbus of God the Father had the form of a single triangle, or of one triangle superposed on another, with divergent rays and, occasionally, the Greek letters α (alpha) and ω (omega) in the right and left lower corners of the superior triangle. The halo of the Saviour showed, within the circle, parts of the arms of a cross, the rest of which was concealed by the head. The Virgin's head was surrounded either by a plain circle, or by a circlet of stars, while the saint's halo was usually a circle of rays. A square nimbus indicated that the person so adorned was living when the painting was made. The halo is not unknown in sculpture, especially in Indian art. Among

the Hindus it took various shapes. For instance, the hair of the modelled image might be designed as streaming, halo-like, from each side of the head. See Saint.

Hal of the Wynd. Character in Scott's novel *The Fair Maid of Perth*. He is also called Henry Gow and the Gow Chrom (the bandy-legged smith). His name Hal or Henry of the Wynd, is applied to him because he lives in the Wynd of Perth. Known as the best arm-ourer that ever made sword, and the truest soldier that ever drew one, his fear that Catharine Glover had been promised to Conachar (Eachin MacIain) makes Hal espouse the cause of Clan Chattan against Clan Quhele, in the famous battle of the North Inch. Four months after the battle Hal and Catharine are married.

Halogens (Gr. *hals*, salt; *gen-*, to produce). Name applied by Berzelius to a group of closely allied elements: fluorine, chlorine, bromine, and iodine. The salts of these elements are known as haloid salts. Each of the halogens is monatomic, and they exhibit well-marked gradation in their properties according to the atomic weights of the elements.

Halophytes. Plants whose natural habitat subjects them to the influence of salt water. In its restricted sense the term is applicable to such flowering plants as marsh samphire or glasswort (*Salicornia*) and cordgrass (*Spartina*) which are unusual in thriving in salt marshes. Halophytes are often succulent with numbers of water-storing cells. They can absorb water from the solutions of high concentration which frequently surround their roots; this capacity is possibly due to the unusual degree in which their protoplasts are permeable to the chief solutes in sea water. In their ash may be found as much as 30 p.c. sodium and

Halo as depicted by famous artists: 1. Fra Angelico, 1397-1455. 2. Botticelli, 1444-1510. 3. Raphael, 1483-1520. 4. Raphael. 5. Doré and later pictures. 6. Raphael, the floating halo

25 p.c. chlorine. Many halophytes adapt themselves readily to alterations of salt concentration in mud. Thus they are fitted for colonising mud around bays and estuaries, where they may raise the level of the mud flat and make it salt pasture fit for reclamation.

Haloragaceae. Large family of herbs and shrubs. Mostly perennial, they are widely distributed throughout the world. Many of them are marsh or aquatic herbs, like water milfoil (*Myriophyllum*). The flowers are mostly minute, the sexes separate. The plants have no economic importance.

Hals, FRANS (c. 1580-1666). Dutch painter. He was born probably at Antwerp, the son of Pieter Hals Clarz. He may have studied under Adam van Noort at Antwerp, and afterwards with Van Mander at Haarlem. His first known work of importance is the group of the S. George's Shooting Guild of Haarlem, now in the town museum; it was painted in 1616, one of seven large pictures of contemporary guilds. The artist's extraordinary gift for seizing and expressing a fleeting human emotion is nowhere better shown than in the so-called Laughing Cavalier, in the Wallace collection. All his painting is direct, robust, and vital.

The National Gallery possesses five pictures by Hals, but the greatest works of his brush are in Dutch galleries, and it is often said that Hals cannot be appreciated without a visit to Haarlem, where

a museum devoted to his work has paintings representing all periods up to the last year of his life. The Rijks museum, Amsterdam, Glasgow Corporation gallery, and the Louvre have also good examples. For generations his work was held of small account; one of his portraits changed hands in 1786 for 5s.

Hals was twice married. His first wife died in 1615, the victim of his ill-treatment; the second, Lysbeth Reyniers, lived with him for nearly fifty years and bore him five sons, all of whom became artists. During his later years Hals lived on an allowance from the municipality of Haarlem, eked out by the proceeds from a teaching studio. See Descartes illus.; Dutch School.

Halsbury, HARDINGE STANLEY GIFFARD, 1ST EARL OF (1823-1921). British lawyer. Born Sept. 3, 1823,

of a Devon family, he was educated at Merton College, Oxford. He became a barrister, having hereditary connexions with that profession, and after steady practice, especially in criminal cases, was made a Q.C. in 1865. In 1875, not yet having a seat in parliament,

Frans Hals Dutch painter. self-portrait
Haarlem Museum

which are unusual in thriving in salt marshes. Halophytes are often succulent with numbers of water-storing cells. They can absorb water from the solutions of high concentration which frequently surround their roots; this capacity is possibly due to the unusual degree in which their protoplasts are permeable to the chief solutes in sea water. In their ash may be found as much as 30 p.c. sodium and

he was made solicitor-general by Disraeli, and in 1877 entered the house of commons for Launceston. In 1885 he was created Baron Halsbury, and was made lord chancellor, an office he held throughout the Conservative ministries of 1886-92 and 1895-1905. In 1898 he was made earl of Halsbury and Viscount Tiverton.

Halsbury was remarkable for physical vigour. When over 80 he edited *The Encyclopaedia of the Laws of England*; when over 90 he sat as a judge in the lords. He vigorously resisted the Parliament Bill of 1911. Although not a profound lawyer, he was an able judge. He died Dec. 11, 1921. The 3rd earl, John (b. 1908), succeeded to the title in 1943.

Halsey, SIR LIONEL (1872-1949). British sailor. Born Feb. 26, 1872, he entered the navy in 1885. He served in the defence of Ladysmith as a lieutenant, was promoted captain 1905, and in 1912 was given command of H.M.S. *New Zealand*, which he led into action at Heligoland, Aug., 1914, and the Dogger Bank, Jan., 1915. He was on Jellicoe's staff at Jutland. In 1917 he became third sea lord and in 1918 was put in command of the Australian navy, and later created K.C.M.G. He was chief of staff to the prince of Wales during the latter's tours in Canada, the Antipodes, India, and Japan, and from 1920 was his comptroller and treasurer. Halsey, who retired from the navy 1922, was gazetted admiral 1926. Died Oct. 26, 1949.

Halsey, WILLIAM FREDERICK (b. 1882). American sailor. Born at Elizabeth, N.J., Oct. 30, 1882, he was educated at Virginia university and the Annapolis naval academy. Commissioned in 1905, he commanded a destroyer flotilla in the First Great War. Rear-admiral in 1938, he was given command of a carrier division. He led the attack against Japanese bases in the Marshall and Gilbert Islands in Jan., 1942, and on Oct. 24 replaced Admiral Gormley as commander in the S. Pacific. Halsey was thus responsible for the victories of the Solomon Islands and off Bougainville.

On June 15, 1944, Halsey was appointed commander of the U.S.

3rd fleet in the Pacific. He supported Gen. MacArthur's invasion of Leyte in Oct., defeating the Japanese navy in the battle for Leyte Gulf. On Jan. 9, 1945, his fleet assisted in the Luzon (q.v.) invasion and in the summer aircraft from his carriers attacked Kyushu and Honshu. The Japanese surrender terms were signed on his flagship *Missouri* in Tokyo Bay on Sept. 2. Halsey retired with the rank of admiral of the fleet.

Halstead. Urban district and market town of Essex, England. It stands on the Colne, 15 m. N.W. of Colchester, on the railway. The church of S. Andrew dates from the 14th century, and contains stone effigies of two unknown knights and brass effigies of members of the Bouchier family. Other buildings include the corn exchange and cottage hospital. Silk and crape are manufactured, and there are brass and iron foundries, breweries, and a tannery. The council owns the waterworks and public baths, and maintains public gardens. Market day, Tues. Pop. est. 6,150. Another Halstead is near Knockholt in Kent.

Haltemprice. Urban dist. of the E. Riding of Yorkshire, England. Created in 1935 by the amalgamation of the urban dists. of Hessle and Cottingham with part of the rural dist. of Soulecoates, it extends from Hessle on the R. Humber on the S. to Dunswell on the N., and includes also Anlaby, Willerby, Kirk Ella, W. Ella, and Cottingham. Mainly residential, the district has some light industries, particularly market gardening (Dutch style) at Cottingham (from where Hull obtains its water supply), and Dunswell, shipbuilding, light engineering, whiting and cement making at Hessle, and is on the rly. The townships within the urban dist. are all of ancient foundation, records dating back to c. 520 and including several references in Domesday Book. Pop. (est.) 36,000.

Halton. Village of Bucks, England, 4 m. S.E. of Aylesbury. The principal school of technical training for what is now the R.A.F. has been here since 1917. Halton camp, which has an airfield adjoining, has room for about 1,500 aircraft apprentices.

Haltonwhistle. Market town and parish of Northumberland, England. It stands on the S. Tyne, 16 m. W. of Hexham, on the Carlisle-Newcastle rly. line. A stretch of the Roman wall runs 2 m. N.,

and many antiquities have been found in the neighbourhood. The chief industry is coalmining, followed by quarrying and making paint and varnish. Market day, Thurs. Pop. 4,193.

Ham. In anatomy, the back part of the leg behind the knee-joint, the five muscular tendons there being the hamstrings; secondarily, the thigh and buttock of any animal. The word is applied particularly to the thigh of a pig, salted, smoked, and cooked. The thigh is pickled in brine made of water, salt, saltpetre, and a little sugar, or simply rubbed with salt. When sufficiently salted it is hung for several days on an upper floor of a smoking house, the smouldering fire of wood or peat being on the lowest floor. It can be boiled, or baked in a crust of flour and water. Wiltshire and Yorkshire hams are the best.

Ham. Part of the bor. of Richmond, Surrey, England. A residential suburb of London, it stands between Twickenham, N., and Teddington, S., and is bounded on the E. by Richmond Park. The manor was given by Athelstan to his chief alderman, Wulgar, 931; and, after being in the possession of Francis, 1st Viscount Lovell, Anne of Cleves, Henry prince of Wales, and Charles I, was granted to John Maitland, 5th earl of Lauderdale, and his wife, Elizabeth, countess of Dysart.

Facing the Thames, in the parish of Petersham, is Ham House, seat of the earl of Dysart, built 1610 on the site of the home of Wulgar by Sir Thomas Vasour. It was the scene of the secret meetings of the Cabal (q.v.) and the birthplace of John Campbell, 2nd duke of Argyll. Notable for its art collection, it inspired the vision of the haunted house in Hood's poem, *The Elm Tree*. The meadows, known as Ham Walks, extending from Ham House to Twickenham Ferry, are mentioned in Thomson's *The Seasons*, and were a favourite haunt of Swift, Pope, and Gay. Ham Common, 20 acres, is between Richmond Park and the road from Petersham to Kingston. S. Andrew's Church, on the S. side of the common, dates from 1832.

Ham is not to be confused with East Ham and West Ham in Essex. There was another Ham House in Portmore Park, Weybridge, which was given by James II to Catherine Sedley, who married the 1st earl of Portmore.

Ham. A town of France. It stands on the Somme, in the dept. of Somme, 36 m. E.S.E. of Amiens.

W. F. Halsey,
American sailor

Ham, France. The castle from which Louis Napoleon escaped in 1846 after six years' confinement

It is famous for its castle, one of the most formidable of its kind. This was founded in the 10th century, but the present building dates mainly from the 13th century, with improvements of the 15th. A feature is the donjon, or constable's tower, one of enormous strength, having walls 35 ft. thick. This was long used as a prison, e.g. for Louis Napoleon.

The church of Notre Dame is the successor of an old building, most of which was burned in 1760. Erected to serve the abbey of S. Augustin, its 12th century crypt survives. The town has a library and a small museum. It figured in the First Great War battles of the Somme (q.v.).

Ham. One of the sons of Noah (Gen. 9 and 10). He is said to have been the ancestor of the Ethiopians, Egyptians, and the nations of N. Africa generally. The name means hot or black, and is also the ancient name for Egypt, to which country it is applied in Psalms 105 and 106.

Hama. A town of Syria, the Hamath of the Bible, and the ancient Epiphania. Situated on the Orontes among attractive gardens and groves of palms, 110 m. N. by E. of Damascus, and 30 m. almost due N. of Homs, it has a flourishing weaving industry and a fair amount of general trade, which is helped by its being on the Syrian rly. An early Canaanite stronghold, it was subdued by Shalmaneser III, Tiglath-pileser III, and Sargon II. It was renamed Epiphania after Antiochus IV, converted to Mahomedanism A.D. 639, and captured by Tancred and Saladin. Five basalt stelae now in Istanbul bear Hittite inscriptions. Pop. 71,391. See Hittites.

Harnadan. City of Persia and capital of a prov. of the same name. It is about 180 m. S.W. of Teheran, and is built on the site of the ancient Ecbatana. Long a place of importance as a centre of trade on the great road through Kermanshah to Khanikin and Bagdad, and

also with Teheran and the Caspian, it manufactures leather goods, carpets and silks. It contains the tomb of Avicenna, and, according to tradition, those of Esther and Mordecai. It was occupied in 1918 by British troops marching to the Caspian. Pop. 104,000.

Hamadryad (Gr. *hama*, together with; *drys*, tree). In Greek mythology, name given to nymphs who presided over trees. Their lives were co-existent with the lives of the trees in which they dwelt. See Nymphs.

Hamadryad OR KING COBRA. Large species of the cobra, found in India, Malaya, and the Philippines. It is extremely venomous and of fierce and rather aggressive disposition. In colour yellow or yellowish brown, with black bands, it attains a length of about 14 ft. As it feeds to a large extent on other snakes, it is in some degree a useful reptile.

Hamadryad. Head of the poisonous snake

Hamadryad is also the name of a baboon, *Papio hymandryas*.

Hamamelis. Botanical name (*H. virginica*) of witch hazel, an extract from whose leaves provides useful remedies for internal and external use. See Witch Hazel.

Haman. The chief minister and favourite of Ahasuerus, king of Persia. Because Mordecai, a Jew, paid him no reverence he resolved to destroy all Jews in the kingdom. Without mentioning Mordecai or the Jews he obtained from the king a decree requisite for his purpose. The plot, however, was exposed by Esther, cousin and adopted daughter of Mordecai, with the result that Haman was hanged on the gibbet he had prepared for Mordecai.

At the feast of Purim it became a custom among the Jews to hang Haman in effigy; and today when the Book of Esther is read in the synagogues the name of Ahasuerus' one-time favourite is received with contumely. The gallows is said to have been 50 cubits high, hence

the phrase to hang as high as Haman. See Esther; Mordecai.

Hamar. Town of Norway, in Hedmark co. It stands attractively between two bays of Lake Mjøsen, 78 m. by rly. N. of Oslo. The town dates from 1849 and is an episc. see. Locomotives and condensed milk are made and agricultural produce sold. Hamar was chosen as the seat of government and home of the royal family when the Germans invaded Norway, April 9, 1940. It was heavily bombed by aircraft and occupied by the invaders on April 20, after the king and government had gone to Elverum.

Hamasa. Word meaning brave and given to an anthology of Arabic poetry. This was collected by Abu Tamman in the 9th century and is divided into ten books. The first book deals with the heroes of the past, hence its name, and remaining ones with love, travel, and the like. Certain poems were translated by Sir A. C. Lyall in *Ancient Arabic Poetry*, 1885.

Hambach. Village of W. Germany in the Rhineland-Palatinate. It stands in the Hardt, 15 m. W. of Spires, in the centre of a vine-growing region. It is chiefly noted for its castle, where on May 27, 1832, the revolutionary movement in Bavaria was inaugurated by a meeting attended by 30,000 persons. This is also called the Maxburg and stands on a hill over 1,000 ft. high. Built by the emperor Henry II, the early building was destroyed by the French in 1688. Maximilian II of Bavaria replaced it in the 19th century by a modern residence.

Hamble. Village of Hampshire, England, at the mouth of the Hamble. It is 5½ m. S.E. of Southampton and has lobster fisheries. The aerodrome, with flying school and aircraft works, served as a training station for pilots during the Second Great War.

Hambledon. Village of Hampshire, England, famous for its cricket club. It is 6 m. N.E. of Fareham. Formed about 1750, the club was the first of its kind in England. The games were played on two downs, Windmill and Broad Halfpenny. The club was at the height of its fame in the 1780s, when David Harris and William Beldham played for it, and the Hambledon men were strong enough to encounter an all-England eleven. The village gives its name to the Hambledon Hunt. There is another Hambledon in Surrey, 3 m. from Godalming. See Cricket; Nyren.

Hamburg, MARK (b. 1879). Russian-born British pianist. Born at Bogutchar, May 30, 1879, he first appeared

on the concert platform at Moscow in 1888. He studied under Leschetizky at Vienna, and made his London debut in 1890. He established his reputation as a concerto player, but later devoted himself to recitals, touring Europe and the U.S.A., and being noted for the vigour of his style and for performance in the Liszt tradition. An autobiography, *From Piano to Forte*, appeared in 1931. His daughter Michal became well-known as a concert pianist.

Mark Hambourg,
British pianist

Hamburg. Second largest city and largest port of Germany. Standing 75 m. inland on the river Elbe, navigable for the biggest liners to this point, the area of the free state covered 158 sq. m., 52 being occupied by the city itself. The total of the built-up area, however, was much

larger, as the towns of Altona, Harburg-Wilhelmsburg, etc., within the adjoining Hanoverian area, and their parts of the port, formed an inseparable unit with Hamburg. The river Alster, forming two connected lakes, the Inner and the Outer Alster, in the heart of the city, determines the picture of the town. Divided by the Lombard bridge and, at the inner end, flanked by the once-fashionable promenade of the Jungfernstieg, these lakes with their lively traffic in motor, steam, sailing, and rowing boats, and their many old canals running between huge, old warehouses built at the time of the Hanseatic League justified a comparison of Hamburg with Venice; while there was something of London in the habits, attire, and behaviour of the people, mainly Saxon in origin, seafaring, trading, and for centuries closely linked with England, whose language many of them spoke.

Before the Second Great War, the remnants of medieval Hamburg had, by several great fires, especially one of 1842, been reduced to S. James's (1392) and S. Catherine's (1426) churches

(both gutted by air attack in the Second Great War) and a number of old business houses along the "fleets" or canals. A number of buildings had, however, been reconstructed to their original pattern, e.g. Great S. Michael's (1750), S. Petri's (1849) and, S. Nicholas's, with its high tower, Hamburg's main landmark, rebuilt by Gilbert Scott, 1845-63.

Among the many outstanding secular buildings, the huge town hall, a modern Renaissance pile, with the adjoining exchange; the Johanneum with library and historical museum and several other public buildings were overshadowed by such 20th century buildings as the Chile House (1923), the Ballin House, the Sprinkenhof, the Mohlenhof, all characteristic of a proud merchant spirit. The university, founded in 1919, was remarkable for its library (705,000 volumes, 13,439 manuscripts, 929 incunabula)—lost as to two-thirds by aerial bombing in the Second Great War—and by the importance it attached to overseas studies and economics. Many other big libraries, museums, scientific societies (a mathematical society

Hamburg, Germany. 1. General view of the city in pre-war days. 2. British forces patrolling a street after the surrender, May 3, 1945. 3. Three U-boats which escaped destruction by Allied bombing. 4. Pre-war air view of Germany's largest port

existing since 1690), famous hospitals, among them one for tropical diseases, observatory, meteorological institute, zoological and botanical gardens, an opera, two permanent theatres, and a number of famous orchestras, conservatoires and a musical academy testified to Hamburg's lively intellectual and artistic activities.

Shipping and commerce, however, were the backbone of its life. After New York and London the world's biggest port, receiving e.g. in 1932 18,024 vessels, and dispatching 20,087, Hamburg was the home port of 1,700 sea-going vessels with a tonnage of 1.5 million, as well as an inland fleet of 8,300 vessels with a tonnage of 1.2 million. The port area proper covered more than 6 sq. m. and held huge granaries, tanks, cranes, docks, shipyards, etc., the most famous of the latter that of Blohm & Voss. Along the many branchings of the port—the largest part of which was a free port for goods in transit or in store for later importation, such as coffee, oil-seed, rubber, tobacco, cocoa, tea, etc.—great industrial activity had developed. Flour and rice mills, cigar and tobacco factories, margarine, oil, asbestos, jute, rubber, saltpetre, phosphate, tanning and dressing, chemical and pharmaceutical, furniture and piano factories flourished, many of them working for export, and there were also multiple plants producing all shipping requisites. Hamburg had also become an important European air junction.

Hamburg in History

Hamburg's history started in 811 with the building of the Hammaburg by Charlemagne. It became an archbishopric in 834 and was closely connected, for a time, with the missionary work of Archbishop (Saint) Ansgarius in Denmark, Sweden, and Norway, and later, in the 10th and 12th centuries, when the archbishopric had moved to Bremen, among the Slavonic tribes beyond the Elbe and Oder. Towards the end of the 12th century the new town was built, as a warehousing and trading centre, and in 1241 a treaty was made with Lübeck, for the reciprocal protection of their trade, and of their shipping in the Baltic and the North Sea respectively. This contributed towards the creation of the powerful Hanseatic League, as a member of which Hamburg fought pirates in the North Sea, and protected land routes from its own enlarged

territory. It was made a free city in 1510, though the kings of Denmark, in succession to counts of Holstein, claimed rights of suzerainty until 1768. Converted to the Protestant religion between 1522 and 1529, Hamburg granted asylum to refugee Lutherans, Calvinists, and Jews, and admitted English merchant adventurers in 1609, gaining, by this liberal attitude, the trade and importance as N. Europe's main trading centre, formerly held by Antwerp.

Spared by the Thirty Years' War, Hamburg fought successfully Danish, Brandenburg, and Hanoverian assailants in 1686, overcame home conflicts between aristocrats and democrats by imperial mediation, and benefited by the French revolution, once more as a centre of the emigration. Conquered by the French in 1806, cut off from Britain, annexed 1810 and fortified by Marshal Davout, it regained its liberty in 1814, and joined the Zollverein, with a separate free port, in 1838, after having placed its military protection in the hands of Prussia in 1868.

In the course of the 19th century, Hamburg suffered from political conflicts, mainly over its electoral laws; from a devastating fire in 1842, and a severe cholera epidemic in 1892; but it had steadily gained in wealth and size. Its pop., 107,000 in 1811, was 1,384,106 in 1946.

SECOND GREAT WAR. The almost total destruction of its port, and the destruction of more than two-thirds of the industrial and residential parts of the city by frequent heavy air attacks in the Second Great War only temporarily affected the pre-war pop. figure. Most of the museums of Hamburg escaped with repairable damage, and the greater part of the city's art treasures, private and public, were saved by evacuation or by storage in the huge Flakturm and other air raid shelters.

Hamburg surrendered without direct attack to the British 2nd army on May 3, 1945, and was the headquarters of the British zone of occupation in Germany until the administrative amalgamation of the British and American zones in 1947. The great U-boat pens, which had taken four years to build with slave labour, were blown up by the R.E., Oct. 21, 1946. In Nov., 1947, Hamburg resumed its status (abolished by the Nazis) as a Hanseatic city.

HAMBURG STATE comprised the seaport of Cuxhaven, the garden-city of Bergedorf (about 20,000 pop. each), Geesthacht, with pop. 5,000, and 28 rural communities, including the Vierlande vegetable, fruit, flower, and beekeeping area, with total pop. 40,000.

Hamburg-America Line or **HAPAG.** Anglicised and abbreviated forms of the German name of one of Germany's two biggest shipping lines. Founded 1847, it began to run steamships in 1855, and owned 36,000 tons of shipping in 1871, when the Reich was united by Prussia. It built the 50,000-ton steamers *Imperator*, *Vaterland*, and *Bismarck* before the First Great War, and owned 1,360,360 tons of shipping before it lost, under the treaty of Versailles, more than 90 p.c. of it. Reconstructed with state assistance, it had more than a million tons again by 1928; it was temporarily federated with its competitor, the *Norddeutscher Lloyd*, (q.v.) of Bremen in 1930, after having absorbed several smaller lines. During, and in consequence of, the Second Great War, it again lost all its liners and its big overseas branches. Albert Ballin, its directing genius 1888 to 1918, died by suicide when the First Great War was lost.

Hamburger. Kind of meat cake or rissole. Originally hamburgers consisted of lean beef, twice minced, flavoured with pepper, salt, and grated onion, formed into small round steaks of equal thickness, and broiled slowly (not fried). They were served with a little butter on each, and a dusting of salt, or with brown or tomato sauce. They became popular first in the U.S.A., where they were a standby of delicatessen stores. The name has come to be used for any round cake made of minced beef (or other meat) with herbs and sometimes potatoes.

Hamel, GUSTAV (1889-1914). A British aviator. Educated at Westminster, he took up aviation in its early days, and in 1911, after qualifying for his pilot's certificate at Pau (France), carried the first official air mail between Hendon and Windsor. In 1913, after winning the Aerial Derby around London, he became a leading exhibition pilot, early in 1914 looping the loop 14 times in 17 mins. at Windsor in the presence of King George V and Queen Mary. In May, 1914, he was lost in the Channel while returning in a new monoplane from Paris, no trace of him or his machine being found.

Hameln. Town of Germany, in the former Prussian prov. of Hanover. It is situated on the Weser, above the junction with the Hamel, which flows through the town, 25 m. S.W. of Hanover. Its fame is connected with the legend of the Rattenfänger or Ratcatcher, known to English readers through Browning's poem *The Pied Piper of Hamelin*. The story may have originated in the fact that most of the town's youth perished in a battle in 1259, and an outbreak of dancing mania in 1284.

There is fine Renaissance architecture in the town hall and other houses. A 14th century minster, dedicated to S. Boniface, was restored 1870-75. The industries include sugar refining, spinning, milling, and soap and paper making. A large river trade is carried on, and there are salmon fisheries. Hameln, a Saxon settlement, grew up round the old abbey of S. Boniface in the 8th century, and in 1259 belonged to the bishopric of Minden, passing in 1277 to Brunswick, after which it became a member of the Hanseatic League. It fell to the Swedes in 1633, and on two subsequent occasions, 1757 and 1806, to the French, finally becoming a Prussian town in 1866. Pop. 27,985.

Hammerling, Robert (1830-89). Austrian poet. He was born at Kirchberg, Lower Austria, Mar. 24, 1830, and as a student at Vienna shared in the troubles of 1848-49. In 1855 he was appointed lecturer at Trieste. Owing to ill-health he retired on a pension in 1866 and lived an invalid's life at Graz, where he died July 13, 1889.

The most notable of his volumes were *Sinnen und Minnen* (Meditations and Love), 1860; *Das Schwanenlied der Romantik* (The Swan Song of Romanticism), 1862; *Ahasver in Rom* (Ahasuerus in Rome), 1866; *Der König von Sion* (The King of Sion), 1869; *Amor und Psyche*, 1882; *Blätter im Winde* (Leaves in the Wind), 1887; *Homunculus*, 1888.

Hamerton, Philip Gilbert (1834-94). British art critic, born at Laneside, near Oldham, Sept. 10, 1834. He showed no remarkable talent for painting, but in search of landscapes he visited Scotland, and in *The Isles of Loch Awe*, 1855, made his first appear-

Hameln, Germany. The Ratcatcher's House, built in 1602, the reputed home of the legendary ratcatcher

ance as a poet. In 1857 he was back encamped at Loch Awe; the fascinating story of that and later encampments in the company of his French wife, as related in *A Painter's Camp in the Highlands*, 1862, caught the public fancy.

Hamerton became an accepted authority on art, and like Ruskin gave attention to social philosophy. *The Intellectual Life*, 1873, being one of the classics of the Victorian era. Etching and Etchers, 1868, and *The Graphic Arts*, 1885, stand

Philip Gilbert Hamerton, British critic Elliott & Fry

out beyond the mass of art criticism of his time. He died at Boulogne-sur-Seine, Nov. 6, 1894.

Ham Hill. Elevation in Somerset, England, 4 m. W. of Yeovil, alternatively called Hamdon. Covering an area of about 210 acres on the summit is an ancient British earthwork 3 m. in circumference, in a good state of preservation and yielding interesting traces of British and of Roman occupation. Valuable building stone is quarried on the hill.

Hami. A town in the N.E. of Sinkiang, China, on the road from Peking to Kashgar. Established on an oasis in the desert, Hami was captured from the Tartars in 1477. It is an important trading centre, and forms a meeting ground of the Buddhist and Muslim worlds. Pop. 46,200.

Hamilcar. Name of several famous Carthaginians. (1) Son of Mago, one of the suffetes or supreme magistrates. Having invaded Sicily 480 B.C. with a large army of mercenaries, he laid siege to Himera, but was utterly defeated by Gelo (q.v.). Hamilcar himself was slain and his army virtually annihilated. (2) Ambassador to Alexander after the fall of Tyre in 332 B.C.: he was later executed for betraying Carthaginian interests. (3) Military and naval commander during the first Punic War. After various successful operations by land, the Carthaginian fleet, commanded by Hamilcar and Hanno, was defeated (256 B.C.) by Regulus and Volso off Enomus.

Hamilcar. Transport glider designed by General Aircraft Ltd. for the R.A.F. in the Second Great War. It first went into operational service at the invasion of Europe in June, 1944, when its ability to transport a Bren gun carrier or light tank or equivalent load up to 8 tons proved of immediate value. A large craft (wing span 110 ft.), it needed a heavy bomber or transport plane as its tug. See Glider.

Hamilcar Barca (c. 270-228 B.C.). Carthaginian soldier and statesman, the father of Hannibal. In command of Carthaginian forces in Sicily during the first Punic War, he successfully held his ground against the Romans, until the naval victory of the latter under Catulus, in 241 B.C., forced the Carthaginians to conclude a peace, in negotiating which Hamilcar took the leading part. On his return to Carthage he had to deal with a revolt of mercenaries, which he crushed after three years. He then turned his attention to Spain, and in nine years, by fighting and by negotiation, had established Carthaginian dominion over

Hamilcar, Carthaginian soldier From a coin

a great part of the country, when his career was brought to an end by his death in battle in 228 B.C. His surname means lightning (Heb. *barak*).

Hamilton. Burgh and market town of Lanarkshire, Scotland. It stands near where the Avon falls into the Clyde, 11 m. S.E. of Glasgow, on the rly. It has a race-course (July meetings). It is the centre of a rich coal and ironstone district, and depends chiefly on

mining. There are also cotton and other manufactures, while the place is a centre for the produce of market gardens.

Hamilton's chief buildings are the town hall with a lofty clock tower, and the municipal buildings (1914).

Hamilton arms

The grammar school was founded in 1588, and moved to its present building in 1847. There are barracks, and the place is a regimental depot. Tramways connect the town with Glasgow and Motherwell. It gives its name to a county division returning one member to parliament. Hamilton was originally known as Cadzow, but took its present name when it passed to the family of Hamilton. Its modern growth began with the opening of the mines in the 19th century. Market day, Fri. Pop. est. 39,800.

Hamilton Palace, seat of the dukes of Hamilton, formerly stood near the town. The third building of that name on the same site was built 1820-30, but became unsafe owing to underground workings and was demolished in the 1920s. The park covers 1,500 acres. Included in the ducal property are the ruins of Cadzow Castle, in the park of which is a famous breed of wild cattle.

Hamilton. City and port of Ontario, Canada. It stands on a branch of Burlington Bay, at the W. end of Lake Ontario, 36 m. S.W. of Toronto. It is served by the great transcontinental lines, C.P.R. and C.N.R., and electric trains run to towns in the neighbourhood. Steamers go to Toronto and other ports on the St. Lawrence and the great lakes. Behind are hills

and in front is the narrow strip of Burlington Beach, which, separating Hamilton from Burlington Bay, has been cut by a canal.

The city has Anglican and R.C. cathedrals and a number of churches. The seat of McMaster university, it has many colleges and schools, hospitals, public libraries, and theatres: also parks and recreation and athletic grounds, the chief parks being Gore and Dundurn Castle. There are the county buildings of Wentworth co., and a fine market square. Electric tramcars run through the wide streets, and electric light and power come from Niagara and De Cew Falls. Sometimes called the Birmingham of Canada, Hamilton has the largest and most modern blast furnaces in the British Empire, also the biggest canning corporation. The centre of the Canadian steel industry, it makes agricultural and textile machinery, also silk, cotton, and woollen goods.

The city was founded about 1778, its first inhabitants being loyalists from the U.S.A. Its growth during the early 20th century to what is now the fifth city of Canada was mainly due to the introduction of electric power. Pop. 166,337.

Hamilton. Town of Victoria, Australia. It lies on the Wannon river in Dundas and Normanby counties, 197 m. by rly W. of Melbourne, at the point where the Great Dividing Range dies down to the plain of West Australia. It is a sheep-farming and agricultural centre; mutton is frozen and exported. The town has two colleges, and there is a racecourse. Pop. 6,100.

Hamilton, Ontario, arms

Hamilton. A town of North Island, New Zealand, in Waikato co. It is 86 m. by rly S.S.E. of Auckland, the centre of a grazing and dairying district and an important rly. junction. It was first laid out for settlement by British soldiers after the Maori Wars. Pop. 26,401.

Hamilton. Chief town and administrative centre of the Bermuda. It is situated on Great Bermuda or Main Island, with a deep harbour approached by a long, intricate channel through Two Rock Passage. There are well-laid-out gardens, and it is a winter resort for American visitors. Pop. 2,978.

Hamilton. City of Ohio, U.S.A., the county seat of Butler co. It stands on the Great Miami river. 25 m. N. of Cincinnati, and is served by the Pennsylvania, Erie, and Baltimore and Ohio rlys., having also an airport. Its industries include the manufacture of bank vaults and safes, machine tools and machinery of many kinds, coated paper, and woollen goods and felt. It is at the centre of a farming and stock-raising area, and has several business colleges. Settled in 1791, Hamilton was given its charter as a city in 1857. Pop. 50,592.

Hamilton. Famous Scottish family to which the dukes of Abercorn and Hamilton belong. 'All branches appear to have descended from Walter Fitzgilbert (13th century) and one story is that the name is taken from a place in Leicestershire. Walter called himself of Hameldone and obtained the barony of Cadzow in Lanarkshire. His younger son was the ancestor of the earl of Haddington, one of the many titles held by the Hamiltons. Walter's eldest son David, who held the barony of Cadzow, was taken prisoner at Neville's Cross, 1346, and was a

Hamilton, Canada. General view of the city on Lake Ontario

lord of parliament. From him various branches of the Hamiltons descended, one being now represented by Lord Hamilton of Dalzell.

James Hamilton, baron of Cadzow who was made Lord Hamilton in 1445, founded the family's greatness by his marriage with Mary, daughter of James II. His son was made earl of Arran in 1503, and one of his illegitimate children was John Hamilton, archbishop of St. Andrews, hanged in 1571. The 2nd earl of Arran was the father of Claud, Lord Paisley, from whom the dukes of Abercorn are descended, and of John, made marquess of Hamilton. From the latter the dukes of Hamilton are descended, though, after the death of the 2nd duke in 1651, only in the female line. The heir male of the family is therefore the duke of Abercorn, whose eldest son is known as the marquess of Hamilton. In 1786 the earl of Abercorn was created Viscount Hamilton of Hamilton in Leicestershire. A history of the house, by G. Hamilton, appeared in 1934.

Hamilton, DUKE OF. Scottish title, the oldest of its kind in the peerage, borne by the families of Hamilton and Douglas-Hamilton since 1643. The younger son of the 2nd earl of Arran (*q.v.*) was created marquess of Hamilton in 1599. In 1604 he was succeeded by his son James, who, in 1619, was made an English peer as earl of Cambridge. The latter's son James was the first duke (*v.s.*), created in 1643. Executed in 1649 for his share in the civil war, he was followed in the title by his brother William, earl of Lanark, secretary of state in Scotland under Charles I. William having been mortally wounded at Worcester in 1651, the title and estates passed to his niece Anne. She married William Douglas, earl of Selkirk, who, in 1660, was created duke of Hamilton. This duke, who ranks as the 3rd, supported William of Orange in 1688 and died in 1694.

The duchess survived him, but in 1698 she resigned her titles to her son James Douglas, who was created duke with precedence from 1643. He was made duke of Brandon in 1711, and was killed in a famous duel with Lord Mohun in 1712, an incident depicted in Thackeray's *Esmond*. From him the later dukes are descended. James, the 6th, married the beauty, Elizabeth Gunning (*q.v.*); James, the 7th, inherited in 1761 the title of marquess of Douglas; he failed after litigation to secure

William, 3rd Duke of Hamilton
After Mylens

the Douglas estates, but the family was known thenceforward as Douglas-Hamilton. Alexander, 10th duke, ambassador at St. Petersburg, was a great collector of works of art. William, 12th duke, was made duke of Châtellerault in 1864 by Napoleon III.

The semi-royal position of the dukes of Hamilton passed with the death of the 12th duke in 1895. He was succeeded by a cousin, Alfred Douglas, but left many of his estates to his daughter, who became duchess of Montrose. The 14th duke is separately noticed. The estates are at Dungavel, Lanarkshire, and the eldest son is known as marquess of Douglas and Clydesdale.

Hamilton, JAMES HAMILTON, 1st DUKE OF (1606-49). Scottish politician. The eldest son of the 2nd marquess of Hamilton, he was born June 19, 1606. For a time he was at Exeter College, Oxford, and, having become marquess in 1625, he went to the court of Charles I.

1st Duke of Hamilton,
Scottish politician
After Van Dyck

He spent 1631-34 in Germany, whither he took a force to aid Gustavus Adolphus, but returned to advise Charles, and was made commissioner for Scotland in 1638. Always an intriguer, in 1641 he deserted Charles, but soon was serving him again.

When the Civil War broke out Hamilton remained in Scotland, being leader of a faction there. He was raised to a dukedom in 1643, but his plans and intrigues failed, and, discredited, he left

Edinburgh for Oxford. Charles put him in prison, but soon he was released. Then came the crowning act of his life, his leadership of a strong Scottish force to restore Charles, which led to the renewal of the civil war in 1648. Incompetent as a general, he was easily routed at Preston, and was made prisoner. On March 9, 1649, he was executed.

Hamilton, DOUGLAS DOUGLAS-HAMILTON, 14TH DUKE OF (b. 1903). Scottish politician and airman. Eldest son of the 13th duke (whom he succeeded in 1940), he was born Feb. 3, 1903, and educated at Eton and Balliol College, Oxford. As marquess of Douglas and Clydesdale he became well known as a boxer and explorer, accompanying as pilot the Mt. Everest expedition in 1933 and flying over the peak. He represented E. Renfrewshire as Conservative M.P., 1930-40. In 1937 he married Lady Elizabeth Percy, daughter of the duke of Northumberland, and in 1940 was appointed lord steward of the royal household. Hess (*q.v.*), Nazi leader, after his sensational flight to Scotland in 1941, declared that he had wished to land on the estate of the duke, whom he claimed to have known in Germany before the Second Great War.

The duke's brother, Lord David Douglas-Hamilton (1912-44), a noted boxer, married Ann Prunella Stack, director of the Women's League of Health and Beauty.

Hamilton, ALEXANDER (1757-1804). American statesman. He was born Jan. 11, 1757, on the island of Nevis, West Indies, of which his mother was a native; his father was a Scotsman. Educated at King's (later Columbia) College, New York, at the age of 17 he published essays on The Rights of the Colonies. At 20 he was a lieutenant-colonel and aide-de-camp to Washington, and he led a column against Yorktown. In 1780 he married a daughter of Gen. Schuyler, who survived him 50 years.

Hamilton
After Trumbull

In 1782 he was elected a member of congress for the state of New York, in 1786 became a member of the State legislature, and in 1787 he was a delegate to the Philadelphia convention for framing the con-

stitution of the U.S.A., with the drafting of which he had much to do. In 1789 at the New York convention he secured ratification of the federal constitution. With two friends, he had produced *The Federalist*, explaining the constitution to the people.

During 1789-95 he was secretary to the Treasury, when he established the national bank and proved himself a great financier. After resigning he practised law in New York but remained a powerful political figure, embarrassing President Adams. In 1798 he was appointed second in command of the provisional army in anticipation of a French invasion, and on the death of Washington, 1799, was in chief command. Hamilton incurred the enmity of Aaron Burr, who blamed him for the election of Jefferson as president, and on July 11, 1804, he was wounded in a duel with Burr, and died the following day. Washington's closest associate, Hamilton was a great and clear thinker, whose influence on the political development of his country was enormous, though he did not subscribe to Jefferson's faith in the good judgement of the common man. He was portrayed in a film by George Arliss, 1932.

Hamilton, ANTHONY, COUNT (c. 1646-1720). British author and soldier. Son of Sir George Hamilton, a younger son of the duke of Abercorn, he is believed to have been born at Rosecrea, Tipperary. He took part in the fighting in Ireland, 1689-90, and was at the battle of the Boyne, after which he went abroad and spent most of his life at the court of the Stuarts in exile at St. Germain-en-Laye, where he died, April 21, 1720. He is chiefly remembered as writer of the lively *Memoirs of his brother-in-law, the count of Gramont* (g.v.), dealing with the court of Charles II.

Hamilton, ANTHONY WALTER PATRICK (b. 1904). British dramatist. Born at Hassocks, Sussex, Mar. 17, 1904, he was educated at Westminster. He made his reputation with the psychological thriller *Rope*, produced at the Ambassadors Theatre, London, 1929, and again scored a great success with *Gas Light* at the Apollo Theatre, 1938. Two screen versions based on this play proved popular, the first in 1940, the second (*The Murder in Thornton Square*) in 1944. The *Duke in Darkness* was produced at the St. James's Theatre, 1942. A novel, *Hangover Square*, 1941, was made into a film, 1945.

Hamilton, CICELY (b. 1872). A British dramatist, actress, and journalist. Born in London, she spent 12 years between acting and journalism, and made her name as a dramatist with *Diana of Dobson's* (Wyndham's Theatre, London, 1908). She created the part of Mrs. Knox in *Fanny's First Play*, by Shaw, 1911. After collaborating with Lillian Baylis in a study of *The Old Vic*, 1926, she wrote a series of surveys of conditions in European countries. Modern Italy appeared in 1932, Modern Sweden in 1939, with many companion books between. A leading feminist writer, she was awarded a civil list pension in 1938.

Hamilton, Cosmo (1872-1942). British novelist and dramatist. Elder brother of Sir Philip Gibbs (g.v.), he adopted his mother's surname. He wrote over 40 plays and some 30 novels. He collaborated with Seymour Hicks in *The Catch of the Season*, 1904, and *The Beauty of Bath*, 1906. Later plays included *The Aunt of England* (with Anthony Gibbs), 1935. His novels began with *Adam's Clay*, 1907, followed by many best sellers, e.g. *The Rustle of Silk*, 1922; *Every Man to His Wife*, 1938. *Discord and Harmony*, 1938, was on the collaboration of Gilbert and Sullivan. He died Oct. 14, 1942.

Hamilton, Sir Edward (1772-1851). British sailor. Born March 12, 1772, when a boy he served for two years with his father, Sir John Hamilton, in the W. Indies. Promoted lieutenant in 1793, he was present at the siege of Bastia, 1794, and in 1796 was sent again to the West Indies. In 1799 he led a party in boats into the harbour of Puerto Cabello and, under heavy fire, seized the Spanish frigate *Hermione*, and towed her out. Only 12 of his men were wounded, but Hamilton himself was badly hit. This unrivalled feat won him a knighthood and the naval gold medal. While returning to England he was captured by a French privateer and taken to Paris, where Napoleon is said to have questioned him about his exploit. In 1818 he was created a baronet and became an admiral in 1846. He died in London, March 21, 1851.

Hamilton, EMMA, LADY (c. 1763-1815). British adventuress. A daughter of one Henry Lyon,

Emma, Lady Hamilton
After Romney, the original belonging to Mr. Froch of Philadelphia

she was baptized at Great Neston, Cheshire, in 1765, being named Amy. April 26, 1763, is sometimes given as her birth date. Her parents were in humble circumstances, and her father having died while she was a baby, she was brought up by her grandmother at Hawarden. She came to London about 1778 as a nurse-

maid, and there are many conflicting stories as to her early life and intrigues. In 1782 she became the mistress of the Hon. Charles Greville, and four years later of his uncle, Sir William Hamilton, British ambassador at Naples. In 1791, Sir William married her at Marlyebone, and returned with her to Naples, where she became the confidante of the queen. In 1793 she and Nelson first met, but it was five years later, after his victory at the Nile, that they became intimate. Their child, Horatia, was born in 1801, after the return of the Hamiltons and Nelson to England. Hamilton died in 1803, and Nelson in 1805. Lady Hamilton was left with comfortable means, soon swallowed up by her extravagance.

After being imprisoned for debt, she went to Calais, in 1813, and died there Jan. 15, 1815. She made extravagant claims to public reward on account of alleged services rendered to the state, and is remembered mainly for her *liaison* with Nelson and for her remarkable beauty, to which over twenty portraits by Romney bear witness. Her memoirs went into several editions. *Consueli* Lady Hamilton and Nelson, J. C. Jeaffreson, 1888; *Lives*, H. Gamlin, 1891; *W. Sichel*, 1905; *O. A. Sherrard*, 1927. A film about Lady Hamilton starred Vivien Leigh, 1941.

Hamilton, Lord George Francis (1845-1927). British politician. Younger son of the 1st duke of Abercorn, he was born Dec. 17, 1845, and went to Harrow. In 1868 he was sent to the house of commons for Middlesex, and after the re-distribution of 1885 represented the Ealing division until his retirement. In 1874 he entered the Conservative ministry as under-

secretary for India, and in 1878 was transferred to the office of vice-president of the council. In 1885-86, and from 1886 to 1892, he was in the cabinet as first lord of the admiralty, and from 1895 to 1903 was secretary for India.

In 1903 he resigned owing to disagreement with Chamberlain's fiscal proposals, and retired from Parliament in 1906. In 1894 he was chairman of the London County Council, and after his retirement was chairman of the commission that inquired into the poor laws, 1904-09, and of the one that reported upon the early failure in Mesopotamia during the First Great War. In 1922 Lord George published his autobiography. He died Sept. 22, 1927.

Hamilton, SIR IAN STANDISH MONTEITH HAMILTON (1853-1947). British soldier. The son of a soldier, he was born at Corfu, Jan. 16, 1853. Educated at Cheam School and Wellington College, he entered the Gordon Highlanders in 1873, and first saw active service in the Afghan War of 1878-79. In the Boer War of 1881 he was wounded and taken prisoner at Majuba Hill. He was with the expedition up the Nile in 1884-85, and in Burma, 1886-87. In 1891 he became colonel, and, after service in the Chitral campaign, 1895, led a brigade in the Tirah, 1897-98. For a short time he commanded the school of musketry at Hythe.

In 1899, when the S. African War began, Hamilton was in Ladysmith as chief of staff to Sir G. White, and he was in command of the infantry at Elandslaagte and other engagements. After the relief of Ladysmith he commanded some mounted infantry, was chief of staff to Lord Kitchener, and was in command of mobile columns in the Transvaal until the end of the war in 1902, when he became quartermaster-general to the forces. He was made K.C.B. in 1900.

During the Russo-Japanese War he was military representative of India, being in Manchuria with the Japanese, an experience which led to his book, *A Staff Officer's Scrap Book*. Having been a member of the army council, from 1910 he was commander-in-chief in the Mediterranean and inspector-

general of overseas forces. In 1915, having been made full general, Hamilton was chosen to command the force that landed on the Gallipoli peninsula. He led it until he was superseded in Oct.

The failure of the expedition was bound to react on the general in charge of operations, and the commission that inquired into the matter censured him, although only on minor points. His sanguine temperament, perhaps, made him unfitted for the task, but it is doubtful whether another would have succeeded. He retired from the army 1920, and his Gallipoli Diary was published that year. He showed distinct gifts of style in his dispatches, and was something of a poet. He wrote *When I Was a Boy*, 1939; *Listening for the Drums*, 1944; and several other books. After his retirement he interested himself in the work of the British Legion. During 1932-35 he was rector of Edinburgh university. He died Oct. 12, 1947. See Gallipoli.

Hamilton, JANET (1795-1873). Scottish poet. Born at Carshill, Lanarkshire, the daughter of a shoemaker named Thomson, she married one of his employees in 1809. Though she never went more than 20 miles from her birthplace, and was blind for 18 years before her death on Oct. 27, 1873, she published verses—e.g., *Poems and Songs*, 1863; *Ballads*, 1868—which have a permanent place in Scottish literature.

Hamilton, MARY AGNES (b. 1894). A Scottish politician and writer. Born July 8, 1884, she was educated at Glasgow high school and Newnham College, Cambridge. She represented Blackburn as Labour M.P., 1929-31, being at the same time a member of the royal commission on the civil service. A governor of the B.B.C., 1933-37, she was later a frequent visitor to its Brains Trust. Her publications included novels, as well as biographies of Margaret Bondfield, Ramsay MacDonald, Sidney and Beatrice Webb, and Arthur Henderson; also *Remembering my Good Friends*, 1944.

Hamilton, PATRICK (c. 1504-28). Proto-martyr of the Scottish Reformation. Born at Stane

House, Lanarkshire, or Kincavel, West Lothian, he was grandson of the 1st Baron Hamilton and of Alexander Stewart, duke of Albany, second son of James II. Made abbot of Ferne, Ross-shire, in his 14th year, he was educated at Paris, Louvain, and St. Andrews.

For commending Tyndale's translation of the N.T. in 1526 he was charged with heresy. He escaped to Marburg, where he came under the influence of Luther and other reformers and composed his *Locci Communes*, known as Patrick's Pleas, in which he set forth the doctrine of justification by faith. He returned to Scotland in the autumn of 1527, was seized Feb. 23, 1528, tried for heresy in St. Andrews cathedral, sentenced by Archbishop Beaton, and burnt at the stake, Feb. 29. Consult Patrick Hamilton, a composite biography, ed. A. Cameron, 1930.

Hamilton, PATRICK. British writer, noticed under his full initials, Hamilton, A. W. P.

Hamilton, WALTER KERR (1808-69). British prelate. Born Nov. 16, 1808, son of Anthony Hamilton, archdeacon of Taunton, he was educated at Eton and Christ Church, Oxford, and was fellow of Merton, 1831, with Manning and Edward Denison. An adherent of

the Oxford Movement (*q.v.*), he succeeded Denison as vicar of S. Peter-in-the-East, Oxford, 1837-41; was canon residentiary, Salisbury, 1841-54; and bishop of Salisbury, 1854-69. In his charges he maintained the doctrines of the Eucharistic Sacrifice, the Real Presence, and sacramental confession. He instituted diocesan retreats; established Salisbury Theological College, 1860; composed *Morning and Evening Services for Every Day in the Week*, 1842; and wrote on *Cathedral Reform*, 1853. Died Aug. 1, 1869.

Hamilton, WILLIAM (1665-1751). Scottish poet. A friend of Allan Ramsay, his *Seven Familiar Epistles* represent a correspondence in verse between the two poets. Hamilton is also remembered by his elegy on his dog Bonny Heck and by "Willie was a Wanton Wag." He wrote a modernised version of *Blind Harry's Wallace*, which attained considerable popularity. Generally

Scottish poet

Lothian. He became involved in the Jacobite rebellion of 1745, and had to flee the country. He eventually returned and succeeded to the family estate, but his health made it necessary for him to go abroad again, and he died at Lyons, March 25, 1754. He was a contributor to Allan Ramsay's Tea-table Miscellany. His fame rests chiefly on the beautiful poem, The Bonnie Braes of Yarrow.

Hamilton, SIR WILLIAM (1730-1803). British diplomatist. Born Dec. 13, 1730, he was a grandson of the third duke of Hamilton, and in early life was a soldier. In 1761 he became an M.P. and in 1764 went to Naples as British minister. There he remained until 1800, varying his easy diplomatic duties with much social and sporting life and a keen study of volcanic activity, encouraged by his proximity to Vesuvius.

He made a valuable collection of antiquities, part of which, bought by the trustees of the British Museum in 1772, formed the nucleus of the department of Greek and Roman antiquities. Ancient vases especially were purchased by him in large numbers; he was an F.R.S. and wrote several books on volcanoes. His first wife, a Welsh heiress, having died in 1782, Hamilton persuaded Emma Lyon to live with him at Naples, and she remained his mistress until the two were married in 1791. About 1793 the pair made the friendship of Nelson, and the three spent a good deal of time together. Hamilton appears to have acquiesced in his wife's intimacy with the great seaman, who was present when he died, April 6, 1803.

Hamilton, SIR WILLIAM (1788-1856). Scottish philosopher. Born at Glasgow, March 8, 1788, and

Sir Wm. Hamilton,
Scottish philosopher
After J. Archer, R.S.A.

educated there and at Balliol College, Oxford, he became professor of history at Edinburgh in 1821, and professor of logic and metaphysics, 1836 to 1856. He was an ardent supporter of university reform and an opponent of the tendency of the colleges to claim for themselves teaching and other functions which rightly belonged to the university. Hamilton, much influenced by Kant, gave a new turn to Scottish philosophy. He especially insists upon the relativity of knowledge; the absolute is not only unknowable, but also inconceivable; it is an object of faith, not of science. His most important work is his Lectures on Metaphysics and Logic, published after his death, May 6, 1856. Consult The Philosophy of Sir W. H., S. V. Rasmussen, 1927.

Hamilton, WILLIAM GERARD (1729-96). English politician. Born in London, Jan. 28, 1729, the son of a bencher of Lincoln's Inn, and originally intended for the law, he gave it up for politics. Having entered Parliament in 1754, his maiden speech in 1755, which Walpole declared never to have been surpassed by anyone except Pitt, earned him the title of "Single-speech Hamilton." The sobriquet is not quite accurate, as he later spoke with success in both the English and the Irish parliaments. After serving as chief secretary to the lord-lieutenant of Ireland, Hamilton entered the Irish Parliament and from 1763-84 was chancellor of the exchequer there. He died July 16, 1796.

Hamilton, SIR WILLIAM ROWAN (1805-65). Irish mathematician.

Born at Dublin, Aug. 4, 1805, as a boy he showed an aptitude for languages, reading Latin and Greek and Persian, Arabic, and nine other languages before

the age of thirteen. Intended by his father for a post in the East India Co., his great genius for mathematics asserted itself and before his seventeenth birthday he had detected a mistake in Laplace's Mécanique Céleste. Sent to Trinity College, Dublin, his brilliance soon attracted attention. At the early age of 22 he was appointed professor of astronomy to the university. In 1835 he was knighted. During these years optics owed him a great debt for his remarkable theoretical researches, the chief of which resulted in his prediction of the phenomenon of conical refraction, leading to a remarkable proof of the undulatory theory of light.

The work by which Hamilton was to become best known was a system of mathematical analysis known as Quaternions (*q.v.*). The method was published in his Lectures on Quaternions, 1853, and The Elements of Quaternions, 1866. He died Sept. 2, 1865. Consult Life, Rev. R. P. Graves, 1883-89.

Hamilton Academicals. Scottish football club. One of the oldest in the country, it was formed in 1873. In 1904 it won the second division championship with 37 points out of 44 possible, and it has twice reached the Scottish cup final, being beaten in 1911 by Celtic and in 1936 by Rangers. Matches are played at Douglas Park, Hamilton.

Hamilton Group. A series of stratified rocks of marine origin, founded in N. America (New York state, Pennsylvania, Ontario, etc.). They form the upper division of Middle Devonian system in that region, and contain abundant fossils (trilobites, brachiopods, etc.). These rocks reach a thickness of 1,500 ft., and are extensively used for building and paving.

Hamirpur. District, subdivision, and town of India, in the United Provinces. The surface is flat and fertile, and is watered by the Jumna, which flows along the N. boundary, and other streams. The town is the capital of the district, and stands on the Jumna, 150 m. S.E. of Agra. Area, district, 2,438 sq. m.; sub-division, 375 sq. m. Pop., district, 575,538; subdivision, 97,166; town, 8,144.

Hamitic. Term denoting an ethnic and linguistic group in N.E. Africa. So called from Ham, one of the sons of Noah, in ethnology it designates a frizzy-haired, medium-headed, red-brown, thin-lipped type, of nomadic culture, best represented by the Nubian Beja, Abyssinian Agas, and the Dan-

akil, Galla, and Somali tribes. Their relationship to the ancient Egyptians is still undecided. An early Himyarite-Negroid blend rather than a distinct race, their contact with peoples of lower culture produced three great ethnic fusions: with Bushmen, the Hottentot; with lake Negroes, the Bantu; with Nilotic Negroes, the Masai. Hamitic speech may be related to Semitic through a common precursor in W. Asia. It is classified into 47 stocks, comprising 71 dialects, spoken over one-fifth of Africa.

Hamlet. Tragedy by Shakespeare. The scene is laid at Elsinore. Hamlet, prince of Denmark, learns from his father's ghost that the father was poisoned by his brother, who has succeeded to both his crown and his wife. Deeply affected, almost to the point of the madness which he immediately feigns, Hamlet sets himself to avenge his father after exposing the murderer. The interest of the play is centred upon Hamlet's tortured mind and the various ratiocinations which delay his action. The dénouement brings the death not only of the usurping king, but of the queen and most of the other leading characters of the play, including Hamlet himself; Laertes, killed by Hamlet; his father Polonius, the king's counsellor; and the latter's daughter Ophelia, who loses her reason before drowning herself.

Its stock of varying and exciting incidents, its store of pregnant utterances and maxims, which have found so permanent a place in the language that many people quote Hamlet habitually without knowing it, its fairly equal division into scenes of tragedy and comedy, above all the appeal of its leading character, have made Hamlet the most popular of all Shakespeare's plays. The many famous actors who have portrayed the part in recent times include Irving, Forbes-Robertson, Benson, Tree, Martin-Harvey, Matheson Lang, John Gielgud, and Donald Wolfit. Forbes-Robertson appeared in a silent film version, and Sir Laurence Olivier played the same rôle in a film made in 1947. Bernhardt, Mounet-Sully, and Rossi are among celebrated foreign players who have appeared as Hamlet. Robert Helpmann appeared in his own ballet based on Hamlet in 1942 and later essayed the part as an actor.

Hamlet is based on an ancient Icelandic saga of the Danish kings,

which found its way, in 1570, from the *Historia Danica* of Saxo Grammaticus, 1514, into Belleforest's *Histoires Tragiques*. There existed a previous play in English on the subject, probably by Kyd. Shakespeare's play was first acted at The Globe, 1602, with Burbage in the title-rôle, and there is a tradition that the poet took the part of the ghost. It was first published in 1603. There were four other quartos between 1604 and 1611. The existing text is collated from the Second Quarto of 1604 and the 1623 folio. The play is in five acts, contains 3,924 lines, of which 1,208 are prose and 2,490 blank verse, with 81 pentametric rhymes, and has found more commentators than any other of Shakespeare's plays.

Hamley, Sir Edward Bruce (1824-93). British soldier. Born at Bodmin, April 27, 1824, and educated at the R.M.A., Woolwich, he entered the artillery in 1843, and saw active service in the Crimean War. In 1859 he was appointed professor of military history at the staff college, where his lectures formed the basis of his great work *The Operations of War*, 1866. During 1870-77 he was commandant of the staff college, and in 1880 he was knighted.

Mortified at what he considered the lack of recognition of the part he played at the battle of Tel-el-Kebir, he issued a special report on the operations. Public sympathy was on his side, and he was made a K.C.B., but no further official employment was given him. He sat in parliament as Conservative member for Birkenhead from 1885, and died Aug. 12, 1893.

Hamlin, Hannibal (1809-91). An American statesman. Born at Paris Hill, Maine. Aug. 27, 1809,

he practised as a lawyer. During 1835-40 he was connected with the legislature of his state, of which he was governor in 1857. Member of congress 1843-47, he took up a strong anti-slavery attitude, and introduced the Wilmot Proviso prohibiting slavery in Mexican territory. He was a senator 1848-61 and 1869-81, and in 1854 left the Democrats owing to their attitude towards slavery, and joined the new Republican party, with the foundation of which he had much to do. He was vice-president of the U.S.A. 1861-65, and minister to Spain 1881-83. Hamlin died at Bangor, Maine, July 4, 1891.

Hamm. German town, in Westphalia, 19 m. N.E. of Dortmund. Best known as Germany's chief rly. and canal junction, it stands on the Lippe, at the E. end of Ruhr industrial area, and was itself an industrial centre, with iron-works and wire, engineering, and bridge-building plants. Its canal port handled up to 400,000 tons a year. The rly. marshalling yards at Hamm, the greatest in the country, were bombed 106 times by Allied aircraft during the Second Great War. In the neighbourhood are coal mines and thermal baths.

Founded in 1226 and from 1417 a member of the Hanseatic League, Hamm passed to Brandenburg together with Julich and Cleves in 1666. Its old fortifications were demolished in 1763. Of the old town, the Gothic church of S. Paul (13th-14th centuries), S. Agnes (16th century), and a town hall (15th century) were remarkable remnants. On April 3, 1945, troops of the U.S. 9th Army entered the town, which was cleared of German troops on the 6th. Pop., pre-war, 53,532.

Hamm, Germany. R.A.F. bombs falling on the great marshalling yards which, during the Second Great War, carried an enormous traffic in munitions

Hammamet. Gulf and town of Tunisia, on the N.E. coast. The town is situated on the gulf, 40 m. by rly. S.E. of Tunis, and is a popular bathing resort. The British 6th armoured div. cut off German forces in the Cape Bon peninsula by a rapid advance from Soliman to Hammamet, May 10, 1943.

Hammer. Percussion tool consisting of a metal or fibre head fixed on a shaft for hand use. Fibre or hard rubber-headed hammers are used for striking blows on soft metal parts which would be apt to suffer damage from a metal tool. In shape of head and length of shaft or handle the tool varies widely in different trades. The hammer of the carpenter or

joiner has usually a flat-faced head at one side and a flattened pene at the other, being used mainly for driving nails. A variety, more used in the U.S.A., is the claw-hammer, in which the pene is replaced by a split claw which can be employed to lever up and draw out nails. This claw, except in well-made tools, is inclined to upset the balance of the hammer.

The engineer and mechanic use a hammer with a round head and a ball pene or cross-pene; the latter pene is vertical, whereas that of the carpenter's hammer is horizontal. The engineer's hammer drives chisels and punches. Bricklayers use a club-hammer, with a short handle and comparatively heavy head, used for driving brick or stone chisels. Stonemasons have special hammers of similar type for use on their steel chisels. Both the carpenter's and the engineer's hammer are made in sizes ranging in weight from a few oz. to 3 lb.

Heavier hammers, with much longer shafts, to drive road or rock chisels, are termed sledge hammers. Similar tools are used by the smith and in engineering works. Set-hammers, used by the smith, resemble these but do not strike the work directly: the set-hammer is held upon the work by one operator while another strikes the tool with an ordinary hammer. A small type of mechanical hammer drives brick drills when making holes for wall plugs. Its drills

are driven by a combination of rotary and percussion action; the tool may be operated by a crank turned by the hand, or by an electric hammer. In the same class

Hammerfest, Norway. General view of the town and harbour. Top, right: the Meridian Column on Bird's Cape, marking the end of the meridian are accurately measured, 1816-52

but with more power are mechanical hammers used for finishing the surface of concrete or masonry (e.g. bush hammering). See Mallet; Steam Hammer.

Hammer, THROWING THE. A branch of field athletics. It is of ancient date and probably Celtic

Hammer-headed shark. Specimen of *sphyrna zygaena*

origin, as it has been for centuries a favourite pastime in Scotland and Ireland. Under the term casting the bar, it was a popular feature of rural sports in England, being a form of amusement indulged in by Henry VIII. The conditions governing modern hammer throwing require the performer to throw from inside a circle of 7 ft. in diameter, within which he must remain after having hurled the hammer. The hammer must weigh 16 lb. and not exceed 4 ft. in length. The head and handle may be of any shape, size,

or material. The American hammer consists of a steel wire handle with two loops for the hands, joined to the head by a ball-bearing swivel. A world record throw of 193 ft. 6½ in. was made by E. Blask (Germany) in 1938.

Hammerfest. Town of Norway, in the county of Finnmark. The most northerly town in the world, it stands on the W. coast of Kvalø island, which lies off the N.W. Norwegian shores in lat. 70° 40' N., 675 m. by sea N.E. of Trondhjem. Timber-built, the town suffered severely from a conflagration, July 21, 1890, after which the town hall, churches, and schools were all rebuilt. There is a good harbour, which is the base of the Spitsbergen and Kara Sea whale fisheries. Cod-liver oil, train oil, salt fish, reindeer hides, fox skins, and eiderdown are exported, and a large trade is carried on with Archangel. Here the sun does not set from May 13 to July 29, and does not rise from Nov. 18 to Jan. 23. Pop. 2,297.

Hammer-headed Shark (*Sphyrna*). Name given to a group of sharks differing much in appearance from the ordinary ones. They include five species, and have the sides of the head expanded so as to resemble a hammer when viewed from above. The eyes are at the extremities of these lateral head processes. These fish are common in the tropic seas, and one species (*S. zygaena*) is occasionally found off the British coasts. They frequently attain a length of 14 ft., and are voracious and dangerous.

Hammerkop, HAMMERHEAD, OR UMBRETTE (*Scopus umbretta*). African bird, related to the herons and storks. It is about 2 ft. long and has brown plumage. When the crest of feathers at the

back of the head is raised, it gives the head a certain resemblance to a

Hammerkop. Specimen of this large African bird

hammer. The bird is always found near water, and feeds chiefly on fish, frogs, and lizards.

Hammersmith. Parl. and mun. borough of the co. of London. It is bounded S. by Fulham and the Thames, where it is fringed by the Upper Mall and Lower Mall; W. by Chiswick and Acton; E. by Kensington; and N. by Willesden. It is on the main road A4 from London to the West, and is served by District, Piccadilly, Metropolitan, and Central Lines. Once a parish of Fulham, it was constituted a borough in 1899 and covers about 34 sq. m. It possesses a fine town hall, 1939, three public libraries, and many churches and schools, the last named including S. Paul's, removed here from the city in 1883; S. Paul's school for girls; Godolphin School, dating from the 16th century; Holborn Estate grammar school; and those of the Latymer foundation, 1824.

The parish church of S. Paul, consecrated by Laud in 1631, and rebuilt 1882, contains monuments preserved from the demolition of the old building. A suspension bridge erected across the Thames in 1827, the first of its kind near London, was replaced by the existing structure

Hammersmith arms

in 1887. This narrowly escaped destruction by I.R.A. bombs, Jan., 1939. The Lyric Theatre was opened April 20, 1891; under the direction of Nigel Playfair it achieved fame, e.g. producing Drinkwater's Abraham Lincoln in 1919, and reviving The Beggar's Opera in 1920. The King's Theatre was opened Dec. 26, 1902. In Blythe Road is the Post Office Savings Bank, 1903, and at Addison Road is Olympia, a glass-roofed building, 1886, used for varied exhibitions and shows.

At Shepherd's Bush are a common, 8 acres, opened 1871, and the White City Stadium built for the Franco-British exhibition and Olympic games, 1908, and the scene of later exhibitions. At Wormwood Scrubs are a prison, 1874, and two recreation grounds, 215 acres and 22 acres respectively, opened 1879 and 1886. Ravenscourt Park, 32½ acres, at the W. end of King Street, was acquired by the L.C.C. in 1887. Brook Green, 4½ acres, was made public in 1881. The Broadway is a busy rly. and bus centre, where six roads meet. The bus garage, near

Hammersmith. Bridge across the Thames, built in 1827; this view is from the towpath which runs along the Surrey side of the river

the parish church, includes the façade of Bradmore House, pulled down in 1913, once the residence of Elijah Impey, and occupying the site of Butterwick Manor House, Cromwell's headquarters in 1647.

Once noted for market gardens, orchards, and dairy farms, Hammersmith, which derives its name from two Saxon words meaning a town with a harbour or creek, is now covered with small houses, iron and dye works, electric lamp, sugar, and other factories. Its notable residents have included Sir Nicholas Crispe, who built Brandenburg House, once the headquarters of Fairfax, and the home of Queen Caroline, wife of George IV; Kneller; Radcliffe; Morland; Thomson; Turner; William Morris, who here started the Kelmscott Press (*q.v.*); Sir Alan Herbert. Two members are returned to parliament. Much damage was done by air raids in the Second Great War. Pop. est. 118,300. *Consult* Hammersmith Hoy, Sir N. Playfair, 1930.

Hammerstein, OSCAR (1847-1919). American opera impresario. Born in Berlin, he went at 16 to the U.S.A., where he made a fortune as a cigar maker. In a chequered career he built the Manhattan Opera House in New York, putting on seasons, 1906-10; also six other theatres in the city. The Philadelphia Opera House was started in 1908 and the American Opera House in 1912. But his London Opera House in 1911 failed, and became the Stoll Theatre. He died Aug. 1, 1919.

Oscar Hammerstein II was the author of book and lyrics of several musical comedies by Sigmund Romberg, Jerome Kern, etc.

Hammer Toe. Condition in which the first phalanx of the toe is bent upwards, and the second phalanx downwards, the third or terminal phalanx being bent either downwards or upwards. This re-

sults from wrong balance between the extensor and flexor muscles. The base of the toe presses upwards against the top of the boot, and the person walks on the extremity of the toe or even on the nail, the shape of the toe thus coming to resemble somewhat the head of a hammer. An operation involving removal of part of the toe is usually required.

Hammerton, SIR JOHN ALEXANDER (1871-1949). British editor and writer. Born at Alexandria in the parish of Bonhill, Dumbartonshire, of Anglo-Scottish parentage, he took to journalism in Glasgow, 1888, and edited newspapers at Blackpool, Nottingham, and Birmingham before settling in London as a writer and editor of books and periodicals, 1900. His name is associated as editor with many noteworthy publishing enterprises, such as The Punch Library of Humour, Peoples of All Nations, Countries of the World, Wonders of the Past, the Universal Encyclopedia (now reissued as the New Universal Encyclopedia), the Universal History, Practical Knowledge for All, and The New Book of Knowledge. Throughout each of the two Great Wars he edited the journal War Illustrated and standard contemporary histories, The Great War (13 vols.) and The Second Great War (9 vols.). He also founded (1939) and edited the monthly magazine World Digest.

He spent nearly two years, 1912-13, in Spanish America as managing editor of El Diccionario Enciclopédico Hispano-Americano, and his impressions of the Argentine and Uruguay are given in The Argentine Through English Eyes, 1917. Among his books are Stevensoniana, 1903, George Meredith: His Life and Art, 1909, An Outline of English Literature, 1927, Memories of Books and Places, 1928, a life of Barrie, 1929, With Northcliffe in Fleet St., 1932, two books of essays, As the Days

Go By, 1941, and Other Things Than War, 1943, and a life of Arthur Mee (g.v.), Child of Wonder, 1946. His autobiography, Books and Myself, appeared in 1944. Knighted 1932, for his services to popular education, he died May 12, 1949.

Hammock (Span. *hamaca*). Swinging bed of netting, canvas, fibre, skins, etc., suspended at

Hammock of the type used in the British navy

each end to supports. On ship-board, and particularly on warships, the hammocks are made of canvas, and in the old days of sailing vessels they were folded and stowed along the bulwarks to give some protection from the enemy's fire. The word is thought to have been derived from the fact that the natives of Brazil used the bark of the Hamack tree for nets in which to sleep.

Hammond. City of Indiana, on the boundary with Illinois, U.S.A., in Lake co. It stands on the Grand and Little Calumet rivers, 21 m. S.S.E. of Chicago, and is served by several rlys., a canal to Lake Michigan, and an airport. There are two harbours on Lake Michigan. One of the fastest growing cities of a very heavily industrialised region, Hammond had become the state's chief meat packing centre by 1900, but this industry then declined and was succeeded by steel. Rly. equipment, hospital and surgical supplies, and punch presses are made, and there are iron and brass foundries. Hammond was incorporated in 1883. Pop. 70,184.

Hammond, AUBREY LINDSAY (1893-1940). British theatrical designer. Born at Folkestone, Sept. 18, 1893, he was educated at Bradfield and studied art at Julien's, Paris. From black-and-white work he developed an originality in stage settings and costumes for, e.g., *The Man with a Load of Mischief*; *The Sacred Flame*; *Jew Süss*; *The Dubarry*; *Wild Violets*; *Ballerina*; *The Shining Hour*; *To Have and to Hold*. His designs for Shakespearean productions at Stratford-on-Avon were notable for their brilliant

colour. He also worked for the cinema and for commercial exhibitions. He died March 19, 1940.

Hammond, JOHN HAYS (1855-1936). American mining engineer. Born at San Francisco, March 31, 1855, he was educated at Yale, and in 1880 was appointed to the geological survey of the Californian gold fields. One of the leaders of the reform movement in the Transvaal, he disapproved of the Jameson Raid, 1896, but after its failure was sentenced to death, this sentence being commuted to imprisonment and later to a fine. Retiring to America, he

interested himself in mining and development schemes in the U.S.A. and Mexico. He attended the coronation of George V as representative of President Taft. Hammond died June 8, 1936.

Hammond, JOHN LAWRENCE LE BRETON (1872-1949). British historian. Educated at Bradford grammar school and S. John's College, Oxford, he became a journalist, edited *The Speaker*, 1899-1906, was leader writer on the *Daily News*, 1907, and special correspondent to the *Manchester Guardian* after the First Great War, joining the editorial staff in 1939. With his wife, (Lucy) Barbara Hammond (b. 1873), he wrote a series of standard books on conditions of the British working class from 1760 to 1832: *The Village Labourer*, *The Town Labourer*, *The Skilled Labourer*. Their other publications included *The Age of the Chartists*, 1930; *The Bleak Age*, 1934; and a biography of Shaftesbury, 1923. He died April 7, 1949.

Hammond, WALTER REGINALD (b. 1903). English cricketer. Born at Dover, June 19, 1903, he went to Cirencester grammar school, and played cricket for Gloucestershire in 1920; as a professional 1923-37; as an amateur again from 1938. In 1928 he played for England in Australia and returned with a batting average of 113.12 in test matches. From then until 1939 Hammond had claims

to be regarded as the finest all-round cricketer in the world. He was a good bowler with the new ball and a brilliant slip fieldsman. In test matches against all countries he made more appearances (84 in all), more runs (over 7,000), and more catches than

Walter Hammond, English cricketer

any other cricketer, and also had a record spell as captain. In English seasons he headed the batting averages in 1933 (in which year he scored 3,323), from 1935 to 1939 inclusive, and in 1946. He passed 1,000 runs in May, 1927, in Aug., 1933, and in Aug., 1936 (1,281); and made 15 centuries in 1938. That year he captained England against Australia, as he did on the 1946-47 tour. After the latter, Hammond retired from regular first-class cricket. He published *Cricket My Destiny*, 1946.

Hammurabi, KHAMMURABI, OR HAMMURABI. King of Babylon about 2100 B.C.; identifiable with Amraphel, king of Shinar (Gen. 14). A British Museum stèle portrays him as a bearded Semite. Sixth and greatest monarch of the first dynasty of Babylon, he established its supremacy over the city states of Sumer and Akkad, besides subduing Elam. He reigned for 43 years, developed a peaceful administration whose memorial is the code of laws described below, and engaged in building and irrigation. His letters illuminate the political and economic conditions of his age. See *Babylonia*.

Hammurabi Code.

Body of laws codified by Hammurabi, king of Babylon. It was inscribed upon a black diorite stèle for the temple of the sun-god Shamash at Sippara, and carried thence by Shutrak-Nakhkhunte of Elam, c. 1200 B.C., to Susa. J. de Morgan found it there in three fragments, 1901-02, and it is now in Paris. The block, 7 ft. 3 ins. high, tapering from 6 ft. 2 ins. to 5 ft. 4 ins. round, is surmounted by a sculptured relief representing Shamash delivering the code to Hammurabi. Incised

Hammurabi Code. Stone inscribed with the code
Louvre, Paris

on front and back were about 8,000 words in Semitic cuneiform. A portion chiselled out by its Elamite captor is partly recoverable from fragmentary copies previously found in Ashurbanipal's Nineveh library, whence the code was known before its authentic original came to light.

The 282 extant sections comprise enactments pertaining to witchcraft, false judgement, licensing laws, assault, desertion; marriage, divorce, dowry, inheritance, adoption; contracts, debts; tenancy, distraint, agricultural rent; rights of orphans and widows; regulation of boat-building, river-traffic, and riparian rights; wages, interest, and insurance. Three grades of society were recognized, nobles, commoners, and slaves. Mutilation and fines prevailed, imprisonment is unmentioned; the absence of a murder-penalty points to the retention of the blood-feud.

The code was a unification of Semitic elements pertaining to pastoral life, violence, and theft, with the commercial and agricultural law of the Sumerian city-states, whereof glimpses appear in the legal reforms of Urukagina, king of Lagash, about 2825 B.C. For an Assyrian code somewhat similar to Hammurabi's, see Mesopotamia. See also Babylonia.

Hamp, PIERRE. Contemporary French novelist. Apprenticed to a pastrycook, he worked his way up to chef. He then became a railway worker, qualified as an engineer, and was an inspector on the chemin de fer du Nord. His novels are virile documents presenting life as the under-dog sees it, though with no doctrinaire bias. *Marée fraîche*, tracing the history of a sole from sea to restaurant, shows the whole complicated business of distribution. *Vin de Champagne* takes a similar course. *Le Rail* is a striking study of rly. conditions, and *Gueules Noires* of mining communities.

Hampden. R.A.F. bombing plane, a product of Handley Page. It was in service with bomber and coastal commands early in the Second Great War. A monoplane of unusual design, it had a fuselage to the rear of the bomb-bay that was a mere tail-carrying boom. The mid-mounted wing had a span of 69 ft. The Hampden was powered by two Bristol Pegasus engines which gave it a speed of 265 m.p.h. and a range of 1,990 m. Its bomb load could be 2,000 lb.

Hampden, HENRY BOUVIERE WILLIAM BRAND, 1ST VISCOUNT (1814-92). Speaker of the British

house of commons. Born Dec. 24, 1814, and educated at Eton, he entered parliament as a Liberal, 1852, representing Lewes till 1868 and Cambridgeshire 1868-84. For many years a party whip, he was elected Speaker in 1872, and filled that office during the years of the Parnellite obstruction. The sitting of Jan. 31, 1881, lasted for 41 hours, and at 9 a.m., Feb. 2, Brand, on his own responsibility, closed the debate. This action led to the adoption of the closure as a form of procedure. On retirement from the chair in 1884, Brand was created Viscount Hampden. He died at Pau, March 14, 1892. The 3rd viscount was born in 1869 and succeeded to the title in 1906.

Hampden, JOHN (1594-1643). English statesman. The eldest son of William Hampden, of Great

John Hampden, British statesman

Hampden, Bucks, and Elizabeth, an aunt of Oliver Cromwell, he was probably born in London. Educated at Thame grammar school and Magdalen College, Oxford, in 1613 he entered the Inner Temple. He inherited his father's estates, and became M.P. for Grampound, Cornwall, in 1621; later he sat for Wendover and for Bucks.

In 1627 Hampden was imprisoned for refusing to pay a share of a forced loan raised by Charles I, and in 1635, on the attempt to raise ship-money from inland places, he refused again and was prosecuted; a majority of the judges decided against him, but the Long Parliament reversed their judgement. His courageous stand on a matter of principle established him as a popular figure, and he became one of the leaders of the parliamentary party, though always subordinating himself to Pym. He took part in the impeachment of Strafford, 1641, voted for the Grand Remonstrance, and in 1642 was one of the five members whose attempted arrest by the king led to the outbreak of the Civil War.

Hampden raised a regiment of infantry and led it to the relief of

1st visct. Hampden, British politician

Coventry and the siege of Reading. In a skirmish at Chalgrove Field, Oxon, June 18, 1643, he was badly wounded, and he died at Thame, June 24. Friend and foe united in regarding him as a man of uncommon honesty and selflessness. He had little initiative, ambition, or zest for leadership, but he inspired trust and showed efficiency as an organiser. Consult *Memorials of Hampden*, Lord Nugent, new ed. 1889; *Life*, H. R. Williamson, 1933; also *Critical and Historical Essays*, Lord Macaulay, 1843.

Hampden, RENN DICKSON (1793-1868). A British prelate. Born at Barbados, March 29, 1793, he was educated at Oriel College, Oxford, where he was fellow with Keble and Newman in 1814. After he had held curacies he became principal of S.

Renn D. Hampden, British prelate After D. Macnee, R.S.A.

Mary's Hall, Oxford, 1833, spending £4,000 on the buildings, and professor of moral philosophy, 1834. His Hampton lectures on the Scholastic Philosophy Considered in its Relation to Christian Theology, discussing the injurious effect of scholasticism on Protestant truth, were regarded as heretical. His appointment as regius professor of divinity, 1836, was opposed with some vigour by Newman, Pusey, and others, but defended by Arnold. His nomination in 1847 as bishop of Hereford was opposed by 13 bishops and led to some ineffective litigation. Hampden wrote *Lectures on Moral Philosophy*, 1856; *The Fathers of Greek Philosophy*, 1862. He died April 23, 1868.

Hampshire OR HANTS. County of southern England, officially the county of Southampton. It is

Hampshire. Badge of county of Southampton

bounded W. by Dorset and Wiltshire, N. by Berkshire, E. by Surrey and Sussex, and has a coast-line on the English Channel, where are the openings of Southampton Water and Portsmouth Harbour. The Isle of Wight forms part of the administrative county, although it has a separate council; it is described in a separate article. In the N. are downs, low

ranges of hills rising to nearly 1,000 ft. on the Berkshire border, and in the S.W. is the New Forest. The chief rivers are the Itchen, Test, Avon, Hamble, and Lymington. The area of the county, with the Isle of Wight, is nearly 1,650 sq. m.

Hampshire is mainly an agricultural county, a feature being the number of sheep reared. There are also many pigs. Wheat, barley, and oats are grown, but there is much waste or forest land, including, in addition to the New Forest, the forests of Bere, Woolmer, and Alice Holt. Winchester is the co. town. Largest places are the two great seaports, Southampton and Portsmouth; the county also includes Bournemouth, Southsea, Aldershot, and Eastleigh. Some of the small market towns, e.g. Andover, Basingstoke, Christchurch, Romsey, and Lymington, are boroughs with a long history behind them; others, not now boroughs, are equally old—e.g. Petersfield, Fareham, Alton, Odiham, Whitchurch, and Stockbridge were, at one time or other, represented in parliament. Farnborough and Gosport are of more recent growth. Hurn airport is 6 m. N. of Bournemouth. Hampshire sends five members to parliament in addition

to one for the Isle of Wight. It is in the dioceses of Winchester and Portsmouth.

There are abbey ruins at Beaulieu and Netley and beautiful old churches at Christchurch and Romsey. Of old castles there remain Porchester and Hurst. Other ruins are at Basing House; Strathfieldsaye, the seat of the duke of Wellington; Hursley; and Titchborne. At Bishop's Waltham the bishop of Winchester had a palace. Porchester was a Roman station. Notable houses include Heron Court, near Christchurch, and Broadlands, once the residence of Palmerston. Hampshire was the birthplace of cricket (see Hambleton). Pop. 1,102,770

LITERARY ASSOCIATIONS. Hampshire was first notably used as a literary background in Gilbert White's *Natural History of Selborne*. Jane Austen made capital out of the comfortable classes of the county in which most of her life was spent (Steventon and Chawton). Cobbett extended his *Rural Rides* into Hampshire. Kingsley, rector of Eversley, dealt with the county in *Yeast*. Hereward the Wake, and Madam How and Lady Why. Hardy introduced Bournemouth and Winchester into

Tess of the D'Urbervilles. Hampshire Days is one of W. H. Hudson's most attractive books. The *Victoria History of the co.* appeared in 5 vols., 1908-12.

Hampshire. Name of several British warships. On June 5, 1916, off the Orkneys in extremely rough weather, an 11,000-ton cruiser of this name, which was conveying Lord Kitchener, secretary for War, on a mission to Russia, ran into a minefield and sank. There were only twelve survivors of over 600 officers and men, among those lost being Kitchener. See Kitchener, 1st Earl.

Hampshire Regiment, ROYAL. Formerly the 37th and 67th Foot, raised in 1702 and 1758 respectively.

Royal Hampshire Regiment badge

The former regiment first saw active service in Holland, afterwards taking part in Marlborough's battles. At Dettingen, 1743, and at Minden, 1759, it played a notable part. The combined regiment formed a portion of the "fighting brigade" employed against the French in Holland, and distinguished itself at Tournai, 1794, and Barossa, 1811. Later campaigns include the Indian Mutiny, the China War, 1860-61, the Afghan War, 1878-80, and the Burmese War, 1885-87. After the S. African War it saw field service in Somaliland.

In the First Great War, battalions of Hampshires, regular and territorial, served on five battle fronts as well as in Aden, Persia, and Siberia, and at Archangel. In the Second Great War they fought in Malta, N. Africa, Sicily, Italy, France, Belgium, Holland, Germany, and Burma. The regiment became the Royal Hampshire Regiment Dec., 1946.

Hampstead. Parl. and mun. bor. and residential district of N.W. London. Occupying about 3½ sq. m., it is served by suburban electric and underground rlys. and by London Transport. Modern buildings include the town hall; public libraries; New College (Congregational); Westfield college for women; University College School; Hampstead general hospital, on the site of Bartrum House, once the resi-

Hampstead arms

Hampshire. Map of this South of England coastal county

Hampstead Heath, London. View showing (behind the fencing) the site which, in 1947, it was proposed to purchase and add to the Heath. The site, which adjoined the inn Jack Straw's Castle was $3\frac{1}{2}$ acres in extent

dence of Sir Rowland Hill; New End hospital; Mount Vernon hospital (now the National Institute for Medical Research); Royal Soldiers' Daughters' Home; Sailors' Orphan Girls' Home. The church of S. John, 1747, replaced a structure pulled down in 1745, and contains a facsimile bust of Keats, by Anne Whitney, presented by Americans—the original being in the Keats museum.

In the churchyard were buried Sir James Mackintosh; Joanna Baillie, who lived at Bolton House; Lucy Aiken; John Constable; George Du Maurier, who lived at New Grove House; Walter Besant; Wilson Barrett.

For long a favourite residence of artists and literary men, Hampstead is full of associations. Dr. Johnson wrote *The Vanity of Human Wishes* at Priory Lodge, 1749; Clarkson Stanfield lived at Stanfield House; Sir Harry Vane was arrested at his residence here in 1660; Keats, who wrote *Hyperion* and *The Eve of St. Agnes* at Lawn Bank, also lived in Well Walk, as did Constable. Other notable inhabitants include Romney, William Blake, Akenside, Arbuthnot, Mrs. Barbauld, Mrs. Siddons, Shelley, Leigh Hunt, Steele, Talleyrand, Edward Irving, Baron Erskine, Lord Mansfield, the 1st earl of Chatham, Spencer Perceval, Galsworthy, Gerald Du Maurier, C. E. M. Joad, Dame Myra Hess.

The manor, first mentioned in 978 and referred to in Domesday, is owned by the Maryon-Wilson family. The history of Hampstead is linked

with that of Belsize, and it was part of Hendon in the 16th century. With Highgate (*q.v.*) it was once a favourite hunting ground. Its chalybeate wells are said to have been known to the Romans, and Well Walk, Wellside, and Flask Walk recall the fashionable spa of the 18th century, the scene of novels by Fanny Burney and Richardson. The Kit-Kat Club (*q.v.*) met at the Upper Flask Tavern, now Upper Heath, where lived George Steevens, the Shakespearean scholar.

Hampstead Garden Suburb, situated N. of Hampstead Heath extension, of which it was an outcome, and E. of Golders Green (*q.v.*), was founded by Mrs. Henrietta Octavia Barnett, who formed a company in 1906, when the 240 acres were purchased from the Eton College trustees. The land had not previously changed hands since the time of Henry VIII. The first sod was cut May 4, 1907. Hampstead returns one member to parliament. Pop. 88,947. See *Bull and Bush*; *Jack Straw's Castle*; *Ken Wood*; *Spaniards, The*. Consult *The Annals of Hampstead*, T. J. Barratt, 3 vols., 1912.

Hampstead Heath. Open space in N.W. London. It occupies the

summit and N. slopes of Hampstead Hill, at an elevation of 430 ft. above sea level. From its higher stratum of Bagshot sand, some 80 ft. thick above the London clay, issued the Holbourne, Tybourne, and other streams which once traversed the capital. The heath, famous for its firs, broken hillocks, wild gorse, grassy glades, extensive views, and old inns, covers 250 acres, Parliament Hill (265 acres), Golders Hill (36 acres), and Ken Wood (73 acres) all adjoining.

Down to the early days of the 19th century a haunt of highwaymen and robbers, it once saw fairs races, and still is a popular resort. On bank holidays by reason of its entertainment of the swings and roundabouts kind. Preserved from enclosure by the Metropolitan Commons Act, 1866, the greater part was acquired as a public recreation ground in 1870, additional ground being added in 1907. Old inns on and near the Heath are the Bull and Bush, Jack Straw's Castle, and the Spaniards.

Hampton. Part of the bor. of Twickenham, Middlesex, England. It stands on the Thames, 15 m. S.W. of London by electric rail way. Hampton Court (*q.v.*), 1 m. to the S.E., and Bushy Park (*q.v.*) are within its boundaries. The parish church of S. Mary is on the site of an older structure, was built in 1830, and enlarged and restored in 1888 and 1898; in the churchyard lies Huntington Shaw (d. 1710), who wrought the iron gates at Hampton Court.

At Garrick Villa, formerly Hampton House, E. of the church, David Garrick lived, 1754-79. There is a 16th century grammar school. To the W. of the village are large waterworks under the control of the London Water Board. Near are Kempton Park and Hurst Park racecourses; Hampton has a ferry to Molesey Hurst. The manor, which belonged

Hampstead. Church Row, a characteristic street of the North-West London borough

in Edward the Confessor's time to Earl Algar, is mentioned in Domesday, and was once held by Wolsey. Pop. 13,053.

Hampton Court. Palace on the left bank of the Thames, between Hampton and Hampton Wick, Middlesex, 15 m. S.W. of London Bridge. Built by Cardinal Wolsey in 1515, and surrendered by him to Henry VIII in 1526, it remained a royal residence until the time of George III. The red brick buildings containing more than 1,000 rooms, cover 8, and the gardens 44, acres.

The E. and S. wings were built by Wren; the gardens were laid out for Charles II and William and Mary. The state apartments were restored and opened to the public in 1839. The Haunted Gallery is said to be visited by ghosts of Strafford, Jane Seymour, Catherine Howard, and Mrs. Penn, Edward VI's nurse. The Chapel Royal was opened to the public in 1918. Many paintings, including Lely's portraits of court beauties, tapestries royal beds and suites of furniture, etc., and an astronomical clock are to be seen. Features of the gardens are

the grape vine, planted 1768, the maze, and the Long Water. The Home Park covers 600 acres; adjacent is Bushey Park (1,000 acres), famous for its chestnut avenue and tame deer. The old moat was opened up in 1910.

At Hampton Court, Edward VI was born. Jane Seymour died, Catherine Howard was disgraced, Henry VIII married Catherine Parr, Philip and Mary, also Charles I and Henrietta Maria, spent their honeymoons, Charles I was a prisoner, James I presided over the Prayer Book conference, the authorised version of the Bible was planned, and William III was injured while riding. Portions of the palace buildings were slightly damaged by German bombs in the Second Great War. Present residents are principally royal pensioners.

Hampton Court Conference. Conference arranged by James I in 1604 at Hampton Court between the bishops and four representatives of the Puritan clergy. James had just ascended the English throne, and the Puritans had petitioned him to recognize their

views as to certain changes in the Prayer Book and upon ceremonies and vestments. The proposals of the petitioners were rejected, and James administered a scolding to their representatives.

Hampton Roads. Channel in Virginia, U.S.A., which connects the estuary of the James with Chesapeake Bay, the mouths of the Elizabeth and Nansemond also being here. Here are the ports of Norfolk, Newport News, and Portsmouth, the site of a U.S. naval yard. Forts Monroe and Wood are at the entrance.

Hampton Roads, BATTLE OF. Naval engagement during the American Civil War, March 8-9, 1862. On March 8 three Confederate ships, the largest of which was the ironclad Virginia, formerly the Merrimac, entered Hampton Roads, set fire to the Federal frigate Congress, and sank the sloop Cumberland. The Confederates got away with little damage, but the same evening the Federal ironclad Monitor, which had been launched earlier in the year, steamed into the Roads, and the following morning put out to

Hampton Court. 1. Interior of the Great Hall, built by Henry VIII, 1530-35. 2. West Front and Great Gatehouse, built by Cardinal Wolsey. 3. Anne Boleyn's Gateway, in which is the entrance to the Great Hall. 4. Fountain Court, designed by Sir Christopher Wren

give battle to the Merrimac. The latter vessel was already crippled, and the action of the Monitor during the engagement and her superiority over the Merrimac were a signal success for her designer, Ericsson (*q.v.*). This was the first encounter between armoured warships. See American Civil War.

Hampton Wick. Parish and village of Middlesex, England. It is situated on the Thames opposite Kingston, with which it is connected by a bridge, and is $2\frac{1}{2}$ m. E. of Hampton, with a rly. station. The church of S. John Baptist was enlarged 1887. The duke of Nemours lived at Bushey House. Steele lived at Hampton Wick for a time, and Timothy Bennet, who secured the public way through Bushey Park, was a native of the parish. Pop. 2,957.

Hamrin Hills or **JEBEL HAMRIN.** Range of hills in Iraq. It came into prominence during the First Great War in the course of British operations against the Turks, who were defeated here in April, 1917. It runs N.W. from the DIALA, an eastern tributary of the Tigris, to the Tigris about the village of Fathah, and is traversed from N. to S. by the Shat el Adhaim, another affluent of the great river. The average height is 2,000-3,000 ft. See Mesopotamia Campaign.

Hamster (*Cricetus*). A small rodent, common in Asia and N. Europe, especially in some parts of Germany. It is less than a foot long, and has about 2 ins. of tail. The thick fur is yellowish brown in colour, glossy, and has a modest value in the trade for lining garments. The animal lives in

Hamster, a North European rodent

burrows, rather elaborately constructed, consisting of a dwelling chamber and a granary which are connected by galleries and provided with separate tunnels for entrance and exit.

Sometimes four or five granaries will be found in a single burrow. These are used for storing corn for consumption in winter, during which season the hamster keeps below ground and spends most of its time in profound sleep. Separate burrows of a simple kind are constructed for the summer, in

which the young are reared. Two families, ranging in number from six to eighteen, are reared every season, hence the hamster often becomes a most destructive pest to crops. Its flesh is eaten by the country people. The golden hamster (*C. auratus*) of Palestine is used in laboratory experiments.

Hamsun, KNUT (b. 1859). A Norwegian novelist. He was brought up as a cobbler in the Lofoten Isles, and worked variously as clerk, teacher, street-car conductor in the U.S.A., farmer, and in the Norwegian fisheries. His success as a novelist began with the publication of *Sult* (*Hunger*) in a Danish magazine. Pan, 1895, is perhaps his greatest work, though English readers are most familiar with *Growth of the Soil*, published 1917, and trans. 1920. His style shows the influence of the Russian school, and has affinities also with the Americans. Other works which have been trans. into English are *The Women at the Pump*, 1928; *Chapter the Last*, 1929; *Vagabonds*, 1931; *The Road Leads On*, 1935. In 1920 he was awarded the Nobel prize for literature.

When the Germans invaded Norway in 1940, Hamsun supported Quisling and during the occupation wrote in the Norwegian and German press in favour of the Nazis. In 1946 the Norwegian state attorney announced that no action would be taken against him in view of a medical report, but his wife was sentenced to three years' imprisonment and a fine of £3,750. In 1947 Hamsun was sued for £25,000 by the directorate of compensation, and was ordered to pay £21,250 and costs.

Hamtramck. City of Michigan, U.S.A., in Wayne co. Though completely surrounded by the city of Detroit, it has resisted annexation. The pop. of 49,839 is predominantly Polish, public notices being in Polish as well as English. The establishment of a motor car factory in 1914 led to a phenomenally rapid increase in its pop. In 1922 it became a city. The Hamtramck public school code for adult education has been widely adopted in the U.S.A. and elsewhere. The name derives from Col. Hamtramck, who took command of the fort of Detroit when the British surrounded it in 1796.

Han. River of China. It takes its rise in the Ta-pa-ling mts. of Shensi, and flows E. and S. across the provs. of Shensi and Hupeh, to effect a junction with the Yangtse-kiang at Hankow. Floods are

common, but the river is navigable by small craft to Simpuwan, a distance of 1,260 m., and for large junks to Fancheng, 450 m. Much traffic is carried on the river, which is 1,300 m. in length, and passes several important towns. The Han has often changed its course.

Hanaper (late Lat. *hanaperium*, hamper). Name given to a wicker basket in which documents were kept in the English chancery, and so to a department of that court of law. Controlled by the clerk of the hanaper, the department used to receive the fees for sealing charters, patents, and writs under the great seal. The office of keeper of the hanaper was abolished in 1842.

Hanau. Town of Germany, in the state of Greater Hesse. It stands in fertile country at the confluence of the Main and Kinzig rivers, 14 m. E. of Frankfurt; after the Second Great War it was in the American occupied zone. It was granted urban rights in 1303, and fell by inheritance to the house of Hesse in 1736. Napoleon won a victory here over a Bavarian-Austrian army which was trying to cut him off from the Rhine after Leipzig, Oct. 30-31, 1813. Refugees from the Low Countries settled in Hanau in the 17th century and founded its important diamond cutting and jewelry industry; other factories in the town manufacture surgical instruments, chemicals, motor tires, leather goods, and cigars. The brothers Grimm were born at Hanau and have a memorial. The town, severely damaged in 1940-45, contained a number of fine old buildings, outstanding among which were the 15th century church of S. Mary, the old town hall (1538), and the Philippsruhe palace (1710), once the seat of the Hessian dynasty. Wilhelmsbad mineral springs are near. Pop., pre-war, 40,655.

Hancock, WILLIAM KEITH (b. 1898). Australian historian. He was born at Melbourne, June 26, 1898, and was a fellow of All Souls, Oxford, 1924-30. He was professor of modern history at Adelaide, 1924-33, and of history at Birmingham, 1934-44, then went to Oxford as Chichele professor of economic history. In 1949 he became professor of Commonwealth affairs in London University. His publications include *Ricasoli*, 1926; *Australia*, 1930; *Survey of British Commonwealth Affairs*, 1937, 1940, 1942; *Argument of Empire*, 1943; *Politics in Pitcairn*, 1947.

Hand. Prehensile extremity of the arm. It consists of three divisions—the carpus or wrist, the metacarpus, and the phalanges of the fingers. The carpus consists of eight small bones arranged in two rows. From the radial to the ulnar side, the bones of the first row are the scaphoid, lunar, pyramidal, and pisiform. Those in the second row are the trapezium, trapezoid, os magnum, and unciform. The metacarpus consists of five long bones, which articulate at the upper end with the wrist, and at the lower end with the first phalanges of the fingers. The phalanges are fourteen in number, three for each finger and two for the thumb.

Hand. Left, of a negro from the Blue Nile; right, of a very aged gorilla, showing the shorter thumb typical of the apes

The hand is supplied with blood-vessels derived from the radial and ulnar arteries of the forearm. The palm of the hand is protected by a strong and dense layer of tissue lying beneath the skin, known as the palmar fascia. In middle-aged persons this fascia may contract, causing some fingers, often the ring and little fingers, to be drawn in towards the palm, thus crippling the hand. This condition, Dupuytren's contraction, as a rule requires operative treatment, but even then tends to recur. There is no fundamental difference between the hands of the higher apes and those of man. The chief difference is in the thumb, always shorter in the ape, and in the degree of its opposability. It is most human in the chimpanzee, and in some of the Anthropoidea is practically absent. See Anatomy.

Hand. English measure of length. Like foot, it originated from a human limb, being the breadth of a man's palm. After a time a fixed length was given to it and it is now 4 ins. It is only used for measuring horses.

Handbells. Small bells of sweet tone, used both for the sake of their own music, and also for

Handbells. Set of bells in diatonic scale

practising the changes (*q.v.*) for ringing on church bells. One player can easily control four handbells, two with each hand, if their handles are leather loops, and the clappers only act when swung in one direction. Parties of five or six players can thus operate a large number of bells, and perform elaborate music in harmony. See Campanology.

Handcuffs. Devices for fastening the wrists of prisoners. Modern handcuffs consist of two metal rings adjustable to various sizes by means of a ratchet, and fastened together by a short length of chain. Formerly handcuffs were rigid, and a police officer was compelled to carry two or three sets when he went to arrest a prisoner. Handcuffs with no connecting chain, shaped like a figure eight, fixed the wrists in one

position, and often caused great pain. Some handcuffs fit only on one wrist, the other part being held by the officer in charge of the prisoner. Snap-handcuffs enable a detective to imprison one wrist of an offender with a single movement. Nippers are a variety of those handcuffs which are used only on one wrist, the other part of the handcuff forming a handle. Twisters are a similar arrangement, the metal ring being replaced by a short length of chain that can be twisted round the prisoner's wrist. The latter are not used in Great Britain.

Handel, GEORGE FREDERICO (1685-1759). Anglo-German composer. Born at Halle, Saxony, son of a surgeon-barber, Feb. 23, 1685, at a very early age he revealed the possession of great musical gifts but received no encouragement from his father to develop them. Eventually he became a pupil of Zachau, organist of the cathedral at Halle, and spent some time in Berlin, afterwards becoming organist at Halle. In 1703 he went to Hamburg and played the violin in the orchestra of the Opera House; then his first opera, *Almira*, was produced in 1705. He went to Italy for three years to study the methods of Italian opera

composers, and whilst there produced several operas with great success.

In 1710 Handel returned to Germany, and was appointed "chapel-master" to the elector of Hanover, afterwards George I of England. The same year he came to England, where, apart from a few short visits to Germany, he spent the remainder of his life. He introduced himself to English audiences by his opera *Rinaldo*, which aroused great enthusiasm. Other operas followed; also a *Te Deum* to celebrate the peace of Utrecht in 1713. For some time he was organist to the duke of Chandos at Canons, Edgware. In 1719 the Royal Academy of Music was established for the performance of opera, and Handel specially composed many operas

Handcuffs. Pair of handcuffs in common use by the British police

for this society, which came to an end in 1728. He then became interested in other operative schemes, which, however, were unsuccessful owing to financial difficulties, the quarrels of singers, and the opposition of rival composers.

He next turned to oratorio, and began that series of sacred works upon which his fame rests. *Saul*, and *Israel in Egypt*, were composed in 1739, *Messiah* and *Samson* both in 1741, *Judas Maccabeus* in 1746, and his last oratorio, *Jephtha*, in 1751. During this period he was

George Frideric Handel
From a picture in Windsor Castle

subjected to all kinds of petty antagonism and serious financial loss. Prosperity set in later but health declined, and he was blind when he died, April 14, 1759. He had been a naturalised British subject since 1726.

Handel's output was enormous, in quantity exceeding that of Bach and Beethoven together. Besides 41 operas and 27 oratorios he wrote cantatas, chorales, organ concertos, orchestral suites, and sonatas. He was deeply indebted to the Italians but greatly extended their emotional range. Though he stands in the forefront of the classical style, his treatment of the orchestra is dramatic. It would be hard to name a greater melodist, and in even the forgotten operas there are gems of music, like the celebrated *Largo* (from *Serse*), the *Minuet* (from *Berenice*), and the aria *Where'er You Walk* (from *Semele*), which are household tunes, just as the *Dead March* (Saul) and *See the Conquering Hero* (Judas Maccabeus) are familiar from constant use on public occasions. Handel's organ music ranks next to that of Bach, while as a writer for solo voice or choir he has no peer. *Messiah* (*g.v.*) is probably the most popular musical work in England, where Handel is more highly esteemed than anywhere else. His collected works were printed for the Handel Society, 1844-58. There are *Lives* by S. Rockstro, 1883; R. A. Streatfeild, 1909; N. Flower, 1947.

Handfasting. Form of provisional marriage formerly prevalent in Scotland, so called because the couple exchanged vows holding hands. They were then legally entitled to live together as man and wife for a year and a day, after which period they could either part or be married permanently. The child of a couple who parted was supported by the parent who severed the union. Handfasting was also the old English name for betrothal. *See* Marriage.

Hand-grenade. An explosive hand missile. A hand-grenade can usually be thrown about 50 yds., and should not, therefore, have an explosive effect over a greater radius than 30 yds. The provision of a suitable fuse is a matter of difficulty, both percussion and time fuses having their drawbacks. *See* Grenade.

Handicap. In sporting contests, term denoting the bringing together, by penalties and allowances, the chances of the various competitors in such a manner as to afford an equal chance to each. In

foot-racing, billiards, etc., this is accomplished by giving a start to the runner or player who is the inferior performer. In horse-racing, handicapping is effected by apportioning different weights to the various horses entered. Such races or contests are designated handicaps. The word is a contraction of hand in the cap, in reference to the drawing of lots.

Handkerchief. Square of linen, cotton, or silk for wiping the nose. It came into use about the time of Henry VIII, and Elizabeth's reign saw handkerchiefs decorated with lace and made of silk. A muckinder or muckender was a handkerchief usually attached to the girdle, and worn by children about the beginning of the 17th century.

Handley, THOMAS REGINALD (d. 1949). British comedian, known as Tommy Handley. Born

Tommy Handley,
British comedian

and educated in Liverpool, he made his debut at Daly's Theatre in the chorus of *The Maid of the Mountains*, 1917, before joining the R.N.A.S. After the war he was a member of various seaside concert parties, then was successful on the music-hall stage with a sketch, *The Dis-Orderly Room*. His first broadcast was in 1924. His greatest fame came through broadcasting with the success of the weekly programme, *It's That Man Again* (or *ITMA*), of which he was the central figure. First broadcast July 12, 1939, it was given a new form with Ted Kavanagh as script-writer in the autumn of that year, when Handley was among the original members of the B.B.C.'s war-time variety repertory company at Bristol. Its high spirits, great speed, and unique nonsensical quality then soon made *Itma* the most popular B.B.C. programme in history, and it remained a leading feature of British radio, with only short intervals, until Handley's sudden death, Jan. 9, 1949, when aged about 55. Handley was the only actor to take part in all 310 programmes. He also participated in successful radio and music-hall partnership with Ronald Frankau as *Winterbottom* of "*Murgatroyd and Winterbottom*." *Consult* T. H., T. Kavanagh, 1949.

Handley Page. Firm of British aircraft manufacturers; also name of the aircraft it produced. The

firm was founded in 1909 by F. Handley Page (*g.v.*), who was knighted in 1942. The firm manufactured the largest bombers operated by the R.F.C. and R.A.F. in the First Great War: the twin-engined O/400 of 1915 and the four-engined V/1500 of 1918. Between the wars outstanding Handley Page machines were the *Hyderabad*, *Heyford*, and *Harrow* bombers, and the H.P. 42 air liner series for Imperial Airways. Then came the twin-engined *Hampden* (*g.v.*) and four-engined *Halifax* (*g.v.*) bombers. Post-war types included the military *Hastings* and the commercial *Hermes*.

Handsel. Earnest money; payment by a purchaser of part of an agreed sum into the vendor's hand to bind a contract. The word is also applied to the first money taken at a market or on opening a new business, and in the north of Great Britain to presents made for luck. Thus in Scotland *Handsel Monday* is the popular name for the first Monday in the year, when presents of money are given in token of good will.

Handsworth. District of Birmingham, England. Until 1911 it was a separate urban dist., with a pop. of 60,000. Lying to the N.E. of the city proper, it is in Warwickshire, and gives its name to a parl. div. The parish church is the burial place of Matthew Boulton and James Watt.

Handy Andy. Irish story, by Samuel Lover, 1842, and name of its chief character. The book is full of frolicsome fun, and long set a sort of standard for Irish humour of the more farcical kind. Andy himself is a typical blunderer, and many of the episodes were long popular as readings or recitations.

Hangar (Fr. shed). Building to house aircraft. Although modern machines will usually stand up to a degree of exposure hangars are always provided at permanent airfields in order to facilitate repair and maintenance work, as well as storage.

Hangchow. Town of China, capital of Chekiang prov. It is on the T sien-tang river, and was opened to foreign trade in 1896. being a treaty port until the Second Great War. It has an important silk industry. It is 118 m. S.W. of Shanghai, with which it is connected by rly. and waterways. The tide in Hangchow bay, at the mouth of the T sien-tang, forms a bore twice daily, varying in height from a few feet to 20 ft. (at times even 30) at the equinoxes. Pop. 506,930.

Hangchow Bay. Large inlet of the E. China Sea, indenting the shore of the prov. of Chekiang. It penetrates inland for about 110 m. and receives the waters of the Tsien-tang, on which, 20 m. from its mouth, stands the port of Hangchow. At its entrance the distance across is 52 m.

Hanging. Death from constriction of the neck, the constricting force being the weight of the body. In modern judicial hanging, in which a long drop is allowed, death is practically instantaneous, being due to fracture or dislocation of the upper cervical vertebrae which produces compression or rupture of the spinal cord (breaking the neck). In the old form of execution, which was practised at Tyburn, the noose was placed round the neck of the condemned person while standing on a cart, which was then driven away from beneath him. In this method, and in most suicidal hangings, death is due partly to asphyxia and partly to arrest of the circulation in the brain by compression of the large blood-vessels in the neck. Hanging is a method of committing suicide frequently adopted by males, less often by females.

Murder by hanging is almost unknown, but several instances are recorded of a murderer suspending the body of his victim after death in order to suggest suicide. See Capital Punishment.

Hanging Gardens of Babylon. One of the seven wonders of the ancient world. Situated within the confines of the palace of Nebuchadrezzar, they occupied a space of some four acres, and were in a series of terraces, resting on arches and rising to 300 ft. above the level of the plain. They contained a profusion of the choicest flowers, groves of trees, secluded arbours, and banqueting halls, and were watered from a reservoir at the highest point in direct artificial connexion with the Euphrates. The gardens were probably laid out by Nebuchadrezzar, though other traditions associate them with Semiramis. See Babylon.

Hanging Valley. Tributary valley leading to an over-deepened main valley. Many valleys in mountainous districts have been considerably deepened below the level of the side valleys. The rivers of these tributary or hanging valleys descend to the main stream by waterfalls. Geologists differ as to the cause which deepened the main valley, but the general belief is that hanging valleys were

produced by glacial erosion, and this is supported by the fact that they are especially numerous in glaciated regions. Some still contain glaciers. See Fiord.

Hangnest. Popular name for a large group of American birds (*Icteridae*) known also as troupials. Related to the starlings, they take their name from the curious nests they construct. These are closely woven of grass and hair, are rather purselike in shape, often 2 ft. long, with the entrance near the bottom, and hang from the slender branches of trees. As many as 40 nests have been found in a single tree.

Hangö (Finnish *Hankoriemi*). Fortified port in Finland. It is on the peninsula Hangö-Udd, at the entry to the Gulf of Finland, and the terminus of the coast rly. from Leningrad. The harbour is safe, and there is a good shipping trade. The chief exports are butter, timber, and paper. The sea baths are much patronised. Hangö was among the concessions that Russia demanded from Finland in 1939. Russian troops attempted a landing on Nov. 30 and the place was heavily bombed by aircraft. It was leased to Russia for 30 years as a military base in accordance with the peace treaty of 1940. On Dec. 4, 1941, the Russians withdrew, Finland having become an ally of Germany. By the armistice signed on Sept. 19, 1944, Russia renounced her rights to the lease of the peninsula in exchange for an area near Helsinki.

Hank. Standard measure of length; also a convenient form in which to put up yarns for transit. Thread is wound off a bobbin round the arms of a reel. Eighty wraps round the $1\frac{1}{2}$ -yard reel used in cotton yarn represent one lea or 120 yds. Seven leas equal 840 yds., or one cotton hank. For measuring worsted yarns the reel has a circumference of one yard; the worsted lea is thus 80 yds., and the worsted hank 560 yds., or one-third less than cotton. The linen lea is 300 yds., and the spun silk hank is 120 yds.

The hank is in effect a large skein and after being measured it is tied with a thread which separates lea from lea and holds the end of the thread. The hank is knotted for convenience by being twisted and folded back upon itself. The hanks are then bundled into neat packages normally of 10 lb. weight.

Hankey, MAURICE PASCAL ALERS HANKEY, 1ST BARON (b. 1877). British civil servant. Born April 1, 1877, he was educated at Rugby, and joined the Royal

Marines in 1895. During the First Great War he was secretary to the war cabinet in 1916 and then to the imperial war cabinet.

Concerned with the arrangements for the peace conference, he was British representative on its secretariat. He was awarded £25,000 for his services in the war, and was clerk of the privy council, 1923-38. He became minister without portfolio in Chamberlain's war cabinet, 1939-40, was then chancellor of the duchy of Lancaster, paymaster-general, and from 1943 chairman of the colonial research products council. He was knighted in 1916 and created a peer in 1938.

Han-Kiang. River of China, described in this work as Han.

Hankow. River port of China, in Hupeh prov. It is on the left bank of the Yang-tse, 600 m. from the mouth, at the junction of the Han river. Founded during the Ming dynasty, it was left in ruins after the Taiping rebellion of 1853-60, but was opened in 1862 to foreign trade and remained a treaty port until the Second Great War. Hankow is connected by rly. with Peiping, 755 m., and is accessible in summer to ocean-going steamers. With Hanyang, across the Han, and Wuchang, on the S. bank of the Yang-tse, it forms the foremost trading centre in central China, surpassed in importance in the whole country by Shanghai only. Pop. of the three cities, 777,993.

After the capture of Nanking by the Japanese in 1937, Hankow became the headquarters of Gen. Chiang Kai-shek and the provisional capital of China. Japanese troops entered the city on Oct. 25, 1938, but the government had retired to Chungking. Though bombed by Allied aircraft, Hankow remained in Japanese hands until Aug., 1945.

Hanley. District of Stoke-on-Trent, formerly a county borough and market town. It is 18 m. N. of

Hanley arms

Lord Hankey,
British civil servant

Stafford and is served by railway. Hanley's chief buildings are the town hall, Victoria Hall, public library, school of art, and technical museum, as well

as a number of churches. There are three parks and two recreation grounds. The staple industry is the manufacture of pottery of all kinds from chinaware to tiles; there are also foundries and iron-works, while around are extensive coal mines. A modern place, Hanley developed with the growth of the pottery industry. It was made a borough in 1857, and in 1910 was included in Stoke-on-Trent. It had then a pop. of 66,000, being the most populous of the so-called Five Towns. Arnold Bennett was a native. See Potteries; Stoke-on-Trent.

Hanna, MARCUS ALONZO (1837-1904). American politician. Born at Lisbon, Ohio, Sept. 24, 1837, he worked in his father's grocery store at Cleveland after a brief schooling. Later he developed iron and coal industries on a large scale. In 1880 he organized a business men's movement on the Republican side. In 1896 he led the campaign for McKinley's nomination and subsequent election. From 1897 until his death he represented Ohio in the Senate, where his principal achievement was securing the acceptance of the Panama, as opposed to the Nicaragua, route for the canal. A shrewd political manager, he has been described as "the nearest thing to a national boss that ever emerged in this country." He died Feb. 15, 1904.

Hannah. Wife of Elkanah and mother of the prophet Samuel (1 Sam. 1, 2). Samuel was born in answer to prayer, and she dedicated him to God's service, taking him to Eli, the high priest, to become his attendant. Fairly common as a Christian name, Hannah in Hebrew means grace.

Hannay, JAMES (1827-73). A Scottish author. Born at Dumfries, Feb. 17, 1827, he served in the navy 1840-45. He then became a journalist, working for *The Morning Chronicle* and in 1860-64 as editor of *The Edinburgh Courant*. From 1868 he was British consul at Barcelona, where he died Jan. 3, 1873. Hannay's writings include novels, essays, and miscellaneous articles. Satire and Satirists, 1854, and Characters and Criticisms, 1865, show literary knowledge and taste. His novels include Hearts are Trumps, 1848; Singleton Fontenoy, 1850; Eustace Conyers, 1855. He also wrote studies on Thackeray, 1869.

Hannay, JAMES OWEN. Irish novelist, better known as George A. Birmingham (q.v.).

Hannay, RICHARD. An adventurous character and the narrator in a number of novels by John Buchan (Lord Tweedsmuir, q.v.). A modern Admirable Crichton, he first appeared in the trilogy: *The Thirty-Nine Steps* (1915), *Greenmantle* (1916), *Mr. Standfast* (1919). He also figured in *The Three Hostages* (1924), *John McNab* (1925), *The Dancing Floor* (1926), *The Runagates Club* (1928), and *The Island of Sheep* (1936).

Hannen, JAMES HANNEN, BARON (1821-94). British lawyer. Born in London, he was educated at S. Paul's and Heidelberg University, and was called to the bar at the Middle Temple, 1848. Appointed junior counsel to the treasury, 1863, he became a judge of the queen's bench, 1868, and judge of the probate and divorce court, 1872. He was president of the admiralty and divorce division, 1875 to 1891, when he was appointed a lord of appeal and created a life peer. In 1888 he presided over the Parnell commission, and in 1892 was an arbitrator in the dispute concerning the Bering Sea fisheries. Strong, dignified, learned, and accurate, Hannen ranks among the greatest English judges of the 19th century. He died March 29, 1894.

Hannen, NICHOLAS JAMES (b. 1881). British actor. Born in London, May 1, 1881, he was educated at Radley, Heidelberg, and Rouen. He studied architecture under Lutyens, but in 1910 went on the stage, in *The Girl in the Train*, playing for

Nicholas Hannen,
British actor

four years in musical comedy. He made his first London success as Nelson in *The Dynasts*, and created a series of restrained, purposeful characters in such plays as *The Conquering Hero*, *Escape* (q.v.), *Many Waters*, *Accent on Youth*, *Winter Sunshine*, and *People of Our Class*. In 1944 he joined the Old Vic company, playing in Shakespeare, Sheridan, Ibsen, and Shaw. He was a leader of opposition to the regular opening of theatres on Sundays.

Hannibal. City of Missouri, U.S.A., in Marion co. It stands on the right bank of the Mississippi river, 120 m. N.W. of St. Louis, and is served by the Chicago, Burlington, and Quincy rly., an airport, and river steamers and barges. Across the Mississippi are two bridges, the Wabash (formerly Hannibal) completed 1871, and the Mark Twain, completed in 1935, the centenary of the birth of that writer, who passed his boyhood at Hannibal. The city abounds in memorials to him, including a lighthouse rising 200 ft. above the river, and a statue in the 200-acre Riverview Park, while his home is preserved. The world's first rly. mail car was produced here. Industrial plants include rly. shops, a large cement works, and factories making structural steel, precision tools, metal furniture, and shoes. Hannibal was founded in 1819, and received a city charter in 1845. Pop. 20,865.

Hannibal (c. 247-183 B.C.). Carthaginian soldier. He was the son of Hamilcar Barca, who, after the first Punic War (264-241 B.C.), in which Rome had wrested the command of the sea from her rival, organized what was virtually an independent Carthaginian dominion in Spain. In childhood Hannibal had taken a great oath to his father that his life should be devoted to the overthrow of Rome. In Spain the boy showed such extraordinary capacity that after Hamilcar's death the soldiery demanded his appointment to the supreme command. But Hannibal served under his brother-in-law Hasdrubal until the death of the latter in 221.

Two years later, by laying siege to the allied town of Saguntum, he roused Rome to declare war upon Carthage. He at once resolved upon an invasion of Italy. With extraordinary skill he led his army from Spain through S. Gaul in 218, defeated in the Rhône valley a Roman expedition sent to hold him in check, carried his army over the Alpine passes, as Napoleon did 2,000 years later, in the face of extraordinary difficulties, descended by the pass of Mont Genève into the Lombard plain, and routed the Roman armies at the battles of Ticinus and the

Hannibal, Carthaginian soldier
From a bust found at Capua,
now in Naples Museum

Trebbia. He led into Italy perhaps 20,000 men and 6,000 horse, also elephants which he used in battle.

Throughout the struggle Hannibal had to live upon the country, while he was entirely dependent upon his own military genius, the small and miscellaneous but devoted and admirably trained army, and such support as he could persuade or compel Rome's Italian enemies to supply. The Romans had the ascendancy by sea, so that he was in effect cut off from Spanish and African bases.

Carthaginian Victories

In the spring of 217 he pushed southwards, ambushed the great army of the Roman general Flaminius, and annihilated it at the battle of Lake Trasimeneus. Failing to force a general engagement upon the new Roman commander Fabius Maximus (*q.v.*), he succeeded in passing by him and penetrating into S. Italy. There on Aug. 2, 216, he beguiled a third Roman commander with an army of 80,000 men into fighting a pitched battle at Cannae in Apulia. The finest force Rome had ever assembled was surrounded and almost annihilated, with the political effect of bringing over the S. Italians to Hannibal's side. The fact that he was still unable to besiege and capture Rome, but wintered at Capua instead of making the attempt, demonstrates the desperate character of his task.

From this time, while his ascendancy in the field was never broken, he was always struggling with diminishing resources against an inexhaustible adversary. Hannibal, like Frederick the Great in the Seven Years' War, might strike and strike again, but his blows could do no more than preserve his own army from destruction. At last, in 207, the Carthaginians threw another army under his brother Hasdrubal into N. Italy. Could he have effected a junction with Hannibal, the tide might have been turned; but while Hannibal was being contained in the S., the Roman general Nero, by a brilliant march, brought Hasdrubal's advancing army to action on the Metaurus and destroyed it. The battle was decisive. Hannibal remained on the defensive in the S., while the Romans crushed the Carthaginian power in Spain and in Sicily, and prepared a great expedition against Carthage itself.

Thither Hannibal was recalled in 203. But though he was placed in command, he was not, as in Italy, in effective control of

veteran troops who knew and trusted him. The Carthaginian army was crushed by Scipio at Zama, 202, and in the following year Rome dictated terms of peace. Hannibal retired from Carthage, where he was made powerless by the jealousy of the oligarchical government, and withdrew to Asia Minor, whence he urged the enemies of Rome to make war upon her. In 183, finding that his protector Prusias could not resist the Roman demands for the surrender of his person, he took poison at Libyssa. So perished one who as a military genius stands beside Alexander the Great, Julius Caesar, Marlborough, and Napoleon. *See* Carthage; Rome.

Hannington, JAMES (1847-85). English missionary bishop. Born at Hurstpierpoint, Sept. 3, 1847,

James Hannington, Missionary bishop

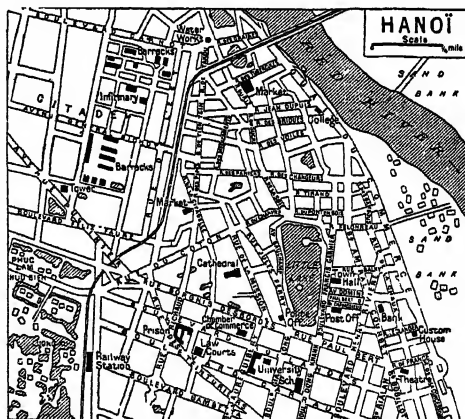

he was educated at St. Mary Hall, Oxford. His first ministerial duties were discharged at Martinhoe, Devon, and S. George's, Hurstpierpoint. In 1882 the murder of two missionaries on the Victoria Nyanza induced him to offer his services to the Church Missionary Society. Soon after his arrival in Uganda he was prostrated with fever, and forced to return to England. In 1884 he was consecrated bishop of Eastern Equatorial Africa. He reached Mombasa in Jan., 1885, in July he started for Uganda, and when almost at his goal his party was suddenly attacked by forces of King Mwanga. Imprisoned in a grass hut for eight days, he, with the men of his caravan, was murdered on Oct. 29, 1885. *Consul* Last Journals,

ed. E. C. Dawson, 1888; *Life*, C. D. Michael, 1928.

Hanno. Name of several eminent Carthaginians. Hanno the Great (*fl.* 3rd century B.C.) was for 35 years the leader of the aristocratic party at Carthage which favoured peaceful relations with Rome, as opposed to Hamilcar Barca, Hannibal, and Hasdrubal, who advocated war. About 240 he was governor of Libya, where his oppression of the inhabitants caused them to revolt, in which they were supported by the Carthaginian mercenaries. Hanno was at first successful, but his inability to take advantage of his victory at Utica and his carelessness in withdrawing his forces led to a severe reverse, with the result that he was superseded by Hamilcar Barca, against whom he afterwards cherished a life-long enmity. After the battle of Zama he was one of the Carthaginian deputies sent to ask for peace.

Another Hanno was a navigator who lived about 500 B.C. Having passed the Straits of Gibraltar, he undertook a voyage of discovery along the west coast of Africa, the object of which was the increase of the commercial prosperity of Carthage and the foundation of colonies. He wrote an account of his voyage, originally in the Punic language, which has been preserved in a Greek version, entitled *The Periplus* (Eng. trans. Thomas Falconer, 1797).

Hanoi. Town of Vietnam, in North Vietnam (Tongking). The town stands on the right bank of the Song-ka or Red river, about 100 m. from its mouth in the China Sea. In 1902 it superseded Saigon as capital of Indo-China; from 1903 it was the seat of the governor-general of French Indo-China;

Hanoi. Plan showing the business quarter of this town of North Vietnam (Tongking)

made capital of Vietnam 1946, it was displaced as seat of government by Saigon, 1949.

The town occupies a large area. A fine rly. bridge, opened 1902, spans the river, and there are extensive remains of an ancient royal palace. The old native quarter lies between the citadel and the river. The houses are mainly of wood and mud, but after the coming of the French many handsome buildings arose: official premises, museum, hospital, theatre, and various hotels. A school of medicine for natives was opened in 1902, and together with a European college was formed into the university of Indo-China in 1917. The latter has faculties in arts, law, medicine, and pharmacy. The twin-towered cathedral is a prominent landmark. The citadel, which is perched on an eminence, is a square, 1,200 yds. to each side, surrounded by a brick wall, and contains many of the public buildings. In the vicinity is the Great Lake, on the shore of which is a Buddhist temple and a huge image of Buddha in bronze.

The city has electric tramways and a racecourse. An important centre of trade, mostly carried on by Europeans and Chinese, it has rly. connexion with Haiphong, the principal port, and with China. Manufactures include inlaid and lacquer ware, filigree work, mats, gold and silver wire, leather articles, and embroidery. Pop. 134,849.

Hanoi was occupied by Japanese forces in Nov., 1941, by agreement with the Vichy government. When Chinese troops entered North Indo-China on Sept. 16, 1945, to receive the Japanese surrender, their headquarters were established at Hanoi. This occupation ended in April, 1946, under the terms of a Franco-Chinese treaty signed at Chungking, Feb. 28.

Hanotaux, (ALBERT AUGUSTE) GABRIEL (1853-1944). French historian and statesman. He was

Gabriel Hanotaux,
French historian

born at Beauverre, Aisne, Nov. 19, 1853. An article by him in *La République Française* attracted Gambetta and secured him an appointment in the foreign office. In 1885

Hanoi, Vietnam. Air view of the central section of the "city between the waters," showing the Petit Lac in the foreground

langer. Having been director of the French foreign office, 1892, he was foreign minister 1894-95 and 1896-98. Hanotaux was a firm supporter of the policy that brought about the Franco-Russian alliance; but his anti-British policy in Africa led to the Fashoda incident of 1898. In 1897 he was elected to the Academy.

Hanotaux wrote a *History of the War of 1914*, which was published serially in many vols. His standard works are *Histoire de Richelieu*, 1893-1903, awarded the Gobert Prize by the Academy; *Histoire de la France Contemporaine*, 1903-08, Eng. trans. J. C. Tarver; *Histoire de la Troisième République*, 1904; *Histoire de la Nation Française*, 1920-24. In 1929 he published a study of Foch. He died April 11, 1944.

Hanover (Ger. Hannover). Former German province. Originally a principality, then an electorate, then a kingdom, Hanover became a province after its annexation by Prussia. Before it lost, 1816, the duchy of Lauenburg to Prussia, the kingdom of Hanover had an area of 14,733 sq. m.; on its annexation by Prussia in 1866, its area became 14,892 sq. m., owing to the incorporation in it of E. Friesland, the former bishopric of Hildesheim, etc. Its capital is the city of Hanover; its greatest extent E.-W. is 180 m., S.-N. 150 m.; it borders E. on the river Elbe, from Wittenberge to its mouth; N. on the North Sea—with the ports of Emden and Wilhelmshaven; W. on the Netherlands; S. on Westphalia, Greater Hesse, and Thuringia. Its pop. (1933) was 3,365,610, mostly of the Lower Saxon race;

82 p.c. are Protestant, 1 p.c. R.C. Its mostly flat and well-watered countryside has given rise to specialised agriculture; the breeding of fine horses and of the famous Frisian cattle, growing of wheat, rye, and barley, beekeeping and, especially in the Lüneburg heath area, mutton-grazing, are the main branches.

Coal, lead, silver, and salt mining are of some importance, and Germany's main petroleum wells are in Hanover. There are also several large iron works and machine and tool plants, and a considerable fishing industry, as well as shipbuilding and shipping.

The chequered history of the state begins with that of the sovereign principality of Calenberg, founded in 1495 after being a part first of Lüneburg, until 1409, then of Brunswick. The principality of Göttingen was joined to it in 1512, and in 1634 both fell to a younger branch of the Brunswick dynasty. In the meantime several counties had been added to it; in 1689 it acquired the duchy of Lauenburg, and in 1692, under Duke Ernest Augustus, husband of Sophia, daughter of the Elector Palatine and German "Winter King" Frederick V, and granddaughter of James I of England, an electorate was conferred upon the house, now called Hanover, though its family name was still Brunswick-Lüneburg. Under their son, George, the lands of the Celle sideline, and in 1714 the British crown, fell to the dynasty. As George I, this prince established a personal union. In 1715 he bought from Sweden, for Hanover, the duchies of Bremen and Verden; George II acquired further small-

ish areas, and under George III the Hanoverian state chancellery and other offices were transferred to London, Hanover being, in fact, ruled by the Hanoverian nobility. In 1737, under George II, the university of Göttingen was created and rapidly became a centre of historical and political research. Allied with Prussia, Hanover suffered heavily in the Seven Years' War, and was for a period under French occupation.

Fighting the French again, 1793-95; conquered, and for two years occupied, by Napoleon; given by him to Prussia in 1805 and taken back by him, 1807, partly embodied in his brother Jerome's kingdom of Westphalia, Hanover was liberated in 1813 and, enlarged, elevated to a kingdom by the Congress of Vienna. William IV, in 1831, dismissed the all-powerful Count Munster and appointed his brother Adolf Frederick, duke of Cambridge, governor-general.

Separation from Great Britain

With Victoria's accession, 1837, as the Hanoverian law did not allow female succession, the personal union ceased, and George III's fifth son, Ernest Augustus, duke of Cumberland, succeeded to the Hanoverian throne. He abolished the constitution granted in 1833, and thereby provoked the famous protest of seven professors of Göttingen (*g.v.*), and their exodus, in 1837, but had to moderate his regime during the 1848 revolution. His son, George V of Hanover, who succeeded in 1851, was blind; he also tried to turn back the clock and curtail the constitutional rights of the people. In the conflict between Prussia and Austria he backed the latter and, though his forces won a battle at Langensalza (June 27, 1866), was forced to capitulate, to abdicate, and to see his country annexed to Prussia by Bismarck.

The fortune of the royal house was confiscated and, under the name of *Welfenfonds* (=funds for the Guelphs), utilised by Bismarck for political bribery and propaganda; in 1892, however, it was transformed into a debt of the Prussian state, of £3 million, of which the interest was henceforth paid to the duke of Cumberland, claimant to the Hanoverian throne. The claim to independence from Prussia was kept alive by the *Deutsch-Hannoversche Partei*, or Guelph party, which held some 7 to 11 seats (of 379) in the Imperial parliament, and dwindled to only 4 or 5 under the Weimar Republic. A Guelph legion, of

implacable partisans of the Hanoverian dynasty, was formed in 1867; expelled by the Netherlands and Switzerland, it established itself in France, but was dissolved 1870. The Prusso-Hanoverian feud formally ended when, 1913, Prince Ernest Augustus, son and heir of the pretender, the duke of Cumberland, married Kaiser William II's only daughter and was made duke of Brunswick; one of his sons, in turn, was made an officer in the German army and, under the Nazi regime, endowed with the name of Prince George of Hanover.

In the Second Great War, the British 2nd army invaded Hanover in the first days of April, 1945, and advanced rapidly, reaching Lauenburg on the Elbe, April 19. At F.M. Montgomery's tactical headquarters on Lüneburg heath Gen.-Admiral von Friedeburg signed the unconditional surrender of all German naval, land, and air forces opposing 21st army group.

Hanover was in the British zone of occupation in Germany, achieving the status of a *Land* (state) Aug., 1946; two months later it was absorbed in the new *Land* of Lower Saxony, composed of Hanover, Oldenburg, and Brunswick.

Hanover (Ger. Hannover). German city. It lies at the confluence of the rivers Leine and Ihme, halfway between Berlin and the Rhine. Though an old town, first mentioned as *Honovere* (high river bank) in 1163, a city from 1203, and a ducal residence since 1636, Hanover is in the main a modern city. In its centre, however, it preserved a series of precious old buildings until the Second Great War, when no building of importance escaped damage from severe Allied air raids. It had gabled Gothic dwellings; the Knochenhauer, Leibnitz, and other houses; castle, market, S. Cross, and S. Giles churches dating back to the 13th and 14th centuries; the old town hall (15th century); several palaces; and fortifications. The main palace was built 1635-40, while that of Herrenhausen, N.W. of the city, built 1665, was famous for its park arranged on the Versailles pattern. A number of beautiful parks and gardens, mostly dating back to Electoral days, were one of Hanover's main characteristics. Modern buildings, among them a new town hall, an

Hanover town arms

opera house, the technical university, etc., made Hanover one of Germany's most impressive cities.

Hanover was the seat of finishing industry. It had iron- and steel-works, locomotive, bridge, and other engineering plants, Germany's greatest rubber combine (15,000 workers), machine and automobile factories, dye, paint, and ink factories, paper, velvet, and wool mills; made typewriters, gramophone records, tobacco, chocolate, cakes, meat preserves, etc. Some 25,000 separate enterprises gave work to nearly 200,000 workers.

A large river and canal port, with the largest lock in Europe close by, Hanover handled up to 400,000 tons of inland navigation. As a railway junction on the main E.-W. line between Berlin and Cologne, and the main N.-S. line between Hamburg and Bremen in the N. and Frankfurt and Munich in the S., and an airport with services to Russia, Denmark and Sweden, the Netherlands and Great Britain, Belgium and France, and Switzerland and Czechoslovakia, Hanover ranked in importance, though only 10th in order of population figures, with the greatest cities of Germany. Pop. (1948 est.) 400,000.

During the Second Great War, Hanover was captured on April 10, 1945, by infantry of the U.S. 9th army. Capital through centuries of the principality, electorate, kingdom, and province of Hanover, it became capital of the new *Land* (state) of Lower Saxony created in the British zone of occupation in Germany, Oct., 1946.

Hanover Square. A London square. It lies between the junctions of New Bond Street and Regent Street with Oxford Street. Laid out in 1718, and named in honour of George I, it has numbered among residents the book-collecting duke of Roxburgh, at Harewood House, built for him by the brothers Adam; General Lord Cadogan; the earl of Harewood, whose residence became the home of the Royal Agricultural Society; Lord High Chancellor Cowper; Lord Palmerston, father of the prime minister; Augusta, duchess of Brunswick; Mrs. Jordan the actress; Talleyrand; Lords Anson and Rodney; and Thomas Campbell as guest of the 2nd earl of Minto.

Mostly rebuilt, the square is now occupied by learned societies and business establishments. The Oriental Club, founded in 1824, is at No. 18. The once famous Hanover Rooms and the Hanover

Square Club are no more. On the E. side is a statue of William Pitt by Chantrey, set up in 1831; and in George Street is the church of S. George, Hanover Square, built 1713-24, which once had almost a monopoly of society weddings.

Hansard. A verbatim report of U.K. parliamentary debates, named after Luke Hansard (1752-1828), a Norwich compositor. As printer in the house of commons after 1803, he continued Cobbett's Parliamentary History under the title of Hansard's Parliamentary Debates. These reports, issued by himself and his family down to 1889, were at first taken from the newspapers and revised by members. Following actions for libel, the reports were protected by the privileges of the house of commons in 1840, but not until 1857 did the Treasury subsidise them.

In 1889 Hansard became a public company, and when this was wound up the work was done by contract, the reports from 1895 to 1908 being supplied by The Times staff. Then the state took control, and the debates were reported by a government staff, of which James Dodds Shaw (d. 1916) was the first editor. The Speaker and the Lord Chancellor (for debates in the house of lords), assisted by the debates publication committee, is the final authority in the event of complaints as to the reporting. From 1946 Hansard was printed on rotary presses like a newspaper. It can be bought by the public, in daily or weekly editions, while parliament is in session.

Hanseatic League or **HANSA**. Association for commercial purposes of the commercial towns of N. Germany in the later Middle Ages. When not only every country but every town regarded the presence of foreign traders as a necessary evil and the traders themselves as persons to whom no facilities should be conceded, no one could trade abroad without having at his back an association of which he was a member. Each trading town became a trading association. While they retained their mutual jealousies, they gradually realized the advantages of combination for the purposes of trading in foreign lands, exacting concessions, and acting in concert against piracy. Such loose leagues were formed by the towns engaged in the Baltic trade and by those engaged in the North Sea trade, there being several of these in the early 13th century.

The first Hansa or association which obtained concessions in Eng-

Hanover Square. S. George's Church, built 1713-24, where many fashionable weddings have been solemnised

land was that of the Merchants of Cologne, who gradually admitted the Hansas of other towns. In 1282 the German Hansa, which included Cologne, Hamburg, and Lübeck, was permanently established; this prepared the way for a more general combination into the Hanseatic League of the North German commercial towns. The league became so powerful that it was able to dominate the foreign trade of Norway, Sweden, Denmark, and even to some extent of London. Wisby, on Gotland, was its great entrepôt. The English commercial history of the 14th and 15th centuries is largely that of the efforts of the English associations, the Merchants of the Staple, and the Merchant Adventurers, to restrict the privileges of the Hansa in England and to extort corresponding privileges from the Hanseatic towns in Germany.

The League even acquired a political domination in the Baltic; but at the end of the 15th century its power was waning; by the middle of the 16th century it had lost all its privileges in England; geographical discoveries and maritime developments had provided new pathways for commerce, and by the opening of the 17th century the League had ceased to be of great account. Its doom was finally sealed by the disintegration of Germany wrought by the Thirty Years' War. See Bremen; Germany; Guild; Hamburg; Lübeck.

Hansen, GERHARD HENRIK ARMANDE (1841-1912). Norwegian physician. As a doctor in Copenhagen he carried out extensive research work to discover the cause of leprosy, which had hitherto

been associated with the consumption of decomposing fish. Hansen isolated the lepra bacillus, which is believed to cause the disease. The provision of hospitals or sanatoria for leprosy patients in Norway led to a great reduction of the disease there.

Hansen, PETER ANDREAS (1795-1874). Danish astronomer. Born in Slesvig, Dec. 8, 1795, he became director of the Seeberg observatory near Gotha. Having turned his attention to lunar observation, he issued *Tables de la Lune*, 1857, published by the British government, who awarded the author £1,000. Foreign member of the Royal Society, and holder of the Copley medal, 1850, in 1842 and 1860 he received the gold medal of the Royal Astronomical Society. He died at Gotha, March 28, 1874. The work of Hansen, one of the most profound mathematical astronomers, formed the basis of many calculations used in the preparation of *The Nautical Almanac*.

Hansi. Subdivision and town of East Punjab, India, in Hissar district. Area, 803 sq. m. Hansi town, one of the oldest places in N. India, contains cotton ginning and pressing factories. There is rly. connexion with Delhi. Pop. subdivision, 224,370; town, 22,590.

Hansom Cab. Type of horse-drawn vehicle. An improved cabriolet, it was invented by Joseph Aloysius Hansom

(1803-82), Yorkshire architect, who in 1834 registered a "patent, safety cab." Its chief features were two great wheels and a dickey seat for the driver placed above the body of the cab, which gave the passenger an uninterrupted view, thus earning for it Disraeli's phrase "the gondola of London." There was an arrangement for preventing the cab from tipping if the horse overbalanced. Later improvements included double doors in front with sliding glass folding panels, lowered from the roof by the driver. The hansom was especially characteristic of the London scene around the turn of the 19th-20th centuries, when some 7,000 plied for hire. Its use declined as motor traffic grew, but a few survived up to the 1930s. See Cab illus.

Hansson, PER ALBIN (1885-1946). A Swedish politician. He was born at Fosie, in Gotland,

J. A. Hansom, inventor of the cab

Oct. 28, 1885, and began to earn his living as an errand boy. In 1905 he joined the Social Democratic youth movement, becoming editor of the party's leading newspaper in 1917. He entered parliament in 1918 and assumed leadership of the Social Democrats in 1932. Hansson was prime minister of Sweden from that year, except for a few months in 1936, until he died suddenly in Stockholm, Oct. 5, 1946. He was regarded as the exponent of a policy of cautious but steady democratisation.

Hanswurst. Traditional character of the German stage; equivalent to the English Jack Pudding. The sausages familiarly associated with the clown in the modern harlequinade may have their origin in Hanswurst, which means literally Jack Sausage.

Hanumān. Monkey god in Hindu tradition, worshipped as the type of a faithful servant. In the *Ramayana* (*q.v.*) he is described as helping Rama to rescue his wife Sita from Ceylon, whither she had been carried. Hanumān discovered her, and with his monkey forces helped to build the bridge by which Rama and his army crossed from the mainland to Ceylon.

Hanway, JONAS (1712-86). English traveller and philanthropist, born at Portsmouth, Aug. 12, 1712.

Jonas Hanway,
English traveller

He was in business at Lisbon and then at St. Petersburg, which he left in 1743 to sell woollen goods in Persia. In 1750 he came to England, issuing an account of his travels in 1753. During 1762-83 he was a commissioner of the victualling office. He secured Acts for registering parish infants and for having them brought up not in workhouses but in cottages. He founded the Magdalen Hospital for women; was the first celebrity to use an umbrella in London; and made a violent attack on the habit of tea-drinking, answered by Dr. Johnson. Hanway died Sept. 5, 1786. A Life by R. E. Jayne appeared in 1929.

Hanwell. Residential area of the Middlesex borough of Ealing, England. It is served by rly. from Paddington and frequent trolley-bus and bus services. There are cemeteries for Kensington and Westminster. The chief church is St. Mary's. The Hanwell mental hospital is in Southall. The

Brent separates Hanwell from Southall, and the Grand Union canal is important here.

Hanworth. District of Middlesex, England, $1\frac{1}{2}$ miles N.E. of Sunbury rly. station, on the "Cardinal's river" made by Wolsey for the supply of Hampton Court. The old manor, once belonging to Catherine Parr, was destroyed by fire, 1797. The London Air Park, opened here 1929, became a centre of club and private flying.

Hanworth, ERNEST MURRAY POLLOCK, 1st VISCOUNT (1861-1936). British lawyer. Born Nov. 25, 1861, and educated at Charterhouse and Trinity Coll., Cambridge, he was Conservative M.P. for Warwick and Leamington 1910-23. Made K.C. in 1905, he was recorder of Kingston-on-Thames, 1911-23. He was also appointed solicitor-general, 1919, attorney general 1922, and master of the rolls 1923-35. Created baron in 1926 and viscount in 1936, he died Oct. 22, 1936.

Hanyang. A city of China, in Hupeh prov. A large industrial centre, it stands at the junction of the Han river with the Yang-tse. During the revolution of 1911 it was almost completely destroyed. Hanyang is the oldest of the Three Cities (*q.v.*). See Hankow.

Haparanda. Town of Sweden, in the län or govt. of Norrbotten. It stands at the head of the Gulf of Bothnia, on the W. arm of the river Tornea, and is connected by a bridge with the town of Tornea, in Finland. Its sea harbour is Salmis, 7 m. W. The Finnish-Swedish rly. runs through the town. Pop. 2,951.

Hapgood, EDWIN ALBERT (b. 1908). English footballer. He was born at Bristol, Sept. 24, 1908, and joined Arsenal football club from Kettering Town in 1927. He played

Hanway and his
umbrella
After an old print

over 40 times for England (counting war-time matches) and won five league championship medals with Arsenal, being one of the greatest full-backs of his time and an excellent captain. He served with the R.A.F. during the Second Great War, and retired from ac-

tive football in 1945, becoming manager of Blackburn Rovers.

Haploid. Term primarily applicable to any nucleus which contains a single set of chromosomes; but also used of structures in which such nuclei occur. Nuclei of gametes are normally haploid, as are the gametes themselves and gametophytic structures such as the thallus of *Spirogyra* and the prothallus of the fern. In every cell of an animal there is normally a constant number of chromosomes common to that species. At gametogenesis, the various germ cells undergo a specially modified division which leads by a process of meiosis (*q.v.*) to a reduction of this number to half in the products of the division. These products, gametes, containing half the normal number of chromosomes, are called haploid cells. The union of two at fertilisation gives an organism with the whole number again, which is said to be diploid.

Hapsburg or **HABSBURG.** Name of the family that ruled over the empire of Austria-Hungary until 1918. Members of the family were German kings and Holy Roman emperors from 1438 to 1806, and kings of Spain from 1516 to 1700. The name Hapsburg or Habichtsburg, meaning hawk's castle, was taken in the 11th century from the family seat, a castle near the junction of the Aar with the Rhine. Counts and afterwards landgraves in Alsace, they produced one Rudolph, who made himself useful to the emperor Frederick II.

The first great Hapsburg was another Rudolph, in 1273 chosen German king. Wresting Austria and Styria from the king of Bohemia and giving them to his own sons, he began the family's long connexion with Austria. Rudolph's son Albert became German king, although not immediately on his father's death, and for a short time his son, another Rudolph, was king of Bohemia. In 1314 another Hapsburg was chosen German king but in 1322 he was dispossessed, and for about a century the family was perforce content with ruling Austria and its attendant duchies.

The usual frequent subdivision of their lands between the various members of the family occurred, but these partitions did not prove permanent, a fact which contributed to the rise of the house. In 1437 Albert of Hapsburg, who had married a daughter of the emperor Sigismund, inherited his father-in-law's kingdoms of Hungary and Bohemia. In 1438 he was chosen German king and thus be-

came emperor. The two kingdoms were lost to the family when Albert's son Ladislaus died without sons in 1457, but Frederick, another member of the family, had already secured the German throne.

Frederick was the strange monarch, who dreamed of the future greatness of the Hapsburgs, but it was his son, Maximilian I, who translated these dreams into realities. He himself married Mary, daughter of Charles the Bold, duke of Burgundy, and his son Philip married the heiress of Castile and Aragon. In this way his grandson Charles V, received in 1519 a vast inheritance. His brother Ferdinand, by a marriage, secured the kingdoms of Hungary and Bohemia for the Hapsburgs, this time to keep them until 1918. Henceforward there were two main branches of the Hapsburgs—Austrian and Spanish.

In 1556 Charles V was succeeded as emperor by Ferdinand, whose line was more fortunate. One after another succeeded to the empire, elective now only in theory, and to the hereditary Austrian lands. Their hold on Bohemia was shaken by the Thirty Years' War and on Hungary by the advances of the Turks, but both dangers were repelled. Maximilian II succeeded Ferdinand, and after the brothers Rudolph and Matthias came Ferdinand II and III and Leopold I. With the death of Charles VI, the male line ended in 1740.

Fortunes of Later Hapsburgs

The existing Hapsburgs are descended from Maria Theresa, the daughter of Charles VII, and her husband Francis of Lorraine—hence the family is sometimes known as Hapsburg-Lorraine. Two of their sons, Joseph II and Leopold II, succeeded to the imperial throne. A grandson, Francis II, was the last Holy Roman emperor and the first to call himself emperor of Austria. A succession of younger members of the family ruled over Tuscany, which Francis of Lorraine had brought to the common stock. About this time the family increased rapidly, and in the 19th century there was a bewildering number of archdukes. In 1859 the Hapsburgs lost Tuscany, but in Austria-Hungary Francis Joseph, in spite of several humiliations, was still emperor and king when he died in 1916. His grand-nephew Charles lost all in 1918, and the various Hapsburgs became private persons. *See* Austria; Biology illus.; Bohemia; Empire, Holy Roman; Europe; Hungary; *consult also* The Haps-

Hara-kiri. Scene at the condemnation of a samurai to the suicide made obligatory by Japanese feudal custom
After a drawing from a Japanese print

burg Monarchy, H. W. Stead, 2nd ed. 1914; *The Glory of the Hapsburgs*, Princess Fugger, 1932.

Hapur. Subdivision and town of the United Provinces, India, in Meerut district. The cultivated area is large. Hapur town is a local trade centre, connected by rly. with Meerut, Delhi, and Aligarh. Area, 407 sq. m. Pop., subdivision, 311,420; town, 33,756. Hindus predominate.

Hara, Trezzo. Japanese sailor. As vice-admiral commanding Japanese naval forces in the Andaman Is. from 1942 to 1945, he was responsible for the ill-treatment and transportation of 236 Indians to Havelock Is., where all but 13 died. He signed the surrender at Port Blair on Oct. 9, 1945, and was sentenced to death as a war criminal at Singapore on April 4, 1946.

Hara-kiri (Jap., belly-cut). Form of suicide by disembowelling practised in Japan. The custom originated as a means of honourable death among the medieval feudal nobles, and in the 14th century obligatory hara-kiri was recognized by the mikado as the privileged form of execution for a samurai convicted of disloyalty or breaking the law. The ceremony consists in ripping up the stomach from left to right.

Obligatory hara-kiri was abolished in 1868, but the voluntary form—committed from loyalty to a dead superior or as a protest against a living one, or out of desperation—survived. A notable modern instance is that of General Nogi (*q.v.*) and his wife, through grief at their emperor's death in 1912. By women the throat was cut. Among the Karens of Burma

honourable suicide is committed by strangulation. Seppuku, the Japanese pronunciation of the Chinese synonym *chi 'eh fuh*, is the more elegant term for this method of "happy dispatch."

Harar or **HARRAR.** Town of Abyssinia. The capital of the prov. of the same name, it lies in the E. highlands, some 160 m. E. of Addis Ababa. An old walled town and trading centre, it is noted for the coffee grown in the neighbourhood. Pop. 25,000. The town was occupied by British Imperial forces on March 25, 1941 (*see* East Africa Campaign).

Somali peoples, many of them Mahomedans, dwell in the prov. The duke of Harar, second son of the emperor Haile Selassie, took his title from this prov.

Harbin or **KHARBIN.** Town of central Manchuria. It stands on the Sungari river, 325 m. N.N.E. of Mukden. Here the Trans-Siberian rly., or that section known as the Chinese Eastern Rly., branches S. to Mukden and thence to Peiping, Dairen, and Korea, while the main line continues to Vladivostok. Harbin was opened to foreign trade in 1909. After the First Great War and the Russian Revolution, the town was much frequented by White Russians. It was developed by the Japanese, 1931-45. Russian airborne troops were dropped on Aug. 19, 1945, during the campaign against the Japanese forces in Manchuria, and the city was occupied the following day. When the Russians withdrew in 1946, Chinese Communists occupied Harbin, overwhelming the small government force. The city was recaptured from the Communists on June 5.

HARBOUR: PROTECTION FOR SHIPPING

M. Nachshen, B.Sc., M.I.C.E., M.I.Struct.E

An explanation of the reasons governing the choice of sites for harbours; and a discussion of the means by which men make natural sites better, and create harbours in unfavourable positions. See articles on harbours mentioned; and on Breakwater; Concrete; Engineering; Mulberry Harbour; River; Tide, etc

A harbour is an area of water sufficiently enclosed and protected from storms to provide a place of shelter for ships. Where only partial protection is available, e.g. from islands, reefs, or shoals, the sea area is called a roadstead. A harbour should have safe and easy entrance from the sea in any weather, and preferably at any state of the tide. It should be large enough in area to accommodate all the ships likely to require to use it at one time, and deep enough to take the largest vessels wishing to enter it. Sufficient and convenient moorings should be provided and if possible the bottom should be a good holding ground for anchors. Where the harbour has quays or piers within it, or where dock-entrances or canals lead from the harbour, these should be in sheltered positions and so placed that a ship can easily come alongside the quays or turn into the entrances in any weather.

NATURAL HARBOURS. The most frequent form of natural shelter is provided by rivers and estuaries; but these are not generally called harbours. Such shelters have the additional advantage of providing, as a rule, ship routes some way into the interior. Most of the world's leading ports are on rivers, notably London, Liverpool, Glasgow, Dublin, Rotterdam, Antwerp, Hamburg, Bremen, Calcutta, New York. In some ports, such as Swansea, a river provides a means of access to a dock system, but is not sufficiently extensive or deep to form a harbour where ships can lie at moorings or at anchor.

River harbours often have to be artificially improved. Rivers bring down silt and tend to deposit it in the sea in front of the river mouth, where it forms a bar. Either the river itself or the bar may need dredging to maintain sufficient depth of water for the needs of shipping. This is particularly so at old-established harbours which were sufficiently deep for the ships of bygone days, but are not deep enough for the larger vessels of today.

The depth and constancy of a river or its entrance are frequently

improved by the construction of training walls or jetties to confine the river flow within a restricted channel and so to improve the scouring effect of its water. Often both dredging and training walls or jetties are necessary. Dredging on a large scale is frequently necessary—e.g. on the Thames, the Clyde, and the Mersey; examples of training walls are those on the Mersey, Ribble, Seine, and the Rotterdam New Waterway.

In some cases the jetties at the mouths of rivers are designed to provide shelter from waves as well as to train the river. In other cases the shelter is the first con-

Harbour. Sunderland, at the mouth of the R. Wear, has an outer harbour formed by two breakwaters

sideration and breakwaters are placed, as at Sunderland, so as to create a small outer harbour into which the river enters.

Southampton, on the river Itchen and Test, is sheltered by the Isle of Wight. New York also is sheltered by islands. Natural landlocked bays or arms of the sea or bays sheltered by islands, provided suitable depths of water exist or can be created, are excellent sites for harbours. Examples are Portsmouth, Stranraer, Belfast, Cork, Cobh (Queenstown), Galway, and many smaller places sheltered by the islands off the coasts of Scotland and Ireland. Farther afield are Sydney, Auckland, Wellington, Halifax, Vancouver, San

Francisco, Durban, S. Africa; Lagos, Nigeria; and Rio Grande do Sul, Brazil, all on large landlocked bays or arms of the sea. Venice is on a completely landlocked lagoon with three entrances.

ARTIFICIAL SHELTER. Many harbours have some natural shelter but have been completed by the construction of breakwaters. The natural shelter may be almost complete as at Plymouth, where a short breakwater completes the shelter of several square miles of deep water in Plymouth Sound and its branches. Portland is sheltered naturally from the W. by the Isle of Portland, which is a peninsula, and from the S. and E. by artificial breakwaters. Peterhead and Brixham harbours require artificial shelter from one direction only.

A particularly interesting example is Alexandria (see Alexandria map, p. 288), where there are two harbours separated by a peninsula, which, with a row of coral reefs, gave partial natural protection. This has been completed by breakwaters which partly follow the line of reefs. The peninsula itself is of artificial origin, having been formed by drifting sand held up by a causeway built over two thousand years ago to connect the mainland with the island of Pharos. The water area of the western harbour is so large that

a subsidiary internal breakwater has been constructed to shelter some of the quays against waves forming inside the harbour.

Examples of harbours with a smaller degree of natural protection, but where some shelter is obtained from a situation in a bay, or cover by promontories

Harbour. Durban Bay, a natural land-locked area of water, provides an excellent sheltered harbour

Harbour. Dover harbour, partly sheltered by high cliffs, has the added protection of several breakwaters

are Dover, Haifa, Colombo, and Barcelona.

At Genoa (see Genoa map, p. 3699) and Marseilles their original small harbours were naturally sheltered in bays, but both have expanded and their newer parts are protected by breakwaters generally parallel with the shore.

Zeebrugge, on an open coast, is sheltered by a single curving breakwater. Madras is an entirely

artificial harbour enclosed by breakwaters on three sides. The original construction was of two breakwaters 1,200 yds. apart, at right angles to the shore and curving inwards at their outer ends to leave

an entrance 500 ft. wide facing E., or seaward. The harbour silted up so rapidly that the original entrance had to be closed and a new one cut facing N. and protected by a new breakwater extending from the N.E. corner.

PLANNING A HARBOUR. Among the points which the layout in plan of an artificial harbour must take into account are: (a) the configuration of the coast and nature and levels of the sea bed; (b) the direction and forces of greatest and most prevalent winds and storms, and the size and direction of waves resulting from them; (c) the tides and currents; (d) the drift of solid material; (e) the size and number of ships to be received, and whether they are to enter at all states of the tide or around high tide only; (f) whether the area between the breakwaters is to constitute the whole of the port, e.g. Dover, or whether it is to be an outer harbour to a river or to docks; (g) the provision to be made for land traffic; (h) cost.

Full advantage should be taken of partial natural protection, and also

of any reefs or shoals which will reduce the height of the breakwaters. The harbour mouth should be as far seaward as possible, and so placed that a ship failing to make it can easily turn and try again. For ease of entry in a storm the entrance should face the direction of maximum storms, but as this exposes the interior to waves, a compromise is usual.

If the direction of entrance is such that a ship would have to turn broadside on to the direction of the storm, the water just outside the entrance can be sheltered by prolonging the windward breakwater to overlap the lee one, or by covering the entrance by an island breakwater. Methods of constructing breakwaters are considered under the head Breakwater.

In some places two entrances are necessary to ensure safe entry under all conditions. According to the direction of the breakwaters and of the entrance, solid material travelling along the shore may enter the harbour or pass it by. The width of an entrance between breakwaters is generally related to the length of the largest ships. Six hundred feet or so is a common width, but there are great variations. Judgement and compromise are necessary as a wide entrance tends to reduce the shelter in the harbour, while a narrow one may be dangerous in rough weather, and is conducive to fast currents and eddies in tidal seas, or where there is much river water to pass through the entrance. To be of maximum service, the depth of harbour entrances should be sufficient to admit a ship to shelter at any state of the tide and to allow for the vertical movement of the ship due to large waves.

Within the harbour the water space should widen in funnel shape so that waves will be rapidly spread and dissipated. In some cases wave traps or spending beaches are contrived inside the harbour mouth where the waves, spreading from the entrance, spend themselves on sloping beaches, while the vessel passes through a second entrance into calmer waters. There are natural spending beaches at Sunderland and Tynemouth, and artificial ones at Whitby and Blyth.

Harbour Grace. Port of entry of Newfoundland. In the S.E., it has a large but exposed harbour on the W. of Conception Bay. Here are a courthouse and an R.C. cathedral. Rly. connexion is available with St. John's. Pop. 2,065.

Harburg-Wilhelmsburg. Seaport of Germany, on the Elbe in the Land of Lower Saxony, S. of and adjoining Hamburg. The towns of Harburg and Wilhelmsburg, merged in 1927, and in 1937 absorbed in the Hansa city of Hamburg, are linked by two bridges over the Elbe, each over 2,000 ft. long. Important industries were mineral oil, margarine, chemicals, textiles, and rubber; the port, administered in common with those of Hamburg and Altona, had before 1939 a traffic of about 4,500 seagoing vessels a year in and out; some 5,000,000 tons of merchandise were handled annually by sea and 2,000,000 by inland navigation. Harburg received its charter as a city about 1300; in 1376 it fell to the house of Celle-Lüneburg, and in 1866 to Prussia. It was severely damaged by bombing and land fighting in the Second Great War. Pop. 118,193.

Harcourt, LEWIS HARCOURT, 1st Viscount (1863-1922). British politician. He was born Feb. 1,

Viscount Harcourt, British politician

1863, the elder son of Sir William Harcourt, and was educated at Eton. For many years he acted as private secretary to his father. In 1904 he entered the house of commons for Rossendale, and in 1905 joined the Liberal ministry as first commissioner of works. Later he entered the cabinet, and during 1910-15 was colonial secretary, reverting to his former post of commissioner of works when the Coalition government was formed in 1915. He resigned with Asquith in 1916, and was made a viscount in 1917. This title had been held by earlier Harcourts, whose estate at Nuneham he inherited. He died Feb. 24, 1922, his son William (b. 1908) succeeding to the peerage.

Harcourt, SIMON HARCOURT, 1st Viscount (c. 1662-1727). English lawyer. The only son of Sir Philip Harcourt, he belonged to the family that, coming from Normandy, had made its home in Oxfordshire, where Stanton Harcourt commemorates the fact. Simon was born at the manor

house and educated at Pembroke College, Oxford. In 1690 he entered parliament as M.P. for Abingdon, and in 1702 he became solicitor-general and a knight. In 1707-08, and again in 1710, he was attorney-general, and later in 1710 was made lord keeper of the great seal. In 1711 he was created a baron; in 1713 he became lord chancellor, but like other Tories he lost his office when George I became king in 1714; in 1721 he was made a viscount. He died July 23, 1727. Swift referred to him as "trimming Harcourt."

Simon, Viscount Harcourt, English lawyer

Harcourt bought Nuneham, which is still the family seat. His son, Simon, predeceased his father, so the latter's heir was his grandson, Simon (1714-77). He was viceroy of Ireland, 1772-77, having previously been governor to the prince of Wales, afterwards George III. In 1749 he was made an earl. His two sons succeeded in turn to the titles and estates. The younger of these, William, the 3rd earl (1743-1830), served in America and in Flanders, becoming a field marshal. When he died the titles became extinct.

Harcourt, Sir William George Granville Venables Vernon (1827-1904). A British

Sir William Harcourt, British statesman

statesman. The son and grandson of clergymen, his grandfather being archbishop of York, he was born at York, Oct. 14, 1827. The archbishop was originally named Vernon, but took the name of Harcourt on succeeding to the estates of that family. Educated privately and at Trinity College, Cambridge, William was called to the bar. He was made Whewell professor of international law at Cambridge, and held this post until 1887.

By birth a Whig, Harcourt joined the Liberal party, and in 1868 entered the house of commons as M.P. for Oxford city. He was member for Derby from 1880 to 1895, when, being rejected there, he was returned by W. Monmouthshire, retaining that seat until his

death. He entered official life as solicitor-general under Gladstone in 1873, going into opposition in 1874. In 1880 he was made home secretary; he had to deal with the Fenian outrages, and the Irish malcontents found in him one of their most vigorous assailants. In 1886 he was for a few months chancellor of the exchequer, having adhered to Gladstone when the party was split over Home Rule; and then followed six more years in opposition.

In 1892 Harcourt, who is remembered for the remark "We are all Socialists now," returned to the exchequer, and in 1894 was responsible for the budget which established the graduated system of death duties. He succeeded Gladstone in 1894 as leader of the house of commons, but Rosebery became prime minister, and this was undoubtedly a bitter disappointment to Harcourt. From 1895 he led the party in opposition, but differences with his followers grew more pronounced, and he resigned in 1898. Henceforward he occupied a detached position, having little save hard words for the Conservatives and for the imperialist section of the Liberals. He died Oct. 1, 1904, having only just inherited the estates of the Harcourts. Endowed with an imposing presence and great mental gifts, he was a witty talker, forceful debater, and most attractive platform speaker. His Life by A. G. Gardiner appeared in 1923.

Harda. Town of the Central Provinces, India, in the district of Hoshangabad. It stands on the high road to Bombay, and is a station on the Great Indian Peninsula rly., 12 m. from Handia. It is a prosperous town with a good water supply, and a trade in cereals and oil seeds. Pop. 13,290.

Hardanger Fjord. Deep, ramified inlet on the W. coast of Norway. It opens S. of Bergen, and extends in a N.E. direction about 70 m. to Vik and Ulvik, which are about 115 m. from the open sea beyond the islands at its mouth. A branch, known as the Sjørfjord, runs S. to Odde, passing the vast Folgefond snowfield. Among the many cataracts on the Hardanger Fjord are the Skjeggedalsfos and the Vöringfos.

Harden, Sir Arthur (1865-1940). British biochemist. He was born at Manchester and educated at Owens College there and Erlangen university. From 1888 to 1897 he was lecturer and demonstrator in chemistry at Owens College, and thence he

went to London as professor of biochemistry. Later he became head of the biochemical dept. of the Lister Institute. From 1913 to 1937 he was joint editor of the Biochemical Journal, in 1929 was joint recipient of the Nobel prize for chemistry, and in 1935 was awarded the Davy medal of the Royal Society for fundamental discoveries in the chemistry of alcoholic fermentation. Harden was knighted in 1936, and died June 17, 1940.

Harden, Maximilian Felix Ernst (1861-1927). German journalist and politician. Born at Berlin

Maximilian Harden, German journalist

Oct. 20, 1861, his real name was Witkowski; he became known as a satirical writer under the pseudonym of Apostata, and won the support of Bismarck and Caprivi. In 1892 he founded the weekly Die Zukunft, in which in 1907 he launched a campaign against Eulenburg, Kuno Moltke, and von Hohenhausen, which led to their disappearance from the imperial circle. He was several times prosecuted for *lèse-majesté*, and his paper was repeatedly suppressed during the First Great War. He died Oct. 30, 1927.

Hardenberg, Friedrich Ludwig von (1772-1801). German poet and romance writer, better known by his pseudonym of Novalis (*q.v.*).

Hardenberg, Karl August, Prince of (1750-1822). German statesman. Born in Hanover, May 31, 1750, he was educated at Leipzig and Göttingen, afterwards entering the public service of Hanover. He was made a count, but left the service because of his wife's intimacy with the prince of Wales, later George IV. In 1782 he entered the service of Brunswick, and in 1792 was made administrator of Ansbach and Baireuth.

Hardenberg was soon busy on behalf of Prussia. On the outbreak of war against France he had been sent on diplomatic work, and helped to arrange the peace of Basel (1795). In 1804 he was made foreign secretary by Frederick William III, but in 1805 Napoleon insisted upon his retirement. He returned to his post in 1807; again the dictator had him dismissed. In 1810 he became chancellor, a moderate reformer, and carried on Stein's work in the reorganization of

Prussia. He supported the policy of making war on France in 1812, and had a share in arranging the settlement of 1814-15, being Prussia's chief representative at the congress of Vienna. He was a member of all the congresses between 1812 and 1822, but could scarcely maintain an independent line between Metternich of Austria and Nesselrode of Russia. He died at Genoa, Nov. 26, 1822.

Hardener. Type of alloy. Various elements may be added to molten metals to give a finished product harder than the pure metal. For convenience the additions are made in the form of alloys rich in the element required.

Harderwyk. Town of the Netherlands. In the province of Gelderland, about 46 m. due E. of Amsterdam, it is on the rly. between Amersfoort and Zwolle, and is a useful agricultural centre. Formerly a port on the Zuider Zee, it had a depot for recruits for the East Indian service. Harderwyk university, founded 1648 and well known in the 18th century, was closed in 1811. Pop. 8,650.

Hard Fern (*Blechnum spicant*). Fern of the family Polypodiaceae. It is a native of Europe, N.E. Asia, the Canaries, and N.W. America. The rootstock is creeping and scaly; the fronds are leathery, polished, long, and narrow, and deeply cut in from the margins to, or nearly to, the midrib. Fertile fronds have the divisions narrower and more distant; the barren fronds are broader, evergreen, more or less prostrate. The fertile fronds are twice the length of the others, erect, the under side of each lobe margined with the line of brown spore-cases. See Fern.

Hardhead, MATFELLON, OR GREATER KNAPWEED (*Centaurea scabiosa*). Perennial herb of the

Hardhead, leaves and flower-heads

family Compositae. It is a native of Europe and W. Asia. The long leaves are deeply cut into boldly toothed segments. The grooved flowering stem is from 2 ft. to 3 ft. in length, covered with soft hairs, branched near the top, each branch ending in a large bright purple (occasionally white) flower-head. The lower part of the head is almost spherical, of extreme

hardness, and invested with large rough scales with brown tips.

Hardicanute OR HARTHACNUT (c. 1018-42). King of Denmark and England. The son of Canute and his Norman wife, Emma, widow of Ethelred the Unready, he passed most of his time in Denmark, where he acted as his father's deputy. In 1035, Canute dying, he became king of Denmark, while Earl Godwin wished him to be king of England also. A contest between him and his half-brother Harold resulted in division of the kingdom between them, Hardicanute taking the S. or English part. He stayed in Denmark, seeking among other things the throne of Norway, and in 1039 his discontented English subjects placed themselves under Harold. Hardicanute then came to England, but his short reign was marked by brutalities, notably the ravaging of Worcestershire, and by a short quarrel with Godwin. He died, says the A.S. Chronicle, as he stood at drink, June 9, 1042.

Hardie, JAMES KEIR (1856-1915). Scottish politician. Born at Legbrannock, Lanarkshire, he

J. Keir Hardie, Labour leader Russell

was a miner from boyhood until at 24 he was appointed secretary of the county miners' union. He founded in 1887 The Miner, which became The Labour Leader. Having unsuccessfully contested Mid-Lanark in 1888, he was elected by West Ham South in 1892 as the first Labour M.P., appearing at the house of commons in a cap. He lost the seat in 1895, but represented Merthyr from 1900 until his death, Sept. 26, 1915.

Keir Hardie worked to remove the Liberal influence from the T.U.C., helped to found the Scottish Labour party and the I.L.P., of which he became chairman in 1893, and in 1899 effected a measure of cooperation between the T.U.C. and various Socialist bodies, which was to gain for his party 29 seats at the election of 1906. He hoped to persuade the Socialist International to call a general strike in the event of European war. Hotly as his views were contested, his integrity and character were never called in question.

Hardiman, ALFRED FRANK (1891-1949). British sculptor. He entered the Royal College of

Hardiman. Memorial to Earl Haig, by A. F. Hardiman, set up in Whitehall in Nov. 1937

Art in 1912, studying under Lanteri and gaining his diploma in 1916. He transferred to the R.A. schools and was Rome scholar in 1920. His works include stone groups for the County Hall extension at Westminster, and stone and bronze sculpture for the new city offices at Norwich. The memorial to Earl Haig in Whitehall aroused much criticism, many disliking the formal treatment of the charger. Hardiman was awarded the medal of the R.B.S. in 1939, and elected R.A., 1944. He died April 17, 1949.

Harding, WARREN GAMALIEL (1865-1923). President of the U.S.A. Born Nov. 2, 1865, in a farmhouse near Blooming Grove, Ohio, the son of a doctor, he was educated at the village school and a local college. Starting life as a schoolmaster, after two years he went into the printing trade, and in 1884 acquired the local newspaper of Marion, Ohio. He represented Marion in the Ohio senate 1899-1903, and from 1904 to 1906 was lieutenant-governor of the state. When Theodore Roosevelt split the Republican party, Harding followed Taft, whom he had nominated in 1912. In 1914 he was elected to the senate at Washington, where he was a member of the foreign relations committee.

W. G. Harding, U.S. President Henri Manuel

Before 1914 he paid three visits to Europe to study fiscal and labour questions. On the outbreak of the First Great War he backed Roosevelt in trying to arouse President Wilson to a sense of impending emergencies, and when the U.S.A. entered the war

he favoured Roosevelt's plan for sending a volunteer division to France without delay.

In June, 1920, Harding was unanimously nominated Republican candidate for the presidency, as a compromise between the two extreme wings of the party. He was elected president in November by a sweeping majority, representing reaction from Wilson's international outlook, and public desire to concentrate on American affairs and so return to what Harding called "normalcy." The election also marked a reaction from that personal domination by the president which had characterised Wilson's administration. Harding was as approachable and friendly as his predecessor had been aloof and autocratic. The chief public events connected with his administration were the signing of the peace treaty with Germany, July 2, 1921; the passage of the Budget Act of 1921; and the holding of the Washington conference for the limitation of armaments, 1921. In San Francisco in the summer of 1923 he contracted pneumonia, following ptomaine poisoning, while returning from a visit to Alaska, and the crisis had no sooner passed than it was announced that he had died of an apopleptic stroke, August 2, 1923.

Corrupt Practices Revealed

Only after his death did it become clear that his administration had been characterised by rampant nepotism and corruption. A particularly notorious example of "graft" was discovered in the granting of various oil concessions by the secretary of the interior, from government oilfields in California and Wyoming. Corrupt practices had also made notorious the administration of the veterans' bureau, which existed to look after the interests of disabled servicemen, as well as that of the alien property custodian. For a time it was widely rumoured that Harding had taken his own life. In a book by G. B. Means, *The Strange Death of President Harding*, it was implied that his wife had poisoned him. In another book, *The President's Daughter*, a self-alleged mistress of Harding claimed to be the mother of his illegitimate child. These personal implications and allegations remained unsubstantiated, but the administrative scandals alone were enough to mar Harding's posthumous reputation. The national memorial to him at Marion, where he was buried, remained undedicated until 1931.

Hardinge, HENRY HARDINGE, 1st Viscount (1785-1856). British soldier and administrator. He

After E. U. Eddis

was born at Wrotham, Kent, March 30, 1785, and educated at Eton. Having entered the army, he served in the Peninsular War, and in 1815 was with the Prussian army at Ligny, where he was wounded. In 1820 Sir Henry (K.C.B., 1815) became Tory M.P. for Durham, and in 1828 he became secretary at war under Wellington; in 1830 he was chief secretary for Ireland, as he was again in the Tory ministry of 1834-35. From 1841 to 1844 he was again secretary at war, resigning to become governor-general of India. He was there until 1852, carrying through the wars against the Sikhs and being rewarded in 1846 with a viscounty. From 1852 to 1856 he was commander-in-chief. He died Sept. 24, 1856. The fourth viscount (b. 1905) succeeded to the title in 1924. See Sikh Wars.

Hardinge of PENSURST, CHARLES HARDINGE, 1st Baron (1858-1944). British diplomatist. Born in London, June 20, 1858, a younger son of the 2nd Viscount Hardinge, he was educated at Harrow and Trinity, Cambridge. From 1880 he was in the diplomatic service, gaining experience in several capitals, especially St. Petersburg, 1898-1903 and 1904-06. Four years under-secretary at the foreign office, he was in 1910 appointed viceroy of India and raised to the peerage. In 1916 he left India and was made K.G. and again under-secretary for foreign affairs, in spite of the censure passed on him by the Mesopotamia commission. In 1920-22 he was ambassador to Paris. He died Aug. 2, 1944, his son Alexander (b. 1894) succeeding to the title.

Hardinge's temperament was too reserved to seek or win popularity; but he possessed sound judgement, great determination and industry, and a thorough knowledge of affairs. Grey described his reports to Whitehall as "real, full, authentic, and confidential."

Hardinge Bridge. Rly. bridge across the Ganges, in Pakistan. It spans the river at Sara and was opened in 1917. A marvellous feat

of engineering, it connects the standard 5 ft. 6 in. gauge system of the E. Bengal rly., S. of the Ganges, with the metre gauge system N. of the river. It comprises 15 girder spans of 345 ft. 1½ ins. with 3 land spans of 75 ft. at each end.

Hardinge Mill. Form of conical ball or pebble mill, much used in ore dressing (*q.v.*). The mill is charged with steel balls or hard pebbles of varying sizes; when it is rotated, the larger balls work to the portion with the largest diameter. The ore is fed in at this end and so first meets the heaviest balls falling from the greatest height. As it proceeds through the mill, the ore meets smaller balls and so is ground progressively finer.

Hardingstone. Village and parish of Northamptonshire, England. It is 2 m. S. of Northampton and is famous for its cross, the best preserved of those erected by Edward I to the memory of his wife Eleanor. There is an old church dedicated to S. Edmund, and the Nen runs through the parish, as does the Grand Union Canal. The battle of Northampton, July 10, 1460, at which Henry VI was defeated and taken prisoner, was fought on Hardingstone Fields. There are remains of a Roman camp. See Northampton, Battle of.

Hard Labour. British legal term. Imprisonment with hard labour, long obsolescent, was abolished by the Criminal Justice Act, 1948. Compelling a prisoner to undertake drudgery is an old practice which was extended in 1775 when, on the revolt of the American colonies, imprisonment with hard labour was substituted for transportation to America. By an Act of 1778 the labour was required to be "of the hardest and most servile kind in which drudgery is chiefly required," *e.g.* working a treadmill. It was considered desirable not only that the work should be exacting and monotonous but that the prisoner should also know it was perfectly useless.

The Prisons Act, 1865, specified hard labour of two classes, the more severe involving work at the treadmill, crank, or capstan, shot drill, or stone-breaking. The Gladstone committee appointed by Asquith in 1894 endeavoured to stress the reformatory rather than the deterrent aspect of punishment, and condemned unproductive hard labour; but separate confinement was retained for the first 28 days of sentence. Picking oakum was at one time the prescribed task. When that was abolished there was no distinction between the work

done by those prisoners sentenced to hard labour and the others. The former worked for 28 days in solitary confinement and slept for 14 days without a mattress. Both these distinctions have been abolished.

Hardness. A mechanical property of materials. The mineralogist uses a test for hardness as an aid to the identification of minerals, noting the effect of scratching with a knife or file or with another mineral. The standard Mohs scale (*q.v.*) ranges from talc to diamond. For example, if a mineral will scratch quartz, but is itself scratched by topaz, it is said to have a hardness between 7 and 8. Such methods are too crude for the metallurgist. The hardness of a metal is an intrinsic property, bearing a relationship to the ultimate tensile stress, and of value in estimating its resistance to wear, or power to withstand heavy loading. Common methods of calculating hardness depend on the measurement of the depth of penetration by a hard steel ball or diamond pressed into the surface by a known load. In the scleroscope test, a pointed diamond is loaded and dropped on the surface, the distance of rebound being proportional to hardness. See Brinell Hardness; Vickers Hardness.

Hardness. Term used to describe the soap-destroying power of a water. It is expressed in the U.K. in degrees (Clark or English), *i.e.* as calcium carbonate, grains per gallon or parts per 70,000. The standard of 1 part per 100,000 is becoming generally adopted; to convert this into grains per gallon multiply by 0.7. Classification of hardness is: soft, less than 5 parts per 100,000; moderately soft, 5 to 10 parts; slightly hard, 10 to 15 parts; moderately hard, 15 to 20; hard, 20 to 30; very hard, over 30.

When hardness is reduced by boiling, the portion which has disappeared is called "temporary" hardness and is due to the carbonates of calcium and magnesium which have been thrown out of solution by the loss of carbonic acid. What remains is "permanent" hardness, due to the presence of sulphates of calcium and magnesium, but occasionally to chlorides and nitrates as well. The disadvantages of hard water are soap wastage; the production of slime in wash-basins, baths, and on textiles being laundered; the formation of scale or fur in boilers, hot water pipes, and kettles.

The condition of foods is improved by cooking in soft water. Personal washing and domestic cleansing are much more efficient and less laborious with soft water. Water of hardness exceeding 20 parts per 100,000 should be softened. Water having hardness of 10 grains per gallon will destroy 17.5 oz. of soap per 100 gallons; a saving of about 17 oz. of soap per 100 gallons of water will result from halving the hardness of 20 grains per gallon. Softening is accomplished either by the removal of calcium and magnesium salts or by their conversion into the corresponding salts of sodium; *i.e.* by precipitation or base exchange. See Water Softening.

Hardoi. District, subdivision, and town of the United Provinces, India. The surface is fairly level, and is watered by the Ganges, Gumti, Ramganga, Gavia, and other streams, and there are several lakes. Dense jungle prevails in parts, inhabited by large game, but the tiger is almost extinct. The chief products are rice and wheat. Area, district, 2,323 sq. m.; subdivision, 631 sq. m. Pop., district, 1,239,279; subdivision, 343,362; town, 53,142.

Hardouin, JEAN (1646-1725). French scholar. He was born at Quimper, became a Jesuit, and in 1683 was appointed librarian at the Collège de Louis le Grand, Paris. He maintained that most of the classic literature of Greece and Rome was the invention of 13th century monks. The exceptions which he admitted were Homer's *Iliad*, Herodotus, Virgil's *Georgics*, Pliny's *Natural History*, the *Satires* and *Epistles* of Horace, and the works of Cicero. In the same way he dismissed all ancient works of art as spurious, and held similarly heterodox views as to the *Septuagint*, the Greek text of the N.T., and the authenticity of all councils of the Church earlier than that of Trent, 1545-63.

Hardt. Mt. range of Rhineland-Palatinate, West Germany. It is a continuation of the Vosges and runs parallel to the Rhine through the Palatinate. The highest summit is Kalmit, 2,250 ft. The upper parts are mainly covered with trees, while the vine is grown on the lower. The E. side, which slopes down to the Rhine, is charmingly picturesque.

Hard Times. Charles Dickens's ninth and shortest novel. Published in *Household Words* (April-Aug., 1854), it is a satire on the utilitarian philosophy of mid-Victorian days, bears unmistakable

evidence of Carlylean influence, was approved as to its main drift and purpose by Ruskin, and dismissed by Macaulay as "sullen Socialism." The utilitarian viewpoint is personified in Thomas Gradgrind, the most memorable character.

Hardwar. Town of the United Provinces, India, in Saharanpur district. At a sea level of 1,024 ft., it stands on the right bank of the Ganges. Originally known as Kapila, it is a town of great antiquity (sacked by Tamerlane in 1399), but its modern name (Door of Hari or Vishnu) dates from 1400. Among the holy places of Hinduism, its temples are visited by pilgrims from all over India. The chief is that of Dakshewara (Siva) with bathing ghat where every twelfth year the Kumbhmela festival is held; elaborate railway, lighting, sanitary, and police arrangements are needed, as the pop. for the period rises to about a million. The Ganges canal system begins at Hardwar, the Bhimgoda headworks containing a weir 2,000 ft. long which can pass a flood of 445,000 cu. ft. per sec. over the crest. Pop. 40,823.

Hardware. Term used for ware made of the cheaper metals, *e.g.* iron, zinc, etc., especially kitchen utensils, tools, and the like. In England hardware is manufactured mainly in the Birmingham district.

Hardwicke, PHILIP YORKE, 1st EARL OF (1690-1764). British lawyer. Born at Dover, Dec. 1, 1690. After education at a private school

1st Earl of Hardwicke,
British lawyer

he entered an attorney's office, but turned to the other branch of the profession, and after serving as a tutor to the sons of the earl of Macclesfield was called to the bar in 1718. His friendship with Macclesfield, the lord chancellor, was useful, and he soon had a good practice. In 1719 M.P. for Lewes, and in 1720 solicitor-general and a knight, in 1723 he became attorney-general.

In 1733 Yorke was made lord chief justice and created a peer, and in 1737 lord chancellor. In this office he remained until 1756, one of the most influential men in the country. As head of the council of regency in 1745, he had to deal with the crisis caused by the Jacobite rising, and showed himself merciless to the rebels. He

carried the measure abolishing the hereditary jurisdiction in the Highlands, but his name is more closely associated with the Marriage Act of 1753. In 1754 he was made an earl.

Hardwicke spent 1757-62 in the cabinet, although without a definite post. Until his death,

Originally formed for the discussion of legal subjects, the society now concerns itself mainly with political subjects. Only bar students and barristers are admitted.

Hardwick Hall. English seat of the duke of Devonshire. It is 6 m. S.E. of Chesterfield, in Derbyshire. Built by Elizabeth, countess of Shrewsbury, 1590-97, it is remarkable for the number and size of its glass windows, and it contains some fine pictures and tapestries. It has been altered very little and is a fine example of an Elizabethan mansion. Notable features are the picture gallery and the chapel.

There was an earlier hall here in which Mary Queen of Scots lived when a prisoner.

The nearest station is Rowthorn, 1 m. away. Near is Ault Hucknall, its little church containing the tomb of Thomas Hobbes.

Hardwood. Term used for a timber that is heavy and close-grained and therefore strong. The opposite term is soft wood. In forestry the term is used for the wood of a broad-leaved tree, such as the beech, in opposition to that of a coniferous tree; this is irrespective of the strength of the timber. *See* Forestry; Timber.

Hardy. Smith's tool for cutting or shaping iron and steel. It is made of tool steel and is formed with a squared shank to fit in a socket of the anvil. The upper portion, rising above the anvil, is shaped to a blunt wedge, resembling a chisel; the angle of acuteness varies according to whether the

tool is to be used on heated or on cold metal. Work to be cut is held over the hardy, resting on the sharp edge, and is struck with a hammer to sever it. *See* Forging.

Hardy. A British warship. Leader of the second destroyer flotilla, she was an Admiralty type flotilla leader with a displacement of 1,505 tons, main armament of 4.7-in. guns, and wartime complement of 200 men. On April 10, 1940, she led four destroyers into Ofot Fjord at Narvik, Norway, where German naval forces had concentrated. Entering the harbour alone, the flotilla leader fired at a German destroyer, engaged other warships, and received considerable damage. The commander of the British force, Capt. Warburton-Lee, was mortally wounded (posthumously awarded the V.C.), and the Hardy was run ashore after sinking one destroyer, setting three ablaze, and accounting for seven merchant vessels.

Hardy, ALEXANDRE (c. 1560-c. 1631). French dramatist. He was born in Paris, but little is known of his life beyond the fact that for some time he travelled with a band of strolling players, for whom he wrote pieces, and later was attached in a similar capacity to the Théâtre de l'Hôtel d'Argent, Paris. He was one of the most prolific dramatists of history, producing some 600 plays, of which 41 are extant. Among these are *Scédase*, 1604; *Alphée*, a pastoral, 1606; *La Mort d'Achille*, 1607; and the two best, *Marianne*, 1610, and *Frédégonde*, 1621. Although now little read, Hardy was the first to give life and movement to the classic drama.

THOMAS HARDY: NOVELIST AND POET

George Sampson, M.A., Author and Critic

The articles English Language & Literature and Novel may be consulted in connexion with the following. See also Bournemouth; Dorchester; Dorset; and under the titles of Hardy's better known works, e.g. Dynasts, The; Tess of the D'Urbervilles, etc.

Thomas Hardy was born at Upper Bockhampton, near Dorchester, June 2, 1840. From local schools he passed to King's College, London. During 1856-61 he was the pupil of an ecclesiastical architect, and in 1862-67 worked at Gothic architecture under Sir A. Blomfield. It is not fanciful to trace the influence of this training in the ordering of his literary work.

He drew and measured old country churches, since pulled down or destroyed by "restoration," and was a prizeman of the R.I.B.A. and the Architectural

Association. Meanwhile he read Latin and Greek with a fellow pupil and wrote a great deal of verse. Some of this was published, some turned into prose and embedded in novels.

His first known appearance in print was with an article, *How I Built Myself a House*, in Chambers's Journal for March 18, 1865. In 1871 appeared his first novel, *Desperate Remedies*, followed in 1872 by *Under the Greenwood Tree*. His last full-length story was *The Well-Beloved*, 1897. Hardy's work, while various in value, has

Hardwick Hall. One of the seats of the Duke of Devonshire seen from the south-west

March 6, 1764, he was one of the leaders of his party in opposition to the ministry of Bute. His eldest son succeeded to his titles; another son, Charles Yorke, became lord chancellor; others were Joseph Yorke, created Lord Dover, and James Yorke, bishop of Ely. Hardwicke's fame rests upon his work as a judge. To him, more perhaps than to anyone else, are due the lines upon which English equity has developed.

Hardwicke, SIR CEDRIC WEBSTER (b. 1893). British actor. Born at Stourbridge, Feb. 19, 1893, he was educated at Bridgnorth, and intended for the medical profession. He studied, however, at the R.A.D.A., played a small part at the Lyceum Theatre, 1912, and toured with Benson in S. Africa. He was the last British officer to leave the war zone in France in 1922. From the Birmingham repertory company he came to London in Back to Methuselah, 1924. He gave outstanding performances in *The Farmer's Wife*; *The Apple Cart*; *The Barretts of Wimpole Street*; *The Late Christopher Bean*; and played leads at the Malvern festivals, 1929-32. Entering films in 1931, he is remembered for *Rome Express*; *Tudor Rose*; *Stanley and Livingstone*; *The Moon is Down*; *Nicholas Nickleby*. He was knighted in 1934.

Hardwicke Society. Legal debating society established about 1835 and named after Lord Chancellor Hardwicke. Its meeting-places have included *Pelee's Coffee House*, *Fetter Lane* (now a tavern), *Anderton's Hotel*, the *Portugal* and *Dicks's hotels* (now no more), and the *Temple*. Its present meeting-place is the *Temple Restaurant*.

remarkable homogeneity, due partly to the literary patriotism, or "localism," that confines his scenes and persons to the limits of a province, but most of all to the character of a writer strong and unglamoured in his view of man and the universe, fearless and unflinching in his artistic sincerity.

What distinguishes him definitely from the purely Victorian writers is his complete abjuration of the popular sentimental attitude towards love, life, and religion, and his almost pagan sense of fate. The difference can be seen by a comparison of the two dairymaids, Hetty Sorrel, in *Adam Bede*, and Tess in *Tess of the D'Urbervilles*. Hardy seems to see human life as something almost pitifully transient against the eternal impassivity of nature. Thus, in *The Return of the Native*, 1878, the most powerful creation is not a person, but a place, Egdon Heath, grim, sinister, and almost malignant in its immemorial indifference to the life that flutters briefly on its ancient bosom.

Hardy's artistic geography must not be taken too literally. It is not for nothing that he reverts to the ancient name Wessex, calls Dorchester Casterbridge, Oxford Christminster, and so forth. He is often treated as the exploiter of a province; but his Wessex is a creation rather than a transcript.

Hardy's output of work was very regular—seventeen long novels or collections of stories in twenty-six years, all at a very high level of imaginative and technical excellence. Every reader will have preferences; but general agreement would group together *Tess of the D'Urbervilles*, *Jude the Obscure*, *The Mayor of Casterbridge*, *The Return of the Native*, *The Woodlanders*, and *Far from the Madding Crowd*, as superior to *Desperate Remedies*, *A Pair of Blue Eyes*, *The Hand of Ethelberta*, and *A Laodicean*. Never overlooked, Hardy became most famous when *Tess of the D'Urbervilles*, with its challenge to the conventions of respectability, appeared in 1891, and something like a storm burst when the grim and dreadful picture of sordid existence, called *Jude the Obscure*, followed a few years later. *The Well-Beloved* (1897), a puzzling fantasy, seemed to indicate a loss of power.

The unwavering views of Hardy's novels find their parallel in the poems. Verse was his earliest literary activity and his latest. What followed *The Well-Beloved* was not another novel, but *Wessex Poems* (1898), including some dating from his activity in

Thomas Hardy.

Russell

the 'sixties. Several other volumes of verse, e.g. *Poems of the Past* and the *Present*, *Time's Laughing-Stocks*, *Satires of Circumstance*, *Moments of Vision*, succeeded.

The poems display the homogeneity of the stories. Many of them, the poet is careful to tell us, are

Abbots Cernel, Cerne Abbas; Alderbury, Reading; Alfredston, Wantage; Anglebury, Wareham; Buckbury Fitzpiers, Okeford Fitzpaine; Budmouth Regis, Weymouth; Casterbridge, Dorchester; Castle Boteler, Boscawen; Chalk Newton, Maiden Newton; Chasetown, Cranborne; Chisne Manor, Canford Magna; Christminster, Oxford; Corvesgate Castle, Corfe Castle; Downstaple, Barnstaple; Durnover, Fordington; East Egdon, Affpuddle; Emmminster, Beaminster; Endelstone, St. Juliot's; Enkworth, Encombe; Everhead, Evershot; Falls Park, Mells; Flintoncomb Ash, Dole's Ash; Great Hintock, Minterne Magna; Havenpool, Poole; Holmstoke, East Stoke; Ivel, Yeovil; Kingsbere, Bere Regis; King's Hintock Court, Melbury Sampford; Knollingwood, Wimborne St. Giles; Knollsea, Swanage; Leddington, Gillingham; Little Hintock, Melbury Osmond; Lornon, Horton; Lulshead, Lulworth; Marlott, Marnhull; Marygreen, Fawley Magna; Melchester, Salisbury; Middleton Abbey, Milton Abbey; Millpond St. Jude's, Milborne St. Andrews; Narrobourne, East Coker; Nuzzlebury, Hazlebury Bryan; Overcombe, Sutton Poyntz; Port Bredy, Bridport; Po'sham, Portisham; Quartershot, Aldershot; Ringworth, Ringstead; Sandbourne, Bournemouth; Shaston, Shaftesbury; Sherton Abbas, Sherborne; Shoutsford Forum, Blandford Forum; Solentsea, Southsea; Stancy Castle, Dunster; Sickleford, Tincleton; Stoke Barehills, Basingstoke; Stourcastle, Sturminster Newton; Talbothays, Norris Mill Farm; Tolcharch, Torquay; Toneborough, Taunton; Warborne, Wimborne; Weatherbury, Puddletown; Wellbridge, Woolbridge; Weydon Priors, Weyhill; Wintoncester, Winchester; Yeusholt, Farris.

Thomas Hardy. Place-names in the Wessex novels, with their generally accepted identifications. The fictitious names are printed in *italics*.

"dramatic or personative in conception," that is, utterances of invented persons, and not necessarily his own. But it is impossible not to find in them the strong, sad sincerity, occasional bitterness, and tragic recognition of life's futility that form a kind of ground bass to the novels. Hardy's poems, it should be added, are original in manner, and but lightly touched with verbal grace and felicity; but he is a genuine poet; the lyric inspiration of his verse is unquestionable. It is not impossible that the poet may survive the story-teller.

The suspicion of exhausted power aroused by *The Well-Beloved* was removed when the most amazing of his works, *The Dynasts*, an epic-drama of the Napoleonic Wars, began to appear in 1904. Two further instalments came in 1906 and 1908. It is a pity that the work did not first appear as a completed thing, for the vastness of the design and the mastery of execution could not be appreciated in a periodical reading of parts coming at intervals of two years. The unique greatness of *The Dynasts* is generally admitted. Hardy's implied view of man as a puny, temporary creature, fretting himself briefly against a spectral background of remote and inexorable forces, here becomes explicit, for the events of the conflict are shown first in the dimensions of man's own experience, and then as the faint writhings of ant-like creatures on little plots of earth, watched from above, interpreted by all-seeing spiritual powers.

As poetry, drama, and history, *The Dynasts* is a noble contribution to world-literature, and a great life work is thus fully rounded off by a great achievement.

Thomas Hardy was given the Order of Merit in 1910. He received the degrees of LL.D. (Aberdeen), Litt.D. (Cambridge), Litt.D. (Oxford), and became an Honorary Fellow of Magdalene College, Cambridge. He was twice married, first, in 1874, to Emma Lavinia Gifford, and next, in 1914, to Florence Emily Dugdale. He died at his Dorchester home, Max Gate, Jan. 11, 1928. His body was cremated and his ashes buried in Poet's Corner, Westminster Abbey, and his heart was buried in Stinsford churchyard, not far from Dorchester.

Published Works. *Desperate Remedies*, 1871; *Under the Greenwood Tree*, 1872; *A Pair of Blue Eyes*, 1873; *Far from the Madding Crowd*, 1874; *The Hand of Ethelberta*, 1876; *The Return of the Native*, 1878; *The Trumpet-Major*, 1880; *A Laodicean*, 1881; *Two on a Tower*,

1882; The Mayor of Casterbridge, 1886; The Woodlanders, 1887; Wessex Tales, 1888; A Group of Noble Dames, 1891; Tess of the D'Urbervilles, 1891; Life's Little Ironies, 1894; Jude the Obscure, 1896; The Well-Beloved, 1897; Wessex Poems, 1898; Poems of the Past and Present, 1902; The Dynasts, I, 1904; II, 1906; III, 1908; Time's Laughing-Stocks, 1909; A Changed Man, 1913; Satires of Circumstance, 1914; Moments of Vision, 1917; Late Lyrics and Earlier, 1922; The Famous Tragedy of the Queen of Cornwall, 1923; Human Shows, 1925; Yuletide and a Younger World, 1927; Winter Words, 1928; The Play of S. George, 1928.

Lea, 1913; Thomas Hardy, H. Child, 1916; Life, Florence Hardy (widow), 1933; Hardy of Wessex, C. J. Weber, 1941; Thomas Hardy, E. Blunden, 1942; Hardy the Novelist, Lord David Cecil, 1943.

Hardy, THOMAS BUSH (1842-97). British painter. Born at Sheffield, he was an extraordinarily prolific painter of marine subjects, chiefly in water-colour. He exhibited at the Royal Academy from 1872, and became a member of the Royal Society of British Artists in 1884. He died Dec. 15, 1897.

Hardy, SIR THOMAS MASTERMAN (1769-1839). British sailor. Born at Kingston, Dorset, April 5, 1769, he served in the merchant service before he was appointed lieutenant in the navy in 1793 and was attached to Nelson's squadron off Genoa. In 1796 he served under Nelson in the Minerva.

After R. Evans

In 1798 he was present at the battle of the Nile, and was promoted to Nelson's flagship, the Vanguard.

In command of the Victory in 1805, he acted as captain of the fleet. He was by Nelson's side when the admiral was struck, was witness to his will, and attended him until his death. Made a baronet in 1806, Hardy was sent to the N. American station, where, except for three years (1809-12) at Lisbon, he remained until 1815.

In 1819 he was made commander-in-chief of the S. American station. In 1825 he was promoted

Thomas Hardy's house, Max Gate, at Dorchester, where he lived in later life, and died

rear-admiral, and in 1830 became first sea lord. Governor of Greenwich Hospital from 1834, he died Sept. 20, 1839. A memorial obelisk surmounts a hill S. of Dorchester. See Nelson; consult Nelson's Hardy: his Life, Letters and Friends, A. M. Broadley and R. G. Bartelot, 1909; Nelson's Hardy and his Wife, J. Gore, 1935.

Hardyng, JOHN (1378-1465). English chronicler. A native of Northumberland, he became a soldier. He saw a good deal of service in France, being at Agincourt, and he was sent on an errand to Rome. He passed much of his time in compiling a rhyming chronicle of England. The first edition ended in 1436; another, Yorkist in its tone, was prepared by him for Richard, duke of York, and yet another for Edward IV; it is inaccurate and dull. Hardyng lived from about 1436 at Kyme, Lincs.

Hare (*Lepus*). Name applied generally to a genus of rodents. There are several well-marked local races or varieties, the majority grey or brown. They are all remarkable for their long hind legs and ears, and their short curved tails, and are capable of great speed. The common hare (*L. europaeus*) is distinguished from the rabbit by its larger size, longer limbs and ears, and the reddish-brown hue of its fur. It also differs greatly in its habits, especially in not living in burrows.

The hare lives usually in the open, crouching in a furrow or in a hollow in the grass, which is called a form, and takes shelter in thickets only in wet weather. It sits so very deep that often it will not stir until almost trodden upon. The hare feeds mainly

on corn, vegetables, and bark of young trees.

Hare, SIR JOHN (1844-1921). British comedian and actor-manager. Born in London, May 16, 1844, and educated at Giggleswick grammar school, in 1865 he made his earlier appearances in London in the leading parts of Robertson's comedies. From 1875

John Hare
Foulsham & Banfield

he was manager of the old Court Theatre, and from 1879 to 1888 was associated with Kendal as manager of the St. James's Theatre. During 1889-95 he was lessee of the Garrick. He brought out, and played in, many of Pinero's plays from The Money Spinner, 1881, to The Gay Lord Quex, 1899. One of his most popular parts was Benjamin Goldfinch in A Pair of Spectacles, 1890. Popular also in America, he was knighted in 1907, last appeared in 1917, and died Dec. 28, 1921.

Hare, J. ROBERTSON (b. 1891). British comedian. Born in London, Dec. 17, 1891, he took his first speaking part on the West End stage in The Scarlet Band, 1913. His reputation was made as the butt to Ralph Lynn and Tom Walls in the Aldwych farces from 1924 to 1933, e.g. A Cuckoo in the Nest, but he gained fresh popularity as a star with Alfred Drayton in Aren't Men Beasts? 1936, and A Spot of Bother, 1937, when he played the timid, harassed little man with pompous utterance. Later farces included One Wild Oat, 1948. He entered films

J. Robertson Hare,
British comedian

in 1929, and appeared in screen versions of Aldwych farces.

Hare, WILLIAM. Scottish murderer, notorious for his connexion with William Burke. See Burke and Hare.

Hare and Hounds. Variation of cross-country running. It is a healthy form of winter exercise in

Hare. The common red-brown hare, *Lepus europaeus*
Chas. Reid

which generally one or two, but sometimes more, of the fleetest runners participating are selected as the hares, the remainder, unlimited in number, being the hounds. The hares set off at a fast pace laying a trail of paper-cuttings as they go, and the pack, who follow at an interval of about ten minutes, endeavour to overtake them. By adroitly doubling and laying cross-trails the hares endeavour to avoid capture. See Running.

Harebell (*Campanula rotundifolia*). Perennial herb of the family Campanulaceae. It is a

Harebell, flowers and buds

native of Europe, N. Africa, N. Asia, and N. America. Near the rootstock the leaves are heart-shaped or kidney-shaped, but up the stem become more slender and elongated. The stems are slender, angled, with blue bell-shaped flowers. See Bell-flower; Flower.

Harefield. Parish and village of Middlesex, England. Situated above the Colne, between Uxbridge and Rickmansworth, it has asbestos and lime works. The manor, in Edward the Confessor's time the property of Countess Goda, passed in 1284 to the Bache-worths, in 1315 to the Swanlands, and then to Sir John Newdegate, whose descendant sold it in 1585; it returned to the Newdegates in 1675.

Lord Keeper Egerton, who married Alice Spencer, dowager countess of Derby, acquired it in 1601, and at Harefield Place entertained Queen Elizabeth in 1602, when, says tradition, Othello was performed. Milton's Arcades was performed here for the countess (d. 1637) in 1634. The mansion, which has had two successors, was burnt in 1660. The church of S. Mary, founded 1300, is rich in monuments.

Hare-lip. Congenital deformity in which the upper lip is fissured. Usually there is a central fissure in the margin of the lip. The defect may involve the nose and the hard and soft palates; this reflects failure in fusion of the parts of the embryo. Hare-lip can be dealt with in infancy by plastic surgery.

Harem (Ar. *hareem*, sacred, set apart, i.e., forbidden). Name ap-

plied in Mahomedan countries to that part of the house in which the women are secluded. The meaning of the word has been extended to include all the women thus kept apart. Although the harem is a Mahomedan institution, the custom of secluding the female members of the household is of great antiquity in the East; excavations prove that the kings of ancient Persia confined their womenfolk to a separate part of the palace, while various passages in the O.T. provide evidence to the same effect.

According to the Koran, no woman may allow her face to be seen by any man save her father, husband, son, or close blood relations, and obedience to this precept, together with the practice of polygamy and concubinage, led to special apartments or entire wings of large houses being devoted to the women of the establishment. Conditions of life in the harem differ widely in Mahomedan countries. The law of Islam permits a man four wives (the sultan is allowed seven), and each wife may demand a separate apartment.

In India and Turkey the inmates had more liberty than elsewhere, and the rule of the eunuchs, in whose charge the harems were frequently placed, was less evil.

Hare's-foot Fern. Rootstock and wedge-shaped fronds

Idleness and scandalmongering are the worst features of the system. Western ideas have gradually had their effect on the harem, and the institution, in more westernised parts of Islam, has become greatly modified. See Polygamy.

Haren, ONNO ZWIER VAN (1711-79). Dutch poet and statesman. Brother of Willem van Haren, he was born at Leeuwarden on April 2, 1711, and occupied various offices of state in the Netherlands, being a staunch supporter of the Orange family. He wrote much verse, among his most notable volumes being *Die Koophandel*,

1769; *Agon*, a poetic tragedy, 1769; *De Geusen*, 1771; *De Vrijheid*, 1778. He translated Pope's *Essay on Man*. He died Sept. 2, 1779.

Haren, WILLEM VAN (1710-68). A Dutch poet. Born of a distinguished family at Leeuwarden, Feb. 21, 1710, Haren studied at Franeker and Groningen. In 1728 he inherited the castle and estates of Henkenshage. His best work was the epic poem *Gevalen van Friso*,

Hare's-ear, leaves and flower-head of *B. fruticosum*

1741, one of the notable long poems in the language. He died July 4, 1768.

Hares. North American Indian tribe of Athapascan stock; properly the Kawchodinné, or great-hare-people. Living N. and W. of the Great Bear Lake, Canada, they number about 600. They subsist on fish, reindeer, and the Arctic hare, which also furnishes their clothing.

Hare's-ear (*Bupleurum rotundifolium*). Annual herb, belonging to the family Umbelliferae, native of Europe and W. Asia. The stem is hollow, appearing to run through the base of the thick, oblong or roundish, glaucous leaves. The minute yellow flowers form tiny umbels in the centre of a cup of bracts whose edges are united. A shrubby perennial (*B. fruticosum*), from Spain, is grown in gardens.

Hare's-foot Fern (*Davallia canariensis*). A fern belonging to the Polypodiaceae, native of W. Europe and the Canaries. The rootstock creeps above ground, densely clothed with shaggy brown scales; the frond is wedge-shaped, cut up into much divided leaflets (pinnae).

Hare's - tail Grass (*Lagurus ovatus*). Annual grass, member

Hare's-tail grass, so called from the flower head

of the family Gramineae. It is a native of W. and S. Europe, N. Africa, and W. Asia. It has numerous stems, broad, flat leaves, and flower spikelets crowded into a white, hairy oval head, which suggested the name.

Harewood, EARL OF. British title borne since 1812 by the family of Lascelles. Edward Lascelles, the head of a well-known Yorkshire family, was created Baron Harewood in 1796, an earlier creation of this name having become extinct when its first holder died. In 1812 he was made an earl. Princess Mary, daughter of George V, became a countess of Harewood, marrying the 6th earl (*v.i.*) in 1922. The family estates are in Yorkshire (W.R.), the chief seat being Harewood House, near Leeds, and an eldest son is known as Viscount Lascelles. *Pron.* Har'-wood.

Harewood, HENRY GEORGE CHARLES LASCELLES, 6TH EARL OF (1882-1947). British peer. He was born Sept. 9, 1882, and educated at Eton and Sandhurst.

A.D.C. to the governor-general of Canada 1907-11, he served with the Grenadier Guards in the First Great War. By the death in 1916 of the last marquess of Clanricarde, brother of his grandmother, he inherited an estate of £2,500,000. On

Feb. 28, 1922, 6th Earl of Harewood as Viscount Lascelles, he married Princess Mary, daughter of George V. He succeeded his father the earl in 1929. Lord-lieut. of the W. Riding from 1927, he was personal A.D.C. to George VI, was created K.G. in 1922, and G.C.V.O. in 1934. A prominent freemason, he was grand master of the united grand lodge of England from 1943. He died May 24, 1947.

His elder son, George Henry Hubert Lascelles, born Feb. 7, 1923, and educated at Eton, succeeded as 7th earl. He was taken prisoner in 1944 by the Germans. Liberated in 1945, he was appointed A.D.C. to the earl of Athlone. He then went to King's College, Cambridge. Having developed by study during his imprisonment a natural love of music, he became music critic for The New Statesman and founder-editor of Opera. He married in 1949 Marion Stein, an Austrian-born pianist. His brother Gerald David was born Aug. 21, 1924.

Harfleur. Town and seaport of France. In the dept. of Seine Inférieure, it stands on the Lé-

Harfleur, France. The church of S. Martin, with its Gothic spire

zarde, near where it falls into the Seine, just E. of Havre. The chief building is S. Martin's church, a Gothic building known for its high steeple and fine portal. There are ruins of the old castle, but the other fortifications have disappeared. A 17th century château occupies the site of the castle.

Harfleur was a port in the Middle Ages, but later it was rendered useless by the accumulation of sand in the Lézarde. In 1887 a canal was cut connecting it again with Havre and the Seine. A new harbour, docks, and other accommodation for vessels and their cargoes were built along the canal, and the port has a trade in coal and timber. There is some fishing, while other industries are connected with oil and spirits. Harfleur was besieged and taken by Henry V of England in 1415, being then the chief port of Normandy. In 1445, inspired by John de Grouchy, the French drove out the English, who returned, but lost the place finally in 1449.

Hargeisa. Town of British Somaliland. Situated in the S.W. of the territory, 120 m. by road S.W. of Berbera, it is an important station on the trade route to Abyssinia. Rice and dates are cultivated, and there is some stock farming. The town was captured by Italian troops, Aug. 4, 1940, during the E. Africa campaign, and retaken by a British force, March 20, 1941. Pop. 20,000.

Hargood, SIR WILLIAM (1762-1839). British admiral. Born May 6, 1762, he entered the navy in 1773. As a youth he saw a good

deal of active service, especially during the war against America. In 1792 he obtained command of a ship, the *Hyaena*, but in 1793 this was taken by a French vessel, and the officers were made prisoners. They escaped and soon Hargood, acquitted by a court-martial, was commanding another ship. He did good service in suppressing the mutiny of 1796; at Trafalgar he led the *Belleisle*; and he was almost constantly at sea until 1814, being appointed to command a squadron in 1810. In 1815 he was knighted, in 1831 was made an admiral, and during 1833-36 was commander-in-chief at Plymouth. Hargood, who died Sept. 11, 1839, owed much to his friendship with William IV, under whom he served in the navy.

Hargreaves, JAMES (d. 1778). British inventor. A carpenter and weaver of Standhill, near Blackburn, in 1760 he invented an improvement of the carding machine, and about four years later built a machine which contained eight spindles in a row. This was called (after his wife) the spinning jenny, and its invention marks the beginning of an era in industrial history. Together with Kay's flying shuttle it revolutionised the cotton and woollen industries, multiplying their output many times.

Imagining that its introduction would replace human labour by

James Hargreaves. Model of his Spinning Jenny, now in the Science Museum, South Kensington

machinery and thus mean ruin for themselves, some Blackburn spinners raided Hargreaves' house and destroyed his apparatus in 1768. He thereupon moved to Nottingham, and, notwithstanding opposition his machines were soon widely used. After his death it was asserted that he had appropriated the invention of Arkwright, and the matter was the subject of a lawsuit. *See* Arkwright; Spinning.

Haricot, FRENCH BEAN, OR KIDNEY BEAN. Seed of *Phaseolus vulgaris*. The green pods, called by

the French *haricots verts*, when boiled form a wholesome and excellent vegetable. They can be preserved in salt for some time for winter use. The beans, either dried or fresh, are boiled. If dried, it is necessary to soak them in cold water for about 24 hours, or they may be placed in cold water and brought to the boil. After simmering half an hour they are again placed in cold water, and this process is repeated till the beans are tender. The older meaning of the French word *haricot* is a dish of stewed mutton, beans, and other vegetables. *Pron.* harryko. *See* Bean.

Häring, GEORG WILHELM HEINRICH (1798-1871). German novelist, who wrote also as Willibald Alexis. Born at Breslau, June 29, 1798, he saw some military service, was engaged in law, and then took up literary work. He was a prolific writer of poems, plays, and historical novels, many of the last having become classics. *Cabanis*, 1832; *Roland von Berlin*, 1840; *Die Hosen des Herrn von Bredow*, 1846-48, are the best known of his romances. He was much influenced by Sir Walter Scott, and his early novels, *Walladmor*, 1823-24, and *Schloss Avalon*, 1827, were long considered works of that author. Häring died at Arnstadt, Dec. 16, 1871.

Harington, SIR CHARLES HARRINGTON (1872-1940). A British soldier. Born at Chichester, May 31, 1872, he was educated at Cheltenham and Sandhurst, entering the army in 1892. He served in the S. African War, and during the First Great War was on Gen. Plumer's staff in Italy. Deputy chief of the imperial general staff, 1918, he commanded the army of the Black Sea, 1920. His tact helped to mitigate the humiliation of the Chanak incident. He held the Northern Command, 1923, Western Command in India, 1927-31, and was governor and c.-in-c. Gibraltar, 1933-38. Harington was knighted in 1919 and died Oct. 22, 1940.

Harington, JAMES. The author of *Oceans* is also spelt Harrington and so described in this work.

Harington, SIR JOHN (1561-1612). English writer. He was born at Kelston, Somerset, and Queen Elizabeth became his godmother, his parents having suffered imprisonment for their loyalty to her in 1554. He was educated at Eton and Cambridge and studied law at Lincoln's Inn. His wit and liveliness made him a favourite at court. In 1591 he

published a translation of Ariosto's *Orlando Furioso* with a prefatory *Apologie of Poetrie*. Later he issued satires of a somewhat free character, especially *The Metamorphosis of Ajax*, 1596, in imitation of *Rabelais*, which aroused the queen's anger. Having been forgiven, he went to Ireland in 1599 with Essex, by whom he was knighted.

When the queen was nearing her end, he wrote *A Tract on the Succession to the Crown*, in favour of James of Scotland (publ. 1880), and in 1605, with a view to becoming chancellor of Ireland, he wrote *A Short View of the State of Ireland* (publ. 1879). He died at Kelston, Nov. 20, 1612. His letters and miscellanies, brought together in *Nugae Antiquae*, 1769, throw much light on Elizabethan times.

Hariri, ABU MOHAMMED AL-QASIM AL (1054-1122). Arabic grammarian and poet. He was born and died at Basra on the Tigris. Author of several grammatical treatises, of which two are extant, his most famous work is his *Maqāmāt* (Assemblies or Lectures), a collection of 50 rhymed tales. The hero of them is Abu Seid, a disreputable but fascinating scamp. There are Eng. trans. by T. Preston, 1850, T. Chenery, 1867.

Hari Rud or Heri Rud. River of Afghanistan, the ancient Arius. Rising in the Hindu Kush, it has a length of about 700 m. It flows W. through Afghanistan, then turns N. to form for part of its course the boundary between Afghanistan and Persia. Herat is situated on the river, which finally loses itself in the Tejen swamps of the Turkmen S.S.R.

Harker, GORDON (b. 1885). British actor. Born in London, Aug. 7, 1885, he was educated at Ramsey grammar school, and made his first appearance on the London stage in 1903. Working with Oscar Asche, he became famous as an interpreter of Cockney characters. His best-known performances were in thrillers

Sir John Harington
English writer
After J. Thurston

by Edgar Wallace and others: *The Ringer* (1926), *The Calendar*, *The Case of the Frightened Lady*, *The Frog*, *Saloon Bar*; but he could be quietly effective as a suburban type, e.g. in *Acacia Avenue* (1943). Many of Harker's characterisations were transferred to the screen.

Harkness, MRS. STEPHEN (1837-1926). American philanthropist. She was the wife of an American railway owner, and made many notable charitable gifts. One was the Commonwealth Fund, est. 1918 "to do something for the welfare of mankind." For candidates of British descent a number of fellowships are tenable for two years at certain American universities. The London offices of the fund are at 35, Portman Sq., W.1. Mrs. Harkness died March 27, 1926.

Harland, HENRY (1861-1905). American novelist. Born at St. Petersburg (now Leningrad),

Henry Harland,
American novelist

March 1, 1861, he spent most of his later years in London, and died in Italy at San Remo, Dec. 20, 1905. His early books were realistic studies of American Jewish life written under the pseudonym of Sidney Luska. He became known in Great Britain as editor of *The Yellow Book* and as author of three volumes of short stories: *Grey Roses*, 1895; *Comedies and Errors*, 1898; *Mademoiselle Miss*, 1903; and of three novels: *The Cardinal's Snuff Box*, 1900; *The Lady Paramount*, 1902; *My Friend Prospero*, 1904. His later work won for him a deserved reputation as a stylist.

Harlaw. Locality in Aberdeenshire, Scotland, famous as "bloody Harlaw" for the encounter here in 1411. It stands near the river Ury, 2 m. N.W. of Inverurie. Donald, lord of the isles, collected his Highlanders to take possession of the earldom of Ross. He was met by troops under the earl of Mar, and his force was completely crushed.

Harlech. Town of Merionethshire, Wales. It lies 10 m. by rly. N. by W. of Barmouth, and is famous for its ruined castle overlooking the sea. There was a fortress here in Roman times, but the present building dates from the reign of Edward I. In 1468 the castle was taken by the Yorkists after a long siege, this incident having, it is said, given rise to the Welsh song of *The March of the*

Gordon Harker
British actor

Men of Harlech. It was dismantled after the Civil War, when it was one of the last places to hold out for Charles I. The town has declined in importance. It was made a borough by Edward I, and was long the county town. There is a golf course on the sands.

Harlech. Castle crowning a rock on the coast of Merionethshire

Harlech, WILLIAM GEORGE ARTHUR ORMSBY-GORE, 4TH BARON (b. 1885). British politician and administrator. Eldest son of the 3rd Baron Harlech, he was born April 11, 1885, and educated at Eton and New College, Oxford. Conservative member for Denbigh, 1910-18, and for Stafford, 1918-38, he was under-secretary for the colonies, 1922-24 and 1924-29; first commissioner of works, 1931-36; and secretary for the Colonies until 1938, in which year he succeeded his father in the peerage. In 1941 he was appointed

Lord Harlech, British politician

high commissioner for the U.K. in the Union of S. Africa and high commissioner for Basutoland, Bechuanaland, and Swaziland, resigning in 1944. He was made constable of Carnarvon Castle, 1946, and created K.G., 1948. He wrote *Florentine Sculptors of the 15th Century*, 1930; *Guide to the Mantegna Cartoons at Hampton Court*, 1935.

Harleian Manuscripts. Collection made by Robert Harley, 1st earl of Oxford (1661-1724), and his son Edward (1689-1741). It contained 7,639 volumes of MSS. and 14,336 rolls and other deeds. In 1753 it was purchased for £10,000 by the government and placed in the British Museum. See *British Museum*; *Manuscripts*.

Harlem District of New York City, U.S.A., and a centre of Negro urban population. It lies north of Central Park, between the East and Harlem Rivers. The name dates from the time of the Dutch settlement of New York, then New Amsterdam. Originally a village—a description of it will be found in Washington Irving's *Knickerbocker History*—it became a resi-

dential suburb, remaining in white occupation until there was a mass influx of Negroes from the S. during the First Great War. Its pop. is now about 325,000. Its supposed disorderly night life attracts seekers after sensational entertainment: an undeserved slur, for the bulk of its pop. consists of Negroes of all classes engaged in the decent occupations commonly followed here as elsewhere by white and coloured folk alike.

Harlequin (Ital. *arlecchino*). Stock character in pantomime. The origin of the name is uncertain. According to one explanation, it is a corruption of Il Lecchino, the lick of plates, Harlequin having been originally a gluttonous eating-house menial, who abandoned that profession and became first soldier, then comedian, tumbler, dancer, merry-andrew, and mountebank at one and the same time.

Disguised as the marquis of Sbruffadeli, he goes to court and makes love to the court ladies and to their waiting-maids. Columbine (*q.v.*) is sometimes his mistress, sometimes his wife. "Harlequin... with his black mask, his many-coloured lozenges, his shower of spangles, represents love, wit, mobility, audacity, all the showy and vicious qualities" (T. Gautier). Another suggested derivation is from old Fr. *hellequin*, demon; cf. A.S. *hella cynn*, people of hell. The harlequin of English pantomime is

Harlequin. Representation in ballet of the traditional pantomime character

a mischievous character who plays tricks on the clown and the pantaloone, to whom he is supposed to be invisible, and who engages in acrobatic dances with the columbine. See *Pantomime*; consult also *History of the Harlequinade*, M. Sand, 1915.

Harlequin Duck (*Histrionicus histrionicus*). A species of wild duck, plentiful in the Arctic regions and occasionally visiting Great Britain. It is a handsome bird, the male having lead-coloured plumage, with purple bars on the wings and white markings on the head, neck, and

Harlequin Duck. Specimens of male and female birds

breast. It spends the summer inland, and is found in winter about rocky coasts.

Harlequins. English Rugby football club. It was established in 1871, and soon ranked as one of the chief of those playing around London. Its first ground was at Wandsworth Common. Under A. D. Stoop, an England player 1905-12, the club was very successful, and in 1908 removed its headquarters to Twickenham.

Harlesden. District of Greater London, England. In the borough of Willesden, it lies between Kensal Green and Stonebridge Park, on the Harrow Road. It is served by electric and Bakerloo llys. and has a wharf on the Paddington branch of the Grand Union Canal. Once known as Harlesden Green, it is now built over. The church of All Souls dates from 1879.

Harley Street. London thoroughfare connecting Marylebone Road and Cavendish Square, W. Named after Edward Harley, 2nd earl of Oxford, its notable residents have included Sir Philip Francis, William Beckford, W. E. Gladstone, Sir C. Lyell, A. A. Procter, B. W. Procter, Allan Ramsay, and J. M. W. Turner. Many leading medical specialists and physicians have consulting-rooms here.

Harlingen. Town and seaport of the Netherlands. In the province of Friesland, it stands on the

coast, 16 m. W. of Leeuwarden. It has a large harbour built in 1870-77 and enlarged in the 20th century, and from it are exported butter, cheese, cattle, potatoes, and other products of Friesland, while timber, coal, cotton, and jute are imported. There is regular steamship communication with London, Amsterdam, and other ports. With the interior it is connected by railway and canal, while it has a service of tramways. The town hall and an old church are the chief buildings. It was liberated from the Germans by the 1st Canadian army, April 17, 1945. Pop. 10,443.

Harlington. Locality of Middlesex, England, belonging to the urban district of Hayes and Harlington (*q.v.*).

Harlow. A market town of Essex, England, on the river Stort, about 20 m. north of London. Excavations here in 1928 brought to light Roman remains. In 1946 Harlow was scheduled for development as a satellite town of London, to provide homes and work for 60,000 people drawn largely from Tottenham, Leyton, and Walthamstow. Approval was given by the ministry of Town and Country Planning, June, 1947.

Harlow, JEAN (1911-37). An American film actress, born March 3, 1911. From her first screen appearance in *Hell's Angels*, 1930, she was nicknamed the "platinum blonde," and then made a film with that title. Her distinctive looks, her original style, and the tantrums of the characters she played made her a success in *Dinner at Eight*, *China Seas*, *Libeled Lady*, *The Man in Possession*. While *Saratoga*, in which she had a part, was being made, she died, June 7, 1937.

Harman, SIR JOHN (d. 1673). English sailor. Of Suffolk birth, he first appears as commanding the

Sir John Harman,
English sailor
After Lely

Welcome in a battle off Portland in 1653. In 1654 he sailed to the Mediterranean with Blake, under whom he also fought at Santa Cruz. In 1665 he carried the duke of York's flag in the *Royal Charles* in the battle of June 3, when the Dutch were defeated. Knighted for his share in the victory, he was promoted rear-admiral and in 1666

was severely wounded in the battle off North Foreland. In 1667 he went to the West Indies as commander-in-chief and destroyed the French fleet at Martinique. Carrying the campaign ashore, Harman took Cayenne and Surinam. In 1672 he took part in the battle of Sole Bay. Next year he distinguished himself against de Ruyter, sitting, owing to illness, in a chair on the deck while directing operations. He died Oct. 11, 1673.

Harmattan. Dry, dust-laden wind which blows away from the Sahara, between Oct. and March. The harmattan, locally known as the Doctor, brings cool dry weather to the steaming jungles of West Africa, and is health-giving. The quantities of fine dust which it brings are a nuisance, often forming a thick haze which impedes navigation.

Harmer, JOHN REGINALD (1857-1944). British divine. Born Aug. 11, 1857, he was educated at Eton and King's College, Cambridge, being elected a fellow of his college in 1883. Ordained in 1884, he later became domestic chaplain to the bishop of Rochester. In 1895 he was made bishop of Adelaide, N.S.W., where his name is associated with the building of the cathedral. He returned to England in 1905 as the bishop of Rochester, resigning in 1930 on account of ill-health. He was a strong advocate of reform in church government, and in favour of prayer-book revision. He edited *The Apostolic Fathers* and other volumes. He died March 9, 1944.

Harmer, SIR SIDNEY FREDERIC (b. 1862). British scientist. Born at Norwich, March 9, 1862, he was educated at University College, London, of which he became fellow, and at King's College, Cambridge where he was assistant tutor 1890-1908. He was also superintendent of the university museum of zoology, Cambridge. From 1919 to 1927 he was director of the natural history departments of the British Museum and keeper of zoology. He was made F.R.S., and was joint editor of *The Cambridge Natural History*. Knighted in 1920, he received the gold medal of the Linnean society, 1934.

Sir Sidney Harmer,
British scientist
Russell

Harmine. Alkaloid which occurs in the seeds of the wild rue (*Peganum harmala*). The seeds

contain about 4 p.c. of alkaloids, one-third of which is harmine, the rest being of harmaline.

Harmodius and Aristogiton. Two devoted Athenian friends. When the sister of Harmodius had been insulted by Hipparchus, brother of the tyrant Hippias, they resolved to murder Hipparchus at the festival of the Panathenaea in 514 B.C. Hipparchus was slain, but Harmodius was killed before Hippias could be reached, and though Aristogiton escaped, he was subsequently taken prisoner. Put to torture, he died without giving any information as to the names of his accomplices. Though the motive of the assassination was to satisfy a private injury, yet the tyranny of Hippias had been so oppressive that Harmodius and Aristogiton were honoured as martyrs by later generations.

Harmonia. In Greek legend, daughter of Arès and Aphrodite, and wife of Cadmus. Among her wedding presents were a robe and necklace which brought misfortune on all those who owned them. According to one story, they were the gift of Hephaestus, who desired to avenge her mother's unfaithfulness. See *Alcmæon*; *Cadmus*.

Harmonica. Alternative name for the musical instrument described in this work under musical glasses. The word later came to be used for the special mouth organ (*q.v.*) used by the expert performer.

Harmonic Motion. A term which may be used as the general description of the periodic oscillatory type of motion which is so common in nature, and of which the motions of the tides, the vibrations of a violin string, and the beating of a pendulum are familiar examples. The ideally simple type of harmonic motion is known as "simple harmonic motion," and it has been found possible, by the method known as "harmonic analysis," to resolve every harmonic motion into a combination of different simple harmonic motions.

Simple harmonic motion is defined as follows. If we look at a particle, which is moving uniformly in a circle $Q^1 M Q N$, from a point P some distance outside it (see

Fig. 1

diagram Fig. 1), the particle will appear to be moving backwards

and forwards along the diameter M O N. While the particle actually moves with uniform speed along the semi-circle N Q¹ M, it will appear to the observer at P to move with increasing speed from N to O, and then with decreasing speed from O to M; its apparent motion is then reversed, and the particle returns to N, again reaching its highest apparent velocity when opposite the centre O. A particle which moves to and fro along a line M O N as the particle considered appears to do, is said to have a simple harmonic motion. The motion of the particle is such that its acceleration towards the fixed point O is proportional to its distance from that point. The circle Q N Q¹ M is called the circle of reference.

The bob of a pendulum which is beating small oscillations is an actual example of simple harmonic motion. The maximum distance attained from the centre of the motion is called the amplitude, while the time of a complete oscillation backwards and forwards is the "periodic time" or the period. A diagrammatic representation of simple harmonic motion can be obtained by plotting the distance from the centre against the time; the resulting

curve is shown in Fig. 2. This curve is the outline of the section of the simplest type of water wave, or tidal wave.

The method of harmonic analysis is based on a mathematical theorem known as Fourier's theorem, which demonstrates that any periodic motion, however complicated, can be built up as a combination of simple harmonic motions. Thus the actual tides at a given port can be studied as the resultant of several different factors, such as the positions of the sun and moon, and the special local conditions, each factor expressing itself as a simple harmonic rise and fall of the water-level. This method was introduced by Lord Kelvin, who invented a machine which would carry out the harmonic analysis, and could be used to predict the tides for any time ahead. See Motion.

Harmonic Progression. Three quantities *a*, *b*, *c*, are said to be in harmonic progression when *a* is

to *c* as (*a* - *b*) is to (*b* - *c*), and *b* is then said to be the harmonic mean between *a* and *c*. It is easy to prove algebraically that the reciprocals of *a*, *b*, and *c* are in arithmetic progression, and this property may be used as an alternative definition. The origin of the term is ascribed to Pythagoras.

Harmonics. In physics, waves whose frequencies are multiples of the fundamental frequency. The difference in quality between different musical instruments sounding the same fundamental note is due to the presence of harmonics to varying degrees.

Harmonic Series. Partial tones which accompany every fundamental musical sound. When

an elastic body, such as a stretched string or a column of air in a tube, is set in vibration, there are produced many notes beside the fundamental one, and musical tone depends for its quality upon the proportions in which these other sounds are combined with the fundamental. The science of harmony also derives much of its justification from this phenomenon. The series is as shown in the stave above when 8 ft. C is the fundamental; similar series are generated by all other

notes; Nos. 7, 11, 13, and 14 are not in tune with the ordinary musical scale. Stopped pipes and cylindrical tubes, such as the

clarinets, produce only the odd numbers of the series. See Acoustics; Harmony.

Harmonious Blacksmith, The Popular name for an Air with Variations in Handel's Fifth Suite (or lesson) for the harpsichord. The story of Handel's taking refuge from the rain in a smithy near Edgware is given at length in Rockstro's Life of Handel, 1883 (pp. 116-21). See Handel.

Harmonists. Communist religious society first organized in Württemberg, Germany, by John

George Rapp (1770-1847). In 1803 Rapp and his followers emigrated to America, and in Butler co., Pennsylvania, in 1805, formed the Harmony Society and the town of Harmony. In 1814 New Harmony was formed on the Wabash, Indiana; and in 1824 the Indiana property was sold to Robert Owen, and a new settlement, called Economy, started on the Ohio.

Under the management of Frederick Rapp (Reichart), adopted son of the founder, the society owned flourishing cotton, woollen, silk, and other industries, and made considerable advance also in intellectual culture, but a division occurred in 1832. The

society became involved in debt and litigation. It was dissolved in 1906. The members held all property in common, discouraged sexual intercourse, and believed the second coming of Christ to be near. See Rapp and His Associates, J. S. Duss, 1914.

Harmonium. Musical instrument with a keyboard or keyboards controlling the access of the wind from the bellows to the reeds which produce the sound. The bellows are actuated by two pedals worked by the player; in larger instruments, especially those which have a pedal keyboard, a hand lever is added, to

be worked by a second person, who keeps up the stream of air.

Harmonium reed. A. Frame. B. Vibrating tongue.

Harmonium. Sectional diagrams illustrating essential parts of the instrument. Above, arrangement of interior: a, feeders; b, reservoir; c, wind-chest; d, spiral springs; e, cranks; f, cords connecting crank-levers to foot-boards; g, wind-trunks; h, safety valve; i, peg to open valve. Top, left, bass end of sound-board: a, vibrator; b, mortice; c, sound-board; d, pallet; e, pallet-lever; f, spring.

The reeds (*q.v.*) are metal tongues of varying curve and thickness. They are free reeds passing through and through their frames as they vibrate. The reeds are fixed above the sound-board, in rows parallel with the keyboard, each reed being over a wind hole controlled by its appropriate key. The various stops govern strips of wood, padded, each of which closes or opens the complete set of holes belonging to a series of

reeds, much as in the organ, but of simpler mechanism. A smaller type of harmonium, called the folding organ, which is an octave higher, is used extensively at open-air religious meetings.

Owing to its penetrating tone, the harmonium gradually fell into disfavour in Britain, its place being taken by the American organ, which approximates more nearly to a true organ and has a mellower tone. *See* Organ.

tone more than perfect or major are augmented and one semitone less than perfect or minor are diminished.

The first recorded attempts at combining musical sounds are those described by Huchbald, a Flemish monk of the 10th century. In his work, *Enchiridion Musicae*, an example appears as shown at (A) in the two staves below, being thus translated by Burney. This crude device was known as *Organum* or *Diaphony*. Later a drone or holding note was used, over which another part moved freely, as at (B). The note marked X suggests what is now known as a passing note, or one inessential to the harmony.

This method was succeeded by *Discantus*, which at first consisted in the simultaneous performance of two different tunes. This later development led to counterpoint,

HARMONY: ITS PLACE IN MUSIC

Sir Walter Alcock, Organist, Salisbury Cathedral, 1916-47

The group of articles to which this belongs includes Music and Singing. See also Voice; biographies of the great composers, Bach, Beethoven, Brahms, Haydn, Mozart, and others, and the articles on musical terms, e.g. Chord; Counterpoint; Fugue

Harmony may be defined as "the art of combining two or more sounds of definite musical pitch, according to accepted rules." Harmony is based upon the scale, which is a succession of eight notes designated alphabetically. The scale is of Greek origin, its introduction being about the middle of the 6th century B.C. The Greeks, though aware of the possibility of combined sounds, used their scales for melodic purposes. The Greek scales or modes may, roughly, be represented by any series of eight consecutive white keys upon the pianoforte. The Ionian mode which starts on C represents our major diatonic scale, and upon this and its minor variant our modern musical system is built. The harmonic possibilities of other series may be explored, such scales being the Aeolian (beginning on A), the Locrian (on B, but rejected), the Dorian (on D), the Phrygian (on E), the Lydian (on F), and the Mixo-Lydian (on G).

Musical sounds are complex. If a low note on the pianoforte be struck and held, notes of higher pitch will be heard, though of less power, simultaneously. These higher notes are called *harmonics*. Stringed instruments are rich in harmonics, and if the G string of a violoncello be sounded with the bow the harmonics given in addition to the generator (or open string) will be as are shown below. This is known as the *harmonic series*, and though it is not possible

to hear every note, their presence can be proved. The notes marked X can be arranged thus:

which is the diatonic major scale of C, starting from the 5th note, or *dominant*; and thus accounted for on acoustical grounds.

The study of harmony presupposes an accurate knowledge of intervals, or the distance from one note to another. Intervals are reckoned (1) from the number of names of notes they contain; (2) inclusively, *i.e.* counting both limits; and (3) upwards, *i.e.* from

which may be described as "the art of combining melodies."

The early rules of harmony were strict and binding, even the 6th being considered a discord. The gradual developments of the next four centuries led to a great advance, such as may be found in the work of Dufay, a Netherlander, born about 1360. Josquin Després, born about a century later, has been acclaimed as "one of the

the lower to the higher note. Intervals are either concords or discords. Concords are either perfect (4th, 5th, and 8th) or imperfect (major and minor 3rd, and major and minor 6th). 2nds, 7ths, and all augmented or diminished intervals are discords. Intervals one semi-

greatest genuises of any period," and in his work there is abundant evidence of the great advance he achieved in developing the contrapuntal devices of his predecessors in the direction of harmony. Early in the 16th century Palestrina was born, and it is difficult to overestimate his influence on music. Of his numerous compositions, which are still in general use, the *Missa Papae Marcelli* is notable as having been written as an attempt to save the art from the degradation to which it had fallen by its

admixture with secular tunes of the worst description.

But the pioneer of modern harmonic thought was Claudio Monteverde, born at Cremona, in 1568. He struck out new paths of his own, questioning and disobeying many rules hitherto regarded as inviolable, and foreshadowing the all-important principle of the relation of chords through a common tonic, or key-note. His operas, *Arianna* and *Orfeo*, show a mastery never before attained. English composers, from Tallis and Byrd (16th century) to Henry Purcell (1658-1695), were also at work, experimenting in new directions. But Purcell, like Monteverde before him, not content with musical rule as he found it, thought for himself, and, experimenting in the most daring manner, wrote passages which command attention to-day. Purcell died when John Sebastian Bach was but ten years old. Bach summed up all that his predecessors had accomplished, and, until the 20th century brought complex departures from tradition, almost any chord in use could be found or was suggested in the works of this composer.

It is important to note how harmony has developed with the gradual improvement in musical instruments. Composition for voices is naturally restricted, as compared with what can be accomplished on instruments.

Musical has been described as the resolution of discord into concord. A chord in which any note forms a concord with every other note, is called a concord. A chord in which any discord appears is called a discord. In the following:

the first chord contains the note F, which as a 7th from G is discordant with it. It is also a discord with the B, as they form a diminished 5th, which is a discord. The first chord, then, can give no sense of finality, and needs to be followed by one in which no discordant interval appears. That condition is fulfilled in the second chord, which is called the resolution of the first, and this is a simple example of a principle of which the possibilities of extension are endless. The greatest advances have been made by those daring enough to widen the harmonic outlook of their day.

It was necessary in early times to prepare a discord, *i.e.* the discordant note in a discord must be heard in the previous chord as a concord. In the following passage:

the F is a discord in the 2nd chord, but a concord (imperfect) in the 1st, and is therefore said to be prepared. Even Monteverde dared to disregard this rule, writing in his madrigal, *Cruda Amarilli*, a seventh and a ninth without preparation. The reverse of this may be seen in Schumann's *Enttörendes Kind*, which concludes with an unresolved 7th.

Systems of harmony have been devised from time to time, but the developments of composition leave them successively out of date, while the modern scale, consisting of whole tones, opens up new fields of thought which are being widely explored. Alfred Day published a treatise in 1845, and his theories have been more or less adopted by other writers. The broad principles of these various treatises agree in the main, and such progressions as consecutive perfect 5ths, and octaves between any two parts, have been universally condemned. Day considered the bad effect of the former to be due to the fact that the two parts moved virtually in two different keys. Consecutive octaves were regarded as weakening the part-writing by making two voices sing the same notes, though one or more octaves apart. Consecutive unisons were forbidden for the same reason.

Harmony, PRE-ESTABLISHED.

In the philosophical system of Leibniz, the theory that all the monads (or primary elements), although independent of each other, were connected by a "pre-established" harmony, previously determined by God, whereby what was produced in one monad was reflected in the rest.

Harmsworth. The name of a family several members of which had notable careers in publishing and politics. Baron Harmsworth, Viscount Northcliffe, and Viscount Rothermere, three sons of Alfred Harmsworth (1837-89), barrister of the Middle Temple, are described under these names. A fourth son, Robert Leicester (1870-1937), Liberal M.P. for Caithness 1900-18, was made a baronet 1918. The name Harmsworth became

familiar to the public in the early decades of the 20th century through the titles of many serial publications originated by Northcliffe.

Harmsworth, Cecil Bisschop HARMSWORTH, 1ST BARON (1869-1948). British politician. Born Sept. 28, 1869, the third son of Alfred Harmsworth and a younger

Baron Harmsworth,
British Politician

brother of Viscounts Northcliffe and Rothermere, he was educated at Trinity College, Dublin, where he had a brilliant career, being senior moderator in literature. He joined his brothers in the firm of Harmsworth Bros. He was M.P. for Droitwich 1906-10, for S. Beds 1911-22, becoming under-secretary for home affairs 1915 and for foreign affairs 1918-22. He was raised to the peerage as Baron Harmsworth of Egham, 1939, and died Aug. 13, 1948, being succeeded by his son Cecil (b. 1903).

Harnack, Adolf von (1851-1930). German theologian, born at Dorpat (Tartu), May 7, 1851, he was the son of Theodosius Harnack, professor of theology there. He started his career in 1874 as lecturer on church history at Leipzig, becoming professor at Leipzig, 1876, at Giessen, 1879, at Marburg, 1886, at Berlin, 1888. Two years later he was made a member of the Prussian academy of science, and its historian and simultaneously during 1905-21 director of the state library. In 1914 he received a Prussian peerage.

Harnack was the greatest German Protestant theologian of his period, liberal and critical, and appreciative of the Greek influence upon Christianity. As president from its creation, 1910, of the Kaiser Wilhelm Gesellschaft der Wissenschaften, which organized and financed research in all fields of science, he exercised a dominating influence upon German intellectual life, his lectures and writings reaching circles far beyond his specific theological field. His *History of Dogma*, 1886-89, Eng. trans. 1895-1900, and subsequent *Outlines of the History of Dogma*, English trans. 1893-97; *Monasticism: Its Ideals and Its History*, Eng. trans., 1903; *History of Early Christian Literature*, 1893-1904; *Nature of Christianity*, 1900; and his autobiography, edited in 1930 by his son Axel

(murdered by the Nazis 1944), are outstanding. He was co-editor with von Gebhardt and T. Zahn of the Apostolic Fathers, 1876-78, trans. Robertson, and edited the Theologische Litteraturzeitung.

Haroeris or **AROERIS**. Name of the earliest Egyptian sun-god, Horus the Aged. He is represented as a hawk-headed man leaning on a staff, and is not to be confused with Horus the Younger, the son of Osiris and Isis. *See* Egypt.

Harold. Masculine Christian name. Of Teutonic origin, it means power for war and in England has retained or perhaps recovered the popularity it won in Anglo-Saxon times. It was introduced by the Danish invaders. In Scandinavian countries it is spelled Harald.

Harold I, CALLED **HAREFOOT** (d. 1040). King of the English, 1037-40. A son of Canute the Great by an English mother, he came into

Godwin and his sons were banished he went to Ireland, but was soon in England again, and when Godwin died in 1053 became earl of Wessex. Henceforward he was the most powerful man in the land. His wars against the Welsh gave him a reputation as a fighter, and when Edward died he was chosen and crowned king. A double danger now threatened him. His brother Tostig came from Norway with Harold Haardraade, the king of that country, to recover his lost earldom of Northumbria; and William of Normandy claimed the crown which, he alleged, Harold had promised to secure for him when shipwrecked off the coast of France. Harold crushed the Norwegians at Stamford Bridge, but was killed at Hastings, Oct. 14, 1066. *See* Hastings, Battle of.

Harold I (c. 850-c. 933). King of Norway 872-c. 930, known as

930, he divided his kingdom. After his death, c. 933, his eldest and youngest sons, Eric Blood-Axe and Haakon I, fought for the sovereignty, and the former was driven into exile.

Harold III (1015-66). King of Norway 1048-66, known as The Severe in Council (Haardraade). He was a son of King Sigurd and half-brother of King Olaf (S. Olaf). When the latter was killed at the battle of Stiklestad, 1030, Harold fled to Russia, where he fell in love with a princess at Novgorod. He then went on to Constantinople, where he became leader of the imperial Varangian guard. He left Constantinople in 1044 for Russia, married the daughter of the prince of Novgorod, and in 1046 returned to Norway, where he shared the kingdom with his nephew, Magnus, and later, 1048, succeeded him as sole ruler. In 1066 he invaded England in support of Tostig, the brother of the English Harold, and was killed at the battle of Stamford Bridge (*q.v.*) in Sept., 1066.

Haroun Al Raschid (763-809). Caliph of Bagdad. Haroun was born at Rai, March 29, 763, and was sent by his father, Mohammed Mahdi, to take part in the invasion of the Eastern Empire in 781; he reached the Bosphorus and imposed tribute on the Empress Irene, 782. He succeeded his brother Musa, as fifth caliph of the Abasside line, in 786, and opened a reign proverbial for its magnificence and prosperity. Haroun made his court a great centre of art and literature. He waged successful wars against the Greek Empire, 797, and suppressed various provincial revolts.

At first he ruled with the powerful aid of the Barmecides, but sudden jealousy made him order their wholesale murder in 803. In the same year he marched against the emperor Nicephorus, invading Phrygia and destroying Heraclea, and exacted heavy tribute from him. On his way to quell a rising in the province of Khorasan, Haroun died at Tus in March, 809. His name is still remembered, if only as a central figure in The Arabian Nights. He was a man of considerable talents and culture, but lacking in strength of character. *See* Arabian Nights; *consult* also Haroun al-rashid, H. St. J. B. Philby, 1933.

Harp. Musical instrument with strings plucked by the fingers. Used in one form or another by all races and from remote ages, its earliest forms seem to have been suggested by the hunting bow, whose tightly stretched string will emit a note of fair musical value;

Harold II. The Battle of Hastings and the death of Harold, struck in the forehead by an arrow, Oct., 1066

From a print after P. J. de Loutherbourg

prominence on his father's death in 1035. England had been left by Canute to his son Hardicanute, who was already king of Denmark, but Harold, more of an Englishman than his half-brother, also claimed it. Both had stout supporters, and the Witan divided England between them, Harold becoming king of the district N. of the Thames. Shortly afterwards Earl Godwin and his party tired of serving the still absent Hardicanute, and in 1037 Harold became king of all England. His reign was disturbed by invaders from Scotland and Wales. He died at Oxford, March 17, 1040.

Harold II (c. 1026-66). King of the English. A son of Earl Godwin, he became earl of East Anglia in the time of his brother-in-law, Edward the Confessor. When

Fair-Hair (Haarfagr). He was a son of Halfdan the Black, one of the petty rulers among whom Norway was then divided. According to the sagas he fell in love with a beautiful girl, Gyda, who refused to marry him while any other king ruled in all Norway; Harold then vowed that he would not comb or cut his hair until he had obtained the sole kingship. After overcoming several of his neighbours, in a sea-fight at Hafursford in 872 he overcame the confederated rulers and united the kingdom. His defeated rivals migrated to the Faroes, Hebrides, Orkneys, Shetland, and Iceland, all of which, except Iceland, he subsequently subdued. He proved a capable ruler of his people, but was troubled by the quarrels of his many sons, among whom, about

when a portion of the bow is reinforced by a hollow resonator the tone is vastly improved. This kind appears to have been carried on the shoulder. It is a short step from this to an instrument of the Old Egyptian type.

Bow-shaped and two-sided harps were limited in power by the ability of their material to stand the strain of the strings. It was

Harp. 1. Contemporary form for orchestra. 2. As depicted in an ancient Egyptian tomb-painting

therefore an important advance when a third side was added, as in the next primitive form.

No reasonable limit was now set to the number or the tension of the strings, allowing much greater variety and power, and it only required the accumulated experience of a few centuries of makers and players to raise this type to the finished modern form.

This kind of harp is essentially a diatonic instrument, set in one key, and possessing only seven strings in each octave, but, in the eighteenth century, mechanism was added to shorten some of the strings at will, and thus allow changes of key. The final improvement, after many partial attempts, was made about 1810 by Sebastian Erard, who built a double-action harp of six and a half octaves in the key of C flat, with seven pedals to be depressed halfway or entirely, raising each string respectively a semitone or a tone. Rods from the pedals pass

up inside the sound box or resonator, the back of the harp, and actuate little cranks which act on the strings as described.

At the close of the 19th century Messrs. Pleyel brought out a new form of chromatic harp, requiring no pedals. It has a string for each semitone in two sets representing respectively the black and the white keys of the pianoforte. These sets cross each other slightly instead of being in the same plane, so that the player commands either the diatonic or the chromatic notes by plucking the strings at different levels, while a rapid chromatic scale is obtainable by running a finger across the centre where the sets pass each other. Harp music is written on two staves, like pianoforte music, and at actual pitch.

Harpagus. Median general. Ordered by Astyages, king of the Medes, to put to death the infant Cyrus, he handed him over to a shepherd, who spared his life. When Astyages discovered this, he killed Harpagus's son and served him up before his father at a meal. When Cyrus grew up, Harpagus encouraged him to revolt against Astyages, who was defeated and dethroned. Harpagus became one of Cyrus's trusted generals, and reduced the Greek cities of Asia Minor to subjection. See Cyrus the Elder.

Harpalus. Treasurer of Alexander the Great. Having betrayed his trust, he absconded from Babylon to Athens with a large sum of money, with which he attempted to bribe public men to support him against Alexander and Antipater, his regent in Europe. Demosthenes was one of those accused of having accepted bribes. Harpalus failed, however, in his object, and to avoid being handed over to Antipater he fled to Crete, where he was murdered.

Harpalyce. In Greek mythology, daughter of Harpalycus, a Thracian king. Famous for her swiftness of foot and skill in manly exercises, after her father's death she lived in the forests, supporting herself by robbery and plunder. She was at last caught in a net by some shepherds and put to death. *Prom.* Harpali-see.

Harpenden. Urban district of Hertfordshire, England. It is 25 m. N.W. of London on the

rly. from St. Pancras station. At Rothamsted, near by, in 1843, Sir J. Bennet Lawes (*q.v.*) started an agricultural experimental station, and his name is commemorated in the Lawes Testimonial Laboratory. At Harpenden also are the S. George's co-educational school, and the National Children's Home for Waifs and Strays. The 12th century church was, with the exception of the tower, rebuilt in 1862, and contains some interesting glass and brasses. A Celtic cross on Church Green was unveiled in 1920 in memory of the 164 Harpenden men who fell in the First Great War.

The urban dist. council maintains a public hall (completed 1938), open spaces, a cemetery, allotments, etc. The public library is maintained by the Hertfordshire county council. Rothamsted Park and the spacious Harpenden Common, widening out from the south end of the town, is in the ownership of the council. Pop. (est. 1946) 14,000.

Harper and Brothers. American firm of publishers with a branch in London. In 1812 James Harper (1795-1869), son of Joseph Harper, a farmer of Newton, Long Island, with his brother John (1797-1875), started a printing business in New York, producing books for booksellers and publishers. Later they began publishing on their own account, and, joined by two younger brothers, Joseph Wesley (1801-70) and Fletcher (1806-77), founded in 1833 the publishing firm of Harper and Brothers. They started Harper's Family Library, a kind of serial publication, which led, in 1850, to the founding of Harper's Magazine (*v.i.*). This was followed in 1857 by Harper's Weekly, in 1867 by Harper's Bazaar, and in 1881 by Harper's Young People, later Harper's Round Table. In 1899 the firm was formed into a company,

James Harper, American publisher

John Harper, American publisher

of which George Harvey was president. James Harper was mayor of New York City, 1844-46. Consult The House of Harper, J. Henry Harper, 1912.

Harper's Ferry. Town of W. Virginia, U.S.A., in Jefferson co. It stands at the junction of the Shenandoah and Potomac rivers, 55 m. N.W. of Washington, and is served by the Baltimore and Ohio rly., which crosses the Potomac here, and by the Winchester and Potomac rly. A river gorge through the Blue Ridge Mts., and the surrounding heights—the Maryland, the Virginia or Loudon, and the Bolivar Heights—contribute to the region's outstanding scenic beauty. Storer College and a normal school for Negroes are here. Pop. 766.

Settled in 1747, Harper's Ferry, largely because of its water-power, was chosen by George Washington as the site of an arsenal and armoury, established 1796. In 1859, the abolitionist, John Brown (*q.v.*), and a few followers raided the arsenal in an abortive attempt to free and arm the slaves, the already high feeling between North and South being further inflamed when he and six comrades were hanged. A strategic spot in the Civil War, Harper's Ferry changed hands several times. It

was the scene of a major Union disaster in 1862, when the surrounded Federal force surrendered to Stonewall Jackson, the Confederates capturing 12,500 prisoners and 13,000 small arms and other weapons.

Harper's Magazine. Monthly magazine founded in New York, June, 1850, published by Harper and Brothers. In 1880 it began to be issued simultaneously in London and New York. Devoted to travel, science, literature, and art, it maintained a very high standard, Dickens, Thackeray, Tennyson, and Mark Twain being among its early contributors. Until 1925 Harper's was illustrated, artists whose work it used including George Du Maurier, Joseph Pennell, and John W. Alexander; but in that year, after an exhaustive questionnaire among its subscribers, the style of the magazine was radically changed, advanced and informative reading matter being substituted for the illustrated fiction which had previously been its main feature. Contributors of later years have included Aldous and Julian Huxley,

Bertrand Russell, J. B. S. Haldane, Walter Lippmann, Gilbert Murray, and Christopher Morley.

Harpignies, HENRI JOSEPH (1819–1916). French landscape painter. Born at Valenciennes, he studied in Paris under Achard, and in Italy. In 1866 his *Evening in the Roman Campagna* was bought for the Luxembourg, and in 1884 his *Moonrise* found its way to the same gallery. He died, painting almost to the last, on Aug. 25, 1916.

Harpocrates. The name of an Egyptian deity, identified with Horus. Worshipped among the Greeks and Romans, and represented with a finger to his lip, he was the god of silence. See Horus.

Harpoon (Fr. *harpon*, grappling iron). Weapon used for the capture of whales, etc. The harpoon is fired from a gun mounted in the bows of a small, fast steamer, and

has a barbed tip containing a bomb with a time fuse. The gun has a bore of $3\frac{1}{2}$ ins., and is usually breech-loading. The steel weapon is 6 ft. in length and when fired from the gun by a charge of gunpowder or ballistite, enters the

whale's body to a considerable depth. The four 12-in. barbs folded flat in the head open out as the attached rope is pulled taut; and the bomb explodes three seconds after leaving the gun, killing the whale. Harpoons are also used for catching sharks and other large fish; and experiments have been made with an electric harpoon, which electrocutes the quarry.

Harpsichord (Ital. *clavicembalo*, abbrev. *cembalo*; Fr. *clavecin*; Ger. *clavizimbel*). The most important of the stringed instruments with keyboards before the invention of the pianoforte. It answered

all purposes in solo and chamber music which the pianoforte now serves, and also occupied a unique position in the orchestras of the 17th and 18th centuries, being used to fill in chords according to the

Harpsichord. Mechanism of jack

- A. Jack.
- B. Plectrum of quill or leather.
- C. String.
- D. Damper to stop sound when jack returns to place.
- E. Dotted lines showing plectrum falling out of the way when descending.
- F. Spring, of bristle, to restore the plectrum carrier to the vertical position

figured bass, and to accompany entirely the *recitativo secco*. The essential difference between the harpsichord and the pianoforte is that in the latter the strings are struck by hammers, whereas in the former they are plucked by quills or rather plectra inserted in "jacks" or uprights, which are caused to pass the strings when the keys are depressed. The harpsichord proper is usually shaped like the modern grand piano, but spinets and virginals, and some other forms, are sometimes given the name. No expression, in the full sense of the word, is possible on the harpsichord, but in the 18th century instruments had elaborate contrivances for securing variety, such as an extra keyboard, stops controlling plectra of various degrees of hardness, and a swell (*q.v.*).

Harpy (Gr. *harpypia*, snatcher). In Greek mythology, monstrous bird with a woman's head and long claws. Harpies were sent by the gods to torment the blind Phineus by snatching his food whenever he raised it to his lips. The expedition of the Argonauts (*q.v.*) passed the Ionian Islands where they dwelt, and Calais and Zetes, the sons of Boreas, delivered Phineus from his tormentors. Virgil parallels this episode, placing his Harpies on the islands of the Strophades. The Harpies are personifications of the storm-winds, which swept away mortals at the bidding of the gods, bearing them to the lower world.

Harpoon. Gun with bomb-nosed harpoon. Above, harpoon with barbs extended

Harpsichord. English 17th cent. model with double keyboard, 5-octave range, exhibited at the Victoria and Albert Museum, South Kensington. The diagram shows the working of the jack and the string

Harpy Eagle (*Harpyia harpyia*). Large and powerful bird of prey, found in Central and S.

America. Its general colour is white, with a black back and tail and grey wings; on the head is a crest of feathers which when erected gives the bird a somewhat owl-like aspect. It is not a true eagle, but is placed between the eagle and the buzzard. It is slightly over a yard in length,

Harpy Eagle, a South American bird of prey
W. S. Bertridge, F.Z.S.

and has a strongly curved beak and powerful claws. It is found in the forests, usually near a river or stream, and spends much of its time watching on the topmost boughs of some dead tree. It will kill animals much larger than itself, young deer, peccaries, monkeys, badgers, and sloths being among its favourite prey. It nests either in a tall tree or on the ledge of an inaccessible cliff.

Harraden, BEATRICE (1864-1936). English novelist. Born at Hampstead, London, Jan. 24, 1864, she was educated at Cheltenham Ladies' College, Dresden, and London university. She made her reputation with *Ships that Pass in the Night*, 1893, a story depending for its interest almost entirely upon its fine character studies. Other novels include *The Fowler*, 1899; *Katherine Frensham*, 1903; *The Scholar's Daughter*, 1906; *The Guiding Thread*, 1916; *Rachel*, 1926. In *Varying Moods*, 1894, is a volume of short stories. She died May 5, 1936.

Harrap, GEORGE GODFREY (1867-1938). British publisher. He was born Jan. 18, 1867, and educated at West Ham modern school. Harrap left school at the age of 14 and obtained a minor post with the publishing house of Isbister & Co., Ltd. He became interested in the educational publications of D. C. Heath & Co., of Boston, U.S.A., and was instrumental in making them known to British teachers. He started publishing in 1901 and founded the firm of George G. Harrap & Co., Ltd., concentrating upon the production of modern language and other text-books. He pro-

duced Harrap's Standard French Dictionary, the first volume appearing in 1934, fifteen years after its inception. Harrap died on Oct. 29, 1938.

Harrier. Breed of hound used for hunting the hare by scent. In appearance it closely resembles the foxhound, but in size is intermediate between that hound and the beagle, standing about 20 ins. high at the shoulder. Probably it was derived from a strain of small foxhound, and in England most of the harriers are actually crossed with that breed. In Wales the pure-bred strain is still found.

The harrier can be readily distinguished from a small foxhound by its longer and more pointed ears, and it should have a narrower and longer head. Many packs are kept, especially in Ireland, where the sport of hare-hunting is very popular. The hunt is a somewhat

Harrier. A winning hound in a harrier and beagle show

slow one, but harriers will follow a cold scent that would completely baffle the ordinary foxhound. See Dog; Foxhound; Cross-Country Running.

Harrier (*Circus*). A genus of hawks, including about 23 species. They are slender in form, with unusually long legs and wings, and comparatively short and small beaks. They do not frequent trees, but are usually found in marshy districts, where they prey upon fish and frogs, in addition to small birds and mammals. Four species occur in Great Britain. The hen harrier (*C. cyaneus*), so called from its habit of preying upon poultry, has now become rare. Montagu's harrier (*C. pygargus*) was formerly common, but is now seldom seen; the marsh harrier (*C. aeruginosus*), the largest of the three, has been

Harrier. Specimen of *Circus cyaneus*

almost exterminated in England; the pallid harrier (*C. macrourus*) is extremely rare.

Harriman, FLORENCE JAFFRAY. American diplomat. The wife of J. Borden Harriman, she was appointed U.S. minister to Norway, 1937. In April 1940 a message from her gave the world the first news of the German invasion of Norway. She left Oslo in 1941, publishing *Mission to the North* in the same year.

Harriman, WILLIAM AVERELL (b. 1891). An American diplomat. Harriman was born on Nov. 15, 1891, and was educated at Groton and Yale. After he had graduated, 1913, he took part in his father's railway enterprises. He entered government service during president F. D. Roosevelt's first term, becoming in 1941 director of the raw materials department of the office of production management. In that year Harriman went to London and Moscow as the president's personal representative to expedite U.S. Lease-Lend (*q.v.*) aid. He was ambassador to Russia, Oct., 1943-Feb., 1946. Ambassador to Great Britain, March-Sept., 1946, he then became secretary of commerce. In 1948 he was appointed ambassador at large for E.R.P.

Harringay. Residential dist. in the borough of Hornsey, N. London. Built in the late 19th century over the once open country called Green Lanes, a name now given to a main thoroughfare, it lies between Finsbury Park and Hornsey. Harringay is a variant of Haringea, Haringhea, or Haringey, by one or the other of which names Hornsey (*q.v.*) was known between the 13th and 16th centuries. There are a greyhound racing track and a sports arena where orchestral concerts were inaugurated in 1947.

Harrington, OR HARINGTON, JAMES (1611-77). English political philosopher. He was born at Upton, Northants, Jan. 7, 1611. Educated at Trinity College, Oxford, he travelled widely in Europe and at Venice imbibed an enthusiasm for republican government. This did not preclude affection for Charles I, under whom he became a gentleman of the bedchamber, accepting a post with the king in captivity in 1647.

Averell Harriman, U.S. diplomatist

But he was thrown into the Tower at the Restoration, but was released, and died Sept. 11, 1677, his last years having been clouded by mental failure.

Harrington is known for one book, *Oceana*. Published in 1656 and dedicated to Cromwell, it is a treatise on government, England being *Oceana*. It shows its author to be the most original political thinker of his time. He advocated the replacement of large estates by small holdings; compulsory education; election by ballot of the executive; and an executive drawn from all classes in rotation. *Oceana* was admired by Hume and Coleridge and studied by the makers of the American constitution and the French Revolution.

Harris. Name given to the southern portion of the island of Lewis, one of the Outer Hebrides. It is about 20 m. long and of varying breadth, and is a mountainous and barren district. It forms part of the county of Inverness. The parish includes a number of adjacent islands, St. Kilda among them. Sheep are reared and wool is woven into tweed (see *Harris Tweed*). The Sound of Harris, which divides it from North Uist on the S., is the only channel of the Outer

ster and Woolwich. He entered the army, 1760, and was severely wounded at Bunker Hill in 1775. Proceeding to India as aide-de-camp to General Medows, he served in the first campaign against Tipoo Sahib in 1790-91, and was afterwards given a high appointment in Madras. In the second campaign he was in command of the operations which, in 1799, ended with the storming of Seringapatam and the annexation of Mysore. In 1815 he was created Baron Harris of Mysore and Seringapatam. He died at Belmont, Kent, in May, 1829.

Harris, GEORGE ROBERT CANING HARRIS, 4TH BARON (1851-1932). A British politician and

cricketer. Born Feb. 3, 1851, he was educated at Eton and at Christ Church, Oxford. In 1872 he succeeded to the title. As a cricketer he was in the Eton eleven for three years (1868-70), while he played for Oxford against Cambridge in 1871, 1872, and 1874. He joined the Kent county team, and in 1875 became its captain, retaining that post until 1889. Harris played for England against Australia in a Test match in 1880, and captained a team that went to Australia. As a Conservative politician, he was under-secretary for India, 1885-86, and for war, 1886-89. During 1890-95 he was

Lord Harris,
Kent and England
cricketer

governor of Bombay. Later he was associated with industrial undertakings in S. Africa. He published *A Few Short Runs*, 1921. After his death, March 24, 1932, a garden was laid out at Lord's as a memorial to him.

Harris, SIR ARTHUR TRAVERS (b. 1892). British air officer. Born at Cheltenham, April 13, 1892, he began his military career in 1914 with the 1st Rhodesian Regiment, transferring to the R.F.C. a year later. He joined the R.A.F. 1919, becoming air commodore, 1937, air vice-marshal, 1939, air marshal, 1941, and air chief marshal, 1943. Deputy chief of air staff, 1940-41,

he was A.O.C.-in-C., Bomber Command, 1942-45. A firm believer in mass raids, "Bomber" Harris

Sir Arthur Harris,
British air officer

directed the British bombing attacks of the Second Great War on Germany's industrial centres which were aimed at crippling her war production. Sir Arthur was made G.C.B. and Marshal of the R.A.F. 1945, retiring that year. He pubd. *Bomber Offensive*, 1947.

Harris, SIR AUGUSTUS HENRY GLOSSOP (1852-96). British actor and theatrical manager. Born in Paris, he made his first appearance at the Theatre Royal, Manchester, in 1873. In 1879 he became lessee of Drury Lane, and with Meritt and Pettitt wrote *The World* (produced July 31, 1880), the first of the spectacular melodramas which helped to revive the prosperity of the house. He also staged pantomimes at

Augustus Harris.

Drury Lane on a scale of great splendour. He was sheriff of London 1890-91, being knighted 1891. Died at Folkestone, June 22, 1896.

Harris, FRANK (1856-1931). British journalist and author. Born Feb. 14, 1856, of Welsh parentage, in Galway, he emigrated to Canada when 15. Returning to Europe, he studied in Paris, Heidelberg, Göttingen, Berlin, and Athens. In 1881 he began to write for *The Spectator*, and in 1882 became editor of *The Evening News*, which he left to edit *The Fortnightly Review*, 1888-93.

Proprietor and editor of *The Saturday Review*, 1894-98, he afterwards edited *Vanity Fair*, and was founder and editor of *The Candid Friend*. During the First Great War he went to the U.S.A. and, adopting violently pro-German views, never returned to England. He was closely associated with Oscar Wilde at the climax of the latter's career in the '90s; his *Life of Shaw*, with whom also he had had some acquaintance, excited controversy. Shakespearian critic,

Harris, Outer Hebrides. Tarbert, the principal town of this part of the island of Lewis, from the east

Hebrides for large vessels. It is 10 m. long and about 7 m. wide. Tarbert is the chief place. In 1920 much of Harris, about 60,000 acres, was purchased by Lord Leverhulme. Pop. 5,500.

Harris, GEORGE HARRIS, 1ST BARON (1746-1829). British soldier. Born at Brasted, Kent, March 18, 1746, the son of a clergyman, he was educated at Westmin-

1st Baron Harris,
British soldier
after A. W. Davis

playwright, and author of some notably good short stories, his works include *Elder Conklin*, 1894; *Montes the Matador*, 1900; *The Bomb*, 1908; *The Man Shakespeare*, 1909; *The Women of Shakespeare*, 1911; *Oscar Wilde, his Life and Confessions*, 1920; *My Life*, 1926; *Life of Bernard Shaw*, 1931; play, *Mr. and Mrs. Daventry*, 1900. **Frank Harris**: *His Life and Adventures*, an abridged version of his 4-vol. privately printed autobiography, was published 1947 with an introduction by Grant Richards. Harris died Aug. 26, 1931.

Harris, HENRY WILSON (b. 1883). British author and journalist. He was born Sept. 21, 1883, at Plymouth, and educated there and at S. John's College, Cambridge. With the *Daily News* from 1908, he became successively news editor, leader writer, and diplomatic correspondent. As editor of the *Spectator* from 1932 he was known for incisive and witty commentary on most topics. Specialising in international problems, the League of Nations, arbitration, and disarmament, he wrote such books as *President Wilson, His Problems and Policy*, 1917; *The League of Nations*, 1929; *The Future of Europe*, 1932; *The Daily Press*, 1943; *Problems of the Peace*, 1944. He also wrote lives of Caroline Fox, 1944, and J. A. Spender, 1945. He represented Cambridge university as an Independent M.P., 1945-50.

Harris, HOWEL (1714-73). The founder of Welsh Calvinistic Methodism. Born at Trevecca, Brecknockshire, Jan. 23, 1714, he was for a time a teacher in a church school but devoted the greater part of his life to itinerant preaching. He founded a number of societies and chapels, formed a community at Trevecca in 1752, served in the Brecknockshire militia, 1759, was a friend of the Wesleys, and wrote an *Autobiography*, pub. 1791. He died July 21, 1773. *Consult* *Life*, T. Jackson, 1837.

Harris, JAMES RENDEL (1854-1941). British scholar. Born at Plymouth, he was educated at the grammar school there and at Clare College, Cambridge, of which he became a fellow and librarian. He was professor at Johns Hopkins university, Baltimore, 1882-85; at Haverford College, Pennsylvania, 1886-92; lecturer in palaeography at Cambridge, 1893-1903; professor of theology, Leyden, 1903-04; director of studies, Friends' Settlement, Woodbrooke,

near Birmingham, 1903-18; and Haskell lecturer at Oberlin College, 1910. President of the Free Church Council, 1907-08, he became

J. Rendel Harris,
British scholar
Russell

curator of MSS. at the John Rylands Library, Manchester, 1918. He travelled widely in the East, where he discovered important MSS. bearing on the Bible. His numerous works include *The Teaching of the Apostles* and the *Sibylline Books*, 1885; *Some Syrian and Palestinian Inscriptions*, 1891; *The Dioscuri in Christian Legend*, 1903; *Sidelights on New Testament Research*, 1909; *Origin of the Cult of Dionysos*, 1915; *Origin of the Cult of Artemis*, 1916; *Ascent of Olympus*, 1917; *Origin of the Doctrine of the Trinity*, 1919; *Jesus and Osiris*, 1927; *Builders of Stonehenge*, 1933. He died March 1, 1941.

Harris, JOEL CHANDLER (1848-1908). American writer popularly known as Uncle Remus. Born at Eatonton, Georgia, Dec. 8, 1848, he worked in a printing office, studied law, and practised at Forsyth. In 1876 he joined the staff of The

Joel Chandler Harris

Atlanta Constitution, of which he was editor, 1890-1901, and to which he contributed the first of his Uncle Remus stories concerning the adventures of Brer Rabbit and Brer Fox. These stories, derived from his knowledge of Negro folklore, were first collected in 1880 as *Uncle Remus: His Songs and His Sayings*. This volume had a number of successors, including *The Tar-Baby and Other Rhymes*, 1904. When he issued his first book he knew little or nothing of folklore in general, and was astonished when he began to receive letters from learned bodies asking him to explain the connexion between his stories and those of a similar kind told in other parts of the world.

He was the author of a *Life of H. W. Grady* (his predecessor as editor of The Atlanta Constitution), 1890, and of *Georgia from*

the Invasion of De Soto to Recent Times, 1899. He died at Atlanta, Georgia, July 3, 1908. *See* Brer Rabbit; *consult also* *Life and Letters of Joel Chandler Harris*, by his daughter-in-law, Julia Collier Harris, 1918.

Harris, THOMAS LAKE (1823-1906). Anglo-American mystic. Born at Fenny Stratford, Bucks, England, May 15, 1823, he went with his parents in 1828 to the U.S.A., became a universalist, a Swedenborgian, and then a spiritualist. In 1861 he founded the Brotherhood of the New Life. Laurence Oliphant (q.v.), who has described him in his *Masollam*, 1886, was for a time one of his converts. He visited England 1859-61 and 1865-66, claimed that his poems were revealed to him in trances, and was the author of *Truth and Light in Jesus*, 1860; *The Millennium Age*, 1861; *The Great Republic, a Poem of the Sun*, 1867. He died at Santa Rosa, California, March 23, 1906. *Consult* *Life*, A. A. Cuthbert, 1908.

Harrisburg. City of Pennsylvania, U.S.A., the capital of the state and the co. seat of Dauphin co. It stands on the Susquehanna river, 105 m. W.N.W. of Philadelphia, at the head of the Cumberland and Lebanon valleys. It is served by the Pennsylvania and other rlys., and is an airport.

It has two road and two railway bridges. Buildings include the capitol, the education building, housing the Pennsylvania state library and the state archives, the Pennsylvania state museum, the Dauphin co. historical society library, the Harrisburg academy (for boys), the state farm products show building, including eleven acres under one roof, where the annual agricultural show is held, and the adjoining farm products show arena, which seats 12,000.

The city has a park system of approximately 1,100 acres, recreational facilities including a municipal beach on an island in the river, a five-mile riverside park, and Front Street, a riverside residential street in which the governor's mansion stands, and the Soldiers' and Sailors' Memorial Bridge, a viaduct crossing the Pennsylvania rly. tracks and leading to the capitol site, and commemorating those who fell in the 1914-18 war.

Iron and coal abound, the latter being salvaged from the river bed for the use of local industries which produce iron and steel, boilers and engines, bookbinding machinery, chemicals, cigars and tobacco,

knitted goods, textiles, shoes, ice cream, candy, and processed foods. There are freight classification yards, meat-packing plants, and printing establishments. The surrounding area engages in farming, dairying, and livestock and poultry raising.

Settled in 1715, Harrisburg became the state capital in 1812 and a city in 1860. Pop. 83,893.

Harrismith. A town of the Orange Free State, S. Africa. It is 60 m. from Ladysmith and 170 m. from Durban, and stands on the river Wilge among the mountains at a height of over 5,000 ft. The chief building is the block containing town hall, public library, and market, opened in 1908. There are churches and a public park. Harrismith is a trading centre for the district and is visited as a health resort. During the South African War it was occupied by the British, Aug. 4, 1900. Pop. 10,383.

Harrison. British steamship line. It was founded in 1830, as the Charente Steamship Co.,

being known later by the name of its managers, T. & J. Harrison. Its chief services are between Liverpool and ports in the Gulf of Mexico, the

W. Indies, and Brazil; also to Calcutta, S. Africa, and E. Africa. From Calcutta its steamers go to the River Plate and S. Brazil. The London offices are 4, Fenchurch Ave., E.C.3.

Harrison, BENJAMIN (1833-1901). American president. Born at North Bend, Ohio, Aug. 20, 1833, grandson of President William Henry Harrison, after practising law he joined the Federal army and greatly distinguished himself in the Civil War. Senator 1881-

Benjamin Harrison,
American president

87, he was elected president on the Republican ticket in 1888, his opponent being Grover Cleveland. During his term of office the treaty for the annexation of Hawaii was negotiated, afterwards withdrawn by Cleveland when president; the first Pan-American Congress was held, the McKinley tariff introduced, and the Bering Sea seal

fisheries controversy with Great Britain settled by arbitration.

Defeated in his candidature for re-election, he abandoned politics for the law. In 1899 he was counsel for Venezuela in the boundary arbitration commission set up to examine the claims of Great Britain, and took part in the Peace Conference at The Hague, May 18, 1899. Harrison died at Indianapolis, March 13, 1901. He was the author of *This Country of Ours*, 1897, an account of the administrative organization of the U.S.A. *Consult Life*, Lew Wallace, 1888; *The Presidents of the United States*, ed. J. G. Wilson, 1894.

Harrison, FREDERIC (1831-1923). A British author and publicist. Born Oct. 18, 1831, he

Frederic Harrison,
British writer
Russell

was educated at King's College, London, and Wadham, Oxford, where he became a fellow. Called to the bar 1858, he was a member of the royal commission on trade unions, 1867-69, and from 1877 to 1879 professor of jurisprudence at the Inns of Court. He was a founder of English Positivism, president of the English Positivist committee, 1880-1905, and wrote many books on the subject. His great literary output included, among historical works, *The Meaning of History*, 1862, enlarged ed. 1894; *Lives of Oliver Cromwell*, 1888, and *William the Silent*, 1897; *Byzantine History in the Early Middle Ages*, 1900; and, on literary subjects, *The Choice of Books*, 1886; *Victorian Literature*, 1895; a life of Ruskin, 1902. His *Autobiographic Memoirs* appeared in 1911. Died Jan. 14, 1923.

Harrison, GEORGE BAGSHAW (b. 1894). British scholar. Born July 14, 1894, he was educated at Brighton College and Queens' College, Cambridge. He was an army officer in India and Mesopotamia, 1914-19, afterwards becoming a schoolmaster. He was lecturer in English literature, King's College, London, 1927-9; professor of English at the university of Chicago, 1929; reader in English literature, university of London, 1929-43; and became professor of English at Queen's University, Kingston, Ontario, 1943. An outstanding student of the Elizabethans, he published editions of and works on Shake-

spere, an edition of the *Letters of Queen Elizabeth*, and *Elizabeth and Jacobean Journals* covering 1591-1606.

Harrison, JOHN (1579-1656). English philanthropist. Born in Leeds, he was left a fortune by his father which he applied to the purchase of land in Leeds. He rebuilt the free grammar school; put up a cross in the market-place, and built S. John's church, erecting an almshouse near it which he endowed. He was one of eight Leeds citizens who purchased the manor from the crown. A staunch royalist, his estates were sequestrated at the close of the Civil War. There is a statue of him in the City Square, Leeds. He died Oct. 29, 1656.

Harrison, JOHN (1693-1776). An English clockmaker. Born at Foulby, Yorkshire, the son of a carpenter, he taught himself the elements of mechanics, and in 1715 made an 8-day clock with wooden wheels, which is still working in the patent museum at S. Kensington. In 1726 he introduced an important improvement with his gridiron pendulum, in which parallel rods of brass and steel contracting and expanding in opposite directions compensated for differences of temperature. In 1736 he produced a ship's chronometer more accurate than any previously made. In 1759 he made a pocket chronometer of remarkable accuracy, which, fulfilling certain conditions laid down by an Act of Parliament of 1713, entitled Longitude Harrison, as he was called, to a reward of £20,000, which was withheld, however, by the board of longitude. Not until 1773 did he receive this money. He died in London, March 24, 1776.

John Harrison,
English clockmaker
After King

Harrison, MARY ST. LEGER. A British novelist. The younger daughter of Charles Kingsley, she wrote as Lucas Malet (*q.v.*).

Harrison, THOMAS (1606-60). English puritan and regicide. He was born at Newcastle-under-Lyme, Staffs, the son of a grazier and butcher. He became clerk to a London solicitor; in 1642 joined the bodyguard of the earl of Essex, and distinguished himself at Marston Moor. He was in command of the force that took King Charles from Hurst Castle to

London, was one of the court that tried him, and signed the death warrant. During Cromwell's ab-

sence in Ireland Harrison was in supreme military command in England, 1650-51.

He took part in the expulsion of the Long Parliament in 1653, in which year came the division of the

Thomas Harrison,
English Puritan
From an old print

Commonwealth party into the Fifth Monarchy idealists under Harrison and the more practical men under Lambert. The latter gained the upper hand, and Harrison lost his offices and commission, and twice suffered imprisonment for his loyalty to his views. He was one of the most consistent and resolute of the Parliamentarians, and though one of the seven regicides excluded from the Act of indemnity, refused to flee the country at the Restoration or to acknowledge Charles II. He was taken, tried, and executed on Oct. 13, 1660. *Consult* Thomas Harrison, Regicide and Major-General, C. H. Simpkinson, 1905.

Harrison, WILLIAM (1534-93). English topographer. Born in London, April 18, 1534, he was educated at St. Paul's and Westminster schools, and 1556 graduated at Oxford. He became rector of Radwinter, Essex, in 1559. At the suggestion of Reginald Wolfe, printer to Elizabeth, he wrote the Description of England, 1577, a vividly actual and most valuable account of the country in the time of Elizabeth. Harrison was appointed in 1586 dean of Windsor, where he died in April, 1593. Much of his work is in Shakespeare's England, edited by F. J. Furnival, 1877-78.

Harrison, WILLIAM HENRY (1773-1841). American president. Born at Berkeley, Charles City co., Virginia, Feb. 9, 1773, he entered the army and fought with distinction against the N.W. Indians. In 1801-13 governor of Indiana territory, he was

W. H. Harrison

responsible for several treaties with the Indians, one of which, involving a large cession of territory to the

Harrogate. Air view of the Valley Gardens, a beautiful central feature of this famous Yorkshire inland spa

U.S.A., indirectly led to the war with Great Britain in 1812. Harrison was appointed to the command in the north-west, and his defeat of a combined force of British and Indians on the Thames, Ontario, Oct. 5, 1813, and other successes, gained him a reputation during the war second only to that of Andrew Jackson.

Member of Congress, 1816-19, and senator, 1825-28, he was an unsuccessful candidate for the presidency in 1836, but was elected in 1840 in what became known as the "log-cabin and hard cider" campaign, in allusion to his once having lived in a log-cabin and to his preferring cider to beer. He died at Washington a month after his inauguration, April 4, 1841. *Consult* Lives of the Presidents, W. O. Stoddard, 1888-89; The Presidents of the United States, ed. J. G. Wilson, 1894.

Harris Tweed. Cloth made from pure wool, produced in the Outer Hebrides. It is spun, dyed, and finished, and handwoven in their homes by the islanders of Lewis, Harris, Uist, Barra, etc. Cloth made of yarn spun on the mainland may be sold as Harris tweed, but it must not be stamped with the trade mark registered with the board of trade, 1934.

Harrogate. Mun. bor., spa, and inland resort of Yorkshire (W.R.), England. It is 203 m. by railway from London. Harrogate is noted for its springs, of which there are 88. It possesses a fine spa establishment well equipped for the treatment of rheumatic disorders and allied complaints, and a number of good modern buildings. The Stray is a large open space, as

are the Valley Gardens and Harlow Moor, and there are many public gardens. The earliest spring was discovered in the 16th century. Near the town are many places of historic interest. Harrogate was originally two villages, Low and High Harrogate. It was made a bor. in 1884, and gives its name to a co. constituency.

The waters are chalybeate, sulphurous, and limestone, and are the property of the corporation. Pop. 48,730.

Harrow. Implement used in agriculture for the same purpose as the garden rake in horticulture. It is drawn by a horse or horses, or by a motor. With its large clods of earth rendered friable by the weather are broken down. It reduces the soil to a sufficient fineness for seed, which it then covers to the required depth. Seed harrows are usually constructed of iron with long or short tines according to the character of the soil on which they are used. In some cases the tines are arranged in a zigzag pattern to ensure maximum soil movement, rather than on the square fashion where the tines follow one another in a series of lines. Drag harrows have curved tines and are used on heavy soils, and on those not well mellowed by the weather. Chain harrows, which are flexible with very short tines or may be merely a series of chains, when drawn over grassland remove weeds, open up matted growth to aeration, and distribute the droppings of livestock. *See* Agriculture.

Harrogate arms

Harrow, Middlesex. The High Street and the parish church, the spire of which is a landmark for many miles

HARROW OR HARROW-ON-THE-HILL. Parish and urban district of Middlesex, England. It is 10 m. by road N.W. from Hyde Park Corner, and is served by Metropolitan, District, and Bakerloo rlys., and steam line from Euston. Situated on the summit and slopes of a hill rising abruptly 200 ft. from the plain, it has grown rapidly since the increase of rly. facilities. Harrow High Street retains much of its old character and contains an inn, the King's Head, dating from 1553. The modern buildings include district council offices, public hall, assembly rooms, fire station, and cottage hospital. The parish church of S. Mary, founded by Lanfranc and consecrated by Anselm, 1094, was largely rebuilt in the 14th century, and restored by Sir Gilbert Scott in 1840. It contains old brasses, among them that of John Lyon, founder of Harrow School, monuments and coloured glass. Its lead-encased wooden spire is a landmark for miles around, and the view from the terrace is famous. In addition to its great public school, Harrow has other educational establishments, including the John Lyon school.

The manor belonged to the archbishops of Canterbury as early as the 9th century, when it was known as Herges, a name replaced in the 14th century by Harewe-at-Hill, whence its present name. Cranmer in 1543 exchanged it for other lands with Henry VIII, who in 1546 granted it to Sir Edward, afterwards Lord, North, in whose family it remained until 1630. Three M.P.s are elected. Pop. urb. dist. (1948) 219,090.

Harrow School. English public school. Originally attached to the local church, it was threatened with extinction by the confiscation of ecclesiastical lands in 1547, but was saved by John Lyon, a neighbouring landowner, who secured a charter in 1572 to

was permitted to take as many other boys as he liked and to charge fees for their tuition. Lyon's intention that the school should be national rather than local was also indicated by his provision for the upkeep of the roads leading from London to Harrow.

Harrow School arms

A century later the number of pupils from outside the district was more than double that of the free scholars. Educational, political, and social developments caused it to rise in reputation in the 18th century. During the 19th century, through the generosity of Old Harrovians, a number of buildings, including the chapel, Vaughan library, speech room, science schools, museum, art and music schools, and the workshop, were erected, and extensive playing fields were acquired. From the same source came many entrance and leaving scholarships. The institution was one of the nine public

schools recognized by the Public Schools Act, 1868.

The number of pupils varies between 500 and 600. The school is organized into five blocks, each of which is divided into forms for administrative purposes and for the teaching of compulsory subjects, but instruction in optional subjects is given in divisions.

The upper school, including the sixth and upper fifth forms, is arranged in groups which specialise in various studies, ancient and modern. Since the time of John Farmer (organist from 1862 to 1885), Harrow has been famous for its music, and it possesses a large collection of songs enshrining its traditions. Among its headmasters have been Benjamin Heath, George Butler, C. J. Vaughan, H. M. Butler, J. E. C. Welldon, Lionel Ford, and Sir Cyril Norwood. Its pupils have included Sheridan, Byron, Peel, Palmerston, and Winston Churchill, Field Marshal Lord Gort and Field Marshal Lord Alexander.

Hart, Sir Robert (1835-1911). British administrator. Born at Portadown, co. Armagh, Feb. 20, 1835, and educated at Queen's College, Belfast, he entered the British consular service in China, 1854. Invited by the viceroy of Canton to undertake the supervision of the customs in 1859, Hart resigned from the British consular service and organized the Chinese imperial maritime customs service, of which he became inspector-

Harrow School. 1. Interior of the Speech Room. 2. Some of the school buildings, showing chapel on right, and part of the old school, left background

general in 1863. About this time he met Gordon, the two men becoming friends. Only on two occasions, 1866 and 1878, did he revisit Europe before retiring from office in 1908.

His thorough knowledge of the Chinese language, his absorption of

the Chinese point of view, and his resolute administration of the service for the benefit of China, won the confidence

Sir Robert Hart,
British administrator
Elliott & Fry

of the Chinese government, and the success of his department brought him the additional charge of the coast and inland waterways and of the imperial

post. In 1906 the Chinese government placed the customs service under a board of Chinese officials, and in Jan., 1908, Hart, nominally president of the board, received formal leave of absence and returned to England. He was created a baronet in 1893, and died near Great Marlow, Sept. 20, 1911.

Hartal (Hindu, the locking of shops). Term applied to a day of national protest in India when all shops and mills are shut as a form of boycott for political purposes. It was first used in this sense by Gandhi (*q.v.*) as part of his campaign for Indian independence from Great Britain, and frequently led to serious rioting.

Hart Dyke, SIR WILLIAM (1837-1931). A British politician. The son of a Kentish baronet with a title dating from 1679, he was born Aug. 7, 1837. Educated at Harrow and Christ Church, Oxford, he was Conservative M.P. for West Kent, 1865 and 1868-85, for Dartford, 1885-1906. He was chief secretary for Ireland, 1885-86, and from 1887 to 1892 was vice-president of the committee of council, on education. He succeeded to the baronetcy in 1875. He died July 3, 1931.

Harte, FRANCIS BRET (1839-1902). An American novelist and poet. Born at Albany, N.Y., on Aug. 25, 1839, he went at the age of 18 to California, where he spent three years as a gold miner and school-master. He became editor of The

Butterfly

Weekly Californian, in which he published his admirable parodies, the Condensed Novels. In 1868-70 he edited The Overland Monthly, for which he wrote the inimitable verses on The Heathen

Chinese and many of his most famous short stories, including The Luck of Roaring Camp, The Outcasts of Poker Flat, Miggles, and Tennessee's Partner.

During 1878-85 he held consular appointments at Krefeld in Germany, and at Glasgow. From 1885 onwards he lived at Camberley, England, producing many novels and short stories, but none quite equal to his early studies. He died at Camberley, May 5, 1902. His Collected Works, 1904, occupy 20 vols. *Consult* Lives, T. E. Pemberton, 1903; H. W. Boynton, 1905; H. C. Merwin, 1911.

Hartebeest (*Bubalis*). Genus of large antelopes, found in S. Africa. The name is Dutch and is derived from the supposed resemblance of the animal to a stag. The hartebeest is one of the swiftest of the antelopes; is about 4 ft. high at the withers; is reddish brown or bay in colour; and has ringed horns which first diverge from the forehead like a V and then turn backwards at right angles. There are probably four species, with various local races. *See* Animal; Antelope.

Hart Fell. Mountain in Scotland. On the borders of Dumfriesshire and Peeblesshire, it is 6 m. N.E. of Moffat. Its height is 2,651 ft.

Hartford. City of Connecticut, U.S.A. Capital of the state and co. seat of Hartford co., it stands on the Connecticut river at the head of navigation for large ships, 125 m. W.S.W. of Boston, and 110 m. N.E. of New York. It is served by the New York, New Haven, and Hartford and other rlys., and by two airports, several excellent highways which enhance its central location, and three radio stations. As it flows into the Connecticut the Little Park R. divides the city approximately in half. The Talcott Mt. range is 6 m. W. of the city. A 9-span granite bridge over the Connecticut, constructed 1907, 1,192½ ft. long, 82 ft. wide, has the largest mass of any purely stone bridge, and is one of the largest cut-stone masses in existence. Hartford is an eminently beautiful city. It has 2,710 acres of parks and public squares. Among a number of imposing buildings are the white marble capitol, the state library and supreme court building, the

state office building, the arsenal and armoury, the Old State House, a colonial structure built in 1796, the Travelers Insurance company skyscraper with its tower soaring 527 ft., the Bushell memorial auditorium, which seats 3,300, and the Junius S. Morgan memorial, which was built by the late J. P. Morgan Sr. in memory of his father, who started as a merchant here, and which contains a notable portion of the J. P. Morgan art collection. Hartford is the see of R.C. and Protestant Episcopal bishops. Educational institutions include Trinity college, the Hartford seminary foundation, and the Hartford college of law. The Hartford Courant, founded in 1764,

is the oldest newspaper published in the U.S.A.

Hartford is a port of entry, but is chiefly important as an insurance centre. The first automobile insurance policy was issued here. Its manufactures include typewriters, small arms, aircraft engines, automobile parts, mechanical counters, precision machines, marine and other types of engines, electrical and telephone equipment, printing machinery, and brushes. The first

woollen mill in New England was established here in 1788.

The site of a Dutch trading post and fort in 1623, Hartford became the first permanent white settlement in Connecticut when the Rev. Thomas Hooker and the Rev. Samuel Stone brought migrants from Massachusetts here in 1636. At first called Newtown, it later received its present name in honour of Hertford, England, Stone's birthplace. Connecticut Colony's first general court met here in 1636, and a constitution was adopted here three years later. In 1662 the colonies of Connecticut and New Haven were united with Hartford as capital. In 1701 New Haven became a joint capital, continuing until 1873, when Hartford again became the sole seat of government. It was an important supply centre for the American army during the revolution, and in 1780 Washington and Rochambeau laid their plans for Yorktown here. In 1814 the Hartford convention (Massachusetts, Connecticut, Rhode Is., New Hampshire, and Vermont) met here to voice the resentment of New England

Hartebeest. Specimen
of *Bubalis caama*

federalists at the prosecution of the war of 1812, which was ruining the region's trade and, in general, to assert New England's interests against the alleged encroachments of the W. and S. It received a city charter in 1784. At the end of the 18th century, the Hartford Wits, a group of literary amateurs, flourished here. Noah Webster, the lexicographer, was born here, and eminent writers who have lived at Hartford include Whittier, Harriet Beecher Stowe, Mark Twain, and C. D. Warner. Pop. 166,267.

Hartington, MARQUESS OF. English title borne by the eldest son of the duke of Devonshire. It is best known as the name of the Liberal statesman who became duke of Devonshire in 1891. Hartington is a village in the Peak dist. of Derbyshire. See Devonshire, 8th Duke of.

Hartland, HENRY ALBERT (1840-93). British painter. Born at Mallow, co. Cork, on Aug. 2, 1840, Hartland worked for a time painting stage scenery in Dublin. His best work was done in water-colour, his favourite subjects being the moorland scenery of Ireland, and N. Wales; most of his working life was spent at Liverpool. He was a frequent exhibitor at the Royal Academy, where a picture of his was first hung in 1869, and examples of his work are to be found in the Victoria and Albert Museum and the Walker Art Gallery, Liverpool. He died at Liverpool, Nov. 28, 1893.

Hartland Point. Headland on the N. coast of Devonshire, England. Forming the S.W. extremity of Barnstaple Bay, it is 350 ft. high. It has a lighthouse with a revolving light visible for 17 m.

Hart Leap Well. Locality in the N. Riding of Yorkshire, England, between Richmond and Leyburn. The story is that a stag, having been hunted for 13 hours, here leaped down from the fell and died. A tree which was planted there would not grow, and no beast would drink from the well. Wordsworth has a poem with this title.

Hartlepool. Mun. bor. of Durham co., England. It stands on a headland on the coast of Durham, 247 m. from London and 18 m.

from Durham by rly. The chief buildings are the church of S. Hilda, dating from the 12th century, with its great tower, and the town hall, a

modern building in the Italian style. The chief industries are engineering, shipbuilding, and shipping. There is a large fishing trade, for which there is a commodious fish quay, and much of the docks is used for timber imports. The town has a service of trolley buses, connecting it also with W. Hartlepool.

Hartlepool originated round a monastery founded about 640. It obtained some municipal privileges from King John, and was a fortified place, there being still many remains of its walls and the Sandwell gate. It was made a borough in 1590. In the Middle Ages and later it had large markets and fairs, and is now a flourishing seaport. It is governed by a mayor and corporation. Known as the Hartlepoons, Hartlepool and W. Hartlepool unite in sending one member to parliament. Pop. 20,545. See West Hartlepool.

Hartlepoons, BOMBARDMENT OF THE. German naval operation in the First Great War, Dec. 16, 1914. Early in the morning of Dec. 16, 1914, a German battle-cruiser squadron under the command of Vice-Admiral Hipper appeared off the N.E. coast of England and shelled the Hartlepoons, Whitby, and Scarborough. The enemy vessels engaged were the battle cruisers Derfflinger, Seydlitz, and Moltke, Von der Tann, the armoured cruiser Blücher, and certain light cruisers and destroyers. Bombardment of the Hartlepoons began at 8.15 a.m. and lasted until 8.50 a.m. Three cruisers got within a range of 4,000 yds., and escaped almost undamaged although the coastal batteries, the light cruiser Patrol, and two destroyers, Doon and Hardy, fired at the enemy.

It was estimated that the German ships fired 1,500 shells. Some 500 houses were hit, as well as important buildings, including the railway station, waterworks, gasometer, and a battery. Civilian casualties were 113 killed, including 30 women and 15 children, and 300 wounded; military casualties were seven killed, 14 wounded—first war casualties suffered on English soil through a foreign enemy since the Norman conquest. The excuses of the government did little to allay public anger that enemy ships could thus approach with impunity to within 3 m. of the shore.

Hartley, SIR CHARLES AUGUSTUS (1825-1915). British engineer. Born at Heworth, Durham, he became a railway engineer. During the Crimean War he served as an

engineer with the Turks. This led to his appointment as engineer-in-chief to the international commission that controlled navigation of the Danube, and in 1892 he was made its consulting engineer. In 1867 he won a prize offered by the tsar for a plan to improve Odessa Harbour, and he was consulted about river and harbour prospects all over the world, including the Mississippi and the Schelde, Durban and Trieste. He was on the commission for the improvement of the Suez Canal. Knighted in 1862, he died on Feb. 20, 1915.

Hartley, DAVID (1705-57). English physician and philosopher. Born Aug. 30, 1705, and educated at Jesus College, Cambridge, he was led by conscientious scruples to abandon his intention of taking Holy Orders. He became a successful physician, finally settling at Bath, where he died Aug. 28, 1757. His chief work is *Observations on Man, his Frame, his Duty, and his Expectations*, 1749. In this he explained the workings of the mind as due to certain tiny vibrations or "vibratiuncles," working both inwards and outwards by way of the nerves, according as the disturbing cause was an external object or an internal impulse. The founder of the Associationist psychological school (see Association of Ideas), he attached special importance to the law of succession and simultaneity. Consult Hartley and James Mill, G. S. Bower, 1881.

Hartmann, KARL ROBERT EDUARD VON (1842-1906). German philosopher. Born in Berlin, Feb.

Eduard von Hartmann, German philosopher

23, 1842, the son of a Prussian general, for five years he held a commission in the Guards-Artillery, but was forced in 1865 to retire on account of a neuralgic affection of the knee which made him a cripple. After a period of study he published, in 1869, his work on *The Philosophy of the Unconscious*, 10th ed. 1890, Eng. trans. W. C. Coupland, 1884; 2nd ed. 1904. His *Modern Psychology*, 1903, is an account of the progress of psychological study in Germany in the second half of the 19th century. His other works include *German Aesthetics* since Kant, 1886; *The Religion of the Future*, Eng. trans. E. Dare, 1886; *The Sexes Compared and Other Essays*, Eng. trans. A. Kenner,

Hartlepool arms

1895; and *The Philosophy of the Beautiful*, 1887. He died at Lichterfelde, near Berlin, June 5, 1906.

Hartmann was a monist. His *Philosophy of the Unconscious* is based on an amalgamation of Schopenhauer's doctrine of will with the metaphysic of Hegel and the positiveness of Schelling. Logical thought and illogical will are merged in the unconscious, i.e. in the one and universal unconscious mind which animates the world. Unlike Schopenhauer, Hartmann denies that will can exist without willing something definite, which is thought or idea. Mind and matter are objectifications. Nature's restorative and reproductive powers are unconscious, as are reflex action and instinct. Consciousness came to life in man, and with it an idea of wretchedness to which the lesser animals are strangers. From this idea man has sought relief in a belief in worldly happiness, faith in a hereafter, and trust in the ameliorative agencies of education and science. The greater part of the will perceives the inevitable misery of existence, and finally man will seek the peace of non-existence. *Consult Pessimism*, J. Sully, 1891.

Hartmann von Aue (c. 1165-1210). German Meistersinger. A Swabian knight, known to have joined in one of the Crusades. He was the author of two Arthurian epics, *Erec* and *Iwein*, which greatly influenced German medieval poetry, and of two religious narrative poems, *Gregorius*, a legend of the early life of Pope Gregory the Great, and *Der Arme Heinrich* (Poor Henry), a tender romance of love and faith based on the legend which Longfellow also used in his *Golden Legend*.

Hartshorn. Popular name for ammonia water, ammonium carbonate. The name originally referred to the preparation made by distillation from the antlers of the red deer, *Cervus elaphus*. The products of distillation have now been replaced by ammonia preparations. See *Ammonia*.

Hart's-tongue Fern (*Scolopendrium vulgare*). Fern of the family Polypodiaceae. It is a native of Europe, N. Africa, Asia, and N. America. The rootstock is short and broad, clothed with slender brown scales; the fronds, 1 ft. to 3 ft. long, are undivided, leathery, and strap-shaped, with a heart-shaped base. The spore clusters are in thick parallel lines at right angles to the thick mid rib.

Hart-Truffle (*Elaphomyces granulatus*). Subterranean fungus of the family Ascomycetes. It is

a yellow tuber of depressed spherical form, attached to the roots of conifers, and filled, when ripe, with a purplish-brown mass of spores. Its presence beneath the soil is indicated above it by the clubbed stems of another fungus, *Cordyceps capitata*, which is parasitic upon the hart-truffle.

Harty, SIR HERBERT HAMILTON (1880-1941). Northern Irish composer and conductor. Born at Hillsborough, Down, Dec. 4, 1880, he received his early musical education from his father and at the age of 12 was organist at Magheracoll, Antrim, later holding similar posts in Belfast and Dublin. In 1900 he moved to London.

Sir Hamilton Harty, British composer and conductor

He achieved celebrity first as a sensitive accompanist, then as a conductor, notably with the London Symphony orchestra. For 13 years from 1920 he was director of the Hallé orchestra at Manchester. Of his compositions the best known are, perhaps, *The Mystic Trumpeter* and *With the Wild Geese*. He arranged many Irish folk-songs and set Irish poems to music of a delicate charm. He married in 1904 Agnes Nicholls, a soprano. He was knighted 1925, and died Feb. 19, 1941.

Hartzenbusch, JUAN EUGENIO (1806-80). A Spanish dramatist. Born at Madrid, Sept. 6, 1806, of German origin, he worked as a carpenter for some years and then became a journalist. After making several translations and adaptations of French and Spanish dramas, he produced *Los Amantes de Teruel* (Teruel's Lovers), 1837. A later success was *La Jura en Santa Gadea*, 1845. He published critical editions of Calderon and others, and *Cuentos y Fables* (Stories and Fables) in 1861. He died at Madrid, Aug. 2, 1880.

Harnspices. In ancient Rome, diviners or soothsayers who drew omens from examination of the

Hart-Truffle, with clubbed stems of its parasite

entrails of slaughtered animals. They also observed the manner in which the victim went to its death, the character of the flames in which it was consumed, and of the meal, wine, etc., used in the sacrifice; and suggested propitiations for divine wrath after portents and thunderstorms. The emperor Claudius formed them into a college which existed until the 5th century.

Harvard. Lofty peak of the Rocky Mts., in Lake co., Colorado, U.S.A. One of the College peaks, it attains an elevation of 14,376 ft. above the level of the sea. It is about 110 m. S.W. of Denver.

Harvard, JOHN (1607-38). English puritan, and one of the founders of Harvard university (v.i.). Born in Southwark, London, he was a son of Robert Harvard (d. 1625), a prosperous butcher, was baptized in S. Saviour's, Nov. 29, 1607, and educated at the local grammar school and at Emmanuel College, Cambridge. He was married, April 19, 1636, at South Malling, to Anne Sadler, of Ringmer, Sussex. In 1637 he went to America, was admitted, Aug. 6, a townsman of Charlestown, Mass., and became second minister of the church there. Dying Sept. 24, 1638, he left his books (all but one of which were destroyed by fire in 1764) and half of his estate to a college which had been chartered in 1636 in the hamlet of Newetowne, renamed Cambridge. The college was named Harvard College.

In 1638 a granite obelisk was erected to Harvard's memory at Charlestown; in 1904 a memorial tablet was placed in Emmanuel College; in 1905 the chapel of S.

Harvard House, Stratford-on-Avon, built by John Harvard's grandfather and restored in 1909

John the Divine, in S. Saviour's, was restored by Harvard men and renamed Harvard Memorial Chapel. Harvard's mother, Katherine Rogers, was a native of Stratford-on-Avon, and, it is suggested, was introduced to his father by Shakespeare. Harvard House, Stratford-on-Avon, built by the father of Katherine Rogers, was restored at the expense of Edward Morris, of Chicago, and opened Oct. 6, 1909, as a rendezvous for Americans visiting England, and a repository of records, relics, etc., of the Elizabethan period. Consult John Harvard and His Times, H. C. Shelley, 1907.

Harvard University. Senior seat of learning of the U.S.A. It was established by the general

developed as outgrowths of earlier foundations, include architecture, landscape architecture, engineering, and city and regional planning.

In addition, the university includes, among other related institutions, Harvard College library, central unit in a university library collection of more than 4,700,000 volumes; the Arnold arboretum, Gray herbarium, Farlow library and herbarium, and Harvard forest; the astronomical observatory with branches in Cambridge and Harvard, Massachusetts, and Bloemfontein, South Africa; extensive laboratories of chemistry, biology, physics, and psychology; the museum of comparative zoology and Peabody museum; the Fogg art museum; the Dumbarton Oaks research library and collection of Byzantine and medieval humanities; and the Harvard university press.

Originally set up under the joint control of state and church, Harvard university is now a privately endowed institution making no religious tests for admission. Enrolment figures before the Second Great War showed approximately 8,300 students in residence in all departments, of whom about 3,750 were listed as undergraduates in the college. Enrol-

ment for the academic year 1946-47 was approximately 12,000. More than 125,000 students have graduated here since the institution was founded. Consult Development of Harvard University, 1869-1919, ed. S. E. Morison, 1930.

Harveian Society. A British medical organization founded in London, Sept. 15, 1831, for the study and discussion of new trends in medical practice and to advance the status of the medical practitioner. In 1875 the society endowed a lecture which is delivered each March by a distinguished member of the profession. Since 1927 it has offered annually a prize and medal for the best essay on a subject of medical interest. The affairs of the society, which has some 300 members, are governed by a council of 20. Its address is 14, Devonshire St., London, W.1. There are Harveian Societies in Edinburgh and New York.

Harvest (A.S. *haerfest*, crop). The final stage in securing crops, especially cereals. Among the

main cereals barley is allowed to remain standing until the grain is fully ripe, whereas oats and wheat may be cut before this stage without detriment to their feeding or milling quality. Except on a very limited scale the sickle and scythe are now superseded by the reaping machine, the self-binder, and the combine harvester which cuts the crop and threshes the grain simultaneously. See Farm.

The straw may be baled directly or left on the ground until it can be picked up and baled; it may, however, be left on the ground and burned where it lies. If a self-binder is used the sheaves are usually stooked and left for a time, then either stacked in the open or in Dutch barns near the farmstead where the straw can be readily handled for livestock. Beans are commonly cut by a self-binder like cereals, but peas are cut by a pea hook and allowed to dry on the ground, being turned as necessary until fit to stack.

Harvest Bug OR **HARVEST MITE.** Names given to mites of the family Trombididae, a red spider group. The British species (*Trombicula autumnalis*) is bright red and hairy. It frequents grassy places where there is rank vegetation, and the adults are believed to feed on decaying matter in the soil. It makes its presence noticeable with the cutting of the corn—hence its name. Its young form, or larva, attaches itself to man and other animals, burrowing under the skin and causing severe irritation which can be temporarily relieved by bathing with ammonia; flowers of sulphur dusted in the shoes enters the blood-stream and kills the creatures.

Harvest Customs. Ceremonies and celebrations associated with the completion of the gathering in of harvest. Of immemorial antiquity and world-wide distribution, they originated in worship of the nature deities associated with the growth of crops. Among the Romans the Cerealia were feasts in honour of Ceres, and many widely disseminated customs are linked with the classical legends of Demeter and Persephone.

One custom which, with but slight variations, can be traced among widely separated peoples,

Harvard University. Students in the Harvard "Yard," so called because the site of the main university buildings was formerly a knacker's yard. In the background is Memorial Hall, built in 1878

court of the Massachusetts Bay colony in 1636, in Newtowne, Massachusetts, just outside Boston. The first master was appointed a year later, when the name of the town was changed to Cambridge in memory of the university in England which many leaders of the Bay Colony had attended; the institution was named Harvard College in memory of John Harvard (v.s.). The first class graduated in 1642, the first scholarship fund was established in 1643, and the college was incorporated by charter in 1650. Degrees in divinity were first conferred in 1692. The first professorships in medicine were established in 1782. Separate faculties and schools in the various professional fields were later established as follows: medicine, 1810; divinity, 1816; law, 1817; applied sciences, 1847; dentistry, 1867; business administration, 1908; public health, 1913; education, 1920; public administration, 1935. Other faculties,

Harvest-Bug, greatly enlarged

is the forming of a crude figure—sometimes merely a handful of corn decorated—which is borne in procession as a personification of the crop and made the central figure of the festivities. This custom still survives in parts of England and Scotland, where a harvest doll or kern, *i.e.* corn baby, is fashioned from some of the best corn into the semblance of a human figure, dressed up, and carried with the last wagonload of the harvest.

In Scotland, the last sheaf, called the Maiden or the Old Woman, according to whether it is cut before or after Hallowmas, is kept till Christmas morning, when it is distributed to the cattle to give them health throughout the next year, or is hung up until replaced by its next year's successor. Similar customs are recorded in various European countries.

Another immemorial custom is the harvest supper given by the owner of the crop to all who help to garner it. The Jews feasted at the getting-in of harvest and made a thank-offering of the first fruits, and among heathen peoples the heads of families feasted on terms of equality with their servants. In England the supper was the crowning celebration of the harvest home, and from the fact that a goose was the principal dish on these occasions originated the custom of eating a goose on Michaelmas Day. *Consult* The Golden Bough, J. G. Frazer, 1917 edn.

Harvester OR **HARVESTMAN**. Any member of the order Phalangidae, a group of the class Arachnida to which also belong the spiders, scorpions, and mites. Harvesters are long-legged and quite harmless, and prey upon small spiders and mites. They are quite distinct from the harvest bug (*q.v.*).

Harvest Festival. Service in the Christian churches of thanksgiving for the safe ingathering of the harvest. It is not a fixed occasion, but is chosen from year to year to fit in with the actual date of the harvest. The congregation decorate the church with offerings of corn, fruit, and vegetables—in the country from their own fields and gardens.

Harvest Moon. Nearest full moon to the autumnal equinox, Sept. 23. Owing to the position of the moon's path with respect to the horizon, it rises nearly at the same time on successive evenings. Traditionally, farmers take advantage of the succession of moonlight evenings occurring at this time of the year to gather their harvest. *See* Moon.

Harvey, GABRIEL (c. 1545-1630). English scholar. Born at Saffron Walden, son of a well-to-do rope-maker, he had a distinguished career at Pembroke College, Cambridge. He advocated the use of classical metres in English verse, was the friend of Spenser (he was the Hobbinol of The Shepherd's Calendar), and carried on a bitter quarrel with Thomas Nashe (*q.v.*). He died at Saffron Walden, Feb. 11, 1630. *Consult* his *Marginalia*, ed. G. C. Moore Smith, 1913.

Harvey, SIR GEORGE (1806-76). Scottish painter. Born in Feb., 1806, at St. Ninian's, Stirlingshire, he studied at the Trustees' academy, Edinburgh. He was an original associate of the Scottish academy, 1826, becoming a full member in 1829, and president in 1864, in which year he was knighted. He died at Edinburgh, Jan. 22, 1876. He painted Scottish genre, portraits, and landscapes. *See* Covenanters; Drumlog.

Harvey, (JOHN) MARTIN. This British actor, who was knighted in 1921, is entered in this work under Martin-Harvey, Sir John.

Harvey, LEONARD AUSTIN (b. 1907). British boxer. A Cornishman, he appeared in the London ring in 1926, becoming heavyweight champion of Great Britain and of the Empire, though qualified to fight in lighter classes. He lost both titles to Jack Petersen in 1934. At 32 he made a "come-back," and when on July 10, 1939, he beat Jock McAvoy he held five titles simultaneously. On June 20, 1942, defending, against Freddie Mills, the light-heavyweight championship of Great Britain, the Empire, and the world, "Len" was knocked out for the only time in his career; but his retirement left him undefeated heavyweight champion of Great Britain and the Empire. He lost only 10 out of 414 contests. In the Second Great War he served in the R.A.F.

Harvey, WILLIAM (1578-1657). English physician, discoverer of the circulation of the blood. He was born at Folkestone, Kent, April 1, 1578, and educated at the King's school, Canterbury, Caius College, Cambridge, and the university of Padua, taking his doctor's degree in physic at Padua and at Cambridge in 1602. He settled in practice in London, and

in 1607 became fellow of the College of Physicians, and in 1609 physician to St. Bartholomew's hospital. In 1615 he was appointed Lumleian lecturer to the College of Physicians;

he first put forward his theories about the movement of the heart and blood, April 17, 1616. He published *Exercitatio Anatomica de Motu Cordis et Sanguinis in Animalibus*, 1628.

Harvey had been appointed physician to James I in 1618, and in 1632 he received the same honour from Charles I, who was his constant and helpful patron. He accompanied the king on one visit to Scotland, was with him at the battle of Edgehill, and followed him to Oxford, where he remained for three years, and was made warden of Merton College. He returned to London in 1646, and pursued his investigation into the subject of generation which resulted in the publication, in 1651, of his *Exercitationes de Generatione Animalium*, his only other work of first importance. He died in London, June 3, 1657, and was buried at Hempstead, Essex.

Harvey, WILLIAM (1796-1866). British wood-engraver and designer. Born at Newcastle-upon-Tyne, July 13, 1796, he studied under Thomas Bewick, and later, under Benjamin Haydon in London. About 1822 he gave up engraving for design, and produced some facile illustrations for Northcote's *Fables*, Lane's *Arabian Nights*, and Hood's *Eugene Aram*. He died Jan. 13, 1866.

Harvey, WILLIAM HENRY (1811-66). British botanist. Born at Summerville, Limerick, Feb. 5,

1811, he went, after a youth spent in business, to S. Africa, and became colonial treasurer at the Cape. Returning to Ireland on account of his health, he was appointed

keeper of the Herbarium at Trinity College, Dublin. In 1846 he began the publication of his important work on seaweeds, the *Phycologia*

Britannica. In 1849 he paid a long visit to the U.S.A., and accumulated material for his *Contributions to a History of the Marine Algae of N. America, 1852-53*. His later works were *Phycologia Australica (1858-63)*, *Thesaurus Capensis (1859-63)*, and *Index Generum Algarum (1860)*. He died at Torquay, May 15, 1886.

Harwell. A hamlet in Berkshire, England, 2 m. W. of Didcot. During the Second Great War a satellite airfield of the R.A.F. station at Abingdon was built here. In 1946 it was converted into an experimental atomic energy plant under the ministry of Supply.

Harwich. Seaport and bor. of Essex. The ancient borough of Harwich comprises Harwich and

Harwich arms

Dovercourt Bay, the two towns being incorporated under a charter of James I. Harwich is a port of importance, Parkeston Quay, 1 m. up the Stour, being the English terminus of passenger and freight services to continental ports, including Hook of Holland, Antwerp, Esbjerg, and Zeebrugge. It stands on a peninsula at the estuary of the Orwell and Stour rivers, 74 m. by rly. N.E. of London.

Harwich's fine natural harbour is completely landlocked and provides safe anchorage for vessels of up to 28 ft. draft, which can lie afloat at all states of the tide. The harbour is easily accessible under all weather conditions, and during the two Great Wars was an important but vulnerable base for minesweepers, submarines, and destroyers. The chief buildings are the church of S. Nicholas and the guildhall. Harwich gives its name to a county constituency.

Dovercourt Bay, a modern residential seaside resort, adjoins Harwich, to the W. It has many

attractions for visitors, including yachting and excellent sandy beaches, with a 3 m. promenade facing due S.

During the Second Great War the borough of Harwich had 1,200 air raid alerts, 1,750 bombs being dropped on it or into the surrounding sea. Pop. 12,700.

Harwood, Sir Henry Harwood (b. 1888). British sailor. Born Jan. 19, 1888, he entered the R.N. in 1904 and served throughout the First Great War as a lieutenant. In 1928 he was promoted captain and appointed to command the 9th destroyer div. On the staff of the Royal Naval War College, 1934-36, in 1936-39 he was commodore commanding the S. America div. and H.M.S. Exeter, and in Dec., 1939, led the cruisers Ajax, Achilles, and Exeter in the action which resulted in the destruction of the German pocket-battleship Graf Spee, as a result of which he was made K.C.B. and promoted rear-admiral, 1940. In 1942 he was appointed naval c.-in.-c. Mediterranean, and the following year was appointed vice-admiral and made c.-in.-c. the Levant. He retired in 1945, with the rank of admiral. See Plate, Battle of the.

Harz. Mountain range of N. Germany lying between the Leine and the Saale and crossed by the waterparting between the Weser and the Elbe. The existing heights are the remains of an ancient and more extensive system of fold mountains which were uplifted during the period when the coal measures were under formation.

The Harz consists of carboniferous and older rocks with intrusive

Sir Henry Harwood, British sailor

granites; the Brocken, 3,730 ft., the highest point, being the largest granite mass. North of the range outlying hills lead to the lowland of N. Germany; the drainage is by the Ocker and other streams to the Weser; to the S. lies "Golden Meadow," valley of the Helme, tributary of the Saale.

The range, 56 m. by 20 m., comprises the Upper Harz, a thickly forested district where at Clausthal and other centres silver is mined at depths below sea level, and the Lower Harz where agriculture prevails on land cleared of the forest, and copper is mined at Mansfeld, the chief German centre for this mineral. The whole region, which is associated with witchcraft and legendary occurrences, (see Walpurgis Night), is visited by tourists, the valley of the Bode being noted for its mountain scenery.

Harzburg. Town and spa of Germany. It lies on the N. slopes of the Harz mts., 27 m. from Brunswick. It is known for its saline baths and springs, its beautiful woods and pleasant sights, among them the Burgberg, 1,580 ft. high and linked with Harzburg by a suspension railway, and before the Second Great War attracted 40,000-50,000 guests a year. The town takes its name from a castle, the ruins of which can still be seen. Built by the Emperor Henry IV between 1065 and 1069, destroyed by the Saxons, 1074, rebuilt by Frederick Barbarossa as imperial palace and fortress, it was pulled down 1650-54. In modern times, Harzburg was famous for its horse races. The compact between the Deutschnationale (Conservative) party and the Nazis, paving the way for Hitler, was made here, 1929. Pop. (1935) 6,950.

Hasa or El Hasa. Prov. of Arabia. It lies on the W. side of the Persian Gulf, a low-lying plain 350 m. long, bounded N. by Kuwait, whose sheikh is independent under British protection, and S. by the peninsula of Qatar. Off the coast are the Bahrain Islands (q.v.). Before the First Great War the Turks claimed the sovereignty of Hasa, but in 1914 it was taken by Ibn Saud and came under the sovereignty of Arabia. The capital is Hofuf. pop. 20,000. Dates, rice, cotton, and indigo are grown; camels are bred. Area, 31,000 sq. m. Pop. (est.) 150,000.

Hasan (625-669) AND **HUSSEIN** (629-680). Sons of Ali, adopted son of Mahomet and Fatima, the Prophet's daughter. After their father had been fatally stabbed in the mosque at Kufa, 661, the

Harwich, Essex. In the foreground is the Parkeston Quay extension from which travellers and merchandise leave for Hook of Holland and other Continental ports

brothers lived in retirement at Medina. Hasan is believed to have been poisoned by his wife. Hussein, who married a daughter of Yezdigerd, the last Sassanian king of Persia, was slain in battle at Kerbela, when on his way to respond to a popular call to the caliphate. The brothers are venerated by the Shiites as martyrs. *See* Ali; Mahomedanism; Shiites.

Hasdrubal OR **ASDRUBAL**. Carthaginian soldier. Left in Spain by his brother Hannibal (*q.v.*), when the latter set out on his expedition against Rome in 218 B.C., Hasdrubal carried on the war against the two Scipios, whose object it was to prevent him from reinforcing Hannibal. In 208 he crossed the Pyrenees, and in 207 the Alps, and reached Italy with his army. It was defeated, however, at the battle of the Metaurus. Hasdrubal himself was killed, and the disaster was made known to Hannibal by the throwing of his brother's head into his camp.

The name of Hasdrubal was borne by several other eminent Carthaginians, the most distinguished of these being the son-in-law of Hamilcar Barca (*q.v.*). As commander of the Carthaginian forces in Spain, he was responsible for the treaty fixing the boundary between the Carthaginian and Roman territory. *See* Carthage.

Hase, **KARL AUGUST VON** (1800–90). German Protestant theologian. Born at Steinbach, Saxony, Aug. 25, 1800, he was educated at Leipzig and Erlangen. He was tutor at Tübingen, 1823, and after being a political prisoner for ten months, during which period he wrote a novel, *Die Proselyten*, 1827, he went to Dresden. In 1828 he became professor of philosophy at Leipzig, and was during 1830–33 professor of theology at Jena, where he died Jan. 3, 1890.

He was the author of numerous works on theological questions, church history, ecclesiastical law, etc. His *Life of Jesus* first appeared in 1829, reached a 5th ed. in 1865, was rewritten in 1876, and translated into English in 1881. His *History of the Christian Church*, 1834, reached a 12th edition in 1900, and appeared in English in 1855. He also wrote a handbook of Dogmatics, 1826, a *Life of S. Francis*, 1856, a book on Protestant polemical theology, 1863, a *Life of S. Catherine of Siena*, 1864; lectures on Church History, 1880.

Haselden, **WILLIAM KERRIDGE** (b. 1872). A British cartoonist. Born at Seville, Spain, he began his career as a clerk at Lloyd's,

London, but devoted his leisure to sketches and caricatures for publication. In 1904 he was appointed cartoonist to the *Daily Mirror*, and worked in that capacity until 1940. He was a pioneer in the art of the social cartoon, as in that of expressing pictorial humour in a minimum of lines. For many years he also drew caricatures to illustrate the theatrical reviews in *Punch*. He is chiefly remembered for his Big and Little Willie, humorous representations of the German kaiser and crown prince, during the First Great War.

Haselrig, **SIR ARTHUR** (d. 1661). English Parliamentarian. He was the eldest son of Sir Thomas Haselrig, Bart. (d. 1629), of Noseley, Leicestershire, and was one of the Five Members whose attempted arrest precipitated the Civil War. He became prominent among the

Haslar Hospital, Gosport. The main entrance

Haslar Hospital. Royal Naval hospital at Gosport, Hants. It was opened in 1754. The buildings and grounds cover 57 acres. Haslar was once the largest brick building in the world, and it still remains Great Britain's principal naval hospital, with accommodation for 1,116 patients. It is administered by a surgeon rear-admiral. The library and museum were destroyed by an air raid, Jan. 10, 1941.

Haslemere. Market town and parish of Surrey, England. It is 13 m. from Guildford and 43 m. from London, with a rly. station (Southern region).

It stands in a valley between Blackdown Hill and Hindhead; around is some of the finest scenery in Surrey. There is an old church dedicated to S. Bartholomew, and an educational museum. Haslemere was a town at the time of the Domesday Book, and from 1582 to 1832 sent

Haslemere, Surrey. The High Street, looking north

Puritans, was a firm upholder of the parliament, and opposed Cromwell's protectorship. In 1647 he was governor of Newcastle. Imprisoned in the Tower on the Restoration, he died there, Jan. 7, 1661. The name is variously given as Hesilrige and Haslerig.

Hashimite Kingdom OF JORDAN. Official name, adopted 1949, of the country known from 1926 as the kingdom of Transjordan (*q.v.*).

Hashish (Arab., herbage). Confection of *Cannabis indica*, or Indian hemp. Made from the dried leaves and small stalks of the plant, it is a narcotic drug which is smoked, drunk, or eaten. It is classified as a dangerous drug. The word assassin is derived from hashish. *See* Cannabis; Hemp.

two members to Parliament. In 1887 Prof. Tyndall came here to live, and soon a number of literary and other professional people made it their home. Near is Aldworth, the residence of Tennyson and where he died. Pop. 4,340.

Haslingden. Mun. bor. and market town of Lancashire, England. It is 19 m. N.W. of Manchester, with a rly. station. Cotton silk, and woollen goods are manufactured, and there are also stone quarries and iron foundries. Accrington and Rawtenstall supply electricity in bulk for both lighting and power purposes. Water is obtained from Irwell valley water board, of which the council is a constituent member. Pop. 14,000.

Hassall, JOHN (1868-1948). British poster designer and book illustrator. Born at Walmer, and

Hassall

educated at Heidelberg, he became a farmer in Manitoba; then studied art at Antwerp, and at Julian's, Paris, 1891-94. He excelled in posters, book jackets, and children's books. He also produced many

humorous drawings in black-and-white. His bold outlines, simple humour, and unusual signature became well-known to the man in the street. He died March 8, 1948.

Hassan. District, subdivision, and town of India, in the state of Mysore. It is traversed by the W. Ghats and the Hemavati river. Coffee and cereals are raised for export. The minerals include feldspar, kaolin, and quartz. Scattered throughout the district is a large number of archaeological relics. Hassan, the capital of the district, is 64 m. N.W. of Mysore. Area of district, 2,666 sq. m. Pop. district, 627,718; town, 14,596.

Hassan. Drama in five acts by J. E. Flecker. Though the author died in 1915, it was not published till 1922, and was first presented at His Majesty's Theatre, Sept. 20, 1923. It tells of the rise of a Baghdad confectioner to the court of Haroun Al Raschid, and how, sickened by the cruelty there and the wiles of a woman, he came to make the Golden Journey to Samarkand. The dialogue luxuriates in imagery and exquisite lyrics are interspersed. Henry Ainley gained a triumph as Hassan the confectioner. Incidental music was by Delius. In later years the play was broadcast several times.

Hassanein, SIR AHMED MOHAMED PASHA (1889-1946). Egyptian court official and geographer. Born Oct. 31, 1889, at Cairo, he was educated at the Royal School of Law, Cairo, and Balliol, Oxford. Attached to the staff of Gen. Sir John Maxwell, c.-in-c. Egypt, 1914-16, he later made several journeys of exploration in the N. African desert, discovering the oases of Arkenu and

Owenat, 1922-23, and gaining the founder's medal of the R.G.S., 1924, the gold medal of the French geographical society, 1928, and other similar honours. He became first chamberlain to King Fuad I, 1925, and was governor of the royal household from 1936. He was also a notable fencer, representing Egypt at the Olympic games, Antwerp, 1920. He was killed in a motor accident at Cairo, Feb. 19, 1946.

Hassan Ibn Sabbah (d. 1124). Persian sectary. Son of a prominent member of the Shiite sect in Khorasan, he had to leave Persia and later Egypt after unsuccessful political intrigues at the courts of Malik Shah and the caliph Mostansir respectively. His strong personality attracted a number of followers, to whom he taught his peculiar doctrines, and he thus founded the powerful Society of Assassins (*q.v.*). In 1090 he established their headquarters at Alamut, a strong mountain fortress of Persia, whence he came to be known as Sheikh-al-Jebel, or the Old Man of the Mountain. Among his victims were his own sons.

Hasse, JOHANN ADOLF (1699-1783). German composer. Born at Bergedorf, near Hamburg, March 25, 1699, he studied singing in Naples and sang for a time as a

Hastings, Sussex. Carlisle Parade and the pier and beach. Left: ruins of the castle which overlooks this historic coast town

much church music, and for many years lived at Dresden as director of the opera belonging to the elector Augustus of Saxony. After Handel, he is the leading representative of Italian opera before Mozart. He died Dec. 16, 1783.

Hasselt. A town of Belgium, capital of the prov. of Limbourg. It lies in flat country on the river Demer, 16 m. W.N.W. of Maastricht. It is an important rly. centre, and has small tobacco, distilling and brewing industries. A septennial kermesse on Assumption Day has several features of interest to students of folklore. At Hasselt the Belgians were defeated by Dutch troops on Aug. 6, 1831. Its railway yards were a target for Allied air attack during the German occupation in the Second Great War. It was liberated by American troops, Sept. 10, 1944. Pop. 26,828.

Hasselt is also the name of a small town in the Dutch province of Overijssel, lying 5½ m. W. of Zwolle. It was liberated by the 1st Canadian army in the first week of April, 1945.

Hastinapur. Ruined city of the United Provinces, India, in Meerut district. It stands on the Burh Ganga, or former bed of the Ganges, 22 m. N.E. of Meerut, and was the capital of the great Pandava kingdom. It was demolished by a flood.

Hastings. Co. and parl. bor., market town, and seaside resort of Sussex, England. It is also the premier Cinque Port. The bor. includes St. Leonards. It is 62 m.

S.E. of London by railway.

There is a fine promenade extending three m. from old Hastings to the W. end of St. Leonards. Several pleasure grounds include Alexandra Park, 100 acres in extent.

The objects of interest include the remains of a castle built on West Hill soon after 1066, the churches of S. Clements (13th

century), All Saints (15th century), and some underground caves. Ecclesbourne Glen and Fairlight Glen are near. S. Mary's R.C. Church was built 1884 by Coventry Patmore in memory of his wife. The Brassey Institute contains an excellent library; a school of art is housed in the building. There is a town

Hastings arms

Battle of Hastings. Map of the surrounding country showing the routes followed by Harold and William. Inset, plan of the battlefield

hall, museum and art gallery, grammar school, technical schools, hospitals, etc. Many amenities are provided for visitors, catering for whom is the town's chief industry. At the E. end between the East and West Hills lies the fishing quarter, and there is a fish market. Hastings was a town in Anglo-Saxon times, and in the early Middle Ages was a flourishing port. It was made a borough in 1539, and returned two M.P.s 1366 to 1886, since when it has sent one. Pop. est. 61,990.

Hastings. Town of North Island, New Zealand. It is 12 m. by rly. S.W. of Napier, in Hawke's Bay dist., and has refrigerating and fruit-canning works. Pop. 20,330

Hastings, BATTLE OF. Fought Oct. 14, 1066, between the Normans under William, called after this victory the Conqueror, and the English under Harold II (*q.v.*). It took place on a hill, to which a later writer gave the name of Senlac, about 6 m. from Hastings.

Harold had just beaten the Norwegians at Stamford Bridge when he heard that William had landed at Pevensey. Rapidly marching southwards, he chose a position on which to meet the invader. His own bodyguard, the huscarls, men heavily armed with axe and shield, were the nucleus of his army, but he had also with him men of the fyrd, imperfectly armed and trained. All fought in a number of massed groups, and around each was a ring of stakes driven into the ground to impede horsemen.

The archers, the footmen, and finally the horsemen attacked the English, but could make no im-

pression on their closed ranks. Then some of Harold's auxiliaries left their places to follow a few who were routed, and William ordered some of his men to feign flight. The English ran down the hill after the Normans, who turned round and cut them to pieces. But on the hill the huscarls stood firm around their king. As night came on the archers began to shoot into the air. Then, with the arrows falling about their faces, the English gave

way, and the Normans got in among them. Fighting to the last, Harold and his two brothers were killed, and his army was totally destroyed.

Hastings, BARON. English title, now borne by the family of Astley. Sir John Hastings, a great man in the time of Edward I, was the first holder. In 1290 he claimed the crown of Scotland. Laurence, the 3rd baron, was made earl of Pembroke in 1339. John, the 3rd earl, was killed in a tournament in 1391, and the barony remained in abeyance until 1841. It was then given by the House of Lords to a descendant of the Hastings family, Sir Jacob Astley. He ranked as the 16th baron, and from him the present holder is descended. The family seat is Melton Constable, Norfolk.

This barony must be distinguished from another barony of Hastings, one held by the marquess of Hastings until 1868. It then fell into abeyance between the sisters of the last marquess, but in 1920 was claimed by the countess of Loudoun. See Loudoun, Earl of.

Hastings, MARQUESS OF. British title borne by the family of Rawdon-Hastings from 1817 to 1868. The first holder was the soldier, Francis, earl of Moira, who was made Viscount Loudoun, earl of Rawdon and marquess of Hastings in 1817. He married Flora Campbell, in her own right countess of Loudoun, and their son, Francis George (1808-44), inherited titles from both parents. The 3rd marquess was his son, Paulyn, and the 4th was another son, Henry. The latter gained a good deal of notoriety on the turf and in society,

dying without children, Nov. 10, 1868. The titles that had come down from his grandfather, including the marquessate of Hastings, then became extinct, but those of his grandmother passed to his sisters. In addition the marquess had inherited the baronies of Botreaux, Hastings, Hungerford, and Grey de Ruthyn. The estates passed to his elder sister, the countess of Loudoun. The seats were Donington Hall, Leicestershire, and Loudoun Castle, Ayrshire. See Loudoun, Earl of.

Hastings, FRANCIS RAWDON-HASTINGS, 1st MARQUESS OF (1754-1826). British soldier and admin-

After M. A. Shea, R.A.

istrator. Born Dec. 9, 1754, he was the son of Sir John Rawdon, an Irish baronet, afterwards made earl of Moira. Educated at Harrow and University College, Oxford, he entered the army in 1771.

He served in the American War of Independence, commanding a volunteer force of Irishmen, and in 1783 was made a baron. In 1793 he became earl of Moira.

In 1813 Moira was appointed governor of Bengal and c.-in-c. India. He founded Singapore city, 1819. He was made marquess of Hastings in 1817. Hastings resigned in 1821, but did not leave India until 1823. His policy was disliked by the E. India Co. From 1824-26 he was governor of Malta, and he died Nov. 28, 1826. See Life, Ross of Bladensburg, 1893; Private Journal, ed. Marchioness of Bute, 1858.

Hastings, JAMES (1855-1922). A Scottish divine and theological writer. He started The Expository Times; compiled a Dictionary of the Bible, 5 vols., 1898-1904, single vol. 1908; Dictionary of Christ and the Gospels, 2 vols., 1906-7; and Encyclopedia of Religion and Ethics, vols. 1-10, 1908-19. He died Oct. 15, 1922.

Hastings, SIR PATRICK (b. 1880). British lawyer. Educated at the Charterhouse, he began life as a mining engineer, was called to the bar, Middle Temple, in 1906, and became a K.C. 1919. He was Labour M.P. for Wallsend, 1922-26, and attorney-general, Jan.-Nov., 1924. He was knighted 1924. Later he returned to the bar. He wrote several plays, The River, 1925; Scotch Mist, 1926; Escort, 1942.

Hastings, WARREN (1732-1818). A British statesman. Born at Churchill, Oxfordshire, Dec. 6,

Warren Hastings
After T. Kettle

1732, he was the son of Peniston Hastings, the rector of the parish. His mother died a few days after his birth, his father went abroad, and the child was looked after by his grandfather, another Peniston Hastings. He was educated at Churchill, at a school at Newington Butts, and finally at Westminster, where he was a king's scholar. In 1750 he became a writer in the service of the E. India Co.

In 1756 Hastings joined the force that under Clive recovered Calcutta from Suraj ud-Dowlah. He served Clive well in some diplomatic work, and after Plassey was made president at Murshidabad, where he worked in close harmony with his chief, and did good service to the E. India Company. In 1761 he became a member of the council of Bengal, and, returning to Calcutta, he passed three years mainly in disputes with his colleagues. He resigned in 1764.

Governor-General of India

After four years in England, Hastings returned to India in 1768, as second member of the council of Madras, remaining there until transferred to a like position in Bengal. In 1772 he became president of the council of Bengal, and in 1773 he was named governor-general of India under Lord North's regulating Act. The government was controlled by a council of five, and three of these members, led by Sir Philip Francis, habitually thwarted the governor-general. Despite this antagonism, Hastings reorganized the administration of Bengal, laying the foundations of the Indian civil service. The blunders of the British authorities in Bombay and Madras forced him into wars with the Marhatta powers, and with Haidar Ali; the boldness with which he faced these emergencies saved the British power in India from destruction. After the departure of Francis, the council acted somewhat more harmoniously, and Hastings had a less difficult time in the years that preceded his recall in 1785.

In the straits to which he was reduced, by want of funds and lack of effective support from the Com-

pany, Hastings adopted methods which would have been a matter of course for Orientals, but which Europeans cannot employ without risk of censure. Public opinion in England was stirred against him by his chief enemy, Francis, whom he had wounded in a duel in Aug., 1780. Soon after his return he was impeached. The trial, which began in 1788, aroused tremendous interest. It lasted over seven years, the chief charge against Hastings being that he had hired out British troops to exterminate the Rohillas, had robbed the begums of Oudh, and was responsible for the judicial murder of Nuncomar. The house of lords unanimously acquitted him on every charge, and the verdict of successive governors-general was emphatically in his favour. He was ruined financially by the trial, but the Company made tardy reparation by conferring a pension on him, and before his death the house of commons acknowledged formally his distinguished services to Britain. He died at Daylesford, Aug. 22, 1818, and was buried in the church there. *See* India.

Hastings Beds. Series of sandstones, sands, clays, and layers of limestone, forming the lower part of the Wealden series in Kent, Surrey, and Sussex. Their greatest thickness is 1,000 ft., and they contain fossil remains. *See* Cretaceous.

Hat. Covering for the protection or adornment of the head. Its origins are unknown, but hats made from straw or grass or from the skins of animals have been worn by primitive peoples. Hats made from grasses and rushes were worn in Egypt in very early times, and the people of ancient Greece and Rome wore something near the modern hat, a low crowned, wide brimmed felt hat tied under the chin, the brim distinguishing a hat from a cap (*q.v.*; *see also* plate f. p. 1705). Hats seem to have been introduced into England some time during the 12th century. Worn at first as a protection from the elements, hats gradually became an item of personal adornment.

During the 14th and 15th centuries, trades and professions adopted special types of hat. For

instance, in the 14th century, most professional men wore tall felt hats with upturned brims. This type of hat was worn well into the 15th century, when the flat hat, usually of velvet, and popular in Tudor times, was introduced; the best known example is that in Holbein's portrait of Henry, VIII. Then came hats trimmed with plumes and other adornment; later the high crowned, wide brimmed Puritan hat introduced in the early 17th century; and in the time of Charles II the big low crowned hat with a profusion of feathers worn by the Cavaliers.

The clergyman's hat has a long ancestry, and the hats worn by bishops and deans are survivors of a bygone fashion. The red hat of the cardinal was introduced about 1250 by Innocent IV, its colour symbolising the cardinals' willingness to shed their blood for the Church.

HAT MAKING. Most hats in civilized countries are of felted fur or of straw, carefully shaped to suit prevailing fashion by means of wooden or metal blocks.

Composition of Felt Hats

Felt hats are made from a mixture of rabbit fur or wool, the better qualities being made from fur, which is cut into small particles and dropped into a forming machine, the interior of which is a spinning cone. This is fitted with strong suction pipes, upon which acidulated water is sprayed, these two processes causing the hairs to felt together and form a V-shaped hood, which is removed from the cone, and gradually shrunk with boiling water and rotating rollers until the felted fur becomes workable. Shellac is then added in varying degree according to the type of hat being made. Dyeing follows, after which the felt hood is pulled into the desired shape after it has been softened with steam. The shaped hood is dried on the block in an oven, and the hat is then ready for trimming.

The felt hat industry in Great Britain came to be centred principally in the N. of England, at Stockport, Denton in Lancs, and Atherstone, Warwickshire. Later, Luton, Beds, added felt to its straw hat industry.

Hats made of straw were introduced in England quite early, but their modern popularity dates only from about 1850. Straw is an obvious choice for hat-making: not only is it a common substance, but it is extremely light, a hat of closely plaited straw weighing 2½-3 oz. Straw is normally brittle,

Hat. Stages in hat manufacture at Luton, Beds, where the industry has been carried on for nearly two centuries. 1. Forming a felt hood on the cone of a carding machine. 2. Tip stretching to shape felt hat crowns after they have been softened by steam. 3. Finishing wool hoods. 4. Steam pressing at a blocking machine

but when slightly moistened it can be shaped easily; it can be readily bleached or dyed, and is pleasing in its natural colour. Straw hat making in Great Britain was localised in the S. Midlands, Luton and Dunstable, Beds, being centres of the industry. At first the plait used came from the villages near Luton; but later straw plait and straw hoods (for shaping) were imported from many parts of the world, including China, the Philippines, Italy, and France, while synthetic copies and new designs were made in Swiss villages.

Blocks similar to those used in the manufacture of felt hats are used in straw hat making. The straw is machine sewn to form a hood which is stiffened with a mixture of gelatine and water, and blocked to the shape desired. Sometimes hydraulic presses are used for this purpose. Paris, the great fashion centre, remains the source of inspiration of shape and style.

H. W. BARRATT

Hatay, THE. Vilayet of Turkey. At the N. end of the Levant coast, and bounded on the E. and S. by Syria, it has an area of 1,939 sq. m. The chief towns are Antioch and Alexandretta (*q.v.*). Pop. 255,336.

Hatch. Opening on the upper deck of a ship giving entry to the hold. When not in use, the hatch is covered with planks secured to the coaming by battens. The term hatch is also used for a stop-plank or flood-gate falling in ver-

tical grooves in a frame and supporting a head of water in a weir. Another kind of hatch is the small service door between kitchen and dining-room through which food and dishes are passed.

Hatchment. Lozenge-shaped panel used to display the armorial bearings of a deceased person. If erected to commemorate an unmarried person, a widower, or a widow, the whole of the panel surrounding the armorial shield would

Hatchment in heraldry

be painted black; if for a husband or a wife, the arms would be impaled, and half the hatchment would be painted black and half white, the black being on the dexter or sinister according to whether the deceased was the husband or the wife. Hatchments were formerly affixed to the residences of deceased persons and also carried in the funeral procession, to be subsequently hung up in the church. Many country churches in England still retain hatchments of local families. The word is said to be a corruption of achievement (*q.v.*). See **HERALDRY**.

Hatfield or **BISHOP'S HATFIELD.** Parish and market town of Hertfordshire, England. It stands on the Lea, 17½ m. N. of London, on

the railway and the Great North road, is secluded, especially since the construction of the Barnet by-pass road, and remarkable for its picturesque old houses and fine church. There is an aerodrome, with an aircraft factory and technical school. Known as Heathfield in Saxon times and as Hetfelle in Domesday, the manor was given by Edgar to the monks of Ely, and here, 1108-1538, the bishops of Ely had a palace, parts of which, including the banquetting hall and a gatehouse, remain. The manor was conveyed in 1538 by Bishop Goodrich to Henry VIII in exchange for lands in Cambridge, Essex, and Norfolk. Edward VI, who lived here occasionally before coming to the throne, conveyed it to his sister Elizabeth, who here held her first council. It was given in 1603 by James I to Robert Cecil, 1st earl of Salisbury, in exchange for Theobalds (*q.v.*), near Cheshunt, and it has remained since in possession of the Cecil family.

The church of S. Etheldreda dates from Norman times, and has two noteworthy chapels, one containing a recumbent effigy of Robert Cecil (d. 1612), and the other monuments of the Brocketts and Reades, of Brocket Hall, 3 m. from Hatfield, where at different times Melbourne, Palmerston, and Mount Stephen resided. Pop. 11,204. (See **WELWYN**.)

Other Hatfields include one in Worcestershire, 4½ m. south of

Hatfield House. South front of the Hertfordshire mansion built by the 1st Earl of Salisbury, 1611

Worcester. Hatfield Broad Oak, Hatfield Regis, or King's Hatfield, in Essex, $5\frac{1}{2}$ m. S.E. of Bishop's Stortford, is the site of a 12th century Benedictine priory. Hatfield Forest is a parish $2\frac{1}{2}$ m. N.W. of Hatfield Broad Oak; Great Hatfield is in the East Riding of Yorkshire; Hatfield Heath, a parish and village of Hatfield Broad Oak; Little Hatfield, in the East Riding of Yorkshire; and Hatfield Peverel, an Essex village $2\frac{1}{2}$ m. S.W. of Witham, has remains of a 12th century Benedictine priory.

Hatfield Chase. Dist. of Yorkshire (W.R.). Composed of peat moss, it lies between the rivers Don, Idle, and Thorne. Originally, as the name suggests, deer were common in parts of it, while elsewhere there were fish. In 1626 it was drained by Cornelius Vermuyden, and most of its 180,000 acres is now under cultivation. The village of Hatfield, 7 m. from Doncaster on the Don, has an interesting church, S. Lawrence. The manor house here was once a royal residence, used when the kings hunted in the chase. Hatfield is supposed to be the Heathfield at which Penda, king of Mercia, gained a victory over the Northumbrians in 633. The railway station is Stainforth.

Hatfield House. Seat of the Cecils, in Hertfordshire, England. Built of red brick and Caen stone, and one of the most notable examples of Jacobean architecture in the kingdom, it stands in the parish of Hatfield or Bishop's Hatfield. Erected by Robert Cecil, 1st earl of Salisbury, it was completed in 1611. Part of the old palace of the bishops of Ely is near by. The house stands in a park measuring upwards of 10 m. in circumference. In the park is preserved the oak tree under which, according to tradition, Elizabeth was seated when she received news of her accession to the throne.

In shape a parallelogram, with two wings on the S. front, from designs by John Thorpe, the building was restored by the 6th earl. The west wing was almost tot-

ally destroyed in a disastrous fire, Nov. 27, 1835, when the widow of the 1st marquess lost her life at the age of 85, but it was soon rebuilt. Notable features are the hall, grand staircase, long gallery, King James's room, armoury, library, summer and winter dining-rooms, drawing-room, and chapel.

In Hatfield House is preserved a remarkable collection of MSS. and state papers, some of which have been published by the Historical MSS. commission, many relics of Tudor and Jacobean times, and a large number of historical portraits, including that of Queen Elizabeth by Zuccaro. Much interest attaches to a genealogical tree, 42 ft. long, drawn up for Elizabeth, tracing her descent back to Adam. In the grounds an early tank of the First Great War, with a suitable inscription, commemorates the secret trials held there in 1915 of the prototype Mark I tank. Outside the gates is a bronze statue, by George Frampton, of the 3rd marquess of Salisbury, erected by Hertfordshire friends and neighbours, Oct. 21, 1906. See Cecil.

Hathaway, ANNE (1556-1623). Maiden name of the wife of William Shakespeare. She was daughter of Richard Hathaway, yeoman farmer of Shottery, near Stratford-on-Avon, and married Shakespeare Nov. 28, 1582, being eight years older than her husband.

Anne Hathaway's Cottage at Shottery, Stratford-on-Avon, Warwickshire. It is open to the public and receives many visitors in the summer months

Hathor OR **ATHOR** (dwelling of Horus). Ancient Egyptian goddess. A sky-deity, cow-headed or cow-horned, she was associated with the rising and the setting of the sun, and was the great mother of the early dynastic people. In

1906 Naville found in a Deir el-Bahri shrine a superb sandstone cow, now at Cairo. This life-size figure, of the 15th century B.C., was worshipped as Hathor. The goddess represented in human form, with horned disk, was sometimes identified with Greek Aphrodite (*q.v.*). The sycamore was sacred to her, since she was one of the deities of the dead. The seven Hathors were benignant fates. See Dendera; Egypt; Isis.

Hathras. A subdivision and town of the United Provinces, India, in Aligarh district. The district is extensively cultivated. Hathras town is a rly. junction and an industrial and commercial centre. Area, 290 sq. m. Pop., subdivision, 246,784; town, 46,994.

Hatschek, EMLI (1869-1944). British scientist. Hungarian by birth, Hatschek spent his childhood and youth in Vienna, where he studied at the Polytechnicum. Coming to England in 1888, he was naturalised in 1900. An excellent linguist and a man of encyclopedic knowledge, his reputation as a brilliant and original experimenter and an authority on colloid science dated from the start of his investigations into the properties of colloids. His work in this sphere touched on chemistry and biology as well as physics. He carried on a regular course in colloid chemistry at the Sir John Cass Institute, 1911-35. Author of *The Physics and Chemistry of Colloids*, *The Viscosity of Liquids*, and other technical works, he died in London, June 4, 1944.

Hatshepsut, HATASU, HAT-SHEPSET, OR HATSHOPSITU. Egyptian queen of the XVIIIth dynasty, about 1500 B.C. She was for 35 years co-regent with her father, Thothmes I, her half-brother and consort, Thothmes II, and Thothmes III. She built a terrace temple at Deir el-Bahri (*q.v.*).

Hatteraick, DRK. Dutch smuggler in Scott's novel, *Guy Mannering*, who fears neither "dog nor devil." He is an associate of Gilbert Glossin, whom he strangles and then hangs himself.

Hatteras. Cape of N. Carolina, U.S.A. It is known as the graveyard of the Atlantic, its sandy beach being strewn with the

remains of ships wrecked on shoals. The easternmost point of the state, it is separated from the mainland by Pamlico Sound. The Gulf Stream flows past 20 m. out. A 166-ft. lighthouse on the cape has a revolving beacon visible for 19 m. and the Diamond Shoals lightship, anchored 13 m. off the tip, has a beacon visible for 14 m. A recreational area belonging to the federal government includes a waterfowl refuge. Hatteras Inlet, abounding in tarpon, marlin, swordfish, and dolphin, is famous for deep sea fishing. Many of the 500 inhabitants of the community of Hatteras speak with a Devon accent, ascribing it to their supposed descent from shipwrecked English sailors.

Hattiesburg. City of Mississippi, U.S.A. Co. seat of Forrest co., situated at the confluence of the Bowie and Leaf Rivers, 115 m. N.N.E. of New Orleans, it is served by rlys. and an airport. In the midst of an agricultural region, it manufactures metal and chemical products, piping, boilers, castings, roofing, ventilators, tiles, harness, fertilisers, and mattresses. Founded in 1881, it became a city in 1895. Pop. 21,026.

Hattin. Village of Palestine, the Ziddim of the O.T. It lay 5 m. N.W. of Tiberias, and was the scene of the final overthrow of the Crusaders by Saladin in 1187.

Hatto. Name of two archbishops of Mainz. Hatto I became abbot of Reichenau and in 891 archbishop of Mainz. As head of this diocese he took a leading part in German politics. He was a trusted counsellor of King Arnulf, being afterwards ruler of Germany for his son, Louis the Child. He helped Conrad I to secure the throne after the death of Louis, and for some reason brought upon himself the dislike of the Saxons and their duke, Henry the Fowler. He died May 15, 913.

Hatto II, archbishop 968-970, is the person associated with the legend of the Mouse Tower at Bingen, the story being that he was devoured by rats or mice. At one time Hatto I was regarded as the victim, but later research makes the tale refer to Hatto II, who had a reputation for oppressing the poor. *Consult* Curious Myths of the Middle Ages, S. Baring-Gould, 1897.

Hatton, Sir Christopher (1540-91). English courtier. Born at Holdenby, Northants, he was educated at S. Mary Hall, Oxford, and admitted to the Inner Temple in 1559. His prowess in a tourney

attracted the notice of Queen Elizabeth, who made him a courtier. She showered favours upon him, and he entered parliament.

Sir C. Hatton,
English courtier

Elizabeth employed him in the trials of Babington and Mary Queen of Scots, and eventually caused him to be made lord chancellor in 1587, to the disgust of the legal profession. His shrewdness enabled him to acquit himself with moderate success, and he retained the office until his death, Nov. 20, 1591. *Consult* Sir Christopher Hatton: Queen Elizabeth's Favourite, E. St. J. Brooks, 1946.

Hatton Garden. A London thoroughfare. Named after Sir Christopher Hatton (*v.s.*), lord chancellor to Queen Elizabeth, who lived at Hatton House, it connects Holborn Circus with Clerkenwell Road, and is the centre of the diamond trade in London. Wycherley the dramatist visited the countess of Drogheda here before his marriage to her. Mazzini lived at No. 5. Mirabeau was also a resident.

Hauberk (O.H.G. *Hals*, neck; *bergan*, to protect). Coat of chain mail or closely linked iron or steel

Hauberk. Coat of chain mail as worn by John of Gaunt

riings. At first probably little more than a gorget (*q.v.*), it developed until it sometimes reached to the wearer's knees—and had sleeves reaching nearly to the wrists. The Norman hauberk was put on over the head like a modern sweater; other forms were fastened up the front. The hauberk fell out of use in the 15th century. *See* Armour.

Hauch, HANS CARSTEN (1790-1872). A Danish poet. Born at Fredrikshald, Norway, May 12, 1790, in 1846 he was appointed professor of northern literature at Kiel. He left the country during the Holstein revolution in 1848, and in 1851 became professor of aesthetics at Copenhagen, holding the post until his death. He died in Rome, March 4, 1872. Hauch wrote several historical tragedies, many lyrics and romances. An edition of his works was published at Copenhagen, 1873-75.

Hauff, WILHELM (1802-27). A German poet and novelist. He was born at Stuttgart, Nov. 9, 1802, and having studied at Tübingen, acted as tutor for a couple of years. He became editor of *Das Morgenblatt* in his native town in Jan., 1827, but died Nov. 18 the same year. In his short life he wrote much of lasting excellence, notably his three series of Märchen (Fairy Tales), 1826-28; Lichtenstein, a Württemberg romance in the manner of Scott, 1826; *Memoiren des Satan* (Memoirs of Satan), 1826-27, rich in humour; and *Novellen* (short stories), 1828.

Wilhelm Hauff,
German poet

Haugesund. Seaport of Norway, in the amt of Rogaland. It stands on the W. coast, near the N. extremity of the island of Karmö, 60 m. due S. of Bergen. The port carries on a thriving trade, mainly in timber and fish. It was to Haugesund that a German prize crew brought the U.S. steamer *City of Flint* (*q.v.*) in 1939. Pop. 18,119.

Hauksbee, FRANCIS (d.c. 1713). English scientist. An early experimenter in electricity, he discovered that an "electric light" could be produced by rubbing amber, glass, and wool, and invented the first machine, consisting of a glass cylinder rubbed by the hand, for the production of electricity. He also introduced improvements in air-pumps, giving his name to the Hauksbee pump. He was made F.R.S. in 1705; his *Physico-Mechanical Experiments touching Light and Electricity*, afterwards translated into French and Italian, appeared in 1709.

Haulage. Term used for the transport of material. In its broader sense of haulage over road or railways, it is discussed

under Transport; Railways. In mining (*q.v.*) haulage is most important; upon its efficiency the success of an enterprise may depend. The primitive method of removing material from a mine to the place where it is to be deposited for treatment consisted in loading it on to the backs or shoulders of men or women, in some kind of container, and having it carried out. Later mechanical methods of increasing complexity developed into the elaborate haulage plants of the gold and diamond mines of the Transvaal, for example, which include the light railway, the standard railway, and the aerial railway or wire rope.

Haulage in a coal mine is main and secondary or contributory, the latter consisting in transporting the coal from the working face to the main haulage ways; the former in conveying it to the foot of the shaft. In the main haulage, trains of trucks or tubs are drawn along rails either by horses, locomotives powered by compressed air, electricity, Diesel engine, etc., or by wire ropes operated from near the bottom of the shaft either electrically or by means of engines worked by compressed air. The tubs or trucks are of iron or steel or wood, and hold from 10 cwt. to 10 tons of coal, their size being determined by the character of the workings. In the direct haulage system, where the tubs are brought up an incline direct from the working face to the shaft, they are usually arranged to run back empty by their own weight on a single line of rails. Where the gradients are suitable, belt conveyors placed in series are often used.

Haulbowline. Island in Cork Harbour, co. Cork, Eire, S. of Cobh (*q.v.*). On Haulbowline Rock, at the mouth of Carlingford Lough, is a lighthouse, erected 1823.

Haunted House. The idea that houses and other places are haunted by the ghosts of the departed is very ancient, and common to nearly all nations. The usual ghost story describes various noises, together with the appearance of ghostly visitants, usually connected with some crime or tragedy that has been committed in the place. The majority of such tales are founded on careless and inaccurate observation, and the sounds and phenomena are explicable by material causation.

There are on record, however, well authenticated cases which cannot be put down to the imagination, the evidence for them being

as convincing as it well could be. Of several explanations proposed, the most probable appears to be that persons under strong emotion—as when meeting a violent death—may leave some kind of impression on their surroundings, one normally as imperceptible as the image on an undeveloped photographic plate which becomes apparent only when the plate is placed in the developer. So the alleged impression becomes apparent only to those who are psychic or peculiarly sensitive thereto. This would account for the fact that some persons—otherwise perfectly normal—are greatly given to experiencing these strange phenomena, while others never do so.

Byron's Testimony

Among houses at which supernatural appearances are said to have been observed is Mannington Hall, Norfolk, where Dr. Jessop, rector of Scarning, on Oct. 10, 1879, saw the figure of a man in an old-fashioned costume of clerical cut. Newstead Abbey is reputedly haunted by a Black Friar, presumably one of the Augustinian order expelled in 1539 when the property was sold to Sir John Byron. The poet Byron declared he had seen him, and that the appearance of the Friar foretold a death in the family. Incidentally, Newstead Abbey is considered unlucky to its possessors, a view founded on the belief, as expressed in Spelman's History of Sacrilege, that holders of what was once Church property are doomed to disaster.

Numerous instances have been recorded of movements of furniture and other disturbances which people living in a house have been unable to explain. The occurrences at Epworth parsonage, home of the Rev. Samuel Wesley, in 1716-17 were of this character. It was formerly supposed that such happenings were caused by malicious spirits, or poltergeists. Careful analysis has shown that they generally centre round a person, often a child at the age of puberty, who is physically or mentally abnormal. Whether the disturbances, for the most part senseless pranks, are due to subconscious trickery on that person's part, or to more unknown physical force remains matter for debate.

A circumstantial account of haunting is given in the book *The Alleged Haunting of B— House* (2nd ed. 1900), Ballechin House, Perthshire, being the mansion in question; while in its journal of Oct.-Nov., 1914, the society for psychical research published an

account of unexplained happenings—bells, voices calling, groans, visible and invisible presences—occurring during 1901-13 to the inhabitants and to visitors in a 100-year-old house in a Midland village which had no known previous history of haunting.

Ghosts have a kind of quasi-legal status in the sense that the owner of a house stated to be haunted may bring an action at law for "slander of title," and may recover damages, as in the case of the modern house called Hillside at Egham, occupied by Stephen Phillips in 1903. He left the alleged haunted house and forfeited the rent. In 1904 the owner brought an action against his late tenant and a morning newspaper, but the case was settled out of court for £200. In 1906 the Daily Mail was defendant in a similar action, when £90 damages was awarded; but judgement was reversed on appeal. The house was afterwards peacefully occupied.

Hauptmann, BRUNO RICHARD. An American criminal, of German birth. A carpenter by trade, Hauptmann achieved world-wide notoriety when he was tried in 1935 for the kidnapping and murder of the baby son of Col. Charles Lindbergh in March, 1932. Found guilty and sentenced to death, Feb. 1935, he was executed April 3, 1936. See Lindbergh Baby Case.

Hauptmann, GERHART (1862-1946). German dramatist. Born at Salzbrunn, Silesia, Nov. 15,

Gerhart Hauptmann,
German dramatist

1862, at the age of eighteen he became an art student at Breslau, and in 1883 went to Rome, where he hired a studio and dabbled in sculpture. His marriage in 1885 made him independent of earning a livelihood, and, having returned to Germany, he resumed his studies. In 1889 he began writing plays with *Vor Sonnenaufgang*, followed in 1890 by *Das Friedensfest: Einsame Menschen*, 1891. *Die Weber*, 1892, dealing with Silesian weavers, was his most popular success.

The first of these, by its outspoken attack on existing conditions and ways of thought, placed Hauptmann at the head of modern German dramatists. With an almost repellent naturalism and realistic depiction of the mean-nesses and ugly trivialities of

current life, he struck a new chord in contemporary literature and art. From 1892 his outlook broadened, and thenceforward his output was considerable and varied. His novels *Emanuel Quint*, 1910, and *Atlantis*, 1912, were powerful works. Recipient of the Nobel prize for literature in 1912, his works have been widely translated. His *Insel der grossen Mutter* appeared 1924. He kept aloof from the Nazi regime, his later works remaining unpub. until after his death, June 8, 1946, at Agnetendorf, Silesia.

Hauraki, GULF OF. Arm of the Pacific Ocean, on the E. coast of North Island, New Zealand. Protected by the Great Barrier Island athwart its entrance, it affords safe anchorage for the numerous vessels plying to the ports of Auckland and Thames. The southern extension of the gulf is known as the Firth of Thames. The Gulf of Hauraki contains a large number of islands, is 70 m. long and 42 m. broad.

Hauran, THE (Heb. *chauran*, the hollow land, from its many caves). District of Syria, anciently known as Auranitis. It lies E. of the Jordan, with loosely defined boundaries, but it forms the elevated plain, much of which is fertile, lying between the W. Hauran river to the W. and the Jebel Hauran (alt. 6,000 ft.) on the E. It is bounded N. by the Jaulan district S. of Damascus, and S. by the El Belka region. Among its 60,000 inhabitants are to be found colonies of Druses.

Hausa. Negroid people, mostly N. of the Benue and Niger rivers, Nigeria. Their culture, based on settled husbandry, handicrafts, and trade, advanced under Libyan impetus, and the adoption of Islam by the upper classes. Their political power was overthrown by the Fula chief Dan Fodio in 1810, but since the British occupation of Sokoto in 1903 their virile temperament has again emerged. There are vigorous colonies in Tunis and Libya. Walled towns, such as

Kano, indicate their superiority to the general negroid level. The Hausa stock, essentially peaceable, was easily dominated by the pastoral Fula. See *Negro*; *consult also Hausaland*; or *Fifteen Hundred Miles through the Central Soudan*, C. H. Robinson, 1897.

Hausa. Language spoken in Africa by 15,000,000 people of Mahomedan faith, whose original home appears to have been between Sokoto and Bornu. Easy to learn and having a written form, in modified Arabic characters, it has been adopted as the trade language from Lake Chad to the Guinea coast. It is generally considered to belong to the Hamitic family of languages, which include Egyptian (Coptic), Galla, and Berber. According to some, it is a Semitic tongue, but although the vocabulary contains a considerable Arabic element, it has no guttural sounds like Arabic 'Ain and Ghain, and trilateral roots, the characteristic feature of all Semitic languages, are wanting.

The literature consists mainly of religious hymns and war-like songs translated from the Arabic. Since the territory came under British protection Hausa has received considerable attention, and a readership in the language has been established at Cambridge. *Consult Dictionary of the Hausa Language*, Robinson, 4th ed. 1925.

Hauser, KASPAR (d. 1833). Wild boy of Nuremberg. He was found in the market place of that

Kaspar Hauser, wild boy of Nuremberg
From a contemp. print

city, May 26, 1828, dressed as a peasant, incoherent of speech and holding in his hand a letter professedly written by a poor labourer who said that the boy had been deposited at his door, 16 years before, by an unknown person. The boy declared that he had been brought up in strict confinement in a small cage, on a diet of bread and water, and that he had never seen the sun. At first he was imprisoned, but subsequently his education

was undertaken by the city and by Earl Stanhope, and eventually he became a clerk. He died at Ansbach, where he had been sent to be educated, Dec. 17, 1833, from a wound in the left breast, which, he said, had been inflicted by his early custodian. Whether he was impostor or victim has never been determined.

Haushofer, KARL (1869-1946). A German geographer and army officer. Born Aug. 27, 1869, at Munich, he was a professional officer in the Bavarian army, 1887-1918. As a captain on the German general staff, he was sent on a mission to Japan, where he remained until 1910. During the First Great War, rising to maj.-gen., he held a number of commands in the field. In 1921 he was appointed prof. at Munich of geography and of the "science" of geopolitics (*g.v.*), which he had invented and on which subject he founded a monthly in 1924. Through one of his students, Hess, he early came into close personal touch with Hitler, over whose policy he was believed to have had great influence. He published *Japan und die Japaner*, 1923; *Geopolitik des Pazifischen Ozeans*, 1925, and other works. He committed suicide with his wife, on March 13, 1946.

Hausmann, GEORGES EUGÈNE, BARON (1809-91). French administrator. Born in Paris, March 27, 1809, of German extraction, and educated in Paris, he entered the civil service, in which he made good progress. In 1849 he was made prefect

G. E. Haussmann

of Var, and in 1853 prefect of the Seine; in that capacity he became famous as the rebuilder of Paris. Much of the city was remodelled by him, his improvements including the planning of the Bois de Boulogne and of extensive boulevards. He also built bridges and provided Paris with a new system of water supply and sewerage. In 1870, owing partly to the expenditure he had incurred, he was dismissed. In 1877 he entered the chamber of deputies as Bonapartist deputy for Ajaccio, and he died in Paris, Jan. 11, 1891. The Boulevard Haussmann preserves his name; his *Memoirs* were published in 1890-93.

Hautboy, or Oboe (Fr. *hautbois*, high-wood; Ital. *oboe*; Old Eng. *hoboy*). Wood-wind instrument consisting of a conical tube, with side holes, as in the clarinet and flute. It is played vertically with a double reed, and it first "overblows" at the octave. The useful compass of the ordinary treble hautboy is

Hautboy,
military
model

and good players command a few semitones higher. The tone of the hautboy is reedy, with a peculiar nasal ring, very pleasant at its best, harsh when forced. The hautboys were among the earliest of wind instruments to secure permanent places in the stringed orchestra, and in the Handel period (1685-1759) they were used in masses, like the strings. The modern orchestra employs two or three, playing independent parts.

An alto hautboy, a minor third lower in pitch, is known as *oboe d'amore*; a tenor instrument, a fifth lower, is the *cor anglais*. Bach used the *oboe d'amore* a good deal, and also a tenor *oboe di caccia* of the same pitch as the *cor anglais*; but some authorities consider the *oboe di caccia* to

have been a high-pitched bassoon rather than a low-pitched hautboy. See Bassoon.

Haute-Garonne. Dept. of France. In the S.W. of the country, it is on the borders of Spain. Its area is 2,457 sq. m. In the S., where the Pyrenees enter it, the dept. is mountainous, having peaks over 10,000 ft. high; in the N. it is hilly. The chief river is the Garonne, which flows right through it; others are the Salat, Ariège, and Save. The Canal du Midi also runs through the dept. Much land is covered by forests, but in the lower areas the soil is fertile, and wheat, maize, and vines are grown, also fruit. Mineral springs abound, the chief being the Bagnères-de-

Luchon. Toulouse is the chief town, and the dept. is divided into four *arrondissements*. Pop. 512,260.

Haute-Loire. Dept. of France. In the south-central part of the country, its area is 1,930 sq. m. It includes the mts. of the Cévennes, Vivarais, Velay, and other ranges. The Loire is the chief river, others being the Allier, Borne, and Lignon. Much of the land is covered with trees; the soil is not very fertile, and the cereals grown are chiefly the coarser kinds, rye, oats, etc. Cattle, goats, etc., are reared and some coal is mined. Le Puy is the chief town, and the dept. is divided into three *arrondissements*. Before 1790 most of Haute-Loire was in the province of Languedoc. Pop. 228,076.

Haute-Marne. Dept. of France. It is contiguous with the depts. of Aube, Marne, Meuse, Vosges, Haute-Saône, and Côte d'Or, and was formerly part of the province of Champagne. Towards the S., the plateau of Langres and the Monts Faucilles form a hilly region, rising at points to over 1,600 ft. The river Marne rises in this part and flows in a northerly direction through the dept., other rivers being the Blaise, Rognon, Saulx, and the upper reaches of the Aube.

Cereals are widely grown, and the large woods, the vineyards, and grazing land are of importance. There are extensive industries in connexion with iron-foundries, cutlery, etc. The capital is Chaumont (*q.v.*), and the notable towns are Langres, St. Dizier, Wassy, Nogent and the watering-place, Bourbonne-les-Bains. There are three *arrondissements* in the dept. Area, 2,420 sq. m. Pop. 181,840.

Hautes-Alpes. Dept. of France. It is contiguous with the depts. of Savoie, Isère, Drôme, and Basses-Alpes, and is bounded on the E. by the Italian frontier. It is entirely mountainous, its highest point being the Barre des Écrins 13,460 ft., and has no important industries, and only agriculture on a small scale here and there. The rivers Durance and Buech rise in the dept., and there are many small mt. torrents. There are three *arrondissements*, with Gap as the capital, other towns being Briançon, St. Bonnet, Embrun, and Aspres. Area, 2,178 sq. m. Pop. 84,932.

Haute-Saône. Dept. of France. In the E. of the country, its area is 2,074 sq. m. In the N.E. are the Vosges Mts., with the Ballon de Servance, 4,000 ft. high. The chief river is the Saône; others are its tributaries, the Amance, Salon, and Ognon. The dept. is

an agricultural area. In addition to the usual cereals of the temperate zone, the vine and fruit are grown, while many cattle are reared. A good deal of the land, however, is forest. The dept. is divided into three *arrondissements*. Vesoul is the capital; other places are Gray, Héricourt, St. Rémy, and Plancher les Mines. Pop. 202,573.

Haute-Savoie. Dept. of France. In the S.E. of the country, it is on the frontier of both Switzerland and Italy. Its area is 1,775 sq. m. It is a mountainous region, containing Mont Blanc, and is consequently not very fertile. There is, however, a certain amount of agriculture in the valleys, and many sheep are pastured. In parts of the dept. the vine is grown, and white wines are produced. Annecy is the chief town, and the dept. is divided into four *arrondissements*. The principal rivers are the Arve and other tributaries of the Rhône. Herein are Chamonix and other tourist centres; also one side of the Lake of Geneva. Haute-Savoie became the stronghold of the Maquis, the armed resistance movement formed after the Germans occupied Vichy France in Nov., 1942. Pop. 270,468.

Hautes-Pyrénées. Dept. of France. It is contiguous with the depts. of Basses-Pyrénées, Gers, Haute-Garonne, and is bounded on the S. by the Spanish frontier. The southern part is extremely mountainous, embracing a large part of the central Pyrenees, but the flat country N. of Tarbes is fertile, bearing good crops of cereals, vines, and fruit. The chief rivers are the upper reaches of the Adour, Gave de Pau, Baïse, Gers, and Neste d'Aure. Tarbes is the capital, other towns of note being Lourdes, Bagnères-de-Bigorre, Lannemezan, Luz, Vic, and Maubourguet. The grand mountain scenery attracts many visitors; Gavarnie, on the upper Gave de Pau, has the finest of the Pyrenean *cirques*, or vast natural amphitheatres. Area, 1,750 sq. m. Pop. 201,954.

Haute-Vienne. Dept. of France. It is contiguous with the depts. of Vienne, Indre, Creuze, Corrèze, Dordogne, and Charente, and is especially hilly towards the S.W., where lies a part of the Montagnes du Limousin. Cereals, chestnuts, sheep, and cattle are the chief agricultural products. There are miscellaneous industries in the towns, porcelain, boots, paper, and liqueurs being notable products. The Vienne enters the dept. at its easternmost corner and flows W., tributaries in the dept. being

the Taurion and Briance. The Gartempe flows across the N. part, and the Isle, Dronne, Tardoire, and Charente rise in the dept. There are four arrondissements, with Limoges (*q.v.*) as the capital, other towns of note being Bellac, Le Dorat, St. Junien, and St. Yrieix. At Chalusset, 10 m. S. of Limoges, is the ruined castle of the viscounts of Limoges. Area, 2,119 sq. m. Pop. 336,313.

Hautmont. Town of France. In the dept. of Nord, it is 18 m. E.S.E. of Valenciennes and 139 m. from Paris. It has manufactures of glass, pottery, etc. Pop. 14,197.

Haut-Rhin. Dept. of France. Constituted with the other depts. in 1790, Haut-Rhin was annexed by Germany in 1871, except for the arrondissement of Belfort, which became the territory of Belfort (*q.v.*). Under German rule it formed the district of Upper Alsace. It was restored to France by the treaty of Versailles, 1919. Its capital is Colmar. Haut-Rhin was the scene of fierce fighting in the winter of 1944-45. Area, 1,354 sq. m. Pop. 471,705.

Haüy, RENÉ JUST (1743-1822). French mineralogist. Born in St. Just, Oise, Feb. 28, 1743, he was educated for the Church, but while teaching in Paris he became interested in mineralogy. In 1781 he discovered the geometric law of crystallisation, and two years later he was elected to the academy of sciences. Becoming professor of mineralogy at the museum of natural history in Paris, 1802-14, Haüy made a magnificent collection of crystals and wrote extensively on the subject. In addition to his works on crystallography, Haüy took a prominent part in the introduction of the metric system into France. Among his best known works are *Traité de Minéralogie*, 1801; *Traité Élémentaire de Physique*, 1803; *Traité des Caractères Physiques des Pierres Précieuses*, 1817; and *Traité de Cristallographie*, 1822. Haüy died in Paris, June 3, 1822.

Haüyne or **HAÜYNITE.** A member of the feldspathoid group of minerals, named after René Haüy

(*v.s.*) It is a sodium aluminium silicate, with calcium sulphate ($3\text{NaAlSiO}_4 \cdot \text{CaSO}_4$), forming blue crystals with cubic symmetry; often as rounded grains and associated with nepheline or leucite. Haüyne occurs as a constituent of certain igneous rocks, mostly of volcanic origin, that are characterised by a low silica content but are rich in alkalis, such as those of Vesuvius, Eifel, etc.

Havana (Span. *La Habana*). Largest city of the W. Indies. The capital of Cuba, it is situated on the N. coast, on one of two peninsulas forming the harbour, and is a busy commercial centre. It has an excellent rly. service, being linked both by rly. and by motor road with all the chief towns on the island. The bay of Havana is one of the securest harbours in the world, and there is a regular steamship service to New York,

Liverpool, and Tampa, Florida. It is an important air traffic centre. Havana consists of old and new

Havana. Plan of the capital city of Cuba, showing the entrance to the harbour and the quays

towns. The former lies within the limits of the old walls, built between 1671 and 1740 and almost wholly dismantled between 1863 and 1880, and is narrow and cramped. The new town is built on more spacious lines, and generally presents a clean and ordered appearance, with fine promenades, squares, and streets, some of them lined with trees. El Morro and the Castillo del Principe belong to the city's fortifications.

The principal buildings include the cathedral, completed 1724, in which the remains of Columbus reposed before their transference to Spain in 1898; the university, the Jesuit College de Belen, the massive Tacón or national theatre, the old palace in which the president resides, the opera house, the bishop's palace, the admiralty, and the national library, housed in the Maestranza, the former arsenal. The Prado is a wide promenade, fashionably frequented. The residential suburb of Vedado is reached by a good seawall roadway. Pop. 783,000.

Havana. The handsome Prado (Paseo de Martí), with the tower of the fortified Morro Castle, just visible in the distance. Upper picture, the Capitol

The staple industry of Havana is the manufacture of cigars and tobacco. Sugar is also produced in large quantities, and other manufactures include barrels and cases for the cigar and tobacco supplies, and carriages, wagons, and machinery. These, with oil, rum, honey, wax, and fruit, are the chief articles exported, the imports consisting mainly of grain, flour, foodstuffs, and cotton.

Founded by the Spaniards in 1515 on the S. coast, Havana was removed to its present site in 1519, when it was known as San Cristobal de la Habana or Savanna. It frequently suffered at the hands of pirates in the 16th century, and was the object of Dutch attack in the following century. In 1762 it was captured by the English after a lengthy siege, but was restored to Spain at the peace of 1763. On Feb. 15, 1898, the Maine was blown up in the harbour, the incident leading to the Spanish-American War, during which Havana was blockaded by the American fleet.

Havana, Act of Convention between the Pan-American states reached at a conference at Havana, 1940, by which they agreed to take immediate action in the event of any attempt to transfer the sovereignty of any British, French, or Netherlands possession in the W. hemisphere from one non-American power to another, and to establish a joint trusteeship over such possession. See Pan-American Conference.

Havant, Market town of Hampshire, England. It stands on Langstone Harbour, 7 m. N.E. of Portsmouth and 67 m. from London on the electric rly., and with Waterloo forms an urban dist. The chief building is the old parish church of S. Faith, restored in the 19th century, but with some Early English work. Havant is of pre-Roman origin, and is mentioned in Domesday Book. Near is Hayling Island. The industries are tanning, malting, and brewing. Market day, Tues. Pop. of dist., 31,790.

Havas Agency (*Agence Havas*). French news agency. Founded in 1825 by Charles Havas, a journalist who specialised in translations from foreign newspapers, and continued by his son, Auguste Havas, it was converted into a company July 24, 1879, with a capital of 8,500,000 francs, M. Favier being president and M. Lebey director.

Havel. River of N. Germany. Originating in a lake near Neustrelitz, it flows S.E. and S. to Spandau, where it is joined by the

Spree, and Potsdam, turning thence roughly W. to Brandenburg and N.W. to its junction with the Elbe, near the point where the latter river makes its final bend N.W. towards Hamburg and the North Sea. Navigable as far as Fürstenburg, 30 m. from its source, the Havel is important in the waterways system of N. Germany.

Havelock, SIR HENRY (1795-1857). British soldier. The son of William Havelock, a shipbuilder, he was born at Sunderland, April 5, 1795. Educated at Charterhouse School, he studied law until 1815, when he entered the Rifle Brigade. In 1823 he transferred to an

H. Havelock

Indian regiment, two of his brothers being officers in India. His first experience of active service was in Burma (1825-26), after which he was in the Afghan War, where he fought in most of the operations in and around Kabul. He fought against the Mahrattas and the Sikhs, and was made, 1854, adjutant-general of troops in India.

In 1857 Havelock held a command in the short war against Persia, and on the outbreak of the Mutiny went with a force to crush the mutineers. In a succession of fights he showed great skill, but he was unable to relieve Cawnpore, while he only got through to Lucknow when reinforced by troops under Outram. He had just taken that city and been knighted when he died there of dysentery, Nov. 24, 1857. He was created a baronet Nov. 26, his death not being yet known. A baronetcy was conferred on his eldest son, Sir H. Havelock-Allan. Havelock, a sincere if somewhat narrow Christian, belonged to the Baptist denomination. He published his *Memoirs of the Afghan Campaign* in 1839. *Consult* *Memoirs of Havelock*, J. C. Marshman, 1860; *Havelock*, Archibald Forbes, 1890.

Haverfordwest (Welsh, Hwlfordd). Municipal borough and river port of Pembrokeshire, of

which it is the county town. It stands on the W. Cleddau river, 8½ m. from Milford, and is served by railway. A county of itself, it has its own assizes, quarter sessions, and sheriff. The town proper is on the W. of the river, hence the west added to the earlier name; on the E. are the suburbs of Cartlet and Prendergast. The chief buildings are the churches of S. Mary, S. Martin, and S. Thomas. Two bridges cross the river. The dominating feature of the town is the keep of the castle, built by one of the Clares in the 12th century. There are remains of an Augustinian priory. There is a trade by river in coal and agricultural and other produce; and an airport 1 m. from the centre of the town.

Haverfordwest was settled by Flemings in the 12th century. It obtained various privileges, and in 1485 it became a corporate town. Its rights as a county date from 1536. A stronghold of the English, it was several times attacked by the Welsh. After the pacification of Wales it became a flourishing port and with the arrival of the main G.W.R. line to Neyland retained its position as the princi-

Havergal, FRANCES RIDLEY (1836-79). British poet and hymn-writer. Born at Astley, Worcestershire, Dec. 14, 1836, daughter of the Rev. William Henry Havergal, writer of sacred music, she began to write verse at the age of seven. She

F. M. Havergal

is chiefly remembered as a writer of hymns. An edition of her

poetical works appeared in 1884. She died June 3, 1879. *Consult* memoir by T. H. Darlow, 1928.

Haverhill. Market town and urban dist. of Suffolk. It is 16 m. from Cambridge on the railway and 55 m. from London. It is the terminus of the Colne Valley line. The chief building is the restored church of S. Mary. The industries include the making of cloth, rope, twine, and brushes, and there is a trade in agricultural produce. Market day, Friday. Pop. 3,900.

Haverhill. City of Massachusetts, U.S.A., in Essex co. It stands on both sides of the Merrimac at the head of navigation, 32 m. N.E. of Boston, and is served by the Boston and Maine rly. There are five lakes within the city limits, and several bridges cross the river. An important industrial centre since colonial days, Haverhill is the world's greatest producer of women's shoes, and also manufactures other types of footwear as well as soles, heels, lasts, ornaments, and other accessories. There are tanneries, woollen mills, and hat factories; boot-and-shoe and other types of machinery, bricks, and boxes are also produced. Haverhill is the trading centre of the surrounding dairying and market-gardening region, and is the site of Bradford Junior College, a girls' school founded in 1803, Haverford Academy, with notable Shakespeare and J. G. Whittier collections, and a museum commemorating Whittier, who was born here. Originally called Pentucket, Haverhill was later renamed after the English birthplace of the Rev. John Ward, one of the settlement's leaders. Settled in 1640, Haverhill was incorporated in 1645, and received a city charter in 1869. Pop. 46,752.

Haversack (Ger. *hafer*, oats). An oatsack or nosebag. Haver remains a common provincialism for oats in Scotland, especially in the compounds havermeal and havercakes. As part of a soldier's equipment, the haversack was a canvas web bag carried, in full marching order, on the left hip and containing the man's rations, mess-tin, and small kit, i.e. toilet and cleaning articles; in field service order, on the back as a small pack, containing water-bottle and ground sheet in addition to the other articles.

Haversian Canals. Minute canals, running lengthwise through bones, containing blood-vessels. They are named after an English physician, Clopton Havers (c. 1650-1702).

Haverstock Hill. London thoroughfare, mainly residential. It connects Chalk Farm with Rosslyn Hill, Hampstead. Belsize Park station on the Northern line is here; nearby is Hampstead town hall, built in 1877. *See* Hampstead.

Havildar (Pers.). A non-commissioned officer in the infantry and artillery of the Indian army, equivalent in rank to a sergeant.

Havoc. U.S. military aeroplane. The name Havoc was first given to the R.A.F.'s night fighter version of the Boston (*q.v.*) light bomber, and later to the same aeroplane, either as bomber or fighter, when used by the U.S. army air forces. The R.A.F. Havoc was an early example of the successful incorporation both of radar aids to interception and of formidable armament. *See* Aeroplane illus., p. 131.

Havre or Le Havre. Seaport town of France, chief town of the dept. of Seine Inférieure. It lies on the N. bank of the Seine estuary, 49 m. W. of Rouen, and 143 m. by rly. from Paris, with which it is connected by the main Nord line. The town suffered very severely in the Second Great War. Almost entirely modern, and well laid-out with broad main streets running E. and W., it had, however, few features of interest. The hôtel de ville was a handsome modern building in French Renaissance style, as also was the exchange; other public buildings included a theatre, palais de justice, prison,

the large Kléber barracks, and three museums, totally destroyed. The principal church was that of Notre Dame, built originally 1575-1600. The large rly. station had extensive goods yards, and all the principal quays and dock warehouses were connected by rly.

Havre had important engineering works, shipbuilding yards, oil refineries, chemical and dye works, a state tobacco factory, and many miscellaneous industries.

Havre, second greatest of French seaports, was the main centre of trade with N. America, and the docks were extensive and well constructed. Out of the outer harbour, to the N., opened the 17th century Bassin du Roi. The chief dock of the inner harbour was the Bassin de l'Eure, 1846-56, with an area of over 70 acres, used by the liners of the Compagnie Générale Transatlantique; the Bassins Vauban and Bellot were also notable. The chief trade, normally, was in coal, cotton, cereals, woods, sugar, coffee, and cocoa. Pop. 106,934.

Louis XII founded the chapel of Notre Dame de Grâce in 1509, whence came the town's old name of Havre-de-Grâce. Fortifications were built and the harbour enlarged by Francis I, 1516, with a view to English wars, but it was handed over to Elizabeth by

Havre arms

Havre. An aerial view of the port showing the Bassins à Flot in the foreground. The Bassin Vauban, to the right, can be identified by the presence of a three-masted sailing vessel. Beyond this can be seen the railway station on the Amiens-Paris line

Condé, 1562. Recovered in 1563, it was developed by Richelieu and Colbert, and in time became a serious rival to the English ports. It was bombarded by the English a number of times between 1694 and 1795. In 1672 it became the entrepôt of the French East India Co.

During the First Great War, Havre was a base of the British Expeditionary Force, crowded with military works, the port thronged with shipping: tonnage disembarked in 1916 was nearly double that of 1913. Havre was also the seat of the Belgian government, Oct., 1914, to Nov., 1918.

In the Second Great War, Havre was again a base of the B.E.F.; it was overrun by the Germans on June 14, 1940, and, becoming a German port for the intended invasion of England and an E-boat base, was frequently bombed by the R.A.F. A specially heavy air attack was made on D-day (June 6, 1944) against a concentration of E-boats in the harbour there. The 1st Canadian army's rapid advance beyond the Seine isolated Havre by Aug. 31; but its German garrison offered a stubborn resistance. Between Sept. 5 and Sept. 12, the R.A.F. dropped 9,500 tons of bombs on Havre, while H.M.S.S. Warspite and Erebus poured 500 rounds of 15-in. shells into it. In the final assault, by British troops of the 1st Canadian army, flail tanks and flame throwers led infantry through deep minefields to a bitter 36-hour struggle. When the Germans capitulated on Sept. 12, the city was completely devastated.

Hawaii OR OWYHEE. Principal island of the Hawaiian Islands described below in fuller detail. It has an area of 4,021 sq. m.

Hawaii. Territory of the U.S.A., consisting of the Hawaiian Islands, a chain in the Pacific Ocean formerly called the Sandwich Islands (the name Hawaii being the English approximation of the native *Owyhee*.) They lie more than 2,000 m. from the mainlands of both N. America and Asia. They consist of nine larger inhabited and 11 smaller uninhabited islands of volcanic origin, contain a number of active and quiescent volcanoes, and cover an area of 6,420 sq. m. The inhabited islands are Hawaii, 4,021 sq. m.; Oahu, 589 sq. m.; Maui, 728 sq. m.; Kauai, 551 sq. m.; Molokai, 259 sq. m.; Lanai, 141 sq. m.; Niihau, 72 sq. m.; Kahoolawe, 45 sq. m.; and Palmyra. According to the U.S. census for 1940, Kahoolawe had a pop. of 1, after having had 2 in

1930 and 3 ten years earlier. In 1940, Palmyra had 32 inhabitants.

Most of the islands are girdled by coral reefs and the larger of them are mountainous, the loftiest summits, on Hawaii, being the volcanoes of Mauna Kea and Mauna Loa, 13,805 ft. and 13,760 ft. high respectively, the former being the highest peak in the Pacific. Kilauea, on the E. of Mauna Loa, is a constantly agitated lava lake about 8 m. in circumference, and the greatest active crater. Hawaii is the largest mass of volcanic material in the world; it rises 30,000 ft. from the ocean bed and consists almost entirely of

Mammals are few and reptiles are represented solely by the lizard, but bird species number upwards of seventy, and include many peculiar to the islands. Thousands of sheep are pastured on the lower slopes of the mountains, and beef cattle, hogs, and poultry are raised. The production of sugar is by far the most important industry, the crop representing about three-fourths of the entire products of the territory. Rice, fruits, especially pineapples and bananas, coffee, sisal hemp, hides, molasses, and musical instruments, notably the ukulele or Hawaiian guitar, are exported.

Hawaii. Map of the chain of islands in the Pacific which form a territory of the U.S.A.

lava. On Maui is Haleakala, whose crater, 19 m. in circumference, is the largest of all extinct craters. Mauna Loa, Kilauea, and Haleakala are all in the several sections of the 173,405-acre Hawaiian national park, established 1916.

The climate is agreeable, being tempered by the N.E. trade winds which prevail for three-fourths of the year. The temperature ranges between extremes of 56° F. and 88° F. and the rainfall averages about 55 ins. It is heavier in the islands to the W. At Honolulu the mean temperature is 76° F. and the annual rainfall is 32 ins. The mts. inland from Hilo Bay form, however, one of the rainiest places in the world; the annual precipitation frequently exceeds 200 ins.: here the persistent warm moisture-laden trade winds deposit their load of water. The flora is rich and diversified. The mountains are largely forest-clad, characteristic trees being the koa, koala, candle-nut, and sandalwood. Screw-pines, ferns, and a variety of flowering plants abound, and among imported trees and shrubs are the banana, mango, pineapple, coconut, gooseberry, and tamarind. More than 1,000,000 acres are forest reserves, the total public lands covering more than 1,500,000 acres of the islands.

Sulphur, pyrites, sal ammoniac, copper, common salt, and other minerals occur. Most of the foreign trade is with the U.S.A., which takes more than 98 p.c. of the exports and provides more than 88 p.c. of the imports. There are 192 m. of narrow-gauge rlys.

on the larger islands, steamship service to the U.S.A., the Philippines, Asia, and Australia, and airline service with the U.S.A. and the Far East. Honolulu (*q.v.*) is the capital and chief port, and Hilo, on Hawaii, has the best harbour. The Japanese attack on the great U.S. Pacific naval base at Pearl Harbour on Oahu, Dec. 7, 1941, brought the U.S.A. into the Second Great War. Pearl Harbour and Schofield Barracks, both near Honolulu, are the greatest U.S. naval base and military post.

The indigenous population, belonging to the brown Polynesian race, are of good physique and handsome. In language and religion they are related to the Tahitians. The majority are Christians, missionaries having arrived in 1820, and, with traders, reoriented the islanders towards the U.S.A.

The pop. was 423,330 in the 1940 census, and was estimated at 465,339 in 1941, and 502,122 in 1945. Estimated pops., by groups, at July 1, 1941, were: Hawaiian, 14,246; partly Hawaiian, 52,445; Caucasian white, 139,299; Japanese, 124,351; Chinese, 24,886, with smaller numbers of Koreans, Filipinos, and Puerto Ricans. Beginning in 1868, the sugar planters imported large numbers of Japanese labourers because of their

cheapness. By 1924, when an Immigration Act stopped this traffic, 180,000 Japanese—the largest group of emigrants from Japan—had settled in Hawaii. The Japanese born and bred in Hawaii showed enterprise in entering business and the professions, and eventually formed a large part of the black-coat workers. After the Pearl Harbour attack, the Japanese in Hawaii were not interned, but, under martial law, most of their business and other activities were suspended. By Aug., 1943, 1,479 suspected spies and saboteurs had been interned, most of them Japanese, but the bulk of the Japanese population proved loyal to the U.S. and 2,600 Nisei, or second-generation Japanese born and reared in Hawaii, volunteered for the U.S. army and, fighting in a special unit, won distinction in Italy.

Leprosy and tuberculosis have much reduced the native race;

voluntarily ceded their sovereignty to the U.S.A. The territorial governor, who must have been a resident of the islands for three years to be eligible for the office, is appointed for a four-year term by the president of the U.S.A. with the consent of the U.S. senate. The territorial legislature consists of a

Hawaii. 1. Cutting cane on a sugar plantation. 2. Natives gathering pineapples, of which large quantities are exported to the U.S.A.

both diseases are the subject of constant medical attention. In 1865 a leper settlement was established on Molokai island.

Reliable history of the Hawaiian Islands dates from their discovery, or rediscovery, in 1778 by Captain Cook, who was killed by natives in Kealakekua Bay the following year. It is, however, generally accepted that they were visited by Gaetano in 1542 or 1555, while he is thought to have been preceded by survivors of a wrecked Spanish vessel in 1527. The islands were ruled by native kings down to 1891, then by Liliuokalani (1838-1917), the sister of the last monarch. She was deposed in 1893, and a provisional government was formed, the islands seeking unsuccessfully to be annexed by the U.S.A. In 1894, they were constituted a republic; and in 1898

senate of 15 members elected for four years and a house of representatives of 30 members elected for two years. The territory sends to the U.S. congress for a two-year term a delegate who has the privileges of the floor of the house of representatives but no vote.

Hawaii has long sought admission to the union as the 49th state, as has also Alaska. A majority of Hawaiian voters approved another petition for statehood at the 1940 election. The university of Hawaii in Honolulu was established in 1907.

Marie McGowan

Hawara. Village of Upper Egypt, 6 m. S.E. of Medina, in the Fayum. A mud-brick pyramid, once limestone-cased, was identified by Petrie in 1888 as that of Amenemhat III of the XIIth dynasty. The adjacent funerary tem-

ple was the Labyrinth described by Herodotus. Some tombs dated A.D. 100-250, of the Roman period, yielded mummy-portraits on canvas or wood, the finest being now in the National Gallery, London.

Hawarden. Parish and market town of Flintshire, Wales. It stands on a tributary of the Dee, 6 m. W.S.W. of Chester, with its own railway station. There are remains of a 13th century castle, close to which is the modern Hawarden Castle, long the residence of W. E. Gladstone. The church, dedicated to S. Deiniol, has memorials to the Gladstones, and here is S. Deiniol's library and hostel for theological students founded by Gladstone. The building was erected as part of the national memorial to him. The old castle was long the seat of the Stanleys. In the 17th century it came to John Glynn, the lord chief justice. In 1752 one of his descendants built the new castle and in 1874 this passed, on the death of her brother, Sir Stephen Glynn, Bart., to Mrs. Gladstone. The estate is still the property of the Gladstone family. Coal mines have been opened on it. The airfield was used as a test and ferry station during the Second Great War. The Welsh name is Penarlag. Pop. 9,230. *Pron.* Harden. *See* Gladstone.

Hawels. HUGH REGINALD (1838-1901). British author and preacher. He was born at Egham, Surrey, April 3, 1838, and educated at Trinity College, Cambridge. He became incumbent of S. James's, Marylebone, in 1866, where he became known as a vigorous and eloquent if somewhat sensational preacher. He was passionately devoted to music and wrote a number of stimulating works on musical subjects, among them *Music and Morals*, 1871, *My Musical Life*, 1884, and *Old Violins*, 1898. He also wrote on theological subjects. His hymn *The Homeland*, the *Homeland* achieved wide popularity. He died in London, Jan. 29, 1901.

Hawera. Town of North Island, New Zealand. It is 45 m. by rly. S.S.E. of New Plymouth, and is a centre of dairying. Pop. 4,790.

Hawes. Market town of Yorkshire (North Riding). Served by railway, it stands at the head of Wensleydale, at a height of 850 ft., 16 m. W. of Leyburn. It has a trade in dairy produce and there is a butter market. Market day, Tues. Pop. 1,404. Near by is Hardraw Force, a well-known waterfall. Hawes Junction, where

the line from Hawes meets the main line, is 6 m. away. It was the scene of a terrible railway accident on Christmas Eve, 1910.

Haweswater, Westmorland. The lake looking south from Measand Beck. In the distance is Harter Fell
Abraham

Haweswater. Lake of Westmorland, England. It is 15 m. N. of Kendal. Its natural length of 2½ m. was extended to approx. 4 m. by the construction by Manchester corporation of a dam at its northern end to provide an additional source of water for the city and surrounding districts. The lake's natural water level of 695 ft. was raised to 790 ft. above sea level.

Hawfinch (*Coccothraustes coccothraustes*). Bird of the finch family, closely related to the grosbeak. Common in S. Europe, it is frequently seen in England, though rare in Scotland. It is about 7 ins. long, and is a handsome bird, with light or pinkish-brown breast, dark brown back wings banded with black, brown, and white, large yellowish-brown head, and large blue beak.

Haw-Haw, LORD. Nickname popularly given in Great Britain to the traitor William Joyce (*q.v.*), who broadcast regularly in English from Germany to British listeners during the Second Great War. The nickname was coined by a journalist, Jonah Barrington, for Joyce's predecessor, who broadcast for only a few days at the outset of the war; but by the time the British public generally began to be aware of the broadcasts the name was found to suit well enough the voice and manner of Joyce, and was the more generally adopted because Joyce's real identity was not then established.

Hawick arms

Hawick. Mun. burgh and industrial town of Roxburghshire, Scotland. It stands at the junction of the Slitrig with the Teviot, 53 m. S.E. of

Edinburgh on the railway. The church of S. Mary (1763) occupies the site of a former church of that name erected in the 13th century.

Among the antiquities of Hawick are the Moat, an earthen mound 30 ft. high and 310 ft. in circumference, and a portion of the Tower Hotel formerly the peel-tower of the Drumlanrig Douglasses, the only building which escaped the devastation wrought by the earl of Sussex in 1570.

In the neighbourhood are Braxholme and Harden, old residences of the Scotts, the first named the scene of Scott's Lay of the Last Minstrel. The annual "common riding" has been celebrated for

Hawick, Roxburghshire. High Street, with the statue commemorating the capture of an English standard by the Hawick callants after Flodden Field. Unveiled, 1914
Valentine

upwards of 300 years. The hosiery and woollen manufactures are important, and a livestock market is held. Market day, Thurs. The Hawick Burghs formerly returned an M.P., but are now merged into the constituency of the cos. of Roxburgh and Selkirk. Pop. 17,059. *Pron.* Haw-ick.

Hawk. A popular name for birds of prey that are not called eagles, vultures, or owls. The term is vague and unscientific, and is generally used of the sparrow-hawks, goshawks, and harriers. The common kestrel is not really a hawk, but a falcon.

Hawkbit (*Leontodon*). Genus of perennial herbs of the family Compositae, natives of Europe and W. Asia. In general appearance they are much like small

Hawkbit. Foliage and flowers of *Leontodon autumnalis*

dandelions, for which they are often mistaken. They have milky juice, narrow and boldly toothed leaves, all springing from the rootstock. The flower-heads are yellow, and all the florets are strap-shaped, as in the dandelion. The hairs of the fruit-parachute are feathered. The common hawkbit (*L. hispidus*) is more or less bristly all over; the autumnal hawkbit (*L. autumnalis*) is smooth or nearly so.

Hawke, EDWARD HAWKE, 1ST BARON (1705-81). British sailor. Born in London, he entered the navy in 1720. He served in N. America and the West Indies until 1727, becoming commander in 1733. Six years later he commanded the Portland off Barbados and N. America, and in 1743 was promoted to the Berwick, in which he sailed

to the Mediterranean, and took part in the battle off Toulon, 1744.

In command of a squadron of 14 ships of the line off Ushant and Finisterre, Hawke intercepted a French squadron of nine ships of war, with three merchant men, who tried to escape. Hawke attacked from the rear, capturing all but two vessels and was knighted for his services. Elected M.P. for Portsmouth in 1747, he was promoted vice-

After F. Cotes, R.A.

admiral in 1748 and commanded the home fleet until 1755, when he became commander-in-chief at Portsmouth. In 1756 he superseded Admiral Byng in the Mediterranean, but was too late to avert the loss of Minorca. He became full admiral 1758.

His great exploit was in 1759 when, the French fleet under Admiral de Conflans having escaped from Hawke's blockade of Brest, he followed and utterly defeated the French in Quiberon Bay in a battle claimed as the greatest naval victory since the defeat of the Armada. It crushed French naval power and prevented any possibility of an invasion of England. Hawke was first lord of the admiralty, 1766-71, admiral of the fleet, 1768, and was made a baron in 1776. He died at Sunbury, Oct. 17, 1781. See *Life*, M. Burrows, 1883.

Hawke, MARTIN BLADEN HAWKE, 7TH BARON (1860-1938). English cricketer. The second son of the

Lord Hawke,
English cricketer
Russell

6th baron, he was born in Lincolnshire Aug. 16, 1860. Educated at Eton and Magdalene College, Cambridge, he played cricket for both school and university. In 1881 he first played for Yorkshire, and was captain of the county team 1883-1910, the only man ever to play regularly for Yorkshire without the birth qualification. During that time Yorkshire won the county championship eight times, Hawke scoring in all over 13,000 runs. He took out cricket teams to America in 1891 and 1894; India, 1892-93; and South Africa, 1895-96. He was M.C.C. president 1914-18. He died Oct. 10, 1938. Consult his *Autobiography, Recollections and Reminiscences*, 1924.

Hawke Bay. Inlet of North Island, New Zealand. -It is on the E. coast, from C. Kidnappers in the S. to the Mahai peninsula in the N. and is c. 50 m. wide at its mouth. It gives their name to the prov. dist. and co. of Hawke's Bay (*v.i.*). It was first entered in 1769 by Capt. Cook, who named it after Admiral Sir Edward (later Baron) Hawke (*q.v.*).

Hawker. Itinerant dealer or vendor. In law, a hawker is distinguished from a pedlar as one who conveys his goods by horse or other beast, whereas the pedlar

conveys his goods on foot. Hawkers and pedlars must take out licences for their respective trades, the former costing £2, the latter 5s.

Hawker, HARRY GEORGE (1891-1921). British airman. Born in Australia, he was taught to fly at Brooklands, gained his pilot's certificate in 1911, and soon became a noted figure in aviation. He gained the British solo altitude record in 1915, and in April, 1916, made a world's record for height (24,408 ft.) at Brooklands.

In May, 1919, he competed for the Daily Mail £10,000 prize for a trans-Atlantic flight. With Commander K. Mackenzie Grieve, in a Sopwith machine, he left St. John's, Newfoundland, in bad weather. When halfway across the aeroplane was forced to descend through engine trouble. The two airmen were rescued by a Danish steamer and landed in Scotland. They were awarded a consolation prize of £5,000 by the Daily Mail. Hawker was killed while flying, July 12, 1921.

In 1920, the Sopwith co. was reconstituted as the H. G. Hawker Engineering co., its name being later changed to Hawker Aircraft Ltd. It built the Hart bomber and Fury fighter in the years between the Great Wars, most advanced military aircraft of their time, and during the Second Great War produced the Hurricane, Typhoon, and Tempest single-seat fighters.

Hawker, ROBERT STEPHEN (1803-75). British poet and antiquary. He was born at Stoke Damerel, Devon, Dec. 3, 1803, and educated at Pembroke College, Oxford, where he won the Newdigate prize for a poem on Pompeii in 1827. He was vicar of Morwenstow, Cornwall, 1834-75. His best known poems are *The Quest of the Sangraal* and *Cornish Ballads*. Much controversy arose round the question whether the well-known refrain, "And shall Trelawney die?" etc., of the ballad *Trelawney* was really, as he averred, sung by the miners in the days of the trial of the seven bishops. Hawker also wrote on local antiquarian topics. He died at Plymouth, Aug. 15, 1875. See *Life* and *Letters* of R. S. Hawker, C. E. Byles, 1905; *Life*, M. F. Burrows, 1926.

R. S. Hawker

Hawke's Bay. Prov. dist. and co. in North Island, New Zealand. The prov. dist. has a seaboard of 300 m. stretching from just E. of C. Runaway to just S. of C. Turnagain and has an area of 4,241 sq. m. The Ruahine range and other mountains form a continuous ridge along its length, and their peaks, 3,000 to 6,000 ft. in height, are snow-clad in winter. Mostly broken forest country, its chief industry is timber, but sheep-grazing is also extensively followed. Its chief ports are Napier and Gisborne; Hastings, Dannevirke, and Woodville are important towns on the main line to Wellington. Pop. 79,084.

The co. of Hawke's Bay lies round Hawke Bay. Its area is 1,684 sq. m. Napier and Hastings lie within the co. Pop. 14,707.

Hawkesbury. River of New South Wales known near its source as the Wollondilly, later as the Warragamba and Nepean, finally the Hawkesbury. About 233 m. long, it drains a basin 9,000 sq. m. in area and falls into Broken Bay 25 m. N.N.E. of Sydney. It is one of the chief of the east flowing rivers. A weir built on the Warragamba in 1940 to provide an emergency water supply for Sydney was replaced by a dam erected to create a major water storage and hydro-electric station.

Hawking, OR FALCONRY. The art of hunting with trained hawks or falcons. One of the oldest and most universal of sports, it was known in China about 2000 B.C., and is mentioned as prevalent in Europe by Aristotle, Pliny, and Martial. In Great Britain, hawking was practised in Saxon times, as is shown by various illustrated MSS. of the period in the British Museum; in the Bayeux tapestry (*q.v.*) Harold has a hawk upon his wrist. Always a royal and aristocratic sport, hawking was probably at the height of its popularity during the reign of Elizabeth. Her chief falconer was Sir Robert Sadler, who trained hawks for his royal mistress at Everley, Wiltshire.

The sport was a favourite theme with early British writers. Dame Juliana Berners's celebrated Book of St. Albans contains a treatise on Haukyng and Hunting, 1486; George Turberville wrote *The Booke of Faulconrie or Hawking*, 1575; and these were followed by Simon Latham's *The Falcon's Lure and Cure*, 1615-18; Edmund Bert's *An Approved Treatise on Hawks and Hawking*, 1619; and Richard Blome's *The Gentleman's Recreation*, 1686.

The hawks employed are of two groups, the long-winged and the short-winged, the former being termed "hawks of the lure," and the latter "hawks of the fist." The long-winged comprise the peregrine, the northern falcon, and the Iceland and Greenland varieties; the short-winged consist of the goshawk and sparrowhawk. The birds should be taken for training when they are just fledged but have not left the nest. The female bird, being the larger, is invariably chosen.

The several implements used in the confining and training of hawks are the hood, jesses, bells, the lure, blocks, and the cadge. The hood is the principal means by which a hawk is controlled, and a bird once thoroughly accustomed to wear it can be taken anywhere and handled quite easily, always remaining at rest when hooded. Jesses are two short strips of leather placed round the hawk's legs, to which the leash by which the bird is held is attached. Bells are affixed, one to each leg, just above the jess; and are of great assistance in locating the hawk when the quarry has been killed out of sight.

The lure also plays an important part. A good lure can be made of a horseshoe well padded and covered with leather. This is in turn covered with the wings of a wild duck, and strings are attached, to which the meat, constituting the bird's food, is tied. The lure serves the double purpose of familiarising the bird to its prey and accustoming it to come to hand readily. On his left hand the falconer wears a leather glove, for protection from the hawk's claws when the bird is resting upon it. European falconers always carry the hawk on their left hand; in the East it is carried on the right.

Blocks are portions of tree trunks firmly fixed in the ground, upon which the hawks sit when at rest and to which they are secured by the leash. The cadge consists of four pieces of wood, padded and fixed together in the form of an oblong frame, on which the birds perch when being carried from one place to another. Hawks are trained to kill various kinds of game, such as grouse, partridges, and woodcock, and occa-

sionally hares and rabbits. A good dog is essential to assist in starting, and retrieving the game. Consult *The Art and Practice of Hawking*, E. B. Michell, 1900.

Hawkinge. Village of Kent, England, 3 m. N. of Folkestone. There is an ancient church, dating partly from Norman times. An R.A.F. aerodrome here was a base for fighters in the Second Great War, and after the war it became an administrative and training centre for the W.R.A.F.

Hawkins OR **HAWKYNs**, SIR JOHN (1532-95). English sailor. Second son of William Hawkins, a sea captain, he was born at Plymouth and was admitted a freeman of that city in 1556. Until 1561 he was engaged in voyages to the Canary Islands. In 1562, in command of three vessels, he sailed to Sierra Leone, seized 300 negroes, and shipped them to Hispaniola, where he exchanged them for merchandise, which he brought to England and sold to great advantage. Backed by persons of influence, he sailed again from Plymouth, on the *Jesus of Lübeck*, with three other vessels, in 1564, obtained another cargo of negroes and transported them to Venezuela, where, after some difficulty, he disposed of them to the Spaniards.

The success of these voyages induced Hawkins to fit out another expedition in 1567, and he sailed on the *Jesus* with five other vessels, one of which, the *Judith*, was commanded by Francis Drake (*q.v.*). At Sierra Leone he plundered Portuguese vessels of a vast sum of money and goods, and with a cargo of 500 negroes crossed to S. America, trafficked with the Spaniards, and was finally driven by bad weather into the Mexican port of Vera Cruz.

The arrival of a Spanish fleet caused friction with the English, which soon developed into a fight, in which Hawkins lost the greater part of his treasure, and saved but two boats, in which, after great hardships,

he reached England. He had left many of his shipmates in the hands of the Spaniards, but by a curious piece of cunning, in which he was seconded by Burghley (*q.v.*), he secured their release in 1572, and at the same time was offered a bribe of £40,000 from the king of Spain to enter his service. He accepted the bribe but remained loyal to Elizabeth. In the same year he was M.P. for Plymouth and became treasurer and controller of the navy, using his knowledge of seamanship to introduce many improvements. At this time he entered into partnership in a shipbuilding business with Richard Chapman of Deptford, making thereby a fortune.

On the coming of the Armada, 1588, Hawkins as rear-admiral was in command of the *Victory*, one of the new vessels which had been built at his Deptford shipyard under his own supervision, and did excellent service, especially off the Isle of Wight, for which he was knighted on the deck of the *Ark*. In 1590, together with Frobisher, he undertook a cruise to Portugal; in 1592 he founded the Sir John Hawkins Hospital at Chatham, and in 1595, under the command of Drake, he sailed once again to the Spanish Main, where he died of fever, off Puerto Rico, Nov. 12, 1595, and was buried at sea. In accordance with his will a monument was erected to his memory in the church of S. Dunstan-in-the-East, London, in which parish he had lived for thirty years. Consult *A Sea-Dog of Devon*, R. A. J. Walling, 1907; Sir John Hawkins, P. Gosse, 1930.

Hawkins OR **HAWKYNs**, SIR RICHARD (c. 1562-1622). English sailor. The only son of Sir John Hawkins, he sailed to the W. Indies in 1582 under the command of his uncle, William Hawkins. Three years later he was captain of the *Duck* galliot in Sir F. Drake's expedition to the Spanish Main and the coast of Florida. He commanded the *Swallow* in the fight against the Armada, 1588, and in 1593 set sail in the *Dainty* for a voyage round the world.

Passing the Straits of Magellan, he plundered Valparaiso, 1594, and later was caught in the bay of San Mateo by two large Spanish galleons. After a fierce fight he was overpowered and taken prisoner to Lima, whence in 1597 he was sent to Spain and kept captive until 1602. He was knighted in 1603, and became M.P. for Plymouth and vice-admiral of Devon in 1604. In 1620 he sailed under Sir

Sir John Hawkins.
English sailor.
From an old print

Hawking. Falcon with Dutch hood, bells, and jesses, as carried on glove

Robert Mansell as vice-admiral in the fleet which was sent against the corsairs of Algiers. He died in London, April 17, 1622. His *Observations*, ed. J. A. Wilkinson, were published 1934.

Hawkite. Name of an explosive. The hawkites form a series of permitted explosives containing 50-70 p.c. ammonium nitrate and sensitised with T.N.T. These explosives are of several types and are used in coal getting.

Hawk Moth. Popular name for the moths belonging to the family Sphingidae. They have long, narrow fore-wings, and small hind ones, and the antennae end in a hook. They chiefly fly in the evening, and some species have a

Hawk Moth. *Sphinx ligustri*, the privet hawk moth

habit of hovering in the air. Their caterpillars are always smooth, and usually have a horn-like process on the hindmost segment of the body. About ten species are natives of Great Britain, among the best known being the death's head (*Acherontia atropos*), the privet hawk (*Sphinx ligustri*), and the humming-bird hawk (*Macroglossa stellatarum*) moths. The last is often mistaken for a humming-bird, as it hovers before the flowers and sips the nectar with its long proboscis. See Death's Head Moth.

Hawk's-beard (*Crepis capillaris*). Small annual herb of the family Compositae. It is a native of Europe and the Canaries. The leaves grow chiefly from the root, with few bold teeth; the stem leaves are broader at the base, with ears. The stem is branched, bearing small yellow flower-heads with the florets all strap-shaped. The

Hawk's-beard. Left, flower-heads and florets; right, toothed leaves growing from root

fruits have a parachute (pappus) of unbranched silky hairs.

Hawkshaw, SIR JOHN (1811-91). British engineer. Of a Yorkshire yeoman family, he was educated at Leeds

grammar school. After residence in Venezuela (1831-34), he undertook work in the German railway surveys. Settling in

Sir John Hawkshaw, British engineer

London as a consulting engineer in 1850, he had a part in many important undertakings, constructing Charing Cross and Cannon Street stations and bridges, and building part of the Inner Circle underground rly., the E. London rly., and the tunnel under the Severn. Elected F.R.S. 1855, and knighted in 1873, in 1875 he was president of the British Association. He died June 2, 1891.

Hawkshead. Town and parish of Lancashire, England. It is picturesquely situated in a valley between Lakes Windermere and Coniston. Wordsworth attended the grammar school founded by Archbishop Sandys in 1585. St. Michael's church is mainly Elizabethan with some Norman work; restored 1876, it has an altar tomb with effigies. Pop. 575.

Hawksmoor, NICHOLAS (1661-1736). English architect. Born at E. Drayton, Notts, he became a pupil of Sir Christopher Wren (q.v.), assisting him in the design for St. Paul's cathedral. He succeeded Wren as surveyor-general of Westminster Abbey. Hawksmoor designed the churches of St. Alphege, Greenwich; St. George, Bloomsbury; St. George's-in-the-East; St. Anne, Limehouse; and St. Mary, Woolnoth, considered his best work. He also restored Beverley Minster and certain Oxford colleges, was surveyor of the 50 new London churches built towards the close of Anne's reign, and assisted Vanbrugh in the design of Castle Howard, Yorks. He died March 25, 1736. Consult Hawksmoor, H. S. Goodhart-Rendel, 1924; Georgian London, J. Summerson, 1946.

Hawkweed (*Hieracium*). Large genus of perennial herbs of the family Compositae. Natives of the N. temperate and Arctic regions, they have milky juice and alternate leaves. The flower-heads are yellow or orange with the florets all strap-shaped. One of

the best known species is the mouse-ear hawkweed (*H. pilosella*), common on banks, and a pest in lawns, with downy, lance- or spoon-shaped leaves and solitary pale-yellow flower-heads.

Hawkwood, SIR JOHN (d.1394). English soldier. His birth and parentage are uncertain, but he was probably a London apprentice. He won fame in the wars of Edward III, being made a knight. After the peace of Bretigny, in 1360, he became the captain of a band of mercenaries, called the White Company, at the head of which he fought for the Visconti, Pisa, and for and against the pope. In 1375 Florence bought his services, and save for one or two intervals, he remained in that city's pay until his death. He died in Florence; later his remains were carried to England, and were probably buried at Castle Hedingham, in Essex.

Haworth, SIR (WALTER) NORMAN (1883-1950). British scientist. Born March 19, 1883, at Chorley, Lancs, he was educated at Manchester and Göttingen univs. Professor of chemistry and director of the chemistry dept. at Durham, 1920-25, and Birmingham, 1920-48, he was vice-principal of the latter univ., 1947-48. He shared the 1937 Nobel prize for chemistry for work on carbohydrates and immunity to disease, and on vitamin C which he synthesised. Elected F.R.S., 1928, he received the Royal medal of the Royal Society, 1942, for research on sugars. He died March 13, 1950.

Haworth. Village of Yorkshire (W. Riding), England. It is situated within the borough of Keighley. Its chief associations are with the Brontës (q.v.), and the Haworth Round established by the Rev. William Grimshaw, rector of Haworth, 1742-63, and incorporated with Methodism, under John Wesley. Ponden Hall,

Hawkweed of the Mouse-ear variety, *Hieracium pilosella*

on the hill-top above the village, is regarded as the original of Emily Brontë's *Wuthering Heights*. The 14th century parish church, of which Patrick Brontë was curate, 1820-61, was, with the exception of the tower, demolished and rebuilt in 1879-81. Near the churchyard, where Charlotte and Emily Brontë are buried, is the Black Bull inn, frequented by Branwell Brontë. At Haworth is the Brontë Museum, opened 1895. Pop. 5,912.

Hawser (Fr. *hausser*, to raise). Stout rope used aboard ship, and by tugs for towing purposes. The hawse (Icelandic *háls*, neck) holes are the two large apertures at the bows of a vessel through which hawsers and anchor chains run. The term hawser laid applies to ropes for any purpose and denotes that the construction is of three strands, each of a number of yarns. See Rope.

Hawthorn, WHITETHORN, OR MAY (*Crataegus oxyacantha*). Small spiny tree of the family Rosaceae.

Hawthorn. Spray of blossom

It is a native of Europe, N. Africa, N. and W. Asia. The leaves are wedge-shaped, variously cut into lobes; flowers are white, in numerous clusters, fragrant, almost hiding the foliage by their abundance. See Bud illus., p.1520.

Hawthornden. Village of Midlothian. It is 8 m. S.E. of Edinburgh. It is famous for its beautiful glen, through which the Esk flows, and for the fact that the house here was long the seat of the Drummonds. See Drummond, W.

Hawthornden Prize. British literary prize of £100 and a silver medal. It was founded in 1918 by Alice Warrender (born near Hawthornden, d. 1947, and an admirer of the poet W. Drummond, of Hawthornden), to be awarded annually for a work of imaginative literature by a British author not over 40 years of age. The winner is selected by a committee in June from books pub-

lished in the preceding 12 months. Edward Shanks was the first winner with *Queen of China* and other Poems, 1919. Other winners have been David Garnett (*Lady into Fox*), V. Sackville-West (*The Land*), Henry Williamson (*Tarka the Otter*), Siegfried Sassoon (*Memoirs of a Fox-Hunting Man*), Kate O'Brien (*Without My Cloak*), Charles Morgan (*The Fountain*), James Hilton (*Lost Horizon*), Robert Graves (*I, Claudius*), Graham Greene (*The Power and the Glory*).

Hawthorne, NATHANIEL (1804-64). American novelist. Born at Salem, Massachusetts, July 4, 1804,

his ancestors being among the first settlers, he was educated at Bowdoin College, in Brunswick, Maine, where he made the acquaintance of Nath. Hawthorne Long-fellow. From 1825-39 he lived almost as a recluse, publishing his first book of short stories, *Twice Told Tales*, in 1837. In 1842 he brought out a second series. Among his later volumes of stories are *Mosses from an Old Manse*, 1846; *The Snow Image and Other Tales*, 1851; *A Wonder Book for Boys and Girls*, 1851; *Tanglewood Tales*, 1853. Several of these stories reveal a preoccupation with sin, conscience, and evil.

In 1850 appeared his masterpiece, *The Scarlet Letter*, a study of the ravages made by a secret sin of adultery in the hearts and consciences of husband, wife, and lover. This fine work of imagination, wrought with the felicity of phrasing and exquisite rhythm that set its author high among writers of prose, was followed in 1851 by *The House of the Seven Gables*, a story of the decay of a family doomed to bear an hereditary curse.

In 1852 Hawthorne brought out *The Blithedale Romance*, a satire on those reformers who, lacking human nature themselves, think they can improve their fellows out of it. In 1860 appeared his fourth

and last romance, *Transformation, or The Marble Faun*. He died at Plymouth, New Hampshire, May 19, 1864. He had held appointments under the American Government at Boston, Salem, and at Liverpool, England. See Concord; Emerson; consult also Works, ed. G. P. Lathrop, 13 vols., 1893-94; Life, J. Hawthorne, 1885; *Memoirs of Hawthorne*, R. H. Lathrop, 1897; *Hawthorne the Artist*, L. Schubert, 1944.

Hawtrej, SIR CHARLES (1858-1923). British actor. Born Sept. 21, 1858, he was educated at Eton and Rugby. He made his first stage appearance in 1881 at the Prince of Wales's Theatre, under the name of Bankes. In 1884 he played Douglas Cattermole in *The Private Secretary*, which achieved an extraordinary success and ran until 1886. In 1885 he became manager of Her Majesty's and in 1887 he took over the management of the Comedy.

In 1901 he went to New York and appeared in *A Message from Mars*, which he brought to London in 1905. He produced many successful plays, Ambrose Applejohn's *Adventure*, 1921, being one of the most liked, and acquired great popularity. Knighted in 1922, he died July 30, 1923. His reminiscences, *The Truth at Last*, ed. Somerset Maugham, were published posthumously.

Hawtrej, EDWARD CRAVEN (1789-1862). Headmaster of Eton. Born at Burnham, Bucks, May 7, 1789, his father was a clergyman. He was educated at Eton and King's College, Cambridge, and after taking his degree became an

assistant master at Eton, Keate then being the head. In 1834 Hawtrey succeeded him, becoming one

Edward C. Hawtrey,
Headmaster of Eton

of the greatest headmasters the school has ever had. He introduced a number of needed reforms; and buildings were enlarged, and the chapel was restored. In 1852 he resigned and was chosen provost of Eton. He became vicar of Mapledurham, and died Jan. 27, 1862.

Hay and Haymaking. Hay is the fodder produced by drying naturally grass, clover, and other herbage plants. The grass used for this purpose may be derived from permanent grassland or from "seeds," that is, grasses, clovers, and other plants sown as a crop in the ordinary rotation of crops. The average chemical composition of grass, and of hay made therefrom, varies considerably, but average figures, expressed as percentages, are—Grass: water, 80.0; protein, 3.5; ether extract, 0.8; carbohydrates, 9.7; fibre, 4.0; ash, 2.0. Meadow hay: water, 14.3; protein, 9.7; ether extract, 2.5; carbohydrates, 41.0; fibre, 26.3; ash, 6.2. "Seeds" hay: water, 14.0; protein, 12.0; ether extract, 2.8; carbohydrates, 37.4; fibre, 27.5; ash, 6.3. The differences between these figures—showing for hay as compared with grass a decrease in water, and a corresponding increase in the main feeding constituents—reflect the aim of making hay which is to secure such a desiccation of the succulent green material as will permit of its preservation in stack in a sound, sweet condition. Drying is by the sun and wind, and the essence of good haymaking is to get the hay dried without the leaching of the valuable feeding constituents by rain, and with as little loss as possible of the leaves, the most valuable portion of the plants nutritionally.

Hay is the most palatable bulky food produced on the farm, and at the same time one of the least expensive to grow and secure, granted reasonable weather during making. Its feeding value depends primarily on the nature of the herbage of which it is composed, leguminous plants having a higher feeding value than most of the grasses included in grass seed mixtures or found in permanent

meadows. The age and hence the stage of development of the plant at the time of cutting also affect the quality of the resulting hay. Once the seeds of the constituent plants have begun to form there is a gradual withdrawal of material from the leaves and stems, and a distinct increase of fibre, a substance of little use as food, in these parts of the plant. The producer's aim is, therefore, to cut the crop as soon as possible after flowering. If for any reason the constituent seeds, particularly of grasses, have filled too far, there is danger of their being shaken out and lost in the handling subsequent to cutting. Finally, the extent to which hay is thoroughly cured regulates the amount of heating and of moulding in the stack; over-heating reduces the digestibility, moulding affects the palatability of the hay.

Gathering the Crop

The hay crop is usually cut with a horse-drawn or tractor-driven mower, and left in swaths to dry for periods that depend on the rate of drying. As they dry, the swaths are commonly turned by one of many forms of turners, and then either gathered into windrows and collected and stacked from carts provided with loaders or made up into cocks for further drying. In districts where the weather usually precludes rapid curing the cocks are built fairly large, and may be left out for several weeks before they are removed for stacking. Baling is sometimes done directly from the field immediately the hay is sufficiently dry; it obviates stacking and much subsequent handling, and makes the hay much easier to transport.

In wet districts hay is often dried in the long state by some form of grain drier. This does away with much of the unprofitable labour involved in getting hay into condition before stacking, and, indeed, often prevents total loss of the crop. The dried hay is baled, which preserves its good condition, particularly in districts where the air in winter months is heavily charged with moisture.

H. Hunter, D.Sc.

Hay. River of Canada, in the prov. of Alberta and the N.W. Territories. Rising on the frontier of British Columbia and Alberta, it flows N.E. and N. through Lake Hay, and discharges into the S. extremity of the Great Slave Lake. Of its two magnificent cataracts, the Alexandra falls over 250 ft. Its course is about 352 m.

Hay, IAN (b. 1876). Pen-name of the Scottish novelist John Hay Beith (q.v.).

Hay, JOHN (1838–1905). American statesman and author. Born at Salem, Ind., Oct. 8, 1838, he graduated at Brown university in 1858. He then became a law student in Abraham Lincoln's office at Springfield. When Lincoln became president he took Hay with him to Washington as assistant to his principal private secretary, John G. Nicolay, and employed him on various confidential missions during the Civil War. From 1865 to 1870 Hay held posts in the diplomatic service at Paris, Vienna, and Madrid successively. He spent the next five years as chief leader-writer on the New York Tribune. In 1897 McKinley appointed him ambassador to London, but recalled him in 1898 as secretary of state, in which capacity he served under T. Roosevelt also until his death. As foreign minister he was concerned with

the Alaska boundary dispute, the Anglo-German blockade of Venezuela and the Hay-Pauncefote treaty, but his principal achievement was the securing of the "open door" in China. His literary reputation rests upon his monumental *Life of Lincoln* (in collaboration with Nicolay), 1889; *Castilian Days*, 1871; *Pike County Ballads*, 1871; *Poems*, 1890; and an anonymous novel, *The Bread Winners*, 1883. He died at his summer home at Newbury, N.H., on July 1, 1905. *Consult* Life, L. Sears, 1914.

Hay, WILLIAM THOMSON (1888–1949). British actor. Born in Scotland, Dec. 6, 1888, he became an engineer apprentice, but went on the stage as Will Hay at the age of 21. Will Hay's music hall sketches—especially as the schoolmaster of St. Michael's College—were equally successful over the radio and on the screen. His films included *Boys Will Be Boys*, 1935; *Oh! Mr. Porter*, 1938. Hay was also an enthusiastic amateur astronomer, discovering a spot on Saturn in 1933. He died April 18, 1949.

Hayashi, COUNT TADASU (1850–1913). Japanese statesman. Born at Sakura, Jan. 22, 1850, he was

John Hay

educated in England and entered the Japanese foreign office, 1891. He was appointed minister to China, 1895, and from 1897-99 represented Japan in Russia. In 1900 he was made ambassador to London, where he negotiated treaties with Great Britain in 1902 and 1905. Returning to Japan as foreign minister, 1906-8, he held the portfolio of commerce from 1911 until his death, July 10, 1913.

A namesake, Baron Gonsuke Hayashi (b. 1860), was ambassador in London, 1920-25.

Hayashi, SENJURO (1876-1943). Japanese army officer. He entered the army in 1896 and saw active service in the Russo-Japanese war. In 1931, when friction over alleged frontier incidents developed between China and Japan, he was commander of the Japanese troops in Korea and without waiting for authority from Tokyo marched into Manchuria. Promoted general in 1932, he was appointed minister for war two years later, and in 1935 became a member of the supreme war council. Early in 1936 he resigned following the assassination of Viscount Saito and other prominent statesmen by a mutinous clique of junior army officers. He was premier Feb.-May, 1937. He retired from the army in 1939, and died at Tokyo, Feb. 4, 1943.

Hay-box Cookery. Method of fireless cooking which employs a wooden box, lined with paper and stuffed with hay, and having a tightly fitting lid. Food is brought to the boil on a stove and cooked there for a few minutes, then transferred at once to the hay-box. There cooking may continue slowly for several hours through the heat conserved by the hay. When required, the food is brought to the boil again on the stove.

The so-called hay-boxes, used by military rationing units to keep food hot while it is being conveyed from the field-kitchen to troops operating or manoeuvring in the open, are designed on the principle of the vacuum flask (*q.v.*).

Hay Diet. Dietetic system formulated by Dr. W. H. Hay (1867-1941), a New York physician. He advocated meals so

balanced that the consumption of starch and proteins at the same time is avoided. He claimed in his book, *Health via Food* (1934), that application of his diet at his own sanatorium resulted in the cure of asthma and diabetes, but his theories were not accepted by orthodox medical opinion.

Haydn, FRANZ JOSEPH (1732-1809). Austrian composer. The son of a wheelwright, he was born at Rohrau, near Vienna, March 31, 1732. He became a chorister in St. Stephen's Cathedral, Vienna, where he obtained his early musical training, and after leaving there gained a precarious living by teaching. He managed, however, to devote much time to study and composition, and in order to persuade Porpora (*q.v.*), the great teacher of singing, to give him the benefit of his instruction, he entered his service as accompanist and valet.

Haydn's compositions and his connexion with Porpora having brought him into notice, he was appointed in 1759 director of the private band of Count Morzin, and shortly afterwards composed his first orchestral symphony. In 1761 he entered the service of Prince Anton Esterhazy, and on his death continued with his brother Nicholas. Eventually he became director of the music of the prince's private chapel, and had under his control an orchestra and a choir. This gave him unrivalled opportunities for studying the possibilities of the orchestra.

On the death of Prince Esterhazy in 1790 Haydn was persuaded to visit England, and the success of this visit induced him to pay a second in 1794. During these visits he composed some of his finest symphonies. His oratorio, *The Creation*, was produced at Vienna in 1798, and *The Seasons* in 1801. Haydn's importance in the history of music is due to the character of his numerous instrumental works. The best of these are more mature in style and show more skill in the treatment of the orchestra than earlier works.

The total volume of Haydn's work is very great; there are about

150 symphonies, 77 quartets, and some 40 trios, with a large body of religious music and songs. But he was not, according to his own account, a quick worker, and yet scarcely ever is the freshness and clarity of his inspiration affected by his deliberate methods of work. The famous national anthem of Austria, the so-called Emperor's Hymn, also familiar as a hymn-tune and as the tune of *Deutschland, Deutschland über Alles*, was composed in Vienna in 1797. He died in Vienna, May 31, 1809. Consult Joseph Haydn in London, von Karajan, 1861; A Croatian Composer, W. H. Hadow, 1897; biographies by M. Brenet, Eng. trans., 1926; C. F. Pohl, completed 1927; J. C. Madden, new ed. 1934; R. Hughes, 1950.

Haydock. Urban dist. of Lancashire. It is 3 m. S.E. of St. Helens, having its own railway station. The chief industries are coal mining and ironfounding. Race meetings are held in Haydock Park. Pop. 11,000.

Haydon, BENJAMIN ROBERT (1786-1846). British painter and author. Born at Plymouth, Jan. 26, 1786, he studied at the R.A. schools and won prizes with his *Death of Dentatus*, 1809, and *Judgement of Solomon*, 1814, but jeopardised his prospects by quarrelling with the Academy. After a stormy career, during which, though he was paid hundreds of guineas for some of his paintings, he was twice imprisoned for debt, he was ignored in the Westminster Hall competition of 1843—his own idea—and failed with an exhibition of his own works at the Egyptian Hall in 1846, Barnum's Tom Thumb next door drawing crowds. This disappointment drove him to suicide in his studio, June 22, 1846.

Haydon's work as an historical painter was far above the level of his time, although somewhat hard and repellent. One may cite his *Christ's Entry into Jerusalem*, 1820; *Wellington at Waterloo*, 1839; *Banishment of Aristides*, 1846; *Nero playing during the burning of Rome*, 1846. He left an autobiography, pub. 1847; and wrote *Lectures on Painting and Design*, 1844, and other books on art. Consult *Life and Death of B. R. H.*, E. George, 1948.

J. Haydn

B. R. Haydon
After G. M. Zornlin

Hayes. Parish and village of Kent, England. It is situated on the slope of a hill and the edge of a common, 15 m. S.E. of Charing Cross, between West Wickham and Woodside, with a rly. station. Hayes Place, pulled down in 1928, was the favourite residence of the 1st earl of Chatham, who died there, and the birthplace of his son, William Pitt. General Wolfe dined there on the eve of his departure for Quebec. The Early English church of S. Mary, built on the site of a Roman structure, and containing brasses, monuments of interest, and a memorial to Chatham erected 1928, was restored in 1861-62. Hayes Common, a breezy stretch of uplands, 220 acres in extent, covered with heather, bracken, bramble, and hawthorn, commanding picturesque views, and a favourite resort of cyclists, was secured to the public in 1869. Henry Hallam died in Hayes parish. Pop. 1,678. See Keston.

Hayes, CATHERINE (1690-1726). English murderess. Born near Birmingham, she married John Hayes, a carpenter, and lived with him in Tyburn Road, now Oxford Street, London. On March 1, 1726, with the aid of two lodgers, Wood and Billings, she murdered her husband, whose head was thrown into the Thames at Westminster, and whose body, cut into pieces, was secreted in Marylebone Fields. The head being found and identified, Hayes was sentenced to be burnt alive, and her two accomplices to be hanged. Wood died in Newgate; Billings was hanged in chains. Hayes, who tried to poison herself, was executed at Tyburn, May 9, 1726. Thackeray based his story, Catherine, 1839-40, upon her career.

Hayes, RUTHERFORD BIRCHARD (1822-93). President of U.S.A. Born in Delaware, Ohio, Oct. 4, 1822, he was educated at Kenyon College and studied law at Harvard, being admitted to the bar in 1845. Having built up a successful practice in Cincinnati, he joined the Union

R.B. Hayes

army and served with distinction throughout the Civil War. Member of congress, 1865-67, and governor of Ohio, 1868-72 and 1876-77, he stood for the presidency in 1876 on the Republican ticket, and

was finally declared elected by one electoral vote. He did much to improve the financial position of the country and pursued a conciliatory policy towards the southern states. After his term he retired from public life and died at Fremont, Ohio, Jan. 17, 1893. *Consult* Life, W. D. Howells, 1876; *Diary and Letters*, ed. P. Haworth, 1922.

Hayes and Harlington. Urban dist. and parl. bor. of Middlesex, England. It is 11 m. by railway W. of Paddington, on two main London roads—the Uxbridge road and the Bath road—and on the Grand Union Canal. London airport is partly within the S. boundary of the district, which has many and varied light industries, including the manufacture of wireless and television instruments, gramophones, gramophone records, aeroplanes, processed food, furniture, electrical and rubber products, building materials, trailer caravans, etc.

The manor of Hayes, before the time of Henry VIII, belonged to the see of Canterbury. The parish church of S. Mary, restored 1873-74, has a 13th century tower, a 16th century wooden roof to the nave, and an unusual lych gate. Harlington is mentioned in Domesday as a manor of ten hides. The parish church of SS. Peter and Paul comprises all styles of architecture, beginning with Norman. The parish of Cranford, referred to in Domesday as Cranforde, also has an ancient church (S. Dunstan) of great interest, and has claims to historic distinction based on its situation on the great Bath road of coaching days. Pop. 66,670.

Hay-fever. Catarrhal affection of the mucous membrane of the eyes, nose, mouth, and air-passages due to irritation by the pollen of various grasses and plants in the presence of allergy. The disease is common all over Europe and N. America, and chiefly occurs during the hay season. The symptoms are those of a heavy cold with much sneezing and headache. Asthmatical attacks are not uncommon. Sufferers from hay-fever should avoid agricultural districts during the summer months. Mountainous regions or the seaside are the best places for them to live. The bedroom windows should generally be closed at night. Local protective applications and decongesting sprays sometimes give relief. "Pollantin," an anti-toxic serum, has proved efficacious. Septic foci in teeth, tonsils, and sinuses must be removed; herein lies the essential treatment.

Hayling. Island of Hampshire, England. It lies between the harbours and Langstone and Chichester, a short distance from the mainland, and has a railway station. Extending about 4 m. from N. to S., its area is 10 sq. m.; it is popular as a seaside resort. There are golf links and other attractions. The village of S. Hayling has a fine old church dedicated to S. Mary. The island was long the property of the Benedictines. The Fleet Air Arm had an aerodrome here during the Second Great War.

Haymarket. London one-way street for S.-bound traffic extending from the E. end of Piccadilly to Pall Mall, S.W. The name derives from the market for hay and straw held there until removed to Cumberland Market, Regent's Park, in 1830. The Carlton Hotel and His Majesty's Theatre, on the W. side, cover the site of the King's Theatre or Italian Opera House, later Her Majesty's Theatre, demolished in 1893. On the same side are the Carlton and Gaumont cinemas. On the E. side is the Haymarket Theatre, just N. of which is Panton Street containing the Comedy Theatre.

Thyne of Longleat was murdered in this street by assassins hired by Count Königsmarck, 1682. Dr. Johnson's friend, Baretti, mortally wounded a man who attacked him here in 1769, and after being tried for murder was acquitted. Addison lodged for a time in this street, with which are also associated the names of George Morland, Sir Samuel Garth, and Mrs. Oldfield.

Haymarket Theatre. London theatre. The original Haymarket Theatre, in which Fielding produced *Tom Thumb the Great*, and of which he became manager in 1734, was opened Dec. 29, 1720, with a French comedy, *La Fille à la Mode*. Later famous managers were Charles Macklin, Samuel Foote, 1747-67, and the two Colmans. Bannister, Elliston, and Liston all made their first appearance in the Little Theatre, as it was called, and here John Poole's *Paul Pry* was first performed. The second Haymarket Theatre, which stands on a site immediately adjoining that of the first, was opened July 4, 1821.

At the close of Buckstone's management in 1879, it passed into the hands of the Bancrofts, who reconstructed it, abolishing the pit and adding the pit area to the stalls. Under their management, 1880-85, it enjoyed great popularity, which continued undiminished.

ished under Tree, 1887-95, and from 1896 to 1905 under the joint management of Cyril Maude and Frederick Harrison. In 1904 the interior was rebuilt, the pit being restored. Extensive alterations were made in 1934. Later successes included *Mary Rose*, 1920; *The Dover Road*, 1922; *The Man with a Load of Mischief*, 1925; *The Moon in the Yellow River*, 1934; *The Amazing Dr. Clitterhouse*, 1936. In 1943-46 John Gielgud played therein several notable revivals, among them *Love for Love* and *Lady Windermere's Fan*. Consult *The Haymarket Theatre*, C. Maude, 1903.

Haynau, JULIUS JAKOB, BARON VON (1786-1853). Austrian soldier. A natural son of the elector of Hesse, William IX, he was born at Kassel, Oct. 14, 1786. Having entered the Austrian army, he saw service in the Napoleonic Wars. In the Italian campaigns of 1848-49, in which he held a high command, he became notorious for his flogging of women at the taking of Brescia, and for other atrocities. In the Hungarian insurrection of the same period he was in command of the Austrian forces, and his conduct of the campaign, in which he admittedly showed great military talents, was again marred by ruthless ferocity. He decisively defeated the Hungarians near Temesvar. In 1850 he came to London, but his reputation had preceded him, and he was badly mauled by the draymen of Barclay and Perkins's brewery. He died at Vienna, March 14, 1853.

Hay-Pauncfote Treaty. Agreement concluded in 1901 between John Hay, U.S. secretary of state, and Lord Pauncfote, British ambassador at Washington. The treaty was negotiated to replace the Clayton-Bulwer Treaty of 1850 (*q.v.*). Its substance was that Britain conceded to the U.S.A. the sole right to construct, maintain, and police the Panama canal, while the U.S.A. agreed that the canal should be open to the ships of all nations on equal terms.

In 1911, Congress passed the Panama Canal Act, exempting American ships engaged in coastwise trade from canal dues. This move was defended on the ground that the clause providing for equality of treatment of the ships of all nations referred only to foreign nations. An Act of 1914 repealed this exemption.

Haymarket Theatre. Showing the new theatre, opened 1821, replacing the old theatre (left) From an old print

Hays Office. Popular name for the motion picture producers' and distributors' association set up in the U.S.A. in 1922 under the presidency of Will H. Hays (b. Nov. 5, 1879), who resigned the postmaster-generalship to take up the post, to organize the voluntary censorship of films. In 1934 it drew up a production code, the general principles of which were (1) no picture shall be produced which will lower the moral standards of those who see it; the sympathy of the audience shall never be drawn to the admiration of crime, wrong-doing, evil, or sin; (2) correct standards of life, subject only to the requirements of drama and entertainment, shall be presented; (3) law, natural or human, shall not be ridiculed, nor shall sympathy be created for its violation. All large producers in the United States voluntarily accept the rulings of the association. Hays was succeeded in the presidency in 1945 by Eric Johnston, formerly president of the U.S. chamber of commerce. See *Censorship*; *Film Censors*, British Board of.

Hayter, SIR GEORGE (1792-1871). British artist. Born in London, Dec. 17, 1792, he studied at the R.A. schools. After a brief period at sea and three years' study in Rome he settled down in London to portrait and miniature painting. His reputation was already established when he was appointed portrait and historical painter to Victoria on her accession, 1837, and in 1838 he exhibited at the R.A. The Queen seated on the Throne in the House of Lords, now in the Guildhall, London. His picture of the Coronation and the Marriage are now in the royal collection at Windsor. His

Sir George Hayter, British artist Self-portrait

appointment in 1841 as principal painter to the queen was followed next year by a knighthood. He died Jan. 18, 1871. See *Clifden*.

Hayward, ABRAHAM (1801-84). British essayist. Born at Wilton, Wiltshire, Nov. 22, 1801, and educated at Blundell's School, Tiverton, he was called to the bar, but never had more than a moderate practice, although he founded, and for many years edited, *The Law Magazine*, and was made Q.C. in 1845. He was an assiduous contributor to the periodical press, on politics, social and other topics, and an authority on gastronomy. His *Art of Dining* enjoyed great vogue; also his own dinners at the Temple, where he entertained notable people. He edited Mrs. Piozzi's *Autobiography*, 1861, and *Diaries of a Lady of Quality*, 1864. He died in London, Feb. 2, 1884.

Abraham Hayward, British essayist

Hayward, TOM (1871-1939). English cricketer. Born at Cambridge, March 29, 1871, he first played cricket for Surrey in 1893, and for twenty years was one of the mainstays of the county team. His best season was 1906, when he scored 3,518 runs, an English record for one season which stood for 41 years. His highest innings was 315 not out against Lancashire at the Oval in 1898. In 1900 he had scored over 1,000 runs by the end of May. Three times he made a century in each innings of a single match, four of these centuries being obtained in one week, a record in first-class cricket. Altogether he scored 104 centuries. Hayward played several times in test matches against Australia. He died July 19, 1939.

Hayward's Heath. Former urban dist. and market town of Sussex, England. It is now part of the urban dist. of Cuckfield (*q.v.*).

Tom Hayward, English cricketer

Hazara. Dist. of the Peshawar division of the North-West Frontier Province, Pakistan. Its area is 3,000 sq. m. The country was at one time under Sikh rule, but during the Sikh wars the Hazaras rebelled against their governors, and after the British annexation of the Punjab they were put definitely under British administration and not linked with Kashmir, to which state Hazara had previously been joined. The dist. consists of a wedge of land running far into the outer Himalayas, and watered by tribs. of the Indus.

The Hazara tribes live in the Black mt. They are Mongoloid in origin and are mostly Issazai Pathans and are allied in race to the Pathans of Swat on the other side of the Indus. They claim descent from the followers of Genghis Khan. They are poor and fanatical and very much in the hands of their mullahs. From time to time they have raided the settled districts, e.g. in 1890, 1895, 1905, 1920, 1946, but they have usually been dealt with by the Gurkhas stationed in Abbottabad, the hill station named after James Abbott, the first commissioner in charge of Hazara. Their fastnesses are very difficult to penetrate; but their poverty makes them susceptible to blockade. In their territory live a number of Sikh and Hindu craftsmen and traders, roughly handled when the Hazaras are excited.

The forests of the Black mt. produce a considerable amount of timber. Maize, wheat, and barley are the chief crops. Mineral resources include coal, limestone, building stone, gypsum, and iron. Pop. 796,230.

Hazard. Old game of chance, played with two dice by any number of persons. The basis of the game is the "main," or first throw, which determines the value of a subsequent throw and the amount required to win. The lowest score is two aces, termed crabs. Hence the alternative name for the game, crabs or craps.

Hazard is also the name of a card game for four players in partnerships of two. It is played with 25 cards, consisting of all cards above the denomination of 9, together with the joker. Six cards each are dealt, and the players bid and play as in nap (*q.v.*), the lead and the choice of trumps going to the highest bidder. Jacks are given special importance in trumping.

In tennis (*i.e.* real tennis), all that part of the court on the opposite side of the net to the

service or dedans side is known as the hazard side (*see* Tennis). In golf, hazards are patches of rough or difficult ground, both natural and artificially constructed; and there are also water hazards. In billiards, the pocketing or "potting" of a ball other than the striker's, after contact with another ball, is called a winning hazard; a losing hazard occurs when the striker's own ball goes into a pocket after contact with another ball.

Hazaribagh. Dist., subdiv., and town of Bihar, India, in Chota Nagpur Division. It has an area of 7,021 sq. m., of which about one-third is under cultivation, rice being the chief crop. Hazaribagh is the centre of a considerable coal industry, Giridih being one of the most important coalfields in the country, while the Bokaro-Ramgarh field promises to be of great importance. Exports include coal and coke, while food grains and cotton piece-goods are imported. Hazaribagh town is of little commercial importance. Pop., dist., 1,751,339; town, 23,500.

Haze. Condition of low visibility, most frequently due to dust or smoke. The term is applied meteorologically when the foreign solid matter present reduces the visibility so that, under normal illumination, objects 1 km. distant can be discerned while those at 2 km. cannot. If the visibility is below 1 km. a smoke fog or dust fog is said to occur. Haze is commonly experienced over most of the land surfaces of low elevation, but is rarely observed over the ocean and on high mountains, as in these regions the air is free from dust. Fine particles of dust carried from desert areas by the wind, and the smoke from forest fires or burning peat bogs, as well as that due to factories, etc., often cause a haze which extends over hundreds of square miles. Haze is most commonly experienced during spells of dry weather, because rain washes dust from the air. Haze due to these causes must not be confused with the haze due to a damp atmosphere which is, in reality, an incipient fog. *See* Atmosphere; Fog.

Hazebrouck. Town of France, capital of an arrondissement, in

the dept. of Nord. An important rly. junction, it lies on the canalised river Bourre, 32 m. W.N.W. of Lille. Among its industries are tanning and flax spinning, and the manufacture of oil and soap. It was an important strategic centre and railroad in the First Great War, and was frequently shelled by German long-range guns. It was seriously threatened during the enemy offensive in April, 1918, and the civilian population was evacuated. In the Second Great War the town formed part of Lord Gort's line of communications in May, 1940, and when the B.E.F. retired upon the coast it was captured by the Germans, becoming one of their main bases. Later the town's marshalling yards were repeatedly attacked by the R.A.F. in their offensive sweeps over N. France. Hazebrouck was liberated by the British 2nd army at the beginning of Sept., 1944. Pop. 14,391.

Hazel (*Corylus avellana*). Large shrub of the family Fagaceae. It is a native of Europe, N. Africa,

and temperate Asia. The leaves are alternate in two rows, roundish, with an unequal heart-shaped base, doubly toothed. The male flowers, long, pendulous catkins, form in Sept., and mature in Feb.; the female flowers resemble leaf-buds, with the crimson thread-like styles protruding. The fruit is a sweet, oily nut, enclosed in a woody shell, and this in a large, leathery cupule.

Hazel. Leaves, nuts, catkins, and female flower

Filberts, cob-nuts, Barcelona, and Spanish nuts are all varieties of this species. *See* Bud illus.

Hazleton. City of Pennsylvania, U.S.A., in Luzerne co. Situated 1,800 ft. high on a plateau of a spur of the Blue mts., 28 m. S.S.W. of Wilkes-Barre, it is served by the Pennsylvania, the Lehigh Valley, and other rlys. Centre of one of the most valuable anthracite regions in the U.S.A., the veins having been uncovered by a deer's paw, according to local legend. Hazleton is a manufacturing and trading centre for the surrounding mining region. Manufactures include mining machinery, iron, sheet steel, centrifugal pumps, clothing, and silk and knitted goods. The many domes of Greek Orthodox churches in which a

part of the pop. of E. European extraction worships are a distinctive feature of the city. It was settled in 1820, incorporated as a borough in 1856, and chartered as a city in 1892. Pop. 38,009.

Hazlitt, WILLIAM (1778-1830). British essayist and critic. Son of William Hazlitt (1737-1820), a Unitarian minister, of Irish descent, he was born in Mitre Lane, Maidstone, Kent, April 10, 1778. He was in Boston, U.S.A., with his parents, 1783-86. In 1787-93 he was living with them at Wem, Shropshire. A student in Hackney Theological College, 1793-94, he abandoned the idea of a ministerial career in 1797; met Coleridge at Wem, Jan., 1798, and on visiting him at Stowey in the following spring was introduced to Wordsworth. He studied art 1798-1805 (in Paris in 1802), painted portraits of Hartley Coleridge, Wordsworth, and Charles Lamb; and displayed a bent towards the study of metaphysics.

His earlier work included an *Essay on the Principles of Human Action*, being an argument in favour of the natural disinterestedness of the Human Mind, 1805, the outcome of an inquiry in which he was encouraged by Coleridge; *Free Thoughts on Public Affairs*, 1806; an abridgment of Abraham Tucker's *Light of Nature*, 1807; and *Eloquence of the British Senate*, a selection of parliamentary speeches with notes, 1807. On May 1, 1808, at S. Andrew's, Holborn, he married Sarah Stoddart, and settled at Winterslow, near Salisbury, Wilts, which gave its name to a volume of his essays issued in 1839.

Coming to London, 1812, he lectured at the Russell Institution on *The Rise and Progress of Modern Philosophy*. He was parliamentary reporter and dramatic critic of *The Morning Chronicle*, 1812-14, and began to contribute to *The Champion*, *The Examiner*, and *The Edinburgh Review* in 1814. He published *The Round Table essays and Characters of Shakespeare's Plays*, 1817; *A View of the English Stage*, 1818; *Lectures on the English Poets*, 1818; on the *English Comic Writers*, 1819; and on the *Dramatic Literature of the Age of Elizabeth* (delivered at the Surrey Institution), 1820. He joined the staff of *The London Magazine*, his essays in which appeared in *Table Talk*, 2 vols., 1821-22.

The years 1822-23 were notable for his visit to Scotland to secure a divorce; his temporary if passionate attachment to Sarah Walker, one of the two daughters of a Mr. Walker, in whose house at 9, Southampton Buildings, Chancery Lane,

he took lodgings in 1820, which inspired his morbidly egotistical *Liber Amoris*, or the *New Pygmalion*, 1823, new ed. by R. Le Gallienne, 1894; and the issue of *Characteristics in the manner of Rochefoucauld's Maxims*. In 1824 he married the widow of Col. Bridgewater, and travelled with her in France and Italy, but was left by her on the return journey.

A series of personal sketches of contemporaries, *The Spirit of the Age*, appeared in 1825; *Notes of a Journey through France and Italy*, and *The Plain Speaker, Opinions on Books, Men and Things*, 2 vols., in 1826; *Life of Napoleon Buonaparte*, 4 vols., 1828-30; and *Conversations of James Northcote*, 1830. His other works include *A Character of Mr. Burke*, 1807; *A New and Improved Grammar of*

W. Hazlitt

From a miniature by his brother John

the *English Tongue*, 1810; *Memoirs of the Late Thomas Holcroft*, 1816; and *Sketches of the Principal Picture Galleries of England*, 1824. Ill-health and monetary troubles darkened his later years, but his last words, uttered just before he died at his lodgings in Frith Street, London, Sept. 18, 1830, were, "Well, I've had a happy life." He was buried in the churchyard of S. Anne's, Soho. He left a son, William.

Hazlitt's life was rather sordid and stormy. His domestic relations were unhappy; at one period, when he was on *The Morning Chronicle*, he gave way to intemperance, facts of which those of his critics who were politically opposed to him took provocative advantage. He participated in the hopes which formed the legacy of the last decade of the 18th century; when those hopes were shattered, the reaction made him a bitter critic of humanity. Politically he was a democrat; he adhered to certain dog-

mas imbibed in his youth, but kept his often violent political prejudices apart from his literary estimates. He is in the first rank of English literary critics; his literary judgements, generally, are the judgements of posterity. His style, which varies in harmony with his subject, is wholly admirable.

Bibliography. Works, ed. A. R. Waller and A. Glover, with intro. by W. E. Henley, 13 vols., 1902-06; *Memoirs*, W. C. Hazlitt, 2 vols., 1867; *Four Generations of a Literary Family*, W. C. Hazlitt, 1897; Hazlitt, A. Birrell, 1902; *The Fool of Love*, H. Pearson, 1934; *Life of William Hazlitt*, P. P. Howe, intro. F. Swinnerton, 1947.

Hazlitt, WILLIAM CAREW (1834-1913). British author. Born in London, Aug. 23, 1834, he was a son of William Hazlitt (1811-93) and a grandson of the essayist. His father, who was a registrar of the court of bankruptcy, 1854-91, did a good deal of literary work. Educated at Merchant Taylors' School, William Carew Hazlitt was called to the bar at the Inner Temple, 1861. For a short time, he studied civil engineering under George and John Rennie, but devoted most of his life to literary and antiquarian pursuits. He died Sept. 8, 1913. A voluminous writer, he edited *Shakespeare Jest Books*, 1864; *Brand's Popular Antiquities*, 1870; *Warton's History of English Poetry*, 1871; *Doddsey's Old Plays*, 1874-76; *Shakespeare Library*, 1875; *Letters of Charles Lamb*, 1886; and *Cotton's translation of Montaigne's Essays*, 1902.

He compiled *English Proverbs and Proverbial Phrases*, 3rd ed. 1906; and was the author of *Memoirs of William Hazlitt*, 1867; *Handbook of Early English Literature*, 1867; *Bibliographical Collections and Notes*, 1876-1904; *Schools, School Books, and Schoolmasters*, 1888; *Studies in Jocular Literature*, 1890; *The Lambs*, 1897; *Four Generations of a Literary Family*, 1897; *Lamb and Hazlitt*, 1900; *The Venetian Republic*, 3rd ed. 1900; *The Book Collector*, 1904; *Faiths and Folklore*, 1905; and *Shakespeare: Himself and His Work*, 3rd ed. 1908.

Hazor OR **HAZOR.** Name of several places in Palestine. The most important was a city in Naphtali (Josh. xi, 1), a little S. of Kedesh, which had a king named Jabin. It was taken and destroyed by Joshua, but having been rebuilt was fortified by Solomon (1 Kings ix, 15). It was afterwards taken by Tiglath Pileser, king of Assyria (2 Kings xv, 29). Another Hazor, known as Hazor of Benjamin, is now represented

by a ruin to the N. of Jerusalem (Neh. xi, 33). The kingdom of Hazor was a district in Arabia. It is mentioned in Jeremiah (xlix, 28), but little else is known about it.

Head. Part of the body of an animal which contains the brain and organs of special sense. The head is divided by anatomists into the face and the cranium, which contains the brain and is covered by the scalp. (*See Brain; Ear; Eye; Face; Scalp; Skull.*)

The word is used for the chief person in a society or enterprise; the chief boy in a school or form, or the headmaster: and for the top or end of anything, examples being the head of a nail, the head on a pot of beer, a head of water, the head of a river. The head is that side of a coin which bears the figure of a head. The word is a synonym for beasts in the phrase 5,000 head of cattle.

Head, SIR FRANCIS BOND (1793–1875). British administrator. Born at Hermitage, near Rochester, Jan.

1, 1793, and educated there and at Woolwich, he was gazetted into the Royal Engineers in 1811. Serving in the Mediterranean and through the Waterloo campaign, he retired from the army in 1825, and on his return from a brief visit to S. America wrote his *Rough Notes of a Journey in the Pampas and Andes*, 1826. In 1835 he was appointed lieutenant-governor of Upper Canada, where his administration proved a conspicuous success. He resigned in 1837 and settled in England, where he became a regular contributor to *The Quarterly Review*. A baronet from 1836, he died at Croydon, July 20, 1875.

Sir Francis Head,
British administrator
After N. Cook

Headache. Pain in the head. It is a symptom of a large number of pathological conditions.

Arterio-sclerosis, thickening of the coats of the arteries, is most frequently found in men of middle age and later, and is associated with gouty tendencies, Bright's disease, affections of the heart, and other disorders. Treatment of headache due to this disorder is to relieve the underlying condition. In chronic dyspepsia the headache is associated with furred tongue, offensiveness of the breath, constipation, and discomfort after meals. In young girls the condi-

tion is often associated with simple anaemia. Headache is also common in many forms of nervous breakdown, such as neurasthenia, anxiety neurosis, and shell shock. The headaches abate as the general condition improves.

Pain at the back of the neck may be due to eye strain, or to infection of the wisdom teeth and of the sinuses.

Migraine describes a severe pain in the head, always unilateral, always accompanied by nausea and sometimes by vomiting. An attack is ushered in by a disturbance of some sensory tract by sound, light, taste, or smell. It has even been suggested that Moses with his burning bush and Joan of Arc with her voices were both sufferers from migraine of which these were the visual and auditory signs.

Migraine is severe and prostrating. If untreated in highly strung and intelligent subjects, it tends to be an escape from the strains and distresses of life and to become incurable. Migraine is associated with infection of the sinuses or with a mechanical abnormality of the upper air passages, relief of which conditions should be sought, and with abnormal liver function, so that subjects are advised to avoid pork, milk, eggs, chocolate, and all fats except butter. Headaches also occur from toxæmia in fevers, such as typhoid, malaria, influenza, tumours and diseases of the brain, injuries to the head, and affections of the ears and nose.

A simple headache, the result of fatigue or overwork, can usually be relieved by a moderate dose of aspirin, after taking which the patient should lie down for a couple of hours. Frequently recurring headaches indicate some constitutional cause which should be found and, if possible, remedied.

Head Deformation. Artificial modification of the form of the human skull. Widespread in primitive society, the custom, usually practised within the first year of infancy, may have originated in the accidental flattening of the back of the head by cradle-boards with hard supports instead of resilient pillows. Afterwards perpetuated intentionally as a tribal distinction, it developed two types: forehead flattening by

head-boards, to emphasise the broad-headed skull, and sugar-loaf elongation by tight bandages, to emphasise the long-headed skull. Of these types, traceable among the early ancestors of the Armenians and Kurds respectively, the

Head-Deformation. Board and bandage for moulding the shape of an infant's head, Borneo. Above, deformed head of a negro baby of the Algerian interior
Ethnographical Collection, British Museum

latter was characteristic of the ancient Crimean peoples whom Hippocrates called long-headed.

These deformities, still practised by Borneo Klemantans or land Dyaks and some Melanesians, were carried across the Pacific to America. There they occurred among the ancient Maya, Aymara, and other peoples, their alien origin being confirmed by their absence from the Eskimo, Athapascan, and Algonquin regions. Forehead-flattening was observed by the Natchez and some N.W. Pacific tribes such as the Chinook; S. American Indians still practise conical deformation here and there. Cranial disfigurements are not transmitted, and do not appear to affect mental vigour.

Head-dress. Anything worn upon the hair or pate. Head-ornament, amuletic or decorative, was probably devised by prehistoric man prior to protective coverings. In an Upper Palaeolithic cave at Mentone a male skull was found, adorned with stag's teeth, fish-bones, and pierced shells. On Spanish cave-portraits horns and feathers are shown. Fur caps may also have been used in that age; a Neolithic site in Denmark has yielded a woollen cap.

Primitive forms of head-dress, governed by the formation of the hair and climatic conditions, include dressed hair, decorated hair, head-bands, chaplets, brimless caps, brimmed hats, hoods, and veils. The hair may be dyed; stiffened with protective materials, such as S. African ochre and grease, Upper Congo soot and palm-oil, Latuka interwoven bark or twine; or shorn and replaced by a wig. Decoration is widespread; with teeth or bushy animal tails, as in Australia; flowers, as in Polynesia and Burma; and leaves or gems.

Head-bands of skin, bone, or fibre, used by Andamanese, Australians, Bushmen, and Fuegians, suggest an ultimate Palaeolithic origin, and passed in the higher civilizations into turbans and diadems. Sometimes employed for the suspension of burdens, they permit of the attachment of beads, cowries, rams' horns, wood shavings—as with the Ainu—and especially of feathers. These form the tribal or social badges of many peoples, such as the ancient Egyptian and modern Bari ostrich tips, Aztec trogon or quetzal tails, Naga hornbill tail-feathers, Papuan paradise plumes, Maori huia feathers, and N. American Indian eagle bonnets. Chaplets of grass have been worn by Malacca Sakai, flowers by Polynesians, leaves in ancient Greece, jewels in E. Tibet.

High Crowns and Broad Brims

For skull-caps Hottentot women use fur, Nilotic peoples beads with cowry rims, Samoan chiefs' heirs fibre caps covered with women's hair. Tall hats, among the Kavi-rondo, sometimes reach 6 ft. Broad-brimmed hats especially characterise S.E. Asia. The Panama hat reached Central America through medieval Spain and Morocco from pre-Christian Egypt. Hoods are found among Eskimo and some Malay women; veils among most Muslim women and Tuareg men. From remote times head-dresses have been symbols of social or professional distinction, whether it be the helmets of warrior chiefs, the coronals of married women, or those affected by medicine-men, priests, head-men, or kings.

The head-dress of women has ranged through every degree of design from simple to absurdly elaborate. Among the wealthier Anglo-Saxons it consisted of a headrail or coverchief, often confined by a fillet of gold and enveloping head and shoulders and descending to the knees. In the 14th and 15th centuries the so-

called steeple or horned head-dress appeared; this assumed immense proportions, varying from 18 ins. to 3 ft. in height. It was introduced from France, where a similar style is still worn by some of the peasantry. In England this was succeeded by the hood, and by the bonnet of Elizabethan times.

The reign of William III was marked by the towering head-dresses, or fontange, worn by women. Towards 1800 enormously high hair-dressing became fashionable, and a curious hood, termed a calash, was introduced. This was made on the lines of the hood of a carriage, being supported by a framework of whalebone and pulled over the face by means of a string. *See Cap; Costume; Hat.*

Head-hunting. Custom among some primitive peoples of slaying strangers or enemies in order to utilise their heads as cult-objects or trophies. As developed out of human sacrifice by the Austro-speaking peoples of S.E. Asia and its archipelagos, its animistic purpose was partly spirit-worship, partly a productive rite. Until recent years it was practised mostly by ceremonial expeditions, in Austroasia (Naga, Wa); Indonesia (Dyak, Igorot, primitive Formosans); Melanesia (Solomon Islands); Polynesia (Maori). Sea Dyak and Formosans engrafted upon it the derivative purpose of qualifying for manhood and marriage. In Negro Africa—Nigeria, Togoland, Upper Congo—the custom presents local variations.

Bibliography. *Head Hunters:* Black, White and Brown, A. C. Haddon, 1901; *Home Life of Borneo Head-hunters*, W. H. Furness, 1902; *The Tailed Head-hunters of Nigeria*, A. J. N. Tremearne, 1912; *Head-Hunters of the Amazon*, F. de Graff, 1923.

Headingley. Suburb of Leeds, England. A residential district in the N.W. of the city, it is on the Leeds-Harrogate rly. line. Here is a Methodist training college. The cricket ground on which the Yorkshire XI plays is also the scene of test matches. An ancient "shire oak" close to the main road is 29 ft. in girth.

Headlam, ARTHUR CAYLEY (1862–1947). British divine. Born at Whorlton, Barnard Castle, Durham, Aug. 2, 1862, the son of a clergyman, he was a scholar of Winchester and New College, Oxford, and a fellow of All Souls' College, Oxford, 1885–97 (and again from 1924). After holding lectureships in theology at Cambridge, he was rector of Welwyn,

Herts, from 1896 to 1903, when he became principal of King's College, London and prof. of dogmatic theology there. Professor of divinity at Oxford, 1918, he became C.H., 1921, and was appointed bishop of Gloucester, 1923, retiring in 1945. A forthright speaker and writer, Headlam edited the *Church Quarterly Review*, 1901–21; his writings include works on archaeology and on theology, and more popular books such as *The Life and Teaching of Jesus Christ*, 1923; *Economics and Christianity*, 1926; *What It Means to be a Christian*, 1933; the *Holy Catholic Church*, 1945. He died Jan. 17, 1947.

Headmaster. Name given in Great Britain and elsewhere to the principal of a public or other school for boys, although a special name, e.g. rector, is used in certain schools. In addition to the Headmasters' Conference (*v.i.*) there is in Great Britain the incorporated association of headmasters. Established in 1890, and incorporated in 1895, this consists of many headmasters of public secondary schools in Great Britain. The offices are 29, Gordon Square, London, W.C. Here are also the offices of the Association of Head Mistresses.

Headmasters' Conference. An association of headmasters of public schools in Great Britain. Edward Thring, headmaster of Uppingham, inaugurated it in 1869 by calling a meeting of headmasters at his house to form "a school society and annual conference." Since then meetings have been held, generally every year, in Jan., and matters of interest to educationists discussed. The number of schools represented at the conference is limited to 200. It was incorporated in 1909, and the offices are at 29, Gordon Square, London. *See Public School.*

Head Noises or TINNITUS. Sounds, which have no objective existence, registered by the hearing centre in the human brain. They take the form of whistling, singing, ringing, or bubbling. They may be due to some disease of the hearing apparatus; to prolonged use of such drugs as aspirin or quinine; to working amid constant noise, as with electric drills; or to hardening of the cerebral arteries. Hallucinations of sound, "hearing noises," are connected with some forms of mental disorder. The causes should be sought and combated.

Headquarters. Centre of an organization whence instructions are supplied to subordinates, and the

entire enterprise controlled. In military organization, most units have their headquarters (commonly abbreviated to H.Q.), which receive instructions from a higher H.Q. In both Great Wars the chain of communication descending from general headquarters (G.H.Q.) was to army, corps, division, brigade, regiment, or battalion, and battery, company, or squadron headquarters. Each H.Q. must be in a sufficiently central position behind its line to control the whole front for which it is responsible.

In a commercial undertaking, headquarters is sometimes applied to the central offices of the board of management, whence the business can be run in all its ramifications. *See Staff.*

Head Resistance. Opposition offered by the air to a forward moving body. With objects moving over land or water, head resistance is measured independently of the impedance offered by the resistance of the water or by the friction resistance between wheels and road or track. For all geometrically similar bodies inclined at the same angle to the air stream, head resistance experienced is directly proportional to the density of the air and the square of the speed. This fundamental law of aerodynamics holds good for land vehicles, ships, aircraft, rockets, and projectiles fired from guns. Near the ground, density variation, which governs head resistance, is negligible, but density decreases rapidly with height; at 22,000 ft. it is only half that at ground level, consequently resistance is halved also. Air density and head resistance being less at greater heights, high speed aircraft fly at high altitude.

Doubling the speed at ground level squares head resistance, and trebling the speed cubes it. When a speed approximating to that of sound, 770 m.p.h., is achieved at sea level, head resistance attains a maximum which cannot be overcome. Practical application of this theory is to design objects offering the minimum opposition to head resistance as their speed increases. *See Aerodynamics; Faring.*

Head Voice. Highest part of a human voice, so called because the sensation is as of sounds originating in the upper part of the head. The term is sometimes used synonymously with falsetto (*q.v.*). *See Singing; Voice.*

Health. Sound condition of the entire animal organism in which the mind and all the organs function perfectly together. The

word preserves the A.S. *hæth*, as to heal preserves *hælan*, both from *hāl*, hale, safe, sound. Medical practice regards the conservation of health as of equal importance with the cure of disease.

Custom of Drinking Healths
The widespread custom of drinking healths derives from the ancient religious ceremony of pouring libations to the gods, originally at the time of offering sacrifice, and afterwards on solemn occasions, as at ceremonial feasts. This custom was practised by the Greeks and Romans, and with other heathen customs was adapted to their own use by many Christianised peoples. The heathen tribute of honour to the gods, followed by one to the memory of the dead, became among Christians invocations to God and to the saints. From thought of the blessed dead it was a natural transition to tender thought of absent but living friends, and from them again to the friends present in the flesh.

The same sacramental aspect of the wine-cup is seen in the ancient custom of princes and knights pledging mutual amity by drinking to the health of one another. In course of time the formality lost much of its significance, and in the 17th to 18th centuries the merely social custom became so tyrannical in the strictness of its etiquette, to say nothing of the extravagant absurdities attendant upon the proposal of a toast (*q.v.*), that by common consent the toast-list, or number of healths formally drunk at banquets, has now been reduced to the narrowest limits.

Traces survive of long-ago days when the pledge of friendship symbolised by drinking to mutual health was not exchanged without mutual suspicion. Thus the glass bottom to a pewter mug provides the drinker with opportunity of watching for a stealthy blow; and when the loving-cup is passed round, one guest holds the cover in his dagger-hand while his neighbour drinks to him, or if the cup be lidless, the guest who drinks is guarded on either hand by his next neighbour, all three standing simultaneously. *See Insurance.*

Health, DEPARTMENT OF, FOR SCOTLAND. Department of the secretary of state for Scotland established under the Reorganization of Offices (Scotland) Act, 1928, to take the place of the Scottish board of health set up in 1919. The department is concerned with (1) public and personal health services (prevention and cure of disease, general practitioner service, in-

fectious diseases, maternity and child welfare, health of school children, nutrition); (2) provision of state-subsidised houses for the people of Scotland; (3) general administration of the Town and Country Planning Acts; and (4) environmental health services, e.g. water supply and sanitation. Most of these functions are discharged through town and county councils and other local bodies.

Health, MINISTRY OF. Department of the British civil service. It was established in 1919 to exercise in England and Wales functions with respect to health and local government which were previously the responsibility of the local government board, the board of education, and the privy council. It also took over work performed by the national insurance commission set up in 1912; in 1945, however, this function was transferred to the new ministry of National Insurance.

The ministry of Health supervises all matters relating to public health, not only sanitary services but also housing and public assistance. It is concerned with rating and valuation, certain aspects of the law in relation to building, the audit of local authorities' accounts, and the general and financial aspects of local government.

Wide Scope of Health Services

Public health services under the ministry include maternity and child welfare; control of infectious diseases; preventive and curative services in connexion with tuberculosis, cancer, and venereal disease. Protective services controlled by the ministry include supervision of the purity of food, drugs, and therapeutic substances; water supply, sewerage, sewage disposal; refuse disposal; provision of burial grounds and open spaces; and the enforcement of building and other by-laws.

By the National Health Service Act, 1946, the ministry of Health became responsible for free medical treatment for the population, in the home, surgery, hospital, or health centre. Maintenance of hospitals became the responsibility of the ministry, which took over all endowments. Of numerous emergency services of the Second Great War controlled by the ministry, the emergency hospital scheme, the blood transfusion service, the civil nursing reserve, and the first-aid repair of houses were retained.

This department administers Housing Acts, which give local authorities wide powers and duties

in building houses, clearing slums, mitigating overcrowding, and obliging landlords and owners to keep their properties in habitable repair. All plans for new houses require the approval of the ministry, which insists upon standards of design, size, and fittings. Acute shortage of houses after the Second Great War made this one of the chief cares of the ministry of Health, which was given power to requisition empty houses, subject to conditions, for those who were inadequately housed.

The ministry has no jurisdiction in Scotland (*v.s.*) or N. Ireland. Many of its functions in Wales are exercised through the Welsh board of guardians, with headquarters at Cardiff. In general, most services are operated by the local authorities on its behalf. At the head of the ministry is a cabinet minister who receives a salary of £5,000 a year. He is responsible to parliament for his department, and also for the work of the board of control in relation to lunacy and mental deficiency, and for the department of the registrar-general for England and Wales. He is also a member of the committee of the privy council for medical research. Other officials are a parliamentary secretary and a permanent staff of civil servants under a secretary. The offices of the ministry are in Whitehall. *See Housing.*

Health Centre. Building or group of buildings from which medical and social services are supplied to the community. The National Health Service Act, 1946, placed upon local authorities the duty of setting up, equipping, and maintaining health centres providing all or any of the following services: general medical services by medical practitioners; general dental services by dental practitioners; pharmaceutical services by registered pharmacists; services which the local health authority is required or empowered to provide; health education.

The types of buildings used as health centres and the scope of the services provided by them vary considerably in different parts of the world, even in the same country. As regards the area and pop. best served, it is probable that a single health centre can deal adequately with maternity, child welfare, and school medical services required by a pop. of 10,000—the optimum being fewer. Geographical and topographical considerations, *e.g.* the convenience of the people served, also have to be borne in mind.

Health centres began in the U.S.A., where the idea was conceived of decentralising some of the functions of public health departments into district health centres, at the same time centralising health activities within districts. In the development of the idea, Boston led the way, and by 1936 had 11 neighbourhood health centres. Such centres, developed by cooperation between voluntary agencies (including the American Red Cross) and health departments, proved to be of great value in both preventive and curative medicine.

In some countries of Europe health centres have been developed, often on the American model; while in China the League of Nations bulletin for 1936 stated that provincial health centres provided a diagnostic laboratory; hospital; midwifery school and mother and child welfare centre; school health centre; polyclinic; education and propaganda dept.

Medical Planning Commission

In Great Britain, a committee under Lord Dawson's chairmanship expressed the view in 1920 that the general practitioner was too isolated in his work, and described a health centre as "an institution wherein are brought together various medical services, preventive and curative, so as to form one organization." A report of the medical planning commission, 1942, described the accommodation and services that should be given in such centres. The white paper on the national health service, 1944, laid stress upon the value of the health centre as a medical care centre; and many local authorities in Great Britain had already built, before the passing of the 1946 Act, centres from which were supplied maternity, child welfare, school, medical, and tuberculosis services.

A health centre should be properly so called only when it is a neighbourhood centre of both social and medical activities, stress being laid on the social and preventive value of its services. The term cannot justifiably be applied to a building where only medical care is provided. A health centre can, however, be developed within a hospital; in fact, there are advantages in such a scheme. *See Pioneer Health Centre.*

R. H. Farry, M.D.

Health Visitor. British state registered nurse with a further training in midwifery and holding a statutory qualification. Health visiting is a form of social service;

its object is the education of the people in healthy living and in the knowledge of what is meant by full physical and mental health and what is necessary to attain it. The duties of a health visitor vary according to district. Through her, legal enactments affecting the health and welfare of a family are conveyed to the public. She visits homes and supervises children under school age in her district; attends the maternity and child welfare centre and advises mothers on the care and upbringing of their children and their personal health and hygiene during pregnancy and lactation. Her duties may include school nursing, visiting tuberculous patients, and making special investigations.

Healy, MAURICE (1887-1943). Irish author and broadcaster. Born in Cork, Nov. 16, 1887. Nephew of Timothy Healy, he was educated at the Christian Brothers' College, Cork; Clongowes Wood College; and University College, Dublin. In 1910 he was called to the Irish bar and four years later to Gray's Inn. Recorder of Coventry from 1941, he died May 9, 1943. Not until he was almost 50 did he come into public notice as author and broadcaster. His postscripts to the B.B.C. news early in the Second Great War were remembered for their wit, charm, and poignancy. He ranked as an authority on French wines and was a founder of the Wine and Food Society. Healy published *Claret and the White Wines of Bordeaux*, 1934; *The Old Munster Circuit*, 1939; *Stay Me with Flagon*, 1940.

Healy, TIMOTHY MICHAEL (1855-1931). Irish politician. Son of Maurice Healy of Bantry, he be-

Timothy M. Healy,
Irish politician
Ruesell

came a railway clerk, then a London journalist. He was called to the Irish bar in 1884. He had already entered the house of commons in 1880 as Nationalist M.P. for Wexford, and remained therein until his retirement from politics in 1918, sitting for co. Monaghan, 1883-85; S. Londonderry, 1885-86; N. Longford, 1887-92; N. Louth, 1892-1910; N.E. Cork, 1910-18. Healy's gifts as an orator, with his wit and independence, soon made him a prominent figure in parliament and in the Irish party. He broke away from Parnell at the

split of 1890. He was expelled from the party in 1900, as he was opposed to the United Irish League, but was readmitted in 1908, only to be again turned out in 1910. He was made a Q.C. in 1899 and called to the English bar in 1903. First governor-general of the Irish Free State, Dec., 1922, he resigned after five years. He died March 26, 1931. *Consult* Memories and Anecdotes, Sir D. P. Barton, 1933.

Heanor. Urban dist. and market town of Derbyshire, England. It is 8 m. N.E. of Derby and is served by rly. (London Midland region). It stands on the Derbyshire coalfield, and the industries are coal-mining, ironfounding, engineering, pottery, and the making of hosiery and lace. There are a grammar school and a school of mining and engineering. Market days, Fri. and Sat. Pop. 22,380.

Heard (HENRY FITZ-) GERALD (b. 1889). British writer. Born Oct. 6, 1889, and educated at Sherborne and Caius College, Cambridge, he was literary editor of *The Realist*, 1929. He became known to a wide public through his fortnightly broadcasts, *This Surprising World*, 1930-33, and the series *Science in the Making*, 1934. He joined Aldous Huxley in the U.S.A. in 1939 and with him developed a mystical philosophy. A writer of considerable power, his chief publications included *The Emergence of Man*, 1931; *These Hurrying Years*, 1934; *Exploring the Stratosphere*, 1936; *Pain, Sex, and Time*, 1939; *Preface to Prayer*, 1945.

Hearing. Term used for the physiological sensation caused by vibrations which excite the auditory nerve. According to Helmholtz's theory there are in the ear certain vibrators tuned to varying frequencies of from 30 to 50,000 vibrations a second which respond to these vibrations. Each vibrator can excite its attached nerve filaments, and when it does so an impulse, which the brain centres are capable of distinguishing or specifying, is transmitted to them.

There are other implied attributes of the vibrators. They must, e.g., be easily set in motion, but quickly brought to rest. They may, by the amplitude of their own vibrations, signify to the brain the intensity of the vibrations impinging on them, and evoke the sensations corresponding to loudness. If a compound wave of sound falls on the vibrators, they can resolve it into its constituents, each vibrator picking out its sympathetic vibration,

so that the brain may recognize that the vibrations are fused, yet may be sensible of the constituents of fusion. The theory compares the basilar membrane of the ear to the strings of a piano, and it has been found that there are between 16,000 and 20,000 cross fibres in the membrane, sufficient to provide all the combinations to give the sounds we hear.

There are many difficulties in the acceptance of this theory and a number of others, more or less plausible, have been put forward. The Rutherford-Waller or "telephone" theory regards the basilar membrane of the ear as a telephone membrane; while Ebbinghaus considered that one tone set in motion not only certain vibrators, but others harmonically tuned to them.

In order to produce movement in these physiological vibrators, the vibrations reaching them must be of sufficient strength. That the necessary strength is extremely small may be realized from the fact that it has been estimated that the ear is affected by atmospheric vibrations of a wave length comparable to that of the wave length of light, i.e. the energy required to influence the ear is of the same order of magnitude as that which produces impressions on the retina of the eye.

Human and Lower Animal Hearing

The human ear varies in its ability to detect sounds which are produced by a very high number of vibrations, a falling off taking place after middle age; but few ears can detect more than 30,000 vibrations a second. A child can hear the pipe of a bat, but an adult can rarely do so. The lower limit is about 30 a second; the higher usually 38,000 a second. Animals are capable of detecting vibrations that are unheard by human beings, and Francis Galton devised a dog whistle of so high a note of vibration that only his dog could hear it. The Harlequin fly responds to its mate by a vibratory apparatus equivalent to a sound receiver, but the sound is quite beyond human ears. It has been shown by Campbell and Dye that there are "sound waves" of 800,000 vibrations a second.

The sensations of hearing fall into two groups classified as noises and musical sounds. Noises are caused by impulses irregular in intensity or duration; musical notes by periodic and regular vibrations. In musical tones are three characteristics: intensity, pitch, and timbre or quality. Intensity

depends on the amplitude of the vibration; pitch, on the number of vibrations in a given time. A high note has many vibrations; a low note few. Quality, the characteristic by which a tone is identified as proceeding from a particular instrument, or a particular human voice, depends on the fact that many waves of sound are compound waves, built up of other waves. The ear has the power of resolving and classifying these waves. Hearing is apparently very little affected by the use of one or both ears, though undoubtedly one ear corrects the faults of the other. Also it is more difficult to judge the direction of a sound when the hearing of one ear is impaired. G. T. Fechner has suggested that the ears perceive sounds at different pitches, so enabling a judgement to be formed as to the direction and, in many cases, distance from which sounds are coming.

Hearing is not universal among animals, there being no reason to suppose such a sense among the lowest vertebrates, for example. Spiders, earthworms, crustacea, etc., have been supposed to show responses to auditory stimuli. Insects have not been proved to show any sense of hearing, though fishes, which possess a structure analogous to the ear, respond to the vibrations of a tuning fork.

Though such animals as horses, dogs, and the higher vertebrates generally have a sense of hearing, its degree and range have not been fully ascertained. *See* Ear; Sound.

Hearing. In law, term used for the judicial procedure in any law case. Strictly speaking, the term is usually confined to equity cases, but in common usage it applies to the hearing of any lawsuit. The word is also used for a sitting of any commission appointed to hear the evidence for and against any proposition. *See* Procedure; Trial.

Hearn, LAFCADIO (1856-1904).

Author. Born in Leucadia (Santa Maura), one of the Ionian Islands,

Lafcadio Hearn,
writer on
Japan

he was the son of an Irish army doctor by a Greek mother. He became a journalist in the U.S.A., but in 1891 went to Japan, where he was professor of English in the university of Tokyo, 1896-1903. He married a Japanese wife, became

naturalised as a Japanese subject, and professed Buddhism. Hearn wrote with singular acuteness and charm on the people, manners, customs, and spirit of his adopted country. His works include *Glimpses of Unfamiliar Japan*, 1894; *Gleanings in Buddha Fields*, 1897; *Ghostly Japan*, 1899; *A Japanese Miscellany*, 1901; *Japan: an Attempt at Interpretation*, 1904. He died Sept. 23, 1904. His *Life and Letters*, by E. Bissland, appeared in 1906.

Hearne, THOMAS (1678-1735). English antiquary. Born at Littlefield Green, Berkshire, he was the

Thomas Hearne,
English antiquary

son of the parish clerk of White Waltham. Compelled to go out to work as a boy, he found a patron who sent him to school at Bray and later to St. Edmund Hall,

Oxford, where after graduating he was appointed an assistant in the Bodleian Library. In 1712 he became second keeper, but four years later was compelled to relinquish his position owing to his refusal to take the oath of allegiance to the

schools and Peterhouse, Cambridge. Professor of history at Southampton, 1900-10, he held the chair of modern history at Durham, 1910-12, and then went to London university as professor of medieval history. Here he instituted free public lectures and during 1923-33 arranged courses on the social and political ideas of groups of thinkers from Augustine to Herbert Spencer. He retired in 1934, and died at Oxted, March 10, 1946. His chief publications included *Main Currents of European History*, 1917; *Democracy at the Crossways*, 1918; *Survey of Socialism*, 1928.

Hearsay. English legal term. Hearsay evidence is that given by a witness who does not personally know the fact but is merely repeating a statement made by some other person. Such evidence is in general not admissible to prove the fact. There are, however, many exceptions: (1) admissions and confessions; (2) certain statements by deceased persons; (3) statements in public documents. *See* Evidence.

Hearse (Fr. *herse*, harrow). Wheeled vehicle for carrying the bodies of the dead to the place of burial. Hearses range from a simple box-shaped cart to elaborate

April 29, 1863, son of a Californian mining magnate and senator, in 1886 he secured from his father control of The San Francisco Examiner. In 1895 he bought The New York Morning Journal, ran it in opposition to The New York World, re-named it The New York American, and became owner of similar "yellow" journals in leading cities, as well as periodicals. His syndicates of feature articles reached an enormous number of readers of other journals. At one period his profits averaged 15 million dollars a year, his publications consumed 60 acres of forest a day in paper pulp, he had 70,000 men and women on his pay roll, and he paid his principal leader writer \$250,000 a year.

W. R. Hearst,
American newspaper
proprietor

Hearst figured in campaigns against the trusts, achieved notoriety as the exponent of an anti-British policy, and was censured in 1906 by Roosevelt and Root for his part in the campaign against McKinley. He sat in congress, 1903-07. In 1904 he came second

Hearse. Left, traditional open horse-drawn vehicle with glass panels: right, type of motor hearse which has largely superseded the older type

Hanoverians. He died at Oxford, June, 1735, and was buried there.

His principal works are *Reliquiae Bodleianae*, 1703, and a *Collection of Curious Discourses on English Antiquities*, 1720. He edited Leland's *Itinerary*, 1710-12. Extracts from his diaries were published as *The Remains of Thomas Hearne*, 3 vols., 1869, and the publication of the whole was begun by the Oxford Historical Society in 1885.

Hearnshaw, FOSSEY JOHN COBB (1869-1946). A British historian. Born at Birmingham, July 31, 1869, he was educated at Walsall and Manchester grammar

glass-panelled, brass-railed, ornamented conveyances, topped with black plumes. Originally a hearse was a harrow-shaped framework for holding candles in church, especially at funeral services. It developed into a gorgeous, decorated canopy, holding candles, escutcheons, banners, epitaphs, verses, etc., especially for royalty and the nobility. The term is still used for a bier, coffin, or tomb, and, in heraldry, for a charge resembling a harrow or portcullis. *See* Burial Customs.

Hearst, WILLIAM RANDOLPH (b. 1863). American newspaper proprietor. Born at San Francisco,

in the Democratic nomination for the presidency. He received large votes for the mayoralty of New York city in 1905 and 1909, and for the governorship of New York state in 1906 and 1910.

In 1916 the British government refused to allow the international news service controlled by him to use the cables from Great Britain. The Canadian postmaster-general prohibited the entrance of Hearst newspapers into Canada. The embargo was withdrawn in spring, 1918. In 1930 the French government expelled Hearst from French territory for his part in the publication of a secret document

relating to naval negotiations. Following a drop in the circulation of his papers, in 1938 he turned them over to a management committee, and sold two-thirds of his art treasures, as well as the castle of St. Donat's in Wales, which he had purchased in 1925.

Heart. One of the red suits in a pack of playing cards; or any card belonging to that suit. Hearts took their present form early in the history of cards, probably as a

modification of chalices, which in Spanish and Italian packs represented the clergy among the four orders of the community. To fortune tellers, hearts refer to the affections and qualities of the mind; the nine of hearts is the "wish card." Lewis Carroll introduced the royal family of hearts into Alice's Adventures in Wonderland, making use of the old nursery rhyme beginning "The queen of hearts, she made some tarts."

HEART: THE HUMAN PUMP

E. A. Schott, M.D. (Heidelberg), M.B.C.S.

A physiological description of the heart and its action is followed by an explanation of the symptoms and causes of the principal forms of heart disease. See also articles on other parts and organs of the body

The heart is the organ acting as a pump which propels the blood through the circulatory system.

While references to the circulation of the blood are found in the earliest known records (Egyptian papyri of the 15th century B.C.), and the Chinese are believed to have had some knowledge of it as early as 2000 B.C., the discovery of the true function of the heart was made by William Harvey (q.v.), whose epoch-making book *Exercitatio Anatomica de Motu Cordis et Sanguinis in Animalibus* appeared in 1628. The human heart has been closely associated in the popular mind with the emotions, as the folklore and poetry of many countries show.

Propulsion of Blood

A pump mechanism for the propulsion of blood is present in most animals. In most fishes the heart is a single tube which forces the blood through the gills. This tube expands into various cavities which, from the tail forwards, are the sinus venosus, auricle, ventricle, and bulbus cordis. In some form these parts can be traced in all the higher animals: the heart of amphibia contains a sinus venosus, two auricles, one ventricle, and a bulbus cordis; the ventricular septum begins to appear in the reptiles, being nearly complete in the crocodiles. Both septa are complete in the birds, in which the sinus venosus is no longer a separate chamber, but becomes absorbed into the right auricle, as is the case in the mammals.

In the human embryo the heart develops in front of the pharyngeal region from a simple tube in which four expansions, separated by grooves, form; these are the sinus venosus, the primitive atrium, the primitive ventricle, and

the bulbus cordis. By bending on itself the tube assumes the form of an S-shaped loop. The sinus venosus is absorbed into the right auricle; the atrial portion divides into a right and left auricle by growth of (endocardial) cushions, and of a septum (which itself is formed by fusion of the remaining parts of two septa); other septa grow to divide the primitive ven-

line. Its average weight is c. 300 grammes (10½ oz.), and its size is roughly the same as that of its owner's closed fist. It consists of four chambers: right and left auricle or atrium, and right and left ventricle. The right ventricle and auricle lie in front, the left ventricle and left auricle behind, the left ventricle also forming the left border and the apex of the heart. Each auricle has an extension; these extensions are called the auricular appendages. The auricles are separated from one another by the interauricular septum, the ventricles by the interventricular septum. The left auricle communicates with the left ventricle by the left auriculo-ventricular or mitral orifice, the right auricle with the right ventricle by the right auriculo-ventricular orifice. The venous blood returns to the right auricle through the great veins (superior and inferior vena cava) and the coronary sinus, and reaches the right ventricle through the right auriculo-ventricular orifice. The right ventricle propels it into the pulmonary artery through the branches of which it reaches

the lungs, there to take up oxygen and give off carbon dioxide. The blood thus arterialed returns to the left auricle by the four pulmonary veins, passes into the left ventricle, through the left auriculo-ventricular (mitral) orifice, and is ejected by the left ventricle into the aorta, the branches of which carry it into the various parts of the body.

Heart. Section showing the ventricular septum. On the right side the atrioventricular orifice has been cut across. On the left side the section passes through the aortic orifice and in front of the atrioventricular orifice. From Gray's Anatomy, by permission of Longmans, Green & Co.

tricle into a left and right chamber, and the part of the bulbus cordis, which is in proximity to the heart, into the aorta and pulmonary artery.

The heart of a human being lies in the chest between the two lungs, behind the lower two-thirds of the breast bone, in front of the oesophagus and above the diaphragm on which it rests. It is roughly conical in shape, with its base directed upwards, to the right and backwards, its apex downwards, to the left and forward. Normally about one-third of the organ lies to the right and two-thirds to the left of the mid-

Four valves ensure that the blood flows in one direction only: (1) the tricuspid valve, guarding the right auriculo-ventricular opening which consists of three cusps, the close apposition of which during ventricular contraction prevents the backflow of blood from the right ventricle into the right auricle; the free border of the cusps is attached by means of fibrous cords (chordae tendineae) to muscular projections in the interior of the right ventricle (musculi papillares), the contraction of which prevents the cusps of the valve from being driven into the right auricle by the blood stream; (2) the pulmonary valve,

at the origin of the pulmonary artery from the right ventricle, consisting of three semilunar folds which prevent backflow of the blood from the pulmonary artery into the right ventricle during relaxation (diastole) of the ventricles; (3) the bicuspid (or mitral) valve, guarding the left auriculo-ventricular opening, consisting of two cusps which during contraction of the ventricles prevent backflow of blood from the left ventricle into the left auricle by a mechanism essentially identical with that of the tricuspid valve described above; and (4) the aortic valve, at the root of the aorta, consisting of three semilunar folds which prevent regurgitation of blood from the aorta into the left ventricle.

The heart consists of three layers: an inner lining membrane (endocardium), a muscular layer (myocardium), and a double outer lining membrane (pericardium) enveloping the heart. The heart derives its blood supply from the two coronary arteries which originate from the first part of the aorta; the venous blood of the heart returns to the right auricle via the coronary veins and the coronary sinus. The nerve supply of the heart is derived from the vagus nerve and the sympathetic nervous system.

The activity of the heart is rhythmical, consisting of alternating phases of contraction, called systole, and relaxation, called diastole. The two auricles contract virtually simultaneously, and so do the two ventricles; but the contraction of the auricles precedes that of the ventricles by about $\frac{1}{8}$ second. The normal heart rate at rest is 70-75 per min. in the adult, but varies considerably in different individuals. It is higher in the infant and as a result of exercise or excitement, and often lower in athletes and in the aged. The rhythmic contractions of the heart are due to impulses which originate in a definite area in the right auricle, near the orifice of the superior vena cava, where there is an accumulation of cells of special structure: the sino-auricular node (also called the normal pace-maker). From there the stimulus spreads through the auri-

cles to another accumulation of specialised tissue situated at the junction between auricles and ventricles, called the atrioventricular node. Thence it is conducted along (and to) the interventricular septum by the bundle of His (so named after its discoverer) and through its two main branches the ramifications of which, called Purkinje fibres, conduct the impulses to the ventricles. This anatomical arrangement and the high rate of conduction of the impulse through the network of Purkinje fibres (4 meters per sec.) result in the activation of the whole of both ventricles by the impulse in less than $\frac{1}{8}$ second.

Starling's Law

The heart muscle possesses the properties of excitability and contractility, i.e. it responds to (intrinsic and external) stimuli by contracting. Throughout the period of contraction (refractory phase) it does not respond to exter-

Heart. Anterior view of the organ and the pericardium. The anterior part of the pericardium has been removed.

From Buchanan's Anatomy

nal stimuli; it is subject to the "all-or-none" law, which means that if a stimulus is sufficiently strong to provoke a response, the muscle contracts with the full force it is capable of exerting. This force varies with the initial length of the muscle fibres (Starling's law), the length of the preceding period of relaxation (diastole), and the state of nutrition of the heart muscle.

When a physician suspects that a person has heart disease he requires to have a detailed medical history of the patient as well as to make a thorough general examination, including examination of other parts of the circulatory system, e.g. of the pulse in arteries and veins, and of blood pressure

Examination of the heart itself is mainly directed to obtaining information about the condition of its various parts, its position, size, shape, and mode of action.

Inspection and palpation of a person's chest show in many, though not all, a pulsation with each heart beat at a point about $3\frac{1}{2}$ ins. to the left of the midline between the 5th and 6th ribs; this "apex beat" is caused by the forward thrust of the apex with each contraction of the ventricles. By locating the apex beat as well as by the percussion of the heart some idea about the size and position of the heart can be obtained. The normal heart produces two sounds which can be heard by a stethoscope (auscultation) or recorded graphically (phonocardiography). Far more accurate information about the size, shape, position, and mode of action of the heart can be obtained by means of X-rays, by which the shadow of the pulsating heart is studied on a fluorescent screen and photographs of the X-ray picture of the chest are taken.

Electrocardiograms

By this method the heart is visualised since the air-filled lungs allow the X-rays to penetrate whereas the blood-filled heart intercepts them. During each contraction the heart produces changes in electrical potential (action currents) which spread throughout the body and which can be recorded by suitable instruments; such records are called electrocardiograms. The basic fact underlying this method is that the active part of a muscle is electro-negative as compared with the inactive ones. The features of such tracings therefore depend on the site of origin and mode of spread of the excitation wave through the heart which is accompanied by the changes in electrical potential. Electrocardiograms give information about the rate and rhythm of the heart as well as of the condition of the heart muscle, since disease of the myocardium affects the mode of spread of the excitation wave and thereby produces changes in the record.

By studying the effect upon the heart of physical exercise information about the functional state of the heart is obtained.

The normal heart has great reserve power and adaptability which make possible a quick adaptation to the increased demands caused by exercise; in strenuous exertion the output of

blood may be increased from 7 pints per min. (an average normal at rest) to 70 pints per min.

DISEASES OF THE HEART. Two main groups of conditions may be distinguished: those associated with structural changes sometimes called organic heart disease, and those without structural abnormalities in which only the function of the heart is affected. Combinations of the two often occur.

Structural heart disease may be congenital, *i.e.* exist from birth, or acquired. Congenital heart disease is rare, in most cases it is due to malformation of a part or parts of the heart. Several groups of such conditions are recognized according to whether or not an abnormal communication between the two sides of the heart exists and whether and to what extent blood flows through abnormal short-circuiting channels (shunts) from the right to the left side in the heart or the great vessels originating from it. Considerable progress has been made recently in the diagnosis of congenital heart conditions, some of which have been found to be amenable to surgical treatment.

The three most important causes of acquired structural heart disease are infections, long continued strain on the heart, and degenerative changes of the heart muscle due to atheromatosis (arteriosclerosis).

Effect of Rheumatic Fever

Of all infections, rheumatic fever affects the heart most frequently and most seriously. Rheumatic heart disease is one of the most important conditions resulting in death or prolonged invalidism of young people. In the acute stage rheumatic fever tends to affect all three layers of the heart, causing inflammation of the endocardium (endocarditis), of the myocardium (myocarditis), and of the pericardium (pericarditis). Healing of the endocarditis is often associated with scarring, which produces thickening, shortening, and deformities of the valves and their cords of attachment, resulting in chronic valvular heart disease: either a narrowing of the valvular orifice (valvular stenosis) or leaking of the valve (valvular incompetence), in most cases a combination of the two; the left valves of the heart (mitral and aortic) are the ones almost exclusively affected directly. In this condition murmurs are heard on auscultation of the heart which may precede follow, or

replace one or both of the two normal heart sounds; the time of occurrence, the character, and the site of the murmur make possible diagnosis of the type and site of the valvular lesions.

Forms of Valvular Disease

Subacute bacterial endocarditis is an infection usually caused by a certain type of streptococcus which in most cases affects persons with chronic valvular heart disease. In this condition, previously almost invariably fatal, penicillin seems to be effective at least in a certain proportion of cases. Acute bacterial endocarditis differs from the subacute form in producing severe destruction of the valves; it is caused by a variety of micro-organisms, the heart condition forming only a part of a general blood invasion by those germs; it is usually rapidly fatal.

Many other infections may affect the heart, especially during the acute stage of the infection, but as a considerable number of them can now be controlled by drugs their permanent effect on the heart is less serious and rarer than it was a few decades ago. Mention may be made of the toxic damage to the heart muscle by the toxin of the diphtheria bacillus, and of pericarditis in tuberculosis, in the late stages of certain kidney diseases, and in thrombosis of a coronary artery. Many conditions formerly believed to be myocarditis are now known not to be true inflammation of the heart muscle.

If syphilis affects the circulatory system, it causes a special kind of inflammation of the first part of the aorta often affecting the orifices of the coronary arteries. Thence it may spread to the aortic valve, causing aortic incompetence.

The second important group of structural heart diseases is that caused by long continued strain imposed on the heart. Chronic high blood pressure produces this kind of strain in respect of the left ventricle, a rise in pressure in the pulmonary artery and its branches (from various causes) in respect of the right one. The wall of the ventricle, which has to carry out an increased amount of work owing to the increased pressure against which it expels the blood, increases in thickness (hypertrophy), and eventually its cavity enlarges (dilatation). In advanced cases with heart failure both sides of the heart are usually involved.

Atheromatosis of the arteries, in particular of the coronary

arteries, is the most important cause of degenerative changes in the heart muscle and predisposes to thrombosis of a branch of a coronary artery (coronary thrombosis). It is one of the most important causes of death in middle aged and elderly individuals, death often occurring suddenly. An important symptom of atheromatosis of the coronary arteries is angina pectoris.

Functional disorders of the heart without any constant structural changes may be caused by a great variety of factors, *e.g.* by abnormal conditions elsewhere in the body such as certain forms of goitre and Graves' disease; by nutritional deficiencies; by excess of coffee, tea, or nicotine; and by emotional factors. Effort syndrome or neuro-circulatory asthenia is a condition in which symptoms of heart and nervous disorder occur in predisposed individuals as a result of physical or mental fatigue, and is commonly associated with an anxiety state.

Organic heart disease may be present without giving rise to any symptoms. Many persons with some structural abnormality of the heart are able to lead normal lives, the heart compensating for the lesion by adapting its function so as to provide an adequate circulation.

Signs of Heart Failure

When the heart begins to fail certain changes invariably make their appearance. In congestive heart failure shortness of breath is the earliest and an important symptom, occurring at first as a result of severe exertion, but, with increasing heart failure, after an ever slighter degree of exercise, even at rest, and in certain forms of heart failure at night (cardiac asthma). Fluid accumulates in various parts of the body resulting in swelling of the ankles and legs (oedema), enlargement of the liver, retention of fluid in the lungs, chest, and abdomen (dropsy); in certain forms of heart failure a bluish discoloration of the skin (cyanosis) develops, especially marked in some of the exposed parts of the body. The heart is nearly always enlarged.

Angina pectoris is a discomfort variously described as a feeling of oppression, constriction, or pain in the chest, usually behind or to the left of the breast-bone, often radiating to the shoulders and arms (far more commonly to the left). It may occur intermittently, being precipitated by exertion or excitement and aggravated by a

heavy meal and by cold (angina of effort). The same kind of discomfort may occur at rest. In its most severe and prolonged form angina of rest is encountered in coronary thrombosis. Angina pectoris is a result of a disproportion between oxygen supply to, and oxygen demand by, the heart and is most commonly caused by coronary artery disease, but occurs in a variety of other conditions.

Palpitation is an unpleasant feeling of being conscious of the heart's action; it occurs normally with excitement and effort, otherwise mainly in certain forms of irregular heart action, certain valvular lesions, Graves' disease, etc., and is an outstanding symptom in neuro-circulatory asthenia.

Respiratory Arrhythmia

One common form of irregular heart action (arrhythmia) is a variation in heart rate with respiration, called respiratory or sinus arrhythmia, and is normal in children and young adults and occurs in highly-strung individuals; it never denotes heart disease. So-called missed beats is an arrhythmia caused by a premature contraction of the heart followed by a longer pause; it is generally found in healthy hearts, though it may be associated with heart disease. Auricular fibrillation is a condition in which the normal contraction of the auricles is replaced by fine twitchings occurring at a rapid rate and in which the ventricles contract in a completely irregular rhythm; it is often, but not always, associated with some form of heart disease.

Abnormally slow heart action is called bradycardia; heart rates of about 50 per min. and even lower may be normal for certain individuals; bradycardia in elderly persons is usually due to atheromatosis and may (but need not) be due to complete heart block, a condition in which the ventricles contract independently from the auricles owing to an interruption of the conduction of the stimulus of contraction from auricles to ventricles.

Abnormally fast heart action is called tachycardia; several forms are distinguished according to the mechanism of the heart action during the periods of fast action. While certain forms occur in connexion with heart disease, tachycardia in itself does not denote the presence of the disease.

The treatment of patients with heart disease calls for a detailed study of each case individually together with the setting in which

he or she lives. When applicable and possible the underlying condition is treated. Adjustment of the patient's life according to the kind and degree of heart disease is essential, and special attention must be paid to the appropriate kind and amount of work and other activities, both mental and physical, adequate periods of rest, and avoidance of overstrain and fatigue. In many cases some dietetic readjustments are essential, though severe restrictions in the diet are rarely required in uncomplicated cases. Drugs occupy an important place, the choice of the drug and its dose being dependent on the condition and the individual's reaction. Digitalis, sedatives, quinidine, and a great number of drugs, promoting the elimination of fluid from the body, are the ones most commonly prescribed. The psychological aspect of heart disease is most important and every consideration to it must be given in the treatment. Some patients are improved by blood letting and in others the administration of oxygen is of great value. Physical treatment—massage, gymnastic exercises, medicinal baths—is beneficial in some instances; they can with advantage be combined with graduated exercise in suitable cases.

Heartbreak House. Comedy in 3 acts by Bernard Shaw. Described by its author as "a fantasy in the Russian manner on English themes," it was first produced at the Court Theatre, London, Oct. 18, 1921, when Edith Evans (*g. v.*) created the part of Lady Utterword. Unlike many of Shaw's plays, it has emotional content and a romantic setting. The original production was denigrated by the critics, and Shaw publicly challenged their judgement. Revivals in London included those at the Queen's, 1932; Westminster, 1937; Cambridge, 1943.

Heart-burial. Burial of the heart apart from the body. This practice dates from remote times, and in Europe was apparently most common in the 12th and 13th centuries. It was possibly due to the notion that the heart was the seat of the noble qualities, a motive perhaps reinforced later by a pious desire to secure the prayers of more than one community for the soul. Crusaders had their hearts buried in Jerusalem.

Among kings of England whose hearts have been interred apart from their bodies are Richard I, whose heart was buried at Rouen;

Henry I and Henry III, both in France; Edward I, at Jerusalem; and James II, at Chaillot, near Paris. That of Eleanor, queen of Edward I, was buried at Lincoln.

The heart of Robert Bruce, after many adventures, was eventually placed in Melrose Abbey instead of at Jerusalem, as he had wished; the heart of Paul Whitehead, secretary of the Medmenham "Hell Fire" Club, was buried with much pomp in the Le Despenser mausoleum at West Wycombe, Bucks, in 1775; and that of Daniel O'Connell at Rome. The practice was prohibited by Pope Boniface VIII, but again permitted by Benedict XI. A modern example is afforded by the burial at Stinsford, Dorset, in 1928 of the heart of Thomas Hardy, poet and novelist, whose ashes lie in Westminster Abbey.

Heart of Midlothian, THE. Scott's seventh novel, the second of The Tales of My Landlord series, and adjudged by good critics the best of the Waverleys. It is a story of infinite pathos, with a heroine in humble life (Jeanie Deans), whose sweet naturalness and devotion to her erring half-sister Effie have moved the hearts of novel readers all over the world since the book was first published in June, 1818.

Its principal features are Effie Dean's romance, her trial for child-murder, the true-blue Presbyterianism of her father, "Douce Davie," the self-sacrifice of the deputy-schoolmaster, Reuben Butler, and his courtship of Jeanie; the quaint characters of the two lairds of Dumbiedikes; the fateful figure of the ne'er-do-well, Staunton; the tragedy of Meg Murdockson and her daughter, Madge Wildfire; and the picture of the Porteous Riot (1736), with which the story opens. The title is taken from the old Edinburgh Tolbooth (prison). Daniel Terry dramatised the novel in 1819.

Heart's Content.

Seaport of Newfoundland. In the S.E., it stands on the E. side of Trinity Bay, and has a good harbour used by fishermen and others. Here is the terminus of the cables from Valentia, Eire.

Heartsease OR WILD PANSY (*Viola tricolor*). Herb of the family Violaceae, native of Great Britain, N. Europe,

Heartsease, flower and foliage

N. Africa, and Asia. It differs conspicuously from the violets in the lyrate form of leaf with leafy stipules, and in the sepals having ear-like processes. The small flowers are whitish, yellow, and purple, the tints sometimes combined in one flower, sometimes distinct. Among other popular names for the flower were Love-in-idleness, Three-faces-under-one-hood, pawnee, or pansy (*Fr. pensée*). The last name has been adopted generally for the many wonderful

Heartseed. Foliage, flower, and seed pod

garden forms evolved by selection and breeding from the little wildflower. See Pansy.

Heartseed (*Cardiospermum halicacabum*). Climbing herb of the family Sapindaceae, native of the tropics. Its leaves are divided into coarsely toothed, lance-shaped leaflets. The small greenish-white flowers form short sprays. The seed vessel is a bladder-like capsule, and the round seeds bear a heart-shaped scar, whence the name. An altered native name is balloon vine.

division, and marked the "boiling-point" 0 and the "freezing-point" 100. Eight years later Strömer, also of Upsala, suggested the inversion of the numbers, and gave us the present scale of the "centigrade" thermometer.

As different liquids did not expand proportionately one with the other on receiving similar alterations in hotness, some difficulty was experienced in deciding on the points which were to be marked 1, 2, 3, etc., since mercury indicated a slightly different series from other suitable liquids such as alcohol, pentane, etc. Through the researches of Boyle and Amontons in the 17th century, of Gay-Lussac, Dalton, and Charles in the 18th and 19th, and of Regnault in the 19th century, the expansibility of gases had been very carefully observed, and the notable fact that their expansibilities were by no means equal had been clearly enunciated, especially for those gases like hydrogen, oxygen, nitrogen which are more "permanent," i.e. more difficult to liquefy.

By degrees the use of the hydrogen or nitrogen thermometer as a standard of comparison for all liquid-in-glass thermometers became the accepted practice in careful research, and the final touch was added by Lord Kelvin (then William Thompson) in 1848, when he established on purely theoretical grounds an "absolute thermodynamic" scale of temperature which is independent of the particular properties of any particular substance, and in collaboration with Joule of Manchester carried out a famous series of experiments to determine the slight deviations between the indications of a "gas" thermometer and the "absolute scale."

The Platinum Thermometer

This settling of the scale of measurement is quite apart from the great practical development which has taken place in recent years in the construction of thermometers for special purposes, such as measurement of very low or very high temperatures. Mainly owing to the labours of H. L. Callendar the "platinum" thermometer has become an instrument of great precision for such extremes as liquid gases and furnaces. In this type, alteration of temperature is measured by the variation experienced in the electric resistance of a wire of pure platinum mounted and insulated on a mica frame, protected in a tube of porcelain, and connected by suitable leads to apparatus for the accurate

HEAT: A MANIFESTATION OF ENERGY

* R. W. B. Stephens, Ph.D., Lecturer in Physics, Imperial College of Science and Technology

Here are described the various theories of heat and its measurement, serving as a general introduction to the many articles in this Encyclopedia dealing with heat in its various manifestations. Among such articles are Conduction; Freezing point; Fusion; Melting point; Thermo-dynamics. See also Heating

The common sensations experienced by everyone who touches the surface of a body lead to a rough classification of bodies as "hot" or "cold." Also the sensations experienced when in full view of the sun or a fire, or even when sufficiently close to a hot but non-luminous body, and the observations of the tendency of bodies which originally were unequally hot to come to the same state of hotness or coldness, impress on our minds the idea of the transference of something which we call "heat" from body to body. Care is required to avoid confusing the sensation of hotness and the concept of "temperature" based on them, with the concept of heat.

Measurement of Temperature

Historically the study of the science of heat began with investigations concerning the measurement of temperature. The sense of touch is neither sensitive nor precise enough to serve as a reliable guide in such matters. The invention of the first thermometers has been ascribed to various people, but certainly Galileo's claim is one of the best established, and in the hands of his pupils who formed the famous "Accademia del Cimento" at Florence, measurement of temperature attained a very fair standard of accuracy. These Florentine academicians adopted the glass bulb and stem, containing either mercury or spirits of wine, choosing as "fixed

points" the temperature of snow in the severest frost and the temperature of the bodies of cows and deer, and divided the stem between into 40 or 80 equal parts.

Fahrenheit's Discovery

G. H. Fahrenheit (1686-1736) perfected the mercury in the glass thermometer by discovering a simple process for cleaning mercury, and by observing that the temperature of a boiling liquid depends on the pressure impressed on its surface by the atmosphere or by artificial means. Having taken his zero to be marked when the bulb was in a mixture of ice, sal-ammoniac and water, and another fixed point to be indicated when the bulb was under the armpit of a healthy person, he divided this interval into 24 equal divisions; finding these to be too large, he sub-divided them into four equal parts.

On this scale he found that pure melting ice gave constantly 32, and he no doubt used this as a check on his graduation, and he found that boiling water was generally between 211 and 213, varying with the height of the barometer. Ultimately melting ice was taken as one fixed point and marked 32, and steam rising from water boiling under a pressure of one "standard atmosphere" (760 mms. or 29.92 ins. barometric height) was taken as another and marked 212. In 1742 Celsius of Upsala suggested the centesimal

determination of resistance. By inserting large porcelain test-tubes in furnaces, with their open ends just protruding through the wall, and measuring the amount of radiation proceeding from this opening, great precision has been introduced into furnace thermometry. In these "radiation pyrometers" use is made of Stefan's law that the amount of radiation emitted from such a "full radiator" varies according to the fourth power of the absolute temperature.

Thermoelectric Thermometry

Two dissimilar metals electrically connected to form two junctions give rise to an electromotive force, if the junctions are at different temperatures. This e.m.f. can be measured by means of a potentiometer or by using a suitable meter inserted in series with the so-called thermocouple. This type of thermometer is most useful for continuous recording of temperature and its low thermal capacity is particularly advantageous in, for instance, the measurement of skin temperature.

Thermocouples can be used up to $1,400^{\circ}\text{C.}$, this limit being fixed by the suitability of the "sheath" to protect the element from the effects of furnace gases. Temperatures above $1,400^{\circ}\text{C.}$ are measured by radiation and optical pyrometers in combination with a rotating sector between the source and pyrometer which allows only a known fraction of the radiation to fall actually on the pyrometer.

At very low temperatures in the neighbourhood of the normal boiling points of the so-called permanent gases the vapour pressure of a liquefied gas is the property utilised to estimate temperature, a suitable manometer being used for this purpose. Resistance thermometers in which lead is substituted for platinum are also used at low temperatures.

Specific and Latent Heat

Care should be taken to avoid confusion between the famous discussions of the past as to the nature of heat, and the experimental work carried out for the purpose of measuring heat. Even at a time when views were entertained concerning the nature of heat, which are now regarded as inadequate, the question of its measurement had advanced a considerable distance along right lines. Early attempts to utilise the mechanical power of steam in Britain were made in the 18th century, and James Watt received great assistance from Joseph Black, of Edinburgh, who was the first to eluci-

date the ideas of "specific heat" and "latent heat."

One "gram-calorie" of heat is required to raise the temperature of one gram of water through one centigrade degree; but Black discovered that other materials had their specific amount of heat for similar changes, different for each substance. Thus, copper requires about $\frac{1}{11}$ of a calorie per gram per degree, iron about $\frac{1}{8}$, mercury $\frac{1}{37}$, ice $\frac{1}{2}$, turpentine $\frac{1}{3}$, etc. Such numbers are referred to as "specific heats" of copper, iron, etc., and a notable fact is the very large "capacity for heat" enjoyed by water in comparison with nearly all other substances, especially the materials of the earth's crust.

Black also discovered what is, in deference to historic tradition, still called "latent heat"; i.e. the fact that when a body changes state from solid to liquid or from liquid to vapour, a considerable quantity of heat is required to effect this change of state even without any change of temperature.

Quantities of Heat

For accurate work the actual mean temperature must be specified. Hence experimental results are quoted in terms either of the 15°C. calorie, which is the heat required to raise the temperature of one gram of water from 14.5°C. to 15.5°C. , or of the 20°C. calorie, which refers to the temperature change from 19.5°C. to 20.5°C.

Thus, the latent heat of fusion (melting) of ice at 0°C. is 80 calories per gram melted; of tin at 231°C. , 14 calories; of silver at $1,000^{\circ}\text{C.}$, 21; of mercury at -39.5°C. , 3, etc.; the latent heat of vaporisation of water at 100°C. is 537 calories per gram vaporised; of ethyl alcohol at 78°C. , 210 calories; of turpentine at 156°C. , 69 calories, etc.

Similarly definite quantities of heat are involved in chemical changes as distinct from physical, and we speak of "heat of combustion," "heat of reaction," "heat of solution." In fact, in Black's mind there was little difference in nature between such heats and his "latent heats." He shared the view, common in his time, that heat was actually a subtle and highly elastic fluid material with different degrees of affinity for ordinary matter and also endowed with the property of self-repulsion. Black assumed that the apparent disappearance of the heat (since it produced no "sensible" change in the temperature of the atmosphere) was due to a quasi-

chemical combination between the "caloric" (as the hypothetical heat fluid was called) and the particles of the melting or vaporising substance, so that water was "ice cum caloric" and steam was "water cum caloric"—i.e. the caloric was latent in the water and in the steam.

Heat a Mode of Motion

The belief that heat is a mode of motion is to be found in the works of Francis Bacon, Descartes, Boyle, Hooke, Amontons, and Newton; but in their days the theory rested on very slender evidence, so perhaps it is not surprising that the 18th century philosophers abandoned it in favour of the material hypothesis; and, indeed, so long as we exclude from consideration the production of heat by friction and percussion, the caloric theory is an adequate explanation of thermal phenomena. But the literature of the 18th century teems with controversy on the subject, and the ingenious attempts of the "calorists" to evade the difficulties of frictional heat. The decisive blows at the caloric theory were struck by Benjamin Thompson and Humphry Davy.

In 1798 Rumford pointed out that in boring cannon out of solid metal the action of the borer poured out heat unlimitedly. "It is hardly necessary to add," he wrote, "that anything which any insulated body can continue to furnish without limitation, cannot possibly be a material substance." Davy melted ice by rubbing two pieces together by a mechanism in a vacuum. This controverted directly the view that caloric was squeezed out of the pores of a body or torn from combination with its particles by rubbing (this was the calorist's explanation of frictional heat); for, as everyone admitted, heat had to be communicated to ice, and not "torn from" it, to melt it.

Basis of Thermodynamics

J. P. Joule settled the matter finally. Evolving heat by friction of paddles in water, he measured the heat yielded and compared it in every case with the work required to maintain the paddles in motion, discovering that 1 pound-calorie (heat required to raise 1 pound of water through 1 centigrade degree) was produced by the expenditure of approximately 1,400 foot-pounds of work. These experiments repeated by several other workers under varying conditions form the experimental basis of the branch of physics known as thermodynamics. Its

main development on the theoretical side is contained in the researches of four great physicists: Carnot of France, Clausius and Helmholtz of Germany, and Lord Kelvin. Its great feature is the width of view and the fundamental nature of its conclusions, which can be arrived at without any appeal to a theory of heat. Nevertheless, as the human mind must speculate on ultimate nature, there is no doubt that its conclusions are much easier to relate to the dynamical theory of heat than to the material.

One of the most fruitful ways of attacking thermo-dynamical problems is by choosing a hypothetical heat engine which satisfies the particular requirements of the problem. The working substance, which performs the mechanical work when supplied with heat, is in all practical cases either air (in the internal combustion engine) or water (in the turbine and reciprocating steam engine). The atmosphere itself forms the working substance of a vast heat engine with the sun as the prime source of energy, and the cold and warm parts of the earth representing the sinks and sources respectively.

In thermal phenomena we believe we are witnessing the variations which go on in the degree and intensity of the motions of the molecules of a body. Increased agitation produces the sensations of heat, involves a sundering apart which we see in expansion, may even result in a complete rupture between molecules against cohesion, as when fusion or vaporisation takes place. What is transferred from body to body is not a material, but an amount of energy of motion, and so the science of heat in its widest development becomes merged in the study of transformations of Energy.

Heath (*Erica*). Popular name for a genus of wiry evergreen shrubs of the family Ericaceae (*q.v.*). They are natives of Europe, Africa, and N. Asia. The slender, rigid leaves are much like small pine-needles, and are dis-

posed mostly in whorls. The four petals are united to form an egg-shaped, bell-shaped, or tubular corolla.

Four species are natives of the U.K., including purple heath (*E. cinerea*), that colours the heaths and moorlands in summer; the cross-leaved heath (*E. tetralix*), with delicately rosy-tinted flowers, in moist hollows; the crimson-flowered fringed heath (*E. ciliaris*) of S.W. England; and the Cornish heath (*E. vagans*) of the Lizard and Land's End. A fifth species is the Irish heath (*E. medieterranea*). Exotic forms, particularly those of S. Africa,

are grown in English greenhouses; but the first species to be introduced was the S. European briar-root (*E. arborea*) in 1856.

Some of the most popular forms are hybrids of garden origin. In the open air they flourish in sand or peat in any position where rhododendrons would thrive. They should be planted in autumn or early spring. Greenhouse species are usually grown as specimens in pots, in soil composed of two-thirds peat and one-third silver sand. They are chiefly used for decorative purposes in early spring, and, after flowering, are stood out in the open air in a warm and sunny position before being taken into the greenhouse again in autumn. They are propagated by cuttings in spring and division of the plants in autumn, or may be increased by layering (*q.v.*).

The plant gives its name to any stretch of land grown over with shrubs. Such areas are common in England, *e.g.* Hampstead Heath, Mousehold Heath, Walton Heath. Often the name survives when the heath has disappeared, *e.g.* Haywards Heath.

Heathcoat, JOHN (1783-1861). British inventor. Born at Duffield, Derbyshire, Aug. 7, 1783, he was apprenticed to a smith, afterwards taking over a machinery business in Nottingham. He started in business as a lace and net manufacturer in Loughborough, and in 1808 produced his great invention, a machine for making imitation pillow lace. Other inventions included a steam plough and a process for purifying salt. In 1816 Heathcoat's factory at Loughborough was destroyed by the Lud-

dites (*q.v.*); consequently he moved to Tiverton, where he set up as a lace manufacturer. During 1832-59 he was M.P. for Tiverton, and there he died, Jan. 18, 1861.

Heather (*Calluna vulgaris*). Widespread shrub of the family Ericaceae. It is a native of Europe, W. Siberia, Azores, and N. America. The leaves are three-sided and minute, overlapping in four rows; the flowers honeyed and rosy-purple, the four stiff sepals being much larger than the bell-shaped corolla. The plant covers vast extents of heath and moorland. Its wiry stems and branches are useful for thatching, making brooms,

Heather. Leaves and flowers of *Calluna vulgaris*

and for fuel. See Ericaceae.

Heathfield. Village of Sussex, England. It is 15 m. S. of Tunbridge Wells, and has a railway station. It stands on the river Cuckmere, and had once a foundry where cannon were made. The church of All Saints is mainly a 15th century building which has been restored. Lord Heathfield, the defender of Gibraltar, took his title from here; he lived at Heathfield House, the old seat of the Deacres, and is buried in the church. From Gibraltar Tower, erected to his memory, there is a fine view. Heathfield "cuckoo fair," about May 10, is locally supposed to mark the beginning of summer. Pop. 3,659. *Pron.* (locally) Heflie.

Heathfield, GEORGE AUGUSTUS ELLIOTT, 1ST BARON (1717-90). British soldier. Born at Stobs, Roxburghshire, Dec. 25, 1717, he was educated at Leyden university, and served with the Prussian army, 1735-36. On his return to England he trained at Woolwich and was commissioned as field engineer. In 1739 he joined the 2nd Life Guards and was wounded at Dettingen and Fontenoy.

Colonel of the 1st Light Horse in 1759, he distinguished himself in the Seven Years' War under Prince Ferdinand. As major-general he was second in command in the Cuba expedition of 1763, and became lieutenant-general in 1765.

1st Baron Heathfield, British soldier After Reynolds

In 1774 he was appointed commander-in-chief in Ireland, but the following year was sent to command Gibraltar. In 1779 the Spanish opened the siege of the fortress, which Elliott held stubbornly for four years, before he was relieved by Lord Howe. On his return to England he was knighted and in 1787 raised to the peerage. He died at Aix-la-Chapelle, July 6, 1790.

Heathrow. A hamlet near Hounslow, Middlesex, England, 14 m. W. of London. In 1943 Heathrow became the site of London Airport (*q.v.*), opened for service in 1946. During excavations for the runways, remains were found of a settlement estimated to have been built in 600 B.C. They showed the ground outline of a square-moated building, a temple, and some huts.

HEATING: PRINCIPLES & PROCESSES

J. W. Cowan, A.M.I.H.V.E.

An explanation of theory and practice in regard to the raising of the temperature inside buildings to a degree acceptable to human life and activities. See also Air Conditioning; Boiler; Conduction; Fuel; Ventilation, etc.

In the warming of the interior of buildings—space heating in modern phraseology—the aim is to provide a reasonably comfortable temperature, and to maintain this against all variations of the outside temperature. Heating alone cannot establish optimum comfort. This requires, in addition to an equable temperature, an adequate supply of unvitiated air, and depends largely on the cleanliness and humidity of the air supplied.

The purpose of space heating is not, as it might seem, to make the occupants warm. It is, rather, to establish an environment that will promote the comfortable regulation of bodily warmth. In addition to generating and dispersing heat continuously, the human body is so equipped as to be capable, in health, of maintaining within itself an almost uniform temperature. With but slight variation, though not always without discomfort, the temperature of the blood remains constant at 98.4° F. and that of the skin at 91° F., though external conditions may range from extreme heat to extreme cold.

Heat Generated by the Body

In order that the temperature may remain constant, it is necessary that all the heat generated by the body be given off continually to the atmosphere. Some heat is lost in warm exhalation, but nearly 90 p.c. is given off through the skin. The dispersal of this heat is regulated automatically by a thermostatic nerve centre that sets up muscular action to expose more or less of the surface blood vessels to the cooling effect of the ambient air. When additional cooling is necessary, a further motor impulse stimulates sweat glands to pour out comparatively large quantities of

sweat. The consequent evaporative cooling then further reduces the skin temperature. These are reflex actions occurring involuntarily as a motor response to a sensory stimulus originating in temperature-sensitive nerve fibres adjacent to the surface blood vessels.

The motor response is the same whether the change to be countered arises from an external or internal source. Thus, a cooling reaction resulting in redness of the skin and sweating may be brought about by a too-warm or too-moist environment, but equally by vigorous muscular effort calling

for the generation and, therefore, the dispersal of additional heat. Similarly, a heat-conserving contraction of the blood vessels, causing shivering and "goose-flesh," may arise equally from a too-cool environment, or from reduced heat generation due to illness or lack of food. The maintenance of an equable temperature not only promotes a feeling of comfort and well-being; it also tends to conserve nervous energy by evading the cumulative effect of repeated calls upon the reflexes that operate the thermoprotective equipment of the body.

It follows that the most comfortable temperature for a particular room or building depends on the purpose for which it is used and the degree of activity this entails. Clearly, more bodily warmth will be generated, and must, therefore, be given off, in a gymnasium than in a mercantile office. This is recognized by a difference of 10° F. in the design temperatures listed in the table given in the centre column.

The minimum permissible temperatures in factories cover the same range, *viz.* sedentary work 65° F., light work 60° F., and heavy work 55° F., except in rooms where a manufacturing process requires another temperature.

Maintaining a Design Temperature

In order to maintain a design temperature, it is necessary to provide an input of heat that will balance the total hourly loss of heat. This loss occurs partly by direct transmission through the fabric of the building, and also by an outflow of warmed air via chimneys, ventilators, and ill-fitting doors and windows. This naturally-occurring air movement, while accounting for an appreciable loss of heat, ensures a continuous flow of fresh, if cold, air into rooms not mechanically ventilated. The resulting change of air normally varies between one and two room-volumes per hour, but this can be increased to fully ten complete changes of air per hour by the burning of an open fire. It is largely for this reason that an open fire cannot adequately heat a room. At best, some 80 p.c. of the potential heat of the coal passes straight up the chimney, while currents of cool air flowing towards the fire from doors and windows substantially offset the efficacy of the remaining one-fifth of the heat actually radiated to the room.

Open Fire or Central Heating

The British preference for the open fire is thought to arise from an impression that central heating connotes overheating. In point of fact, current house warming practice inclines towards some measure of underheating. This method, known as background heating, adopts a design temperature of 50° F. to 55° F. which is maintained continuously, except during summer, auxiliary units, such as gas and electric heaters, or open fires, being used to "top up" a room temperature shortly before and while it is occupied. In a small house the background temperature can be maintained by a

radiator system coupled to a boiler behind an open fireplace, as in Fig. 1, but a separate heating boiler would be necessary in larger premises. In all cases, the lesser fuel consumption reduces the cost of the background heating to about half that of full heating.

Background heating can be assisted by warm-air ducts taken from a fireplace chimney, and by other aids to heat conservation, but, in common with full heating, depends primarily on an effective circulation of heated water. This has many advantages over steam heating, notably simplicity of operation, and freedom from dependence on mechanical controls. The lengthy warming-up period that follows each first lighting of the fire of a hot water system is reflected in the equally slow cooling of the water should the normal four to five hour stoking period be unavoidably extended on occasions. In contrast, a steam installation heats quickly because of the lesser volume of water, but cools with equal rapidity should the firing be neglected. Further, the maintenance of the designed steam pressure requires skilled boiler attention, or complete dependence on mechanical controls.

Higher Surface Temperature

The higher surface temperature reduces the size of radiators, but these may require guards to prevent contact with the steam backed surface, and may give rise to an unpleasant sense of burning owing to the scorching of solid particles in the air.

Heat is a form of energy necessary in varying degree to all forms of life. It is not necessarily associated with warmth, nor is it the opposite of cold. Hot and cold are virtually synonyms, being descriptive of the same phenomenon, just as a penny is, though less in value, as much currency as is a guinea. These terms serve only to indicate whether a particular temperature is above or below that of the skin.

Heat is transmissible in three ways, namely, by conduction, by convection, and by radiation, but only from a higher to a lower temperature. Conduction means the passage of heat from particle to particle throughout the mass of a substance, or from the hotter to the cooler of two objects in contact. This is not used directly in space heating, although it is by

this means that heat passes into the atmosphere through the metal walls of boilers, pipes, and radiators. It is by this agency that heat is lost from a warmed building, notably through glass.

Heating. Fig. 1. Background heating of house combined with hot water supply. A, open fireplace in living room with back boiler; B, indirect hot water cylinder; C, hot water supply to taps; D, "Fireaid" in bedroom; E, "Fireaid" in dining room; F, column radiator in hall

Convection (Lat. *convehere*, to carry) implies the carrying away of heat by a moving column of water or air. Most space heating is effected by convection, first in water circulation (*v.i.*) and then in room-warming air movement. Air warming radiators are essentially convectors, and provide a maximum area of heated metal for contact with air; modern design ensures this by placing the heating unit, whether it be warmed by hot water, steam, gas, or electricity, low down in a tall and otherwise empty casing in order to increase the convective air movement by the flue or stack effect of the high casing. It is doubtful whether the radiant emissivity of an ordinary column radiator exceeds 15 p.c. of the total heat output.

Invisible Rays of Energy

Radiation refers to the emission of waves of thermal energy. It is not warmth, as such, that is liberated, but invisible rays of energy closely analogous with those of light. At normal temperatures, this energy is transformed into a sense of warmth only when the rays impinge upon, and are absorbed by, a surface cooler than the emissive plane. This energy does not warm the air through which it passes, and, like light, remains unaffected by both air temperature and air movement. This planet is warmed solely by radiant sun heat. Atmospheric warmth arises only from air con-

tact with surfaces that have already converted solar energy into terms of temperature.

Radiation offers several advantages over convection in space heating—notably, a lower air temperature, complete directional control of heat distribution, and a feeling of comfort by a person immediately on entering a room having a low air temperature. The lesser air heating, and the reduced loss of heat by air change, combine to reduce fuel consumption. These benefits are offset to some extent by higher installation costs, and by the large areas of wall or other surface unobscured by furniture required for distribution. For example, approximately the same area of heating surface is used whatever the method of distribution: in convection heating a 4-column radiator of 30 sq. ft. heating surface might measure 30" wide × 5" deep × 24" high; an equivalent radiant panel 2 ft. high would need to be 15 ft. long.

Methods of Distribution

Several methods of distribution are used. In one, small-bore steel or copper pipes through which hot water is pumped are embedded below the surface of the wall, ceiling, or floor so that the fabric of the building becomes the heat-emitting surface. In another, steel or cast-iron plates backed by waterways and insulating pads are fitted flush with the walls or ceiling; ceiling panels would not normally be used in rooms less than 10 ft. in height. One pattern, intended for a dado position, combines the radiant emissivity of a flat front with a fluted back designed for convective air heating of incoming fresh air. Another pattern is made for use at skirting level. Panels designed for floor heating are usually fitted with expanded metal, and are normally confined to the borders of passages and corridors, except in open-air sanatoria and schools. Radiant panels, as distinct from embedded pipework, can be arranged for gravity circulation in small buildings; in larger premises, a pumped circulation would invariably be used. Such panels may be steam heated in a factory where the position admits of the higher surface temperature, or the waterways may be replaced by electric heating elements. Electrically heated wall or ceiling papers, electric "fires" fitted with reflectors, and gas heaters having refractory radiants act almost entirely by radiation.

Heating installations using pipe-work rely on a continuous flow of

the heat-bearing fluid (steam or water) throughout the installation, just as pipeless heating is dependent on a continuous movement of warmed air through concealed air ducts.

Steam flows freely under the influence of pressure. This may be a positive pressure, in excess of that of the atmosphere; or steam generated at or below atmospheric pressure can be caused to flow by the maintenance of a partial vacuum in the condense or return section of the pipework. The water of condensation is normally returned to the boiler in order to conserve heat, and to minimise the use of cold and possibly mineral-bearing make-up water.

Circulation systems

Water may derive the motive energy of its circulation either from gravity, or from the propulsion of an electrically driven pump, usually centrifugal, known as an accelerator. Gravity circulation relies on the difference in temperature and, therefore, in density of the water in two opposing columns, nominally the flow and return sections of the pipework. This

Heating. Fig. 2. Endless loop of rope bearing eight equal weights

action can be understood by reference to Figs. 2 and 3. If the weight D in Fig. 2 were removed, the previously existing balance would be destroyed and the downward gravitational movement of the weights E to H would force upwards the lighter left side of the loop. A similar lack of balance would be established by lighting a fire in the boiler of Fig. 3. Increase of temperature would cause the boiler water to expand and, necessarily, to become less dense. In consequence, the AB column would then be less heavy than the still cold CD column, and would be displaced upwards by the downward gravitational movement of the cooler water. The continuous heating of the cool water entering the boiler, and the progressive cooling of the hotter water, combine to maintain the circulatory flow indicated by the arrows. The velocity of flow, perhaps 1 to 2 ft. per sec., increases with the difference in temperature between the two columns, or sets of columns—usually from 30° F. to 40° F.—and with every ft. of vertical height through which the descending cool water is permitted to

gravitate. Such systems are best suited to tall narrow buildings, but work quite satisfactorily in two-storey 3-bedroom houses, and even in bungalows though somewhat large pipes are

Heating. Fig. 3. Solid lines represent simple hot water heating circuit; dotted lines, 1-pipe drop system of hot water heating. T, tank; b, boiler

necessary in the absence of a basement boiler room. The total available pressure seldom exceeds a few ins. of water gauge, of which one in. is roughly equivalent to a pressure of $\frac{1}{8}$ oz. per sq. in.

A circulating pump is normally used only in an installation of such size or awkwardness of layout that dependence on gravity would entail the use of unduly large pipes. Acceleration also admits of the use of high-level return pipes, often otherwise impossible, and is necessary in all panel systems using embedded pipe coils. The pump is normally coupled to the main return pipe close to the boiler, about point E in Fig. 3. The term accelerator arises from the practice of designing a scheme with a positive, if not wholly adequate, gravity circulation via the pump by-pass when the pump is out of use: this is often sufficient overnight and at weekends. Such pumps normally operate against a friction head of from 5 to 15 ft. or more of water column, equivalent to a total pressure of from 2 lb. to 6 lb. per sq. in. The friction head of the pump refers to the sum of the resistances to be encountered and overcome by the moving water, not to the static head, the height to which the pipework extends above the boiler.

A variety of pipework systems is used to connect heating boilers

to the heat-dispersing radiators or convectors. The names of these, e.g., 1-pipe, 2-pipe, refer only to the main and branch circuits. In all circumstances, a radiator or other unit must have two connexions, a flow or inlet, and a return or outlet. There is no distinct line between gravity and accelerated circulation in the use and application of the different systems, but, generally, a 2-pipe layout is better suited to the use of a pump than a 1-pipe arrangement.

The four systems in common use are seen in Figs 3 to 6, but irregular combinations of these are not infrequent. The 1-pipe drop system is shown in broken lines in Fig. 3. Owing to the

Heating. Fig. 4. 2-pipe drop system of hot water heating. Solid lines, flow pipes; dotted lines, return pipes. T, tank; B, boiler

progressive cooling of the flow water, by return water from higher radiators, the lower radiators must be proportionately larger, perhaps inconveniently so on the lower floors of a high building. The 2-pipe drop system, Fig. 4, is also seen in miniature in Fig. 1. This is the system par excellence of gravity circulation, eminently adapted to acceleration. All radiators receive flow water at the same temperature, and pipes decrease in size progressively from the boiler.

Heating. Fig. 5. 2-pipe upfeed system of hot water heating. Solid lines, flow pipes; dotted lines, return pipes.

The 2-pipe upfeed system, Fig. 5, requires a basement boiler room, and underfloor accommodation for

the main pipes, but it is otherwise similar to other 2-pipe arrangements. The pipework is particularly inconspicuous, and the minimum of overhead pipe-work makes this system the most suitable for a flat-roofed building.

The 1-pipe ring main, Fig. 6, is designed primarily for gravity circulation, and is better adapted to a low than to a

Heating. Fig. 6. 1-pipe ring main system of hot water heating. T, tank; B, boiler

high building. This layout also requires basement space for the boiler and main pipes, and it is subject to the limitations of all 1-pipe systems. A variation of this arrangement is the ladder system in which, referring again to Fig. 3, single horizontal pipes below floor levels would stretch between the verticals AB and CD. Radiators would then be connected to these, and to pipe BC, in the manner of Fig. 6.

The progressive development of space heating has led to the arranging of such installations into three specific groups, namely, central heating, group heating, and district heating, in all of which hot water supply would normally be included.

Central Heating

Central heating, originally a generic term, is now correctly applied to installations serving only one building, from a small house or bungalow to a large hotel consuming some millions of heat units per hour.

Group heating refers to the warming of a number of related blocks from a central boiler plant, as in the case of the several buildings of a hospital, a colony of houses, or a number of separate blocks of residential flats or offices. This arrangement ensures greater economy and greater technical efficiency of operation than is normally possible among a number of smaller units.

District heating might be regarded as large scale group heating, in which the premises served comprise the whole of a small town, or the whole of one district of a large town. Projects of this nature supply both domestic and industrial space heating, and much

industrial process heat, and call for thinking in larger terms than has hitherto been customary in space heating. The primary purpose is to conserve national fuel resources by utilising the vast quantities of heat now wasted daily to river water at electricity generating stations, and eliminating the large and growing number of relatively small manually operated boiler plants used for central heating with their varying efficiency and high cost in fuel and labour. In addition to greater thermal efficiency and a higher standard in domestic warmth and comfort, and therefore in health, improved cleanliness of towns, reduced fuel distribution and refuse collection, and less smoke and fog nuisance are among the many advantages of such projects. Existing schemes in Europe and America supply upwards of 10 m. of underground steam and hot water mains to meet loads varying with density of pop. from 2 to 20 therms per hour per acre. It is doubtful whether, in the absence of a thermal grid, district heating would be economically feasible in areas where the development density is below 8 houses per acre. In a normally developed area the cost per week for a 3-bedroom house would be a few shillings.

thermal-storage is also used in such installations, commonly by immersion heaters up to 100 kW; or electrode-boilers in sizes upwards of 50 kW. These normally take current only overnight and during other off-peak demand periods. The space occupied by the large storage cylinders constitutes a heavy overhead charge in highly rated premises.

District Heating

District heating requires the conversion of power stations to thermo-electric stations which generate and distribute both heat and electricity. Heat is generated partly by burning low grade solid fuel, not readily combustible without special grates, and also by utilising the bulk of the steam heat otherwise wasted by condensers to river water. Such conversion improves the thermal efficiency of turbo-generators from the prevailing 20 p.c. to 80 p.c. of the potential heat of the fuel consumed. Current practice distributes both high pressure steam for industrial use, and low pressure steam for domestic services, through closed circuits of heavily lagged underground pipework. The pressure of the steam supplied for industrial purposes can be reduced for space heating of factories; or superheated hot

Heating. Fig. 7. Diagram of heat pump, ABCD, closed circuit containing a readily evaporable liquid refrigerant

The boilers of small heating installations are commonly designed for solid fuel, and are usually of the cast iron sectional pattern. They are normally hand-fired or magazine-fed, and may also be stoked mechanically. Gas and oil firing are also available for all sizes. Larger boilers are used singly and in batteries for both central and group heating, usually with mechanical stoking and full automatic control. Alternatively, gas and oil firing can be used. A range of boilers is often based on more than one method of firing, so that in the event of the failure of one supply, a modified service can be maintained. Electric

water can be generated under high pressure for process heating, air-heating batteries, and high-level unit heaters. The low pressure steam is used to heat low pressure hot water in underground heat-exchangers. From these, hot water main and branch circuits are laid to supply each house with space heating through a radiator system, and hot water supply by means of an indirect cylinder.

An interesting source of heat suitable for radiant space heating, and other low temperature services such as swimming baths, known as the "heat pump," is shown diagrammatically in Fig. 7.

The principle (enunciated by Kelvin in the mid-19th cent., uses a reversed refrigeration cycle, by which heat from a low temperature source such as river or lake water is raised to a more useful high temperature. The cycle of operation is as follows: on the suction stroke a compressor C, which may be driven electrically, or by diesel engine, steam or water power, reduces the pressure in the evaporator A to such an extent that the liquid refrigerant is made to boil and evaporate by the river water passing through the coil. On the compression stroke the refrigerant vapour in the cylinder of C is so compressed that the temperature of the vapour is raised through, perhaps, 200° F. This same stroke forces hot vapour through the coil in the condenser B, in which the vapour is again condensed to a liquid by reason of the heat it gives up to the relatively cool building heating water circulating through the outer container. Another suction stroke then draws the liquefied refrigerant through the expansion valve D at a reduced pressure, whence it passes to A to complete and repeat the cycle.

The advantage of the heat pump is that the output of heat from D, i.e. the heat supplied for use, may be upwards of three times the heat equivalent of the mechanical power used to drive the compressor. This ratio, output over input, is greatest in serving a low temperature demand such as that of a swimming pool, but it averages from 2½ to 3 times the input for radiant space heating.

Large installations of this kind are in use in Switzerland and the U.S.A.; and a full scale heat pump installation used for space heating at Norwich supplies approx. 4 millions B.Th.U. per day to a building of 500,000 cu. ft. capacity, and shows a co-efficient of performance of 2.8 under test.

Heaton. Common topographic term in the Manchester dist., S.E. Lancs, England. Heaton Norris, Heaton Mersey, Heaton Chapel, Heaton Moor, all lie S.E. of Manchester near the Mersey, and are interested in the cotton industry. Heaton Norris (pop. 10,846), the largest of these places, is a town and parish separated from Stockport only by the Mersey, here traversed by a railway viaduct and by other bridges. Heaton Park, area 1 sq. m. due N. of Manchester, in Prestwich parish, formerly the seat of the earls of Wilton, was bought by the Manchester

Corporation in 1902, and the fine stone mansion now houses collections of pictures and Oriental arms and armour.

Heaton is also the name of an industrial district of Newcastle-upon-Tyne, with its own railway station.

Heaton, SIR JOHN HENNIKER (1848-1914). British postal reformer. Born at Rochester, and educated at King's College, London, he was Conservative M.P. for Canterbury, 1885-1910, and was created a baronet in 1912. He had large interests in Australia and, though never holding an official position in the government, he accomplished, as a private member, universal penny postage for letters within the British Empire, 1898, penny postage between the U.S.A. and the U.K., 1908, money orders by telegraph in Great Britain, and a parcel post to France. He died Sept. 8, 1914.

Heat Stroke. Illness resulting from failure of the mechanism governing heat production and heat loss, accompanied by dilatation of the surface blood vessels with dehydration from sweating. It is commonest in Europeans working in tropical conditions directly exposed to the rays of the sun. Preventive measures against heat stroke are used in the tropics; work is done where possible in shade, but the old-fashioned heavy topee is now rarely worn, and the spine pad is completely discarded as being indeed a source of trouble. Heat stroke and sunstroke are allied conditions. Treatment consists of laying the patient in a darkened cool room, giving fluids and salt to replace those sweated out, applying ice to the head and neck, and stimulating the action of the heart.

Heat Wave. Term popularly applied to a spell of hot weather. During summer the eastern states of the U.S.A. are occasionally invaded by streams of air heated and moistened by contact for hundreds of miles with the warm waters of the Gulf Stream. As the associated depressions in the rear of the warm air move sluggishly, or even remain stationary for days, temperatures rise steadily. The combination of heat and humidity may produce unbearable conditions in great cities. Temperatures sometimes exceed 100° F. in New York; the nights are sultry and there is little relief until the centre of the depression has passed and the wind swings N. The heat and drought, if prolonged, may be serious for agriculture.

The limit of discomfort which the human body can endure depends much more upon the degree of moisture present and the rate of movement than the actual temperature of the air. While the skin may be considerably cooled, by evaporation, etc., below the air (i.e. dry bulb) temperature, it can never be below that of the wet bulb. A decrease in humidity or an increase in wind lowers the wet bulb temperature and makes conditions more tolerable. During heat waves in American cities wet bulb readings about 85° F. are registered.

In the so-called London heat waves the wet bulb temperature does not exceed 75° F., but the dry bulb may on rare occasions, e.g. the end of July, 1943, and the opening of June, 1947, reach the nineties. On six successive days beginning May 29, and on four beginning Aug. 15, 1947, the London temperature exceeded 86° F. Heat waves in the British Isles often result from S. or S.E. indraughts of warm air, caused by an anticyclone lying across W. or middle Europe at the same time as a depression is more or less stationary over the Atlantic. See Humidity; Temperature.

Heave. Geological term used in connexion with faults (*g.v.*), signifying the horizontal component, measured at right angles to the strike, of the relative displacement (i.e. the slip), along the fault-plane.

Heaven. Dwelling place assigned to God and His angels, and to the blessed departed spirits. Belief in a future life is found in most primitive religions. It assumes various forms, some of which are inconsistent with the idea of a happy state after death, or of one which is appreciably better than the present. Many primitive conceptions of the future life represent it as essentially inferior to the present. Among such beliefs may be noted specially the conviction that the spirits of the dead linger round the scenes of their earthly existence, and the conception of transmigration according to which the soul of the departed enters into another human or animal body.

At this early stage of religious development the prevailing notion is that the life beyond the grave bears a close resemblance to the present life, and that the departed continue their avocations in similar though perhaps improved conditions. The entrance to the world of the blessed depends upon the favour of the gods, which is earned

by a due fulfilment of the religious rites and customs of the tribe. A striking illustration of the belief that the future life is a continuation of the present is the common custom of burying implements and weapons with the corpse.

Among the national religions the Egyptian laid great stress upon the life beyond the grave. An ethical development may be observed in the conditions required for admission to the abode of the blessed. Moral purity is regarded as essential in the higher forms of Egyptian religion. The Greek and Roman religion did not develop the idea of a happy life beyond the grave to anything like the same extent. The thought is not, however, entirely absent, and it played a considerable part in the so-called "mystery religions." The prevailing view is nevertheless that the life beyond the grave is merely a feeble and shadowy copy of the present world. Only certain heroes specially favoured by the gods are supposed to enjoy happiness in an earthly Elysium. Philosophical ideas of immortality were developed by Pythagoras, Plato, Aristotle, and other thinkers.

Eastern Conceptions

The religions of the East have made the idea more prominent, and both Hinduism and Buddhism have evolved complex doctrines of the hereafter. According to the Buddhist theology the state of final blessedness consists in Nirvana, which involves the loss of individual existence. Thus the complete attainment of salvation would raise the soul above heaven. Pious people who have not yet attained this final blessedness are rewarded by re-birth in one of the numerous heavens. The highest heaven is a condition in which desire and pleasure have no place.

Mahomedanism offers a very different conception of heaven. The Koran teaches the resurrection of the body and represents the beatitude of the faithful as consisting of enjoyments of a sensual character. The crudity of this view has, however, been modified by the more mystical schools of Mahomedan thought.

In the O.T. the word heaven is used to signify the sky, which is regarded as the roof of the world and also as the dwelling-place of God. The idea of a reward for the righteous after death is not prominent in Hebrew religion, and is only found in the later books. The prevailing belief was that the divine Providence metes out rewards and punishments in this life. Some of the most interesting passages in Hebrew literature are pro-

tests against this view, cf. the book of Job. In later Jewish literature, and particularly in the so-called Apocalyptic writings, the idea of a resurrection and a future life becomes very prominent, though it assumes somewhat fantastic forms.

The New Testament and Heaven

In the N.T. heaven is, as in the O.T., the dwelling-place of God, as we are reminded by the opening words of the Lord's Prayer. It is also represented by the writers of the Epistles and the Revelation as the abode of the ascended Christ. Heaven is also the final home of the righteous. This is a part of the teaching of Jesus and of the apostolic writers. Several passages suggest that there is more than one heaven. It is possible that this is implied in Christ's saying about "many mansions." S. Paul speaks of being caught up into the third heaven (2 Cor. xii, 2). In the Epistle to the Hebrews Christ is said to have "passed through the heavens" (Heb. iv, 14).

No definite statements are to be found in the N.T. on the nature of heaven and the life of the righteous in the world to come beyond the assertion of general principles. The language of the Revelation of S. John must not be interpreted as a literal description of heaven. The Christian conception of heaven is social. It is described as a kingdom and involves intercourse. It is, however, not a decrease of life, but an increase, since the state of the blessed is called "eternal life."

The joy of heaven, in the Christian view, is spiritual and not material. Jesus was careful to point out that the relations which are based on bodily functions are not carried over as such into the heavenly kingdom. It consists in the unimpeded exercise of moral and spiritual activities. Thus the desire for truth and understanding cannot, in the nature of things, be fully satisfied in the present order, and the life of heaven is conceived as one of fuller knowledge as contrasted with knowledge "in part." Another element in the joy of heaven is the fuller development of fellowship with others and of the possibilities of love. For Christianity, however, the supreme good and the final reward is perfect communion with God, or the Beatific Vision. Thus the life of heaven is to be thought of as the complete attainment of an eternal life which can be possessed partially in the present life.

Several philosophical problems have been raised in connexion with the idea of heaven. Such is the question whether heaven can be described as a "place." There are

obvious difficulties in supposing that heaven occupies a portion of space, and a common answer is that "Heaven is not a place but a state." This solution is not entirely satisfactory, because it is not easy to see how individual existence can be preserved if the future life is not accompanied by conditions analogous to those of space. The scientific and philosophical conceptions of space are now the subject of much discussion, and it is possible that new light may be thrown upon the future life.

W. R. Matthews, K.C.V.O., D.D.

Bibliography. Christian Doctrine of Immortality, S. D. F. Salmond, 1901; Human Personality and its Survival of Bodily Death, F. W. H. Myers, 1903; Immortality, ed. B. H. Streeter, 1917; The Hope of Immortality, W. R. Matthews, 1937.

Heaviside, OLIVER (1850-1925). British scientist, born in London, May 13, 1850. He was employed by the Great Northern Telegraph company until deafness caused him to retire in 1874. In Devon he devoted himself to theoretical investigations in electricity, publishing the results in 1892 as *Electrical Papers*. In these he dealt with electrostatic and electromagnetic induction between parallel wires, the high frequency resistance and inductance of a concentric main, and quadruplex and multiplex telegraphy. His practical work made the long distance telephone possible. In 1893 his *Electro-Magnetic Theory*, 2 vols., postulated the presence of an ionised layer (*v.s.*) in the upper atmosphere. Heaviside was elected F.R.S. in 1891, and died at Torquay, Feb. 4, 1925.

Heaviside Layer. Layer of electrically charged particles in the upper atmosphere, several hundred kilometres above the earth's surface. The presence of this conducting layer was suggested by Oliver Heaviside (*v.s.*) to account for the long range propagation of radio waves around the earth, the layer acting as a reflector. The height and degree of ionisation, *i.e.* the number of charged particles per unit volume, vary hourly and show a marked dependence on sunspot activity and so-called magnetic storms. Another name is Kennelly-Heaviside layer. See Appleton Layer; Radio.

Heavy Hydrogen. The existence of two isotopes of hydrogen, in addition to the familiar element, has been reported. These isotopes have been prepared or isolated by the evaporation of liquid hydrogen

and by the electrolysis of heavy water. The isotope with the atomic or isotopic weight of 2 *plus* has been named deuterium or diplogen; ordinary hydrogen may contain as much as 1 part in 5,000 of deuterium. The isotope with the atomic or isotopic weight of 3 has been named tritium, ordinary hydrogen containing a much smaller proportion of this than of deuterium. *See* Deuterium; Heavy Water.

Heavy Water. Name given to water which contains about 99 p.c. deuterium oxide (D_2O), an isotope of hydrogen with an atomic weight of 2.0136. Heavy water has a specific gravity of 1.1, freezing point $3.82^\circ C$, and boiling point $101.42^\circ C$. Ordinary water contains a small proportion of deuterium oxide, and the relative abundance of the different isotopes (that is to say 1H : 2H = 6900: 1 and ^{16}O : ^{18}O = 506: 1: 0.2) is found to be very constant.

Heavy water can be obtained by electrolysis of weak sodium hydroxide solution, followed by concentration until the water has a density of 1.1 and contains about 99 p.c. D_2O . It has been used to trace chemical actions, especially those taking place in the metabolism of animals. *See* Deuterium; Heavy Hydrogen.

Heavyweight. Term applied particularly to boxers in the "unlimited" class; heavyweight champions may be of any weight. The first world heavyweight champion under recognized rules was the American James J. Corbett in 1892; the only Englishman to gain the title was Bob Fitzsimons in 1897. There is also a light-heavyweight or cruiser class for those of 12 st. 7 lb. or under. Similar divisions apply to wrestling. *See* Boxing.

Hebbel, CHRISTIAN FRIEDRICH (1813-63). German dramatist and poet. He was born at Wesselburen, Holstein, March 18, 1813, the son of a mason. He studied at Hamburg, Heidelberg, and Munich, and in 1842 his first tragedy, *Judith*, brought him immediate fame. It was followed by *Maria Magdalena*, 1844, the best of his earlier plays, and a forerunner of the naturalistic drama.

His later plays included *Herodes und Mariamme*, 1851; *Gyges und sein Ring*, 1855; and the trilogy, *Die Nibelungen*, 1862, the two last named being his masterpieces. He also published two volumes of poems, 1842 and 1848. Hebbel died in Vienna, Dec. 13, 1863. His *Tagebücher* (Diaries) were

issued in 1887. A study by E. Purdie appeared in 1932.

Hebburn. Urban district and industrial town of Durham, England. It stands on the Tyne a mile W. of Jarrow, and has its own railway station. The council maintains a public park. Shipbuilding, engineering, chemicals, and sail and rope manufacture provide the industries, which suffered severely in the slump of the early 1930s. Pop. 22,290.

Hebden Bridge. Town in the West Riding of Yorkshire, England, part of the urban district of Hebden Royd. It stands on the Hebden and Calder rivers, 8 m. W.N.W. of Halifax on the railway. Hardcastle Crag, a favourite resort, are 3 m. to the N.W. Manufactures consist of cotton, silk, and fustians, and there are dyeworks and foundries. The council owns the water and electricity undertakings. Pop. 6,700.

Hebdomadal Council (Gr. *hebdomados*, seventh). In the university of Oxford, a board dating from 1631 which holds weekly meetings to discuss matters affecting the government of the university, and submit business to convocation or congregation. It is composed of the chancellor, vice-chancellor, and proctors, *ex officio*, and of 18 other members of the university, elected by congregation, and sitting for six years. *See* Oxford University.

Hēbē (Gr., youth). In Greek mythology, the goddess of youth. She was the daughter of Zeus and Hera, and was given in marriage to Heracles when he became a god.

HEBREW LANGUAGE, LITERATURE, AND RELIGION

M. A. Canney, M.A., former Prof. of Semitic Languages, Manchester University

The article supplements the historical sketch of the Jews. See articles on Jerusalem, Palestine, and various other places and countries associated with this people. See also Alphabet; Bible; Old Testament; the articles on the books of the O.T.; and those on the great Hebrews, e.g. Abraham, Moses, etc. See also Jehovah

Hebrew belongs to the Middle Semitic or Canaanitish branch of the Semitic languages, and is related closely to Arabic (S. Semitic), Aramaic (N. Semitic), and Babylonian (E. Semitic). The term Hebrew, originally a gentilic, derived from a word meaning "country on the other side," was applied by neighbouring peoples to the people "on the other side," i.e. of the Jordan, or more probably of the Euphrates. Whatever the precise origin of the language, it developed in Canaan, and in Isaiah 19, v.18, is described as "the language of Canaan." Elsewhere in the O.T. it is referred to, not as

She was the cup-bearer of the gods before Ganymede (*g.v.*). Her Roman counterpart was Juventas. *See* Canova.

Heber, REGINALD (1783-1826). British prelate and hymn-writer. He was born April 21, 1783, at

Reg Heber
After T. Phillips

Malpas, Cheshire, where his father was rector, and educated at Brasenose, Oxford. He won a prize for English verse with his poem, *Palästine*, 1803. Having married a daughter

of Dr. Shipley, dean of St. Asaph, he became incumbent of Hodnet. He was Bampton lecturer, 1815; preacher at Lincoln's Inn, 1822; and second bishop of Calcutta, 1822-26. He died April 3, 1826, at Trichinopoly. Heber edited the works of Jeremy Taylor, 1822, and wrote many hymns, including *Holy, Holy, Holy*, and *From Greenland's Icy Mountains*.

Hébert, JACQUES RENÉ (1757-94). French Revolutionary. Born at Alençon, Nov. 15, 1757, as a young man he worked in Paris as theatrical manager and doctor's assistant. He became known by his conduct of the journal *Le Père Duchesne*. His arrest was ordered in May, 1793, but popular demonstrations in Paris forced his release. Hébert instituted the so-called cult of the goddess of Reason. He was guillotined March 24, 1794.

the Hebrew language, but as "the Jews' language."

Hebrew is written from right to left. The old character resembles the Phoenician. This was exchanged about the 4th century for the "square character" of Hebrew bibles. Originally Hebrew writing consisted only of consonants, as still in the Synagogue scrolls of the Law. The system of vowel-signs was introduced by the Masoretes in the 7th century to preserve traditional pronunciation (*masora*, "tradition").

The grammatical structure of the language presents curious characteristics in common with the

other Semitic languages. Word-stems are mostly trilateral, and compounds are very rare. The verb has only two tense-forms, which express the state rather than the time of an action. The noun has only two genders, masculine and feminine, neuter ideas being expressed by the latter. Nor has it any cases in the Greek and Latin sense. These are expressed partly by prepositions. There is a comparative scarcity of adjectives, which is compensated for by an idiomatic use of nouns (e.g. "son of death"—worthy of death). Syntactical relations are expressed very simply. In fact, it is characteristic of the purest Hebrew that the clauses are short and simple. The poetry is distinguished from the prose, not by rhyme (which is avoided), but by rhythm.

Outside the O.T. only a few examples of the old Hebrew or old Canaanitish literature have survived. In particular, we have a number of Canaanite glosses in the Tell el-Amarna Tablets (c. 1400 B.C.), an inscription of Mesha, king of Moab (c. 850 B.C.), commonly known as the Inscription of Mesha, or as the Moabite Stone, and the 8th century Hebrew inscription, usually described as the Siloam Inscription because it was discovered on the wall of the Pool of Siloam at Jerusalem. The language of all these is related closely to the language of the O.T. In the O.T. itself reference is made to several ancient writings, more of the nature of books, which were used as sources.

Early Poetical Fragments

The most ancient of these, fragments of which are preserved in the O.T., were poetical. They seem to have been collections of ballads and songs celebrating great events and exploits. Special mention is made of the Book of Jasher (Josh. x, 13; 2 Sam. i, 18) and the Book of the Wars of Jehovah (Num. xxi, 14, 15). From such collections no doubt were drawn fragments like the Song of the Well (Num. xxi, 17, 18) and the Song of Deborah (Judges v). Mention is made also of early prose records, such as the Book of the Acts of Solomon (1 Kings xi, 41), the Book of the Chronicles of the Kings of Israel (1 Kings), and the Book of the Chronicles of the Kings of Judah (1 Kings). There were also collections of wise sayings (Proverbs xxiv, 23).

Between the earliest (c. 1200-1000 B.C.) and latest portions (c. 150 B.C.) of the O.T., or between the Exilic and Post-Exilic writings which together comprise Biblical Hebrew, there is a marked dif-

ference in style. After the Fall of Samaria in 721 B.C., and still more after the Fall of Jerusalem in 586 B.C., Aramaic, the spoken language of the population that surrounded the Jews, made gradual but persistent encroachments upon Hebrew. If the language was spoken still and understood by the people in the time of Nehemiah (5th century B.C.; Neh. xiii, 24) and of the rise and development of the Synagogue (430-330 B.C.), it had lost much of its purity.

Aramaic Influence

The literature from the time of the Exile to the Maccabean period (c. 160 B.C.) shows more and more in style and vocabulary the overpowering influence of the official language of the western half of the Persian Empire (Aramaic). But

Form	Equivalent	Name	Signification

Hebrew Language. The Alphabet

popular works seem to have been written as late as 50 B.C. (e.g. the Book of Judith).

Hebrew, therefore, can hardly be said to have been dead long before the time of Christ, though by that time Aramaic had become the spoken language. We witness the last phases of the struggle between Hebrew and Aramaic on the one hand and Hebrew and Greek on the other in some of the latest books of the O.T. and in some of the books of the Apocrypha. The book of Ezra (between 300 and 250 B.C.) and the book of Daniel (c. 164 B.C.) are partly in Aramaic.

The book of Ecclesiastius (O.T. Apocrypha), composed about 200 B.C., was written in Hebrew, though much of it has survived only in Greek and other versions. It is significant that in order to make this work better known to Jews, it was translated into Greek in 132 B.C. by the author's grandson, who tells us in a prologue that the task of translating Hebrew into Greek already presented difficulties. Again, whereas the first book of Maccabees (O.T. Apocrypha), composed about 125 B.C., though preserved only in Greek and other versions, was written originally in Hebrew, the second book of Maccabees (O.T. Apocrypha), composed between the years 80 B.C. and A.D. 1, was written from the first, like most of the other books of the O.T. Apocrypha, in Greek.

If a number of the works known as Pseudepigrapha, a body of literature written under assumed names between 180 B.C. and A.D. 100, were composed in Hebrew, the reason was to give them, in addition to the prestige of a famous name, the further authority and sanctity of the sacred tongue, regardless of the fact that this was understood no longer by the bulk of the people.

Origin of Targums

Long before the time of Christ it had become necessary, even in the synagogues, to explain the language of the sacred writings. This was done by an official interpreter known as *Targoman* or *Methurgeman*. At a later date these translations were committed to writing and received the name *Targum*.

In the countries of the Dispersion, of course, Hebrew would be forgotten sooner than in Palestine. As early as the 5th century B.C. Jews went to Egypt; others followed under Alexander the Great and the Ptolemies, forming important colonies. Consequently, long before books had ceased to be written in Hebrew in Palestine, part of the O.T. had to be translated into Greek for the sake of the Greek-speaking Jews of Alexandria. The beginning seems to have been made in the reign of Ptolemy Philadelphus (284-247 B.C.).

Before the end of the 2nd century B.C. the larger portion of the O.T. existed in Greek. The spread of the Greek language involved also the spread of Greek civilization. There arose and developed, not only in Alexandria and elsewhere, but even in Palestine, an important Jewish-Hellenistic literature. The authors of some of the O.T. Apocrypha (e.g. the Book of Wisdom) and of the Pseudepigrapha (e.g. the Book of the Secrets

of Enoch) were Alexandrians; but the chief Jewish-Hellenistic writers were Philo of Alexandria and Josephus of Jerusalem.

Philo seems to have been born between 30 and 20 B.C., and to have died between A.D. 45 and 50. Among other works he wrote a *Life of Moses* and a history of the persecutions endured by the Jews in his own time, of which only part has been preserved. The treatise *On the Contemplative Life*, ascribed to him, perhaps belongs rather to the 3rd or 4th century A.D. Josephus, the Jewish historian, who was born A.D. 37-38 and died about 100, completed his book on the Wars of the Jews before 79, and wrote his *Antiquities* and his *Reply to Apion* about or soon after 93-94.

After the destruction of Jerusalem in A.D. 70 a reaction against the use of Greek set in. When all else was lost, the sacred writings and the sacred language assumed a new sanctity. Hebrew was resuscitated and developed, not indeed as a popular speech, but as the language of books and scholars. Hence arose Post-Biblical or Talmudic Hebrew.

Books of the Law

The Hebrew law (the *Torah*) became the text for numerous comments and legal discussions by the Jewish rabbis. These pronouncements at first constituted an oral tradition; afterwards (c. A.D. 200) they were written down and incorporated, probably by pupils of Shammai and Hillel, in the *Mishnah*, a work that forms the basis of the larger work known as the *Talmud* (q.v.).

Closely related to these discussions is a branch of literature which consists of commentaries on the sacred text, called *Midrashim* (singular, *Midrash*). The earliest of these belong to the 2nd century A.D. The Talmudists (2nd-5th centuries) were succeeded by the Masoretes (5th-8th centuries), the Jewish scholars who fixed the text of the O.T.

Another revival of Hebrew took place about the 10th century. There arose, in emulation of the Arab grammarians, a notable school of Hebrew grammarians and exegetes. Representatives of this school include Saadia of the Fayûm (892-942), Rashi (1040-1105), Aben-Ezra (1088-1167), Moses Maïmonides (1135-1204), and David Kimchi (1160-1240). The language used is a new development, and is even less pure than Talmudic Hebrew. It is known as New Hebrew or Rabbinic Hebrew (not to be confused with Yiddish). Aben-Ezra was also a poet whose name recalls the fact that the 10th cen-

tury saw the rise, especially in Spain, of a rather remarkable school of New Hebrew poets.

The beginning of the 18th century brought another renaissance in Hebrew letters, which started in Italy with the activities of M. H. Luzzatto, philosopher, poet, and dramatist. The movement spread to Germany, which in course of time became its centre (the so-called *Haskalah* period, c. 1750-1850). Then, in the early part of the 19th century, the centre of activity was transferred to Galicia (the Galician period).

By the middle of the 19th century the lead was taken by Russia, which produced such famous writers as Abraham Mapu (1808-67), a creator of the Hebrew novel, Judah Loeb Gordon (1831-92), the poet, Peretz Ben Moshe Smolenskin (1839-84), the essayist and novelist, and Constantine A. Shapiro (1840-1900), the poet. More recently poets like H. N. Bialik, Saul Tschernihovsky, Jacob Cohen, and Z. Schneer have greatly enriched the storehouse of Hebrew literature. The language of the modern writers, popularly known as Modern Hebrew, aims at keeping as close to the classical model as possible.

HEBREW RELIGION. This claims exceptional consideration as the parent of two other great and world-wide monotheistic faiths, Mahomedanism and Christianity. Its wonderful development was not quite an ordinary evolution, because in a special degree it was carried from one stage to another by a series of great men who appeared suddenly as leaders and prophets. Among the patriarchs an outstanding figure is that of Abraham, who is said to have led a migration of certain nomadic tribes from Mesopotamia (Ur of the Chaldees) to Palestine; and there is a persistent tradition that Abraham was spiritually the father of Israel. It has even been suggested that the migration of Abraham was due essentially to a religious impulse; it

was a protest against degeneration in the Babylonian moon-worship, or against the polytheism cultivated in Babylonia by the Hammurapi dynasty (so Jeremias).

Moses, however, was the first prophet, and the founder of the Hebrew religion. At first the migrating tribes seem to have shared the beliefs of other Semitic nomads. They believed in powerful demons or spirits which inhabited stones (the sacred stone of Bethel, Gen. xxviii, 22), trees (the sacred oracular tree at Shechem, Gen. xii, 6; Deut. xii, 3), springs (the sacred wells at Kadesh, Gen. xiv, 7, and at Beersheba, Gen. xxi, 28-30, 31), and even animals (the brazen serpent, Nehushtan, Num. xxi, 4-9; 2 Kings xviii, 4). Natural boulders were used for altars, and sacrifices were not prominent. Where blood was shed, it was for the most part used for blood-covenants.

In Egypt the Hebrew tribes do not seem to have been much impressed or affected by the more developed religion which they found there. But here a leader arose, who had clearly been uplifted and inspired by stirring religious experiences (Exod. iii, 2-4). It is possible, as Jeremias has suggested, that, when Moses fled from the court of Egypt into Midian, where he became a shepherd in the service of Reuel or Jethro, the priest of the Midianites, he did so because on religious grounds he had become unpopular at the Egyptian court. In any case, if he was seeking a fresh religious stimulus, he would seem to have found it among the Midianites.

Recent research indicates that before Yahweh (Jehovah) was proclaimed by Moses the covenant God of Israel, he had long been a tribal deity of the Kenite-Midianites. Moses founded the priesthood, being himself both prophet and priest. Inspired by Yahweh (Exod. xx), he gave the people ten simple commandments. The sanctuary of Yahweh was a sacred ark, probably an ancient object which had acquired a new significance.

At this stage the religion may be described as monolatry. Yahweh is the one officially recognized God of Israel, but he is not the only God. In Canaan the Hebrews met with a rather elaborate Canaanite cultus. This in course of time they appropriated in large measure. Sacred shrines and fixed altars were taken over for the use of Yahweh. The sacrificial system and the agricultural festivals of the Canaanites were adopted. Sacrifices are now regarded for the most part as gifts, and special importance is attached to first fruits. Three times in the year all the males in Israel are

commanded by Moses to appear before Yahweh—at the Matssoth Festival or Feast of Unleavened Bread, at the Feast of Weeks or Harvest Festival, and at the Vintage or Feast of Tabernacles; all were originally agricultural festivals (Exod. xxxiv, 14-26).

The rise of a priesthood was inevitable. This was hereditary. An early example of the teaching of the priests is provided by the Book of the Covenant (Exod. xxi, 1-xxiii, 13). The cultus, of course, was not yet centralized. Yahweh was identified with the local Baals of the Canaanites, and Bethel, Gilgal, Dan, and Beersheba appear as favourite places of pilgrimage. At about the time of the institution of the monarchy we hear of a body called the "sons of the prophets." These seem to have constituted a prophetic guild or fraternity, the members of which were able to arouse in themselves and others great religious enthusiasm (1 Sam. xix, 20).

They were organized by Samuel, called the seer of Ramah; and with them the prophets have emerged as a power to be reckoned with. In the reigns of Ahab of Israel (876-854 B.C.) and Jehoshaphat of Israel (873-849 B.C.), in the persons of Elijah and Elisha the prophets begin to assume an active and commanding rôle as religious and social reformers. Hebrew religion now begins to lay stress on ethics rather than on ritual. With the emergence of the great prophets, we arrive at a development of Hebrew religion which may be described as monotheism.

Monotheism of Early Faith

The earlier religion tolerated other deities; the prophetic religion does not. In spite of the curious and doubtful phenomenon presented by the Egyptian king Amenophis IV or Akhenaton, this ethical monotheism is the distinguishing feature of early Hebrew religion. The prophets wished to purge the religion of all heathen contamination. They opposed strenuously the sacrificial cultus, and proclaimed that Yahweh takes no pleasure in sacrificial feasts (Amos v, 21-24, iv, 4; Hos. vi, 4-6; Isa. i, 10-17; Jer. vi, 20). They rejected the use of an image as a representation of God (Hos. viii, 4-6, x, 5, xiii, 2). They even denied the superiority of the Israelites. The dark-skinned Ethiopians are just as dear to Yahweh as the children of Israel. Amos found cherished among the people a well-established doctrine of the Day of Yahweh as a day when Yahweh would make them triumphant over all their enemies. He transformed it so

radically and ethically that "instead of Israel triumphing over her enemies on that day, she is herself to be humiliated, and that by Yahweh himself." (See Amos and Hosea, p. 131, W. R. Harper, 1905, in Int. Crit. Comment.)

The eighth century prophets exercised a very great influence on the Hebrew religion; but they were idealists, and the immediate circles of their influence were not large. In the reign of Manasseh (686-641 B.C.) there was a religious reaction during which old superstitions were revived and new cults were imported. The prophetic party had to wait patiently for a new opportunity. In the meantime they drew up a new ethical code, the Deuteronomic law (roughly equivalent to Deut. v-xxvi, and xxviii). When the inevitable counter-reaction came in the reign of Josiah, this code was produced and made the basis of a great religious reform (621 B.C.). Various heathen superstitions were discarded, local sanctuaries were abolished, and the cult was centralized in Jerusalem.

Jeremiah and Isaiah

Peake points out that in the author or authors of the new code the priest and the prophet have met. An interest is shown in the externals of religion which was foreign to the great prophets of the 8th century. At the same time, in the spirit of the prophets, a striking humanitarianism is displayed, and "love of others is made secondary only to the love of God." The prophet Jeremiah, whose call had come in the thirteenth year of the reign of Josiah (627 B.C.), substituted individualism for nationalism in religion, and emphasised the inwardness of religion (Jer. xxxi, 31-34). The prophet known as Deutero-Isaiah developed universalism. Yahweh wills the salvation of the whole world (Isa. xlii, 1-6, xlix, 6, lii, 10). And Israel is the "Servant of Yahweh," the vicarious sufferer for the sins of all the nations, who by her sufferings makes Yahweh known to the world.

Here we reach what is perhaps the high-water mark of Hebrew religion, but it was too high an ideal. Ezekiel, who was a priest as well as a prophet, understood the limitations of human nature better, and was able to effect a compromise. He was one of the exiles taken to Babylonia in 597 B.C. A disciple of Jeremiah, he reinforced his teaching there (from 592 B.C.); and then, after the capture of Jerusalem and the destruction of the temple in 586 B.C., comforted himself with visions of a restoration of a Hebrew state in

Palestine. To Ezekiel ceremonial and ritual seemed essential, and the direction of the new development represented by the Law of Holiness (about 500 B.C.), and the reform of Nehemiah (about 444 B.C.), had been determined by the activity of Ezekiel.

Day of Atonement

When the cultus was centralized at the rebuilt temple of Jerusalem, the old connexion of the festivals with agriculture was severed, and they were transformed into memorials of historical events. Moreover, a new yearly festival was added, the Day of Atonement (Lev. xvi). A special official class now becomes necessary, a higher order of priests (in contrast to a lower order, the Levites), with a high priest at the head of them (Lev. xxi, 10; Zech. iii, 8).

Robinson, 1934; The O.T.: A Reinterpretation, S. A. Cook, 1936; Hebrew Religion, Oesterley and Robinson, 2nd ed. 1937.

HEBREWS, EPISTLE TO THE. One of the canonical books of the N.T. In the English versions it bears the title The Epistle of Paul the Apostle to the Hebrews. In the epistle itself, however, there is no claim to any particular authorship, and in the oldest MSS. the superscription is simply "to Hebrews." The epistle is less like a letter and more like a treatise than any other of the N.T. epistles. It can hardly have been written by S. Paul, since it differs radically in language, style, and thought from the other Pauline writings.

The epistle is not included in the Canon of Marcion or in the Muratorian Canon, but it is quoted by Clement of Rome. Clement of Alexandria states that it was written by S. Paul in Hebrew and translated by S. Luke into Greek. Hippolytus and Irenaeus were acquainted with it, but they do not accept the Pauline authorship. The "Hebrews" seem to have been a Jewish Christian community, and most probably they were a section of the Church in Rome.

The use made of the O.T. by the writer suggests that his purpose was to save his readers from a relapse into Judaism. The epistle is, in fact, as Prof. Peake says (Crit. Intro. to the N.T., 1909), "an elaborate many-sided demonstration that Judaism is inferior to Christianity." It would seem to have been written towards the end of the 1st century A.D.

Hebrews, GOSPEL ACCORDING TO THE. One of the more important of the N.T. Apocrypha (*q.v.*), which has survived only in fragments found in writings of the Fathers of the Church. It seems to have been written originally in Aramaic, and to have been intended for the Jewish Christian congregations of Palestine. According to Harnack, it was composed between A.D. 65 and 100. As one of the sources for a life of Jesus, it is ranked by O. Holtzmann (*Life of Jesus*, 1904) with the gospel of S. John.

Hebrides. A large group of islands lying off the W. coast of Scotland. They are usually divided into the Inner and Outer Hebrides, which is descriptive of their position in regard to the mainland. The two groups are separated from each other by the Little Minch, which is about 12 m. across in the narrowest part. The Inner Hebrides include Skye, Mull, Islay, Jura, Colonsay, Tiree, Coll, and some smaller ones, Eigg, Rum, Conna, Staffa, and Iona; also Rona, Raasay, and Oronsay. These are known to the geologists as the trap islands, as they are composed of basaltic or trap rocks. On Mull is Ben More, the highest point in the group. The Outer Hebrides form a continuous series of islands extending for about 120 m. The largest is Lewis, with Harris; others are N. and S. Uist, Benbecula, Barra, Scarpa, Eriskay, and Taransay. These are gneiss islands. The outermost member of the group is St. Kilda, 40 m. W. of N. Uist; the Flannan Islands are an isolated group W. of Harris.

The islands number in all over 500, but only about 100 are inhabited, and many are simply islets of bare rock. They fall within the counties of Ross and Cromarty, Inverness, and Argyll. Rainfall averages high throughout the Hebrides, but on the whole the climate is mild and pleasant. In most parts the soil is sparse and agriculture is difficult, but fair quantities of oats, barley, and potatoes are grown on the crofts. Sheep-rearing and fisheries are the staple industries.

Stornoway, on Lewis, is an important herring centre; whisky is distilled in Skye, Mull, and Islay; tweeds are made in Harris; and slate is quarried in Luining, Easdale, and Seil. There are no rly. lines, but communication with the mainland at various points is generally frequent enough for practical purposes. Some islands also have regular air services. The total area is about 2,800 sq. m.

The Hebrides, known to Ptolemy as the Eboudai, were invaded by successive Scandinavian bands between the 6th and 9th centuries, and, together with the Orkneys, Shetland, and the Isle of Man, fell under the dominion of Harold I. of Norway c. 890. Norwegian rule maintained itself against several attacks by the Scottish kings, but in 1266, after his victory at Largs in 1263, Alexander III. secured their cession to the Scottish crown for a payment of 4,000 merks.

In the 14th century the island dynasty known as the Lords of the Isles (*q.v.*) first appeared in John Macdonald of Islay, and the next two centuries were filled with the feuds of rival chieftains and clans, on the islands and mainland—Campbells, McNeills, Macleans, Macleods, and others. The Jacobite risings of 1715 and 1745 found strong support in the Hebrides, but the chiefs paid for participation in the latter by the abolition of their old hereditary jurisdictions. This was the first step towards pacification, and by the time of Johnson's visit in 1773 progress had been made.

As in many parts of the Highlands, the introduction of large-scale sheep-grazing brought many evictions and much distress among the crofting class towards the middle of the 19th century. Canada and Australia received numbers of Hebridean emigrants. The result was frequent "land-grabbing." In 1918 Lord Leverhulme (*q.v.*) purchased Lewis and part of Harris to develop the fishing and weaving industries.

During the Second Great War the Hebrides played a part in the battle of the Atlantic (*q.v.*). Radar was set up on a number of islands for detecting the presence of E-boats; at Broad Bay a radar station guided aircraft on the Atlantic Ferry to Prestwick. The chief minesweeping base in northern waters was at Stornoway, also a base for R.A.F. flying boats on the Atlantic anti-submarine patrol.

The Hebrideans retain many distinctive characteristics. Gaelic is spoken in most parts, and there are a large number of Roman Catholics. A great body of Celtic tradition in story and song has survived, and collections by M. K. Fraser of Hebridean songs, many of unknown antiquity, have made their subtle beauty widely known.

Bibliography. *Journal of a Tour to the Hebrides*, J. Boswell, 1786; *In the Hebrides*, C. F. G. Cumming, new ed. 1901; *History of the Outer Hebrides*, W. C. Mackenzie, 1903; *I Crossed the Minch*,

Hebron (anc. *Kirjath-Arba*; Arab. *El Khalil*). Town of Palestine. It stands in the valley of Mamre, and partly on the slopes of two low hills, 16 m. S.S.W. of Jerusalem. A sacred city, it is one of the oldest in Palestine, and is many times mentioned in the Bible. It was the abode of Abraham, Isaac, and Jacob, besides other patriarchs, and its old walled mosque of Machpelah is supposed to cover the tomb of Abraham. When Moses sent spies to view the Promised Land, they went to Hebron. Joshua gave it to Caleb, and it was afterwards made a city of refuge (Joshua 20). Here David was anointed king (2 Sam. 5), and he chose it for his first capital.

The seat of a bishop in 1167, twenty years later it fell into the hands of the Saracens, and it remained in Mahomedan hands until the end of the First Great War. Always regarded with reverence, Hebron was one of the four sacred cities, Mecca, Medina, and Jerusalem being the other three. The modern town is surrounded by vineyards and other fruit plantations, and there are manufactures of glassware and goatskin water-bags. It is the terminus of the road S. from Jerusalem through Bethlehem. In the vicinity of Mamre is Abraham's oak. Hebron was occupied by the British under Allenby, Dec. 7, 1917. Pop. 24,560.

Hecataeus or **HECATEUS** (c. 550–476 B.C.). One of the Greek logographers or writers of history in prose before Herodotus. He took an active part in the revolt of the Ionic cities of Asia Minor against Persia (502–494). A great traveller, his *Journey round the World* contains a geographical and historical account of Europe, Asia, and Libya, with a map.

Hecate. In Greek mythology, the goddess of night, the moon, child birth, and magic. In art she is represented in triple form, probably symbolic of her different spheres. She is often confounded with Aphrodite and Selene.

Hecatomb (Gr. *hekatōn*, hundred; *bous*, ox). Originally, in ancient Greece, the sacrifice of 100 bulls and then that of any large number of victims. In modern speech the word is used of any great sacrifice or slaughter. *See* Sacrifice.

Hecker, FRIEDRICH KARL FRANZ (1811–81). German politician. Born in Baden, Sept. 28,

F. K. F. Hecker,
German politician
After Schertle

1811. Hecker practised law in Mannheim. In 1845 his uncompromising democratic sentiments which had already made him conspicuous in the Baden parliament, brought about his banishment from Prussia. The revolution of 1848 brought him again to the front, and he strove his utmost to establish a republican government on a stable basis.

His attempts having failed, he transferred his operations to S. Germany, where he organized bands of malcontents with the idea of terrifying the smaller states. Driven into Switzerland, he emigrated to America and occupied himself on his Illinois farm until the outbreak of the Civil War, when he entered the Federal army and rose to be brigadier-general. His latter years were spent at St. Louis, where he died March 24, 1881. The name Hecker in Germany became synonymous with a democratic revolt.

Hecker, ISAAC THOMAS (1819-88). American divine. Born in New York, Dec. 18, 1819, he became a member of the Brook Farm (q.v.) community, and for some time resided with Thoreau at his Hermitage in Walden woods. Becoming a Roman Catholic, Hecker joined the Redemptorist Order in 1845 and worked for some years in England, where he was ordained in 1849. In 1857 he returned to America, severed his connexion with the Redemptorists, and founded the Order of Paulists for missionary work, becoming its first Superior. For over twenty years he edited The Catholic World, and founded The Catholic Publication Society. He died in New York, Dec. 22, 1888.

Isaac T. Hecker,
American divine

Heckmondwike. Urban district and market town of the W. Riding of Yorkshire, England. It is 8 m. S. by E. of Bradford on the railway. Blankets, rugs, and carpets are manufactured, and there are iron foundries and machine and dye works. In the neighbourhood are extensive col-

lieries. Market days, Tues. and Sat. Near are places connected with the Brontës. Pop. 9,000.

Hectare (Gr. *hekaton*, hundred; Lat. *area*, area). Superficial or land measure of the French metric system. It is equal to 100 ares (q.v.), or 10,000 sq. metres, being thus equal to 2.471 English acres.

Hectograph (Gr. *hekaton*, hundred; *graphein*, to write). Device for making a number of copies of a document, etc. It consists of a slab of gelatine material on the surface of which a copy of the document to be duplicated is impressed. The original document is prepared with a special aniline ink, and firmly pressed for a time on the gelatine which absorbs the ink. From this a large number of duplicates may be obtained.

The hectograph developed into, and has been largely superseded by, the rotary duplicating machine, which takes copies from a stencil. The stencil is cut by a typewriter, from which the ribbon has been removed, on a sheet of tough flexible tissue and is then fastened over a revolving cylinder, partially covered by an ink pad. Each revolution of the cylinder brings the stencil in contact with the top sheet of a pile of paper below the cylinder, and the ink, passing through the stencil, registers an impression of the type-script on the paper. The stencils can be used to reproduce drawings, maps, or handwriting, and the duplicator makes 1,600 to 6,000 copies an hour, according to whether it is manually operated, automatically fed, or power-operated.

Hector. In Greek legend, son of Priam, king of Troy, and Hecuba, and husband of Andromachê. He was the chief champion of the Trojans during the war with the Greeks, and his character as conceived by Homer makes more appeal to our sympathy and imagination than that of any other leader, Greek or Trojan. He met his death while unarmed at the hands of Achilles, who had been roused from his retirement when his friend Patroclus had been killed by Hector. His body was tied to the chariot of Achilles, and dragged off to the Greek camp. At the personal entreaty of the aged Priam, Achilles gave back the body for burial. See *Iliad*; Troy.

Hecuba (Gr. *Hekabê*). Wife of Priam, king of Troy, by whom she was the mother of Hector, Paris, Cassandra, and many other children, according to some legends 50

in all. At the taking of Troy she was carried away captive by the Greeks to the Thracian Chersonese, where her daughter Polyxena was sacrificed in obedience to the behest of the wraith of Achilles. Polymestor, the king of the country, having murdered her son Polydorus, she avenged his death by killing Polymestor's children, and putting out the king's eyes. Eventually she was metamorphosed into a dog, and threw herself into the sea. The events of her later life are the subject of Euripides' tragedy *Hecuba*. In Shakespeare's *Hamlet*, it is the simulated passion of the travelling player delivering a recital about the Trojan War that prompts Hamlet's famous cry, "What's Hecuba to him or he to Hecuba?"

Hedemarken, or **HEDMARK**. Fylke or co. of E. Norway, bordering on Sweden. Mountainous in the N., some of its peaks attain an elevation of 6,000 ft. Among its numerous lakes is Lake Fämund and a portion of Lake Mjösen on the W. boundary. Hedemarken comprises the valley of the upper Glommen, one of the most fertile regions in Norway. Area, 10,621 sq. m. Pop. 187,584.

Hedge. Live fence in a garden or between fields. Hedges are planted on the boundaries of fields and gardens as screens and shelter belts; also in gardens to screen one part from another. The trees and shrubs used in gardens are of two kinds, evergreen and leaf-losing. The best evergreen boundary hedge is of holly; laurel is also commonly planted. Yew should not be used, for the leaves are harmful to cattle. Of leaf-losing kinds, quick or thorn, hornbeam and beech are recommended. Privet, either green or golden-leaved, is often used to enclose small gardens.

For planting within the garden to make tall evergreen hedges, there is a choice of yew, arbor vitae, box, or Lawson's cypress. Evergreen honeysuckle makes a good hedge up to 4 ft. Of leaf-losing hedges within the garden, the oval-leaved privet, beech, and hornbeam are suitable. It is difficult to get flowers to grow near hedges, so the latter should be planted alongside paths if possible.

Flowering shrubs may provide informal hedges, but cannot be clipped closely. Examples are the Japanese briar, Penzance briar, the barberries *Darwinii* and *stenophylla*, *laurustinus*, and *pyrus*

japonica. Lavender makes a good low hedge, as does grey-leaved cotton-lavender or santolina. In mild seaside districts Monterey cypress forms a splendid tall evergreen hedge; there also euonymus, escallonia, tamarisk, and hardy fuchsia.

Particular care must be taken in planting evergreen hedges: the trees are likely to fail if the roots are allowed to become dry. For tall hedges, a site 2 ft. deep and 3 ft. wide should be dug, and manure added if possible. Evergreens are best planted in Sept.-Oct. or April-May; the leaf-losing kinds in Nov.-early Dec. or Feb.-March. Hedge plants should be set at the following distances apart: privet, beech, hornbeam, box, and holly, 15 ins.; yew and laurel, 2 ft.; Lawson's cypress and arbor vitae, 3 ft.; lonicera, 12 ins.; quick or thorn, 9 ins.; the last two being generally planted in a double row, the lines 12 ins. apart. Privet hedges must be clipped several times between May and Sept. Yew, holly, arbor vitae, box, and cypress are clipped early in Aug. and, if necessary, trimmed in May. Hornbeam, beech, and thorn may be cut in Feb.; laurel in Aug.; lonicera in May and Aug.

Hedgehog (*Erinaceus europaeus*). Common British mammal, belonging to a genus with many species in various parts of the world. It is the largest of the British insect-eating animals, and the only one provided with a defensive armour of spines. It is about 10 ins. long, and has a short tail of about 1½ in., a snout somewhat like that of a pig, and very short limbs. Hedgehogs have the power of rolling themselves into a ball, with the head and limbs tucked in so that nothing but an array of sharp spines is presented to an enemy. They are nocturnal in habit, and are seldom seen in the daytime, which they spend asleep in hedges and thickets.

Their food consists of insects, snakes, worms, snails, slugs, and birds' eggs, varied occasionally by small birds and mammals, to-

Hedgehog. Specimen of the common British variety

gether with fruit and roots. The hedgehog breeds in summer and early autumn, and produces three or four young ones at a birth. It hibernates during the winter months, sleeping rolled up in a ball beneath a mass of dead leaves or moss. Except where game is preserved, the hedgehog is a harmless animal and is useful in destroying garden pests.

Hedgehog Defence. Defensive system first developed by the German army during the later stages of the Second Great War. Towns were used as nuclei of all-round defence, the surrounding villages being converted into outlying strongpoints. The "hedgehog" was used in face of the various Russian advances on the eastern front, and proved for a time a formidable obstacle. Eventually the Russians learned to bypass a "hedgehog," leaving the garrison to be contained by following troops. See Fortification text and illus.

Hedgehog Mushroom (*Hydnum*). Genus of fungi of the family Hymenomycetaceae. They are char-

Hedgehog Mushroom. Specimen of the edible *Hydnum repandum*

acterised by the spore-bearing surface taking the form of fleshy, awl-shaped spines instead of the plate-like gills of the common mushroom. Several species are among the best of the edible fungi, notably *H. repandum*, which grows in woods, sometimes forming rings or a segment of a circle. It has a short, thick stem, and the spines which cover the underside of the cup extend some way down the stem. Its colour is a pale flesh tint. Another good esculent is *H. imbricatum*, with rough scaly top of a warm brown colour.

Hedgehog Plants (*Echinocactus*; *Echinopsis*). Two genera of succulent, leafless plants of the family Cactaceae. Natives of the hot, dry parts of America, they are more or less globular or cylindrical, with tubercles or ridges that bear bundles of long-spreading spines. The flowers are large and handsome, white, yellow, rose or purple. *Echinocactus visnaga* attains a very large size, and its long spines are used as toothpicks.

Hedgehog Projector. Anti-submarine weapon developed by the Royal Navy during the Second Great War. Normally depth charges have to be dropped when the stern of the attacking vessel is approximately over the target; this results in a "dead space" between the last Asdic (*q.v.*) echo and the release of the depth charge pattern. The hedgehog projector, which consists of a spigot mortar, overcame the dead space, during which a U-boat might take successful evasive action, by firing its projectile while the submarine was still in Asdic contact. The projector fired a salvo of 24 charges, each containing its own propellant and 32 lb. of high explosive, ahead of the ship in the form of an ellipse 120 ft. by 140 ft. A direct hit had to be made to ensure a kill; a near miss was not so effective as a pattern of depth charges dropped normally.

Hedge Hyssop (*Gratiola officinalis*). A perennial herb of the family Scrophulariaceae. It is a native of Central Europe, and has opposite, lance-shaped leaves with toothed edges, and whitish flowers streaked with purple. Formerly used as a purgative and emetic, it was abandoned in medical practice owing to its dangerous properties.

Hedgeley Moor. Locality in Northumberland, England, 8 m. N.W. of Alnwick, famous for the battle fought here during the Wars of the Roses, April 25, 1464. The Lancastrians were making a new effort and a party of them met here some Yorkists led by Lord Montagu, Warwick's brother. The Lancastrians were worsted, and Sir Ralph Percy, one of their leaders, was killed.

Hedge Mustard (*Sisymbrium officinale*). Annual herb of the family Cruciferae. It is a native of Europe, W. Asia, and N. Africa. It is sometimes 2 ft. in height.

Hedgehog Plant. Specimen of *Echinocactus melocactus* showing, left, spines and, right, flower

Hedge Mustard. Flowers and lobed leaves of the wild plant

The leaves are deeply cut into lance-shaped lobes; the flowers are pale yellow, and minute, in a spray. Garlic mustard (*Alliaria officinalis*) with kidney-shaped lower leaves, and larger, white flowers, has a strong odour of garlic when bruised.

Hedge School. Name given to primitive schools in remote districts of the U.K. before education became compulsory. They were common in Ireland, especially in Kerry. The schoolmasters were paid in produce of the soil. The use of the word hedge to imply inferior is exemplified also in such words as hedge priest, hedge marriage, and in Shakespeare's hedge-born (1 Henry VI, iv, 1).

Hedge Sparrow. Popular name for the British accentor (*g.v.*).

Hedging. The art of keeping hedges in order. A newly established hedge must be protected for four years, after which it is trimmed from time to time and occasionally laid. Laying is done from the ditch side, a plank being placed lengthwise and supported on pieces of iron rail, put across the ditch. Dead or unnecessary growths are first cut out. The vertical stems selected as layers are partly cut through, thinned about a foot from the bottom, and bent down into an inclined position, usually to the left. The cut part should be finished off by clean upward slopes, or water will lodge and cause rotting.

The cutting implement used is a hedge slasher or switch bill, consisting of a stout blade, usually slightly curved near the end, and fixed in a long wooden handle. The layers are kept in place by driving in stakes at regular intervals, or actual growing stems may be utilised as "live stakes." The latter should be half cut through near the bottom, as this encourages the growth of shoots below the cuts, and helps to prevent the lower part of the hedge from be-

coming thin. The hedge is trimmed to a height of 4 ft. or 5 ft., and its top made firm by twining willow branches or other flexible material in and out between the stakes.

Hedin, SVEN ANDERS (b. 1865). Swedish explorer and author. Born at Stockholm, Feb. 19, 1865, he attended Swedish and German universities. Beginning his travels at 20 in Persia, he visited many little-known areas of Central and E. Asia, publishing *Through Asia* in 1898. Next he went to the Gobi Desert and Tibet, of which in 1906-08 he made the first detailed map. A British knighthood was conferred on him in 1909; in 1902 he had been raised to the Swedish peerage. Early in the First Great War he wrote for the German government a report on war devastation in Belgium, revealing then and thereafter a strong anti-British feeling.

Hedin went round the world in 1923; undertook an expedition in Sinkiang, 1927-28, and travelled in Mongolia, 1928-30; and was head of the Sino-Swedish expedition throughout 1927-35. In China he organized meteorological stations and collected useful archaeological material. Twice his party were held captives by bands of Tungas. Famous books by Hedin are *From Pole to Pole*, 1911, trans. into 14 languages; *Southern Tibet*, 9 vols., 1917-22; *My Life as an Explorer*, 1925; *Riddles of the Gobi Desert*, 1933; and a study of Chiang Kai-shek, 1939.

Hedjaz. Variant spelling of the region of Arabia also known as Hejaz (*g.v.*).

Hedley, WILLIAM (1779-1843). British inventor and railway pioneer. Born at Newburn-on-Tyne, July 13, 1779, he became a mining engineer and turned his attention to improving the methods of hauling coal from the pits to the Tyne. He introduced engines by Trevithick, Blenkinsop, and Chapman at his collieries. The first to realize that teeth and racks were unnecessary, Hedley, on March 13, 1813, patented his locomotive Puffing Billy to run on smooth rails. It was put into service between Wylam colliery and the river. Hedley discovered the principle of the blast pipe, a method of producing a greater draught by returning the ex-

haust steam into the chimney. In 1822 he put into operation one of the first tugs. At Callerton colliery he introduced an improved system of steam pumping for removing water from the workings. He died Jan. 9, 1843.

Hedon. Borough of the East Riding of Yorkshire, England. It stands near the Humber, 5 m. E. of Hull, and has a railway station. At one time it was a flourishing port. It has a notable cruciform church, S. Augustine's, with a beautiful west front and a tower. There is a trade in agricultural produce. The town still retains its mayor and corporation. Hedon received a charter from Henry II, and in the Middle Ages had a trade guild, while much shipping entered the port, which was connected with the Humber. It was made a municipality in 1661 and returned two members to parliament until 1832. Pop. 1,800.

Hedonism (Gr. *hēdonē*, pleasure). View of life which regards pleasure (bodily or mental) as the greatest good. It was the chief doctrine of the Cyrenaics, and to a certain extent the Epicureans, and, in the 18th century, in its grossest form it found staunch supporters in Helvétius, Holbach, and La Mettrie, of the French materialistic school. In more modern times a refined form of hedonism, represented by Bentham, James and John Stuart Mill, Herbert Spencer, and others, has been associated with the doctrine of Utilitarianism, which, while upholding the hedonistic theory, sought the greatest happiness of the greatest number. See Philosophy; Utilitarianism.

Heem, DAVID DE (c. 1670-1632). Dutch painter. Born at Utrecht, he was a still-life painter of considerable distinction, although some works of his son and grandson have been wrongly attributed to him. The National Gallery, London, contains a study of fruit and flowers by him, and the Uffizi gallery at Florence has a good example.

Heem, JAN DAVIDSZ DE (c. 1606-c. 1684). Dutch painter. Born at Utrecht, he was the son of David de Heem. He learned much from his father, but surpassed him both in variety of his still-life subjects and in technical equipment. His colour is rich, and, within the compass of still life, he may be counted among the most notable of the minor Dutch artists of the 17th century. Examples of his work are to be found in many German galleries and at the Louvre, Amsterdam, and The Hague, while the

Sven Hedin, Swedish explorer

Heem. Typical still-life by the 17th century Dutch painter, Jan Davidsz de Heem
Wallace Collection, London

Wallace Collection has two. His son was Cornelis de Heem (1631-95), who ably carried on the style of his family in painting, working at Antwerp and The Hague.

Heenan, JOHN CARMEL (1835-73). American pugilist. Born at Troy, N.Y., May 4, 1835, he was apprenticed at 15 to a blacksmith at Benicia, California (whence his sobriquet, the Benicia Boy), and soon became known on the Pacific coast as a strong and bold fighter. In 1860 he came to England and fought his battle with Tom Sayers (*q.v.*), at Farnborough, Hants, April 17. The fight ended in a draw after 37 rounds. Heenan afterwards toured in England with circus troupes. On being beaten by Tom King in 1864, he returned to America, where he made and lost several fortunes. He died at Green River City, Wyoming, Oct. 25, 1873.

Heep, URIAH. Character in Dickens's novel David Copperfield. Clerk to Mr. Wickfield, the lawyer, and eventually unwelcome suitor for the hand of Agnes Wickfield, he is presented as an unwholesome figure, red-haired and damp-handed, with the writhing, cringing manner of false humility. His perpetual claim to be "umble" is, however, a thin cloak for envy, hatred, and a malicious furthering of his own ends.

Heere, LUCAS DE (1534-84). Flemish painter. Born at Ghent, he studied under Frans Floris, and while still young executed for the Regent of the Netherlands a picture of Solomon and the Queen of Sheba, in which Solomon is a portrait of Philip II of Spain. He visited England (1568-77), where he painted a curious allegorical picture, now at Hampton Court, containing the portrait of Queen Elizabeth, and Paris, where he

designed some tapestries for Catherine de' Medici, and where he died. His portraits included those of Queen Elizabeth, the earl of Essex, and the duchess of Suffolk.

Heerlen, Town of the Netherlands, in the prov. of Limburg and near the German border, 10 m. N.W. of Aix-la-Chapelle. It is a mining town on the verge of a small coalfield. The fine 13th century Romanesque church has been enlarged. Pop. 56,290.

Hefele, KARL JOSEPH VON (1809-93). German theologian and historian. Born at Unterkochen, Württemberg, March 15, 1809, he was educated at Tübingen, where he became professor of patristics and church history in 1840. He was a member of the national assembly of Württemberg, and in 1869 was appointed bishop of Rottenburg. A Roman Catholic, he opposed the dogma of papal infallibility, but submitted to the decree when it was promulgated. He was the author of an edition of the Apostolic Fathers, a standard History of the Councils of the Church (Eng. trans. 5 vols. down to the year 738), and other works. Hefele died at Rottenburg, June 5, 1893. *Pron.* Hay-feler.

Hegel, GEORG WILHELM FRIEDRICH (1770-1831). German philosopher. Born at Stuttgart, Aug.

27, 1770, he studied at Tübingen and was for some years a private tutor. In 1801 he was appointed to a professorship at Jena, which he was obliged to relinquish owing to the political upheaval. After the battle of Jena, 1806, he removed to Bamberg, where he edited a newspaper. In 1808 he became rector of the academy at Nuremberg, where he remained eight years. In 1816 he became professor of philosophy at Heidelberg, and in 1818 succeeded Fichte at Berlin, where he died of cholera, Nov. 14, 1831.

Georg Hegel

From a print

The style of Hegel's writings is extremely involved and obscure. His system is divided into three parts: Logic, the science of pure ideas, of universal notions; the philosophy of Nature, the development of the real world; the philosophy of Spirit (mind), the development of the ideal world, the concrete spirit that attains actuality in ethics, politics, art, religion, and science. These three divisions correspond to three phases of the Absolute—position, negation, and a combination of both. The Absolute is at first pure, immaterial thought; it is then broken up into the infinite atomism of space and time; lastly, it returns to itself and thus becomes actual thought or spirit. The universal principle of the system is the idea; Being and the idea are identical. The idea contains in itself the capacity for developing into all the determining attributes of being, into all that makes Being Being.

Movement Essential to Being
At first indeterminate, without properties or qualities, Being passes out of this condition and passes into otherness, its negation, its opposite. This negation becomes the principle of a continuous series of higher and successive affirmations. Thus, pure light is the same as darkness and is at first invisible, but after it has passed into darkness it returns to itself, takes on colour, and thus becomes visible. Everything must have an opposite or contradictory; were it not so, nothing could come into existence. The essence of this system is activity and movement. This is a return to the theory of Heraclitus, that nothing remains the same, that all things are in a constant state of flux and their permanence only illusory. Nothing is, but only becomes.

The idea is at once nature, God, and humanity. At first confined within itself, it separates from it and posits itself in what is another self, the external world. It then returns to itself, improved and developed, to go through a further series of developments, becoming ever freer and more conscious of itself. God Himself is nothing but the self-development of the absolute; He does not exist in Himself as a perfect being. Like everything else, He never is, but is always becoming. Similarly, man has no separate personality, being merged in God. Nor is God distinct from the external world; God, nature, and humanity are one. This is pantheism, but a pantheism essentially different from Spinoza's,

whose god (substance) is an absolute unity.

By his support of existing Prussian institutions Hegel obtained great political and social influence. His theories are set forth in *The Philosophy of Right*. All changes and revolutions are only milestones on the road of progress. The individual is of no value by himself; he is absorbed in the family, the family in the state, the real substance of which, individuals, are accidents. The state in return must protect the individual and allow him a certain amount of freedom (liberty of the press, trial by jury, popular representation), but not so as to interfere with progress. Constitutional monarchy is the best form of government, a king being necessary "to dot the i's." War is indispensable to progress, might is right, the weaker state is inferior to and absorbed in the stronger. All states will finally be absorbed in the general movement of the universe. *Pron.* Haygel. *See* Pantheism; Philosophy; State.

J. H. Freese

Bibliography. Hegel, E. Caird, 1883, in *Knight's Philosophical Classics for English Readers*; *Lectures on the History of Philosophy*, E. S. Haldane, 1892-96; *Prolegomena to the Study of H.* and trans. of *The Logic and The Philosophy of Mind*, W. Wallace, 1894; *The Secret of H.*, J. H. Stirling, 1898; *The Phenomenology of Mind*, J. B. Baillie, 1910; *On H.'s Critique of Kant*, J. Maier, 1939; *Introduction to H.*, G. R. C. Mure, 1940; *H.'s Philosophy of Right*, trans., ed. T. M. Knox, 1942.

Hegesias. Greek philosopher. Belonging to the Cyrenaic school, he flourished in Alexandria about 320-280 B.C. Surnamed *Peisithanatos*, or recommending death, from his gloomy outlook upon life, he

regarded the attainment of positive enjoyment as impossible, and declared that death was preferable. According to him, the prevention of pain and indifference to externalities were the objects the wise man should set before him. His treatise entitled *Apokarterōn*, starving oneself to death, had so great an influence on his followers that some of them ended their lives.

Another Hegesias was a sophist and rhetorician, a native of Magnesia at the foot of Mt. Sipylus in Asia Minor. He is considered the originator of the Asiatic or florid school of oratory. He is also said to have written a life of Alexander the Great.

Hegesippus (c.120-180). Christian writer. He was born in Palestine, and was probably a Jewish Christian. He visited Corinth and appears to have written his books in Rome. He prepared a list of the Roman bishops, and

War, somewhat condensed and containing additional matter from other sources. The work probably belongs to the 4th century A.D. Unless there is a confusion between this supposed Hegesippus and the Christian writer, it is probable that the name is simply a corruption of the name Josephus, adopted by the author of the translation.

Hegira. This word, applied to the flight of Mahomet from Mecca in 622, is also spelt Hejira (*q.v.*).

Heidelberg. Tn. of Württemberg-Baden, Germany, on the Neckar, 15 m. from its junction with the Rhine, and 54 m. S. of Frankfurt. It is a rly. centre and has

manufactures, but its main interests are historical, while its beautiful situation between hills reaching 1,600 ft. attracts many visitors and residents. Of the buildings the chief is the ruined castle. This stands on a hill, and was in its prime perhaps the largest in Germany. Dating from the 13th century, it was enlarged by several electors palatine who lived here. The elector Charles Louis restored it after the Thirty Years' War, but it was much damaged by the French in 1693. In 1764 it was struck by lightning. The chief portions are the Otto Heinrichsbau of the 16th century, a beautiful piece of work, richly decorated with sculptures, and the Friedrichsbau of the early 17th. The Friedrichsbau was restored 1897-1903, and houses a museum of antiquities. The great tun of Heidelberg, a vat holding 48,730 gallons, is in the cellars. Remarkable features of the castle include the chapel.

Heidelberg itself stands on the S. bank of the Neckar, with the suburbs of Neuenheim and Handschuhsheim on the N. Two bridges, one having a fine gateway, unite the two. The old buildings are in or around the long High Street. These include the churches of S. Peter and the Holy Ghost.

Heidelberg, Germany. 1. The Neckar Bridge, with the town and castle. 2. The Friedrichsbau, portion of the castle built 1601-7. 3. The castle from the north

wrote a work called *Hypomnemata* (Notes or Memorials), the earliest attempt at a history of the Christian Church, of which fragments are preserved in Eusebius.

Hegesippus is also the name formerly given to the author of a Latin translation, in five books, of Josephus's *History of the Jewish*

The squares include the market place, the Ludwigsplatz, and Bismarckplatz. There are a town hall, a public promenade, the Anlage, a hall for concerts, etc., and on the market place a remarkable old house. Heidelberg university was founded in 1386 by the elector Rupert. The present buildings were begun in 1712. The library houses a most valuable collection of over a million books and MSS. The university has hospitals, laboratories, and an observatory. In the 17th century it was a stronghold of Protestantism.

Heidelberg has manufactures of cigars, leather, fountain pens, surgical instruments, and furniture, while tobacco is grown near. It has electric tramways and there is a cable rly. from the corn market to the castle. Near the town are some noted beauty spots, especially the Molkenkur and the Heiligenberg with the ruins of an abbey. Heidelberg became important when in 1228 the count palatine of the Rhine made it his capital. During the Thirty Years' War it was taken by Tilly and by the Swedes, but was restored to the elector in 1648. In 1721 the capital was transferred to Mannheim, and in 1803 Heidelberg became part of Baden. Units of the U.S. 7th army captured it virtually undamaged, March 30, 1945. Pop., pre-war, 85,000.

Heidelberg Catechism, THE. Symbol and summary of the reformed evangelical faith, published at Heidelberg, 1563. It was written at the instigation of the elector palatine, Frederick III, by Zacharias Ursinus (1534-83) and Caspar Olevianus (1536-87), with the object of ending the conflict then raging in the Palatinate between Lutherans and Calvinists by setting out the evangelical faith in terms incapable of being misunderstood. It contains 129 questions divided into three parts, treating respectively of man's sin and misery, of his redemption by Christ, and of the Christian life. Into these three divisions the decalogue, the creed, the Lord's prayer, and the doctrine of the Church and the sacraments are fitted as parts of an organic system, making an easy and simple, yet profound and comprehensive, whole, unmatched by any other of the Reformation catechisms.

First issued Jan. 19, 1563, an official Latin translation being published the same year for use in the higher seminaries and schools, the Heidelberg Catechism, despite opposition from the ultra-Lutherans, won its way into the hearts of

the Christian world. It was approved by the Synod of Dort in 1619, and has been translated into all the languages of Europe, and into Hebrew, Arabic, and Malay. Moderate in its statement of doctrine, free from metaphysical subtlety, charged with a gracious spirit, and expressed in language of rhythmic beauty, it breathes an undecaying life and remains one of Germany's noblest national monuments.

Heidelberg Jaw. Fossil mandible of primitive man found by Otto Schoetensack, in a sand-pit at Mauern, near Heidelberg, in 1907. From contiguous animal remains it is inferred that the Heidelberg race was later than the Piltown, and may have been a rude precursor of the Neanderthal. See Anthropology; Ethnology; Man.

Heidenheim. Town of Germany, in Württemberg. It stands on the Brenz, 22 m. N.N.E. of Ulm. In ancient times a Roman settlement, it lies at an alt. of 1,617 ft. to the E. of the Swabian Alps, and is overlooked by the ruins of the Schloss Hellenstein. Becoming a place of some importance in the Middle Ages, it is now an industrial town, with manufactures of textile goods, machinery, earthenware, etc. Pop. 21,879. There is a smaller town of the same name in Bavaria, 21 m. S.S.E. of Anspach.

Heidenstam, CARL GUSTAF VERNER VON (1859-1940). Swedish poet and writer, born July 6, 1859, at Olshammer. At the age of 17 he went to Paris to study art, but abandoning this, spent some years in travel. On his return to Sweden he published his first book, poems entitled *Wanderings and Pilgrimages*, 1888, which immediately secured him recognition. The poems were followed by prose—tales, sketches, brochures, and a novel of life under Turkish rule in Damascus, *Endymion*, 1889, glowing with colour and romance. *Hans Alienus*, 1892, is a remarkable book, rich in original thought, expressed in a new and beautiful form.

Heidenstam then returned to poetry in *Poems*, 1895, and after some months in Russia published his most popular work, *The Carolins*, 1897, which consists of a series of stories centred upon Charles XII, and counts among the finest Swedish prose ever written (Eng. trans. A King and his Campaigners, 1902). This and other historical books, *The Pilgrimage of S. Bridget*, and *The Swedes and their Chieftain* (Eng. trans. 1909), are masterpieces of

their kind, burning with the author's love of country. In 1916 Heidenstam was awarded the Nobel prize for literature. He died May 20, 1940.

Heifetz, JASCHA (b. 1901). Russian-born American violinist. Born at Vilna, Feb. 2, 1901, he began to study the violin at 3, and at 9 entered the St. Petersburg conservatoire, where he studied under Auer. At 12 he made a European tour, performing the most difficult works and receiving the highest praise from critics. He appeared in Vienna under Safonov and in Leipzig under Nikisch. Escaping from Russia during the revolution in 1917, he went to the U.S.A., where he was naturalised in 1925. He made his London début at Queen's Hall in 1920. His performances were notable for subtlety of expression and perfect balance.

Heijo OR PING-YANG. Town and open port of Korea. The capital of South Heian prov., it stands on the Ta-tong or Tai-dong, about 35 m. from its embouchure into Korea Bay, and is connected by rly. with Chinnampo, its outport, and with Seoul, the capital. It carries on an active foreign trade, is the centre of an important silk industry, and provides labour for the neighbouring coal mines. The river is navigable to Heijo by small craft; medium draught vessels ascend only to about 12 m. lower down. The town was the site of a Chinese victory over the Japanese in 1592, and the defeat of the Chinese by the Japanese in 1894. Pop. 285,965.

Heilbron, SIR IAN MORRIS (b. 1886). A Scottish chemist. Born Nov. 6, 1886, at Glasgow, educated at its high school and Royal technical college and at Leipzig university, he was appointed lecturer at the Royal technical college in 1909. Following service in the R.A.S.C. in the First Great War, he held the chair of organic chemistry at Liverpool, 1920-33, Manchester, 1933-35, and London from 1938. In 1939 he became a scientific adviser to the ministry of Supply, and in 1942 to the ministry of Production. He served on the advisory council on scientific and industrial research, and on the tsetse fly committee of the Colonial office. A Longstaff and Davy medallist, he was awarded the Priestley medal of the American Chemical Society for his work on synthetic penicillin; this was the first occasion upon which the medal had been awarded outside the

U.S.A. He edited the Dictionary of Organic Compounds and Thorpe's Dictionary of Applied Chemistry.

Heilbronn. A town of Württemberg-Baden, W. Germany. It stands on the Neckar, 28 m. by

Heilbronn, Germany. The church of S. Kilian from the south-west

ry. N. of Stuttgart. Belonging to the Franconian dukes from the 8th century, later to the Würzburg bishops, it became a free city in 1530, and passed to Württemberg in 1802. Its great past is reflected by the huge pile of S. Kilian's church, 13th century Gothic, with a 200-ft. tower in Renaissance style built 1527; by two other churches of the 13th-14th centuries, the town hall, a range of buildings erected 1417-1765, and a castle of the Teutonic Knights. The association with Götz von Berlichingen, the revolutionary knight immortalised by Goethe, is preserved in a wall tower where he was imprisoned; that with Schiller in a house near S. Nicholas's church; and that of the first Protestant service in Germany, 1525, in that church.

Heilbronn has been famous for an intellectual life which gave Germany many democratic leaders. It has a permanent theatre, several museums, numerous public and special schools. Its products include tools and machines, paper, jewelry, furniture, pianos, and food preserves. Heilbronn is linked with the Rhine by a chain-towed traffic line along the Neckar. Pop. 60,308.

Heil Dir Im Siegerkranz. German national song: Hail to thee with victory crowned. The

words were written, to the tune of the English God Save the King, by Heinrich Harries, a Holstein pastor, in honour of the king of Denmark, and were first published in 1790. A few years later it was appropriated, after some adaptation, by Prussia, and remained Prussia's chief national anthem until the First Great War, when it was discarded owing to the indisputably British origin of the music.

Heilsbronn. Town of Germany, in Bavaria. It lies 16 m. by rly. S.W. of Nuremberg. Its main interest lies in its old connexion with the Hohenzollerns, many of the Franconian line of the family having been buried in the Romance-Gothic church of the once famous Cistercian monastery. The three first Brandenburg Hohenzollerns were also buried here. The church contains many memorials of the early Hohenzollerns, and some fine altar-pieces of the Nuremberg school. The building was begun as a basilica in 1132, Gothic additions being made later. Pop. 1,655.

Heilungkiang. Northernmost of the nine N.E. provinces of China. Area, 70,969 sq. m. It contains 25 counties with Anpeh as its capital. Railways and highways connect it with other parts of the country. It is an area of high elevation, embracing the entire Hsiao Hsinganling range, with numerous forests. The winter is extremely cold, and warm periods are so short that plant life is scarce. Principal products are timber and gold. Pop. 2,469,000.

Heimin (Jap., commoners). Third and lowest social class under the feudal system in Japan. The *heimin* were divided into farmers, artisans, and tradesmen, and ranked in that order below the samurai, their masters. The farmers and artisans, who included artists and craftsmen, were treated with respect, but the trading class with contempt. None of the *heimin* had any social status, or intercourse, or any income beyond what was earned.

Heimwehr (Ger., home defence). Politico-military organization established in Austria in 1925. It preached a reactionary nationalist programme and was bitterly anti-Socialist. In 1930 Prince Starhemberg (*q.v.*) became leader of the Heimwehr, which in 1933 joined the Popular Front of Engelbert Dollfuss (*q.v.*). It kept Dollfuss in power and was used to crush the Socialist revolt in 1934. Major, Emil Fey eventually gained control of the whole movement,

though constantly challenged by Starhemberg. As the growing power of the well-equipped Heimwehr constituted a threat to the civil government, it was first disarmed, then dissolved, by decrees in 1936.

Heine, HEINRICH (1797-1856). German poet. Born at Düsseldorf, Dec. 13, 1797, of a poor Jewish family, he was sent, after leaving school, to Hamburg, where a wealthy uncle, Salomon Heine, initiated him into a business career. He proved himself, however, incapable, went bankrupt, and then, still with the support of his uncle, studied law at the universities of Bonn, Göttingen, and Berlin. In these years, 1819 to 1824, he discovered his lyrical genius under the stimulus of unhappy love affairs with his cousin, Amalie Heine, and, after her marriage, with her sister Therese. In 1822 he published a collection of Poems, followed in 1823 by Tragedies, which, although they contained some of the most familiar poems later incorporated in his Book of Songs, were appreciated by only a few.

In 1825 Heine became a convert to Christianity, and in the same year obtained his degree from Göttingen. Owing to the very great success of his two volumes of Pictures of Travel: the Journey in the Harz Mountains, 1826; The North Sea: Buch Le Grand, 1827, he decided to devote himself to literature; and with the appearance of The Book of Songs, in 1827, he became the most popular poet of his day. A visit to London, a stay of some months in Munich, where he was editor of a newspaper, and a journey to Italy provided him with the materials for fresh Pictures of Travel: Journey from

From a drawing by E. B. Vriete, 1851

Munich to Genoa; The Baths of Lucca, 1830; The City of Lucca; English Fragments, 1831.

Like all young men of letters of the time, Heine was stirred by the July Revolution of 1830, and in 1831, disappointed and embittered by the treatment meted out to him at home, he settled in Paris, which remained his home for the rest of his life. Only twice, in 1843 and 1844, did he revisit his native land. Heine was intimately associated with the literary school of "Young Germany," and when in 1835 the government suppressed the activities of the school, he was included in the ban. This interfered with his literary plans; but his uncle did not withdraw his support, and from 1837 to 1848 he was also in receipt of a pension of 4,800 francs (about £200) from the secret fund of the French Government. In 1834 he became intimate with a Frenchwoman of the people, Eugénie Mirat, who inspired him with a lasting affection; and in 1841 she became his wife.

Heine in Paris

During the earlier part of his stay in Paris, Heine's activity was mainly journalistic; he contributed to German newspapers articles on French life, art, and letters. These were followed by four volumes, entitled *The Salon*, 1834-40, which, however, include much more than criticisms of pictures; the principal content is indeed a study of religion and philosophy in Germany, while the later volumes are mainly made up of short stories, such as *The Rabbi of Bacherach*. A later collection bore the title *Lutetia*, 1854. In *The Romantic School*, 1836, Heine criticised with uncalled-for virulence the literary school from which he had himself sprung, and in *Ludwig Börne*, 1840, he attacked his friend and fellow-fighter in the ranks of "Young Germany."

In 1844 he came forward again, with two volumes of *New Poems*, and a satiric epic, *Germany, a Winter Tale*. These were followed, in 1847, by *Atta Troll*, generally recognized as his finest sustained poem, and in 1851 by the collection of poems entitled *Romanzero*. But in 1845 Heine fell a victim to creeping paralysis, which from the spring of 1848 till his death in Paris, Feb. 17, 1856, kept him practically bedridden. In spite of his sufferings, he maintained his mental vigour and freshness, as is to be seen in the wonderful *Last Poems and Thoughts*, which were published posthumously in 1869; indeed, it might be said

that in these years Heine underwent a kind of spiritual regeneration, which to himself was bound up in some mystic way with the romantic devotion of the young poetess Camille Selden (*La Mouche*).

Heine's position among the German lyric poets of the 19th century has been influenced by other than literary factors, and is difficult to define. His Jewish characteristics have been a stumbling block to appreciation by many of his own countrymen, his personal life affords few aspects that awaken sympathetic admiration. And yet *The Book of Songs* is incontestably the greatest, as it has been the most popular, collection of German lyrics of the 19th century. At times Heine's poetry seems lacking in the suggestiveness of the lyricism of Goethe, Eichendorff, or Mörike; and only too often he destroys by an ill-placed gibe or satiric quirk the effect of the purest lyric. Yet he is free from the vague and nebulous sentimentality into which German poetry too easily falls; his imagery is plastic and his metaphors daring almost to the verge of paradox.

As a prose writer Heine's claims are also high; his style, doubtless modelled in part on that of his French contemporaries, forms the greatest possible contrast to the clumsiness of the German prose style of his time. He began his career as a Romanticist, but became a leader of that school which formed the antithesis and negation of Romanticism, "Young Germany." The tragedy of Heine's intellectual life lay in this discord. An exile from his native land, he remained also as a poet a spiritual exile from that romantic world out of which he drew his purest inspiration.

J. G. Robertson

Bibliography. Works, ed. E. Elster, 7 vols., 1887-90, Eng. trans. 10 vols., 1892-1905; *Lives* in English, W. Stigand, 1875; W. Sharp, 1888; *Portrait of Heine*, with trans. of poems, H. Wolfe, 1930; *Poet in Exile*, A. Vallentin, 1934; Heinrich Heine, L. Untermeyer, 1938; Heine in England, S. L. Wormley, 1943.

Heinemann, WILLIAM (1863-1920). British publisher. Born at Surbiton, May 18, 1863, he was associated with Nicholas Trübner, the publisher of Oriental works, of whose business he became manager in 1884. He founded the publishing house of William Heinemann and issued his first book, *Hall Caine's The Bondman*,

in 1890. He was author of three plays, *The First Step*, 1895; *Summer Moths*, 1898; and *War*, 1901. He died in London, Oct. 5, 1920.

Heinkel. German aircraft construction company. It was founded in 1922 by Dr. Ernst Heinkel, whose experience of aircraft design dated back to the First Great War. The most notable civil Heinkel of the next decade was the single-engined He 70, claimed to be the fastest air transport machine at its début. Adaptation to the military needs of the then secret *Luftwaffe* was rapid; and the twin-engined He 111, tried out in the Spanish Civil War of 1936, was one of the first high speed monoplane bombers.

It was used during the early campaigns of the Second Great War, including the battle of Britain, but against determined opposition proved lacking in both speed and defensive power, and carried a light bomb load. Later standardised products were the He 115 float-seaplane, He 177 heavy bomber, and He 162 jet-propelled "people's fighter"—one of Germany's last weapons against the Allied air invasion. The first jet-propelled aeroplane to fly was the experimental He 178, on Aug. 27, 1939. See *Aeroplane illus.* p. 132.

Heinsius, ANTONIUS (1641-1720). Dutch statesman. Born at Delft, Nov. 22, 1641, he studied law at Leyden, and in 1679 was appointed to a government office in his native city. Intimate with William of Orange, he became foreign minister and pensionary of Holland on the accession of the former to the crown of England, and acted as William's agent in the Netherlands. His unwavering opposition to France made him the successor of William as a fierce opponent of Louis XIV, and in 1702 Heinsius was largely responsible for the alliance of the European powers against the French king. He supported Marlborough's plan of taking the Allied army to S. Germany, which led to the victory of Blenheim. He refused to listen to any suggestion of peace until, deserted by England, he realized the impossibility of continuing the struggle against France alone, and signed the treaty of Utrecht. He died on Aug. 3, 1720.

Heinsius, DANIEL (1580-1655). Dutch scholar. Born in Ghent, June 9, 1580, he became the favourite pupil of Scaliger and professor of Greek and Latin at Leyden, 1605. He wrote Latin poems and

edited Hesiod, Theocritus, Terence, and Livy. He published his Latin Orations, 1609-21; a tragedy, The Massacre of the Innocents, 1613; Poems in 1616. He died at The Hague, Feb. 25, 1655.

Daniel Heinsius,
Dutch scholar

His son Nikolaas (1620-81), born at Leyden, July 20, 1620, was a great traveller and collector of MSS. He edited a number of Latin classical authors, in which he proposed a vast number of not always felicitous emendations, which gained him the sobriquet of Restorer of the Latin Poets. He died at The Hague, Oct. 7, 1681.

Heinz, HENRY JOHN (1844-1919). American manufacturer. Born of German parents at Pittsburgh, Oct. 11, 1844, he began his business career at the age of eight, peddling produce from the family garden. While working in his father's brickyard, he extended his market gardening activities, founding in 1869 a firm (bankrupt 1875), to sell grated horseradish. In 1876 he founded H. J. Heinz & Co., manufacturers of pickles, condiments, and prepared foods, and, inventing the slogan of "57 varieties" in 1896, made it the biggest concern of its kind. A pioneer in welfare among employees, Heinz died May 14, 1919.

Heir. Term in English law. Up to 1926 the heir was the person who succeeded to an estate of inheritance—to the real property of a deceased person as distinct from his other property which passed according to different rules to the next of kin. As a result of Acts passed in 1925, altering the rules of succession and abolishing the distinction for that purpose between real and personal property, the heir lost almost all importance. The old rules for determining the heir still apply, however, in the case of the title to the throne, to a peerage, etc.

An heir apparent is a person who if he survives must be heir, e.g. the eldest son. An heir presumptive is a person who, if the present holder of the dignity died today, would be his heir, but if the present holder lives may possibly be defeated by the coming into existence of another heir. Thus a childless man's brother may be his heir presumptive, but, should the man have a son, the son will be heir apparent.

Heirloom. Chattel which by English law descended along with land by custom or settlement to the heir of an estate, instead of to the next of kin of a deceased person like other chattels. Since 1925, heirlooms do not descend direct to the heir but pass in the first place to the personal representatives of the deceased, although from them they will pass to the person who takes the land. Thus it is still possible to provide that certain chattels shall pass with certain land.

The tenant for life of an estate may sell heirlooms with the permission of the court; but this will be granted only when the sale is for the benefit of the estate. Chattels frequently made heirlooms are the garter and collar of a knight; family jewels, (e.g. the Hope diamond); a patent creating a dignity; arms and armour. The word is a compound of heir and loom (A.S. *geloma*) originally meaning any tool or utensil.

Heisenberg, WERNER (b. 1901). German physicist, born Dec. 5, 1901, at Munich. After studying at Munich and Göttingen, he became a lecturer at Copenhagen 1926, and professor of theoretical physics at Leipzig 1927-41. There he created the system of quantum mechanics and performed research in atomic energy, the Zeeman effect, and the principle of indeterminacy which he had found. In 1932 he was awarded the Nobel prize for physics. Director of the Max Planck institute of physics, Berlin, 1942-45, he later held a chair of physics at Göttingen.

Hejaz or HEDJAZ. District of Arabia, part of the kingdom of Hejaz and Nejd, a personal union of the two countries known as Saudi Arabia; the sultan of Nejd being also king of the Hejaz. With a pop. estimated at 3,500,000 and an area a little larger than that of Great Britain, the Hejaz lies to a depth of some 200 m. along the E. coast of the Red Sea for nearly 700 m., and stretches from Akabah on the N. to Asir on the S., its boundaries on the E. being Great Nefud, Nejd, and the Great Arabian Desert.

It owes its importance to the Holy Cities of Mecca and Medina, from the latter of which the Hejaz rly., built 1901-08, runs N. to Damascus, a distance of 1,105 m. Originally constructed by Turkey on the plea that it facilitated the *haj* or pilgrimage to the Holy Cities, this line was also politically and strategically valuable. In Arabia,

however, the Arabs, even under Turkish rule, had a large measure of independence, and Turkey retained such authority as she possessed—more by subsidising the local chiefs than by armed force, except in the towns, along the rly., and at the ports.

Besides Mecca and Medina, the towns of the Hejaz are Jeddah and Yanbu or Yembo, the ports respectively of these two cities, and Taif, in the S., the centre of the Arabia Felix of old. In these cities and towns live the greater part of the pop. The country is mainly a raised plateau, whose W. side is formed by rugged mountains that descend sharply to the Red Sea. Lacking perennial rivers, the land is fertile only in its few valleys. The annual *haj*, with some 60,000 pilgrims in normal times, is the chief source of what wealth the Hejaz possesses. A British company works ancient gold mines.

At the outbreak of the First Great War, the Hejaz was a vilayet of the Turkish empire. When Turkey entered the war the situation in Arabia was quiet, except in Nejd and in Asir, which were in open revolt; in the Yemen the Turks took the offensive against the British in Aden. The Young Turks, led by Djemal Pasha, governor of Syria, arrested and executed in 1916 many Arabs in Damascus and Homs. Enver Pasha visited Mecca and shocked the faithful there by his atheism.

On June 5, 1916, the grand sherif of Mecca, hereditary keeper

Hejaz. Map of the region in which are situated the holy cities of the Mahomedan faith

of the holy places of Islam, proclaimed himself king of the Hejaz under the title of Hussein Ibn Ali; and was recognized by the Allies and the Arabs. He thereupon summoned the Turkish garrison of the Holy City to surrender, but it held out until June 9. Hussein divided his forces into four: one part remained in Mecca; the second went N. to Medina under the ameer Feisal, one of his sons; the third, under another son, the ameer Abdulla, marched S. to Taif; and the fourth, under yet another son, the ameer Zeid, advanced W. on Jeddah. The grand sheriff appealed to Great Britain for assistance, and thereafter the Red Sea patrol of the British navy co-operated with his forces. Before June was out Jeddah had fallen; Yembo was taken in July, Taif in Sept. The whole of the Hejaz, except Medina, which Feisal failed to take, and the rly. zone, was cleared of Turks.

Further Arab Successes

The Egyptian government sent officers and men to the Hejaz to train the Arabs and others who had joined them from the N. Feisal captured Wejeh (El-Wijh) in Jan., 1917, and his force steadily grew into a regular army. He also succeeded in getting all the Arabs in the N., who had been divided by tribal feuds, to support him, among others the sheikh of Howeitat.

During 1917 Feisal made repeated raids on the Hejaz rly., but the chief Arab success of that year was the capture of Akabah in Aug. By April, 1918, Feisal had seized Tafleeh, near the S. end of the Dead Sea, and held the latter against a powerful attack. Still Maan and Medina held out. Now the armies of the king of the Hejaz numbered 40,000 men, who became the extreme right wing of Allenby when he conquered Palestine and Syria. Feisal took part in the advance on Damascus, which was entered first by some of his troops on the night of Sept. 30-Oct. 1. Medina capitulated to Hussein, under the terms of the armistice with Turkey, Jan., 1919.

In Oct., 1924, following an unsuccessful war with the sultan of Nejd (*q.v.*), King Hussein abdicated in favour of his son. The latter was forced to abdicate in 1925, when the ruler of Nejd, Abdul Aziz Ibn Saud captured Mecca and proclaimed himself king. Great Britain then recognized the independence of Ibn Saud and the united state of Hejaz and Nejd, now known as Saudi

Arabia. The constitution of 1926 technically operates. A legislative assembly sits in Mecca in an advisory capacity.

In 1939 the Saudi Arabian government reduced all taxes and dues paid by pilgrims to Mecca, and during the Second Great War the governments of Great Britain and India made shipping available with a guarantee to owners against loss. *See* Arabia; Feisal I.; Ibn Saud; Lawrence, T. E.; Palestine, Conquest of; Saudi Arabia.

Hejira or **HEGIRA** (Arab. *hijra*). Word meaning flight, applied specially to the flight of Mahomet from Mecca to Medina in A.D. 622, from which event the Mahomedan era is reckoned. This era was inaugurated by the caliph Omar in 639 and is reckoned from July 16—the first day of the first month of the year in which the flight took place. Dates of the Mahomedan era are indicated by the letters A.H. (*anno hegirae*, in the year of the flight). The Mahomedan year is a lunar one, and so about 11 days shorter than the solar year. To find the year in the Christian era approximately corresponding to a year in the Hejira, subtract 3 p.c. from the Hejira year and add 622.

Hekla or **HECLA**. Active volcano of Iceland. In the S. of the island, it is about 20 m. from the coast and 70 m. E. of Reykjavik. It attains an alt. of 4,747 ft., having one large crater, 1½ m. in circumference and 200 ft. to 300 ft. deep, and several subsidiary ones. It has been active frequently since the 11th century. The eruption of 1845-46 lasted continuously from Sept. to April. In March, 1878, and again in March, 1947, there were violent outbursts. The principal rocks are composed of basalt and lava; the mountain is devoid of all vegetation.

Hel, in Norse mythology, daughter of Loki. She is described in the Prose Edda as purely evil, care being her bed, hunger her dish, and starvation her knife. In other myths she was the guardian of the plains under the earth, peopled by the happy dead, as well as of the caves of punishment. *See* Mythology.

Hel or **HELA**. Peninsula in Poland commanding the entrance to the port of Gdynia. It was heavily fortified by the Poles and was their last stronghold to fall to the Germans, Oct. 1, 1939, when the garrison of 4,000 laid down their arms after a sea, land, and air attack lasting 30 days. *See* Poland.

Helder. Seaport of the Netherlands, in the prov. of N. Holland. It stands at the N. extremity of the prov., and is separated from the island of Texel by the Mars Diep, a channel 2 m. in width. It is about 40 m. N. of Amsterdam, with which it is connected by the North Holland canal. The place is protected from the sea by a dyke 5 m. long and 40 ft. wide, sloping 200 ft. into the sea. About a mile E. of the town, at the entrance to the North Holland canal, is the harbour of Nieuwe Diep. At Willemsoord are docks and shipyards, a naval cadet school, and a meteorological station.

Formerly a small fishing hamlet, Helder developed owing to its position at the entrance to the former Zuider Zee. Off here, in 1673, the Dutch under Tromp and de Ruyter defeated the combined English and French fleets. Helder was fortified by Napoleon in 1811. Pop. 27,552.

Helderberg Formation. Rocks of the Upper Silurian system. They

Hekla. The great volcano of Iceland in a photograph taken during its violent eruption in March, 1947

are found chiefly in the eastern part of N. America, *e.g.* New York (forming the Helderberg range), the Catskills, New Brunswick, Nova Scotia, and Montreal. Varying in thickness up to 600 ft., these rocks are noted for their fossils.

Helen (Gr. *Helenē*). In Greek legend, the woman of surpassing beauty whose seizure by Paris was the cause of the Trojan War; whose face, in Marlowe's line, "launched a thousand ships." According to the earlier stories

she was the daughter of Tyndareus and Leda, Castor and Pollux being her brothers. In a later version, Leda was visited by Zeus in the form of a swan, and gave birth to two eggs, from which Helen and the twins came forth.

Helen became the wife of Menelaus, king of Sparta, and when Paris, son of Priam, king of Troy, came there on a visit, Aphrodite, in fulfilment of a promise to give Paris the most beautiful woman in the world, caused her to fall in love with the handsome visitor. After the capture of Troy, Helen returned to Sparta with her husband, though, according to some legends, they sojourned for eight years in Egypt before reaching home. The word is a favourite feminine Christian name, as are variants Ellen and Helena. The form Helenus is occasionally used as a masculine name. See *Troy*; consult also Helen of Troy, A. Lang, 1882; The Legend of Fair Helen, E. Oswald, 1905.

Helena. Capital city of Montana, U.S.A., and the co. seat of Lewis and Clark co. Situated 3,955 ft. high at the foot of the Rocky Mts. on the edge of the upper Missouri valley, it is 65 m. N.E. of Butte, and is served by rlys. and an airport. Among its notable buildings are the copper-domed capitol, the Carroll College (R.C.), a veterans' hospital, the R.C. cathedral, and the Protestant pro-cathedral.

Helena lies in a rich mining region, containing gold, silver, copper, lead, and zinc; its main street is laid out on the site of Last Chance Gulch, where gold was struck in 1864 and \$4,000,000 worth of ore extracted in two years. Forests of fir and pine on neighbouring hills provide timber for large sawmills. Sheep and cattle are reared, and there are a huge lead smelter, foundries, machine shops, brick and tile factories, and breweries. The surrounding Prickly Pear or Helena Valley yields cereals and vegetables. Laid out as a mining town in 1864, Helena became the capital of Montana on its organization as a territory in 1875, and received a city charter in 1881. An earthquake in 1935 caused damage valued at a million pounds. Pop. 15,056. *Pron.* with accent on first syllable.

Helena, FLAVIA JULIA (d. 328). Wife of the Roman emperor Constantius Chlorus and mother of Constantine the Great. She was born of humble origin in Nicomedia, and became famous for her

devotion to Christianity. In her old age she made a pilgrimage to Jerusalem, and, according to a legend which first appears at the end of the 4th century, she discovered there the sepulchre of Our Lord and the wood of the Cross.

Helensburgh. Borough and watering-place of Dumbartonshire, Scotland.

Helensburgh arms. It stands on the N. bank of the Firth of Clyde, 4 m. N. of Greenock and 24 m. N.W. of Glasgow on the railway. The public buildings include the municipal buildings, Victoria Halls, Hermitage School, and hospitals. Founded in 1777 by Sir James Colquhoun, after whose wife it was named, Helensburgh has a pier and esplanade. On the latter is a monument to Henry Bell, the pioneer of steam navigation, who died here in 1830. The council owns the gas and water undertakings, four parks, a recreation ground, and the harbour. The beautiful grounds of the Hermitage have been laid out for public use. From Craighend, about 1 m. E., steamers go to Dunoon and other pleasure resorts on the west coast; and the rly. branches off for Fort William, Mallaig, etc. Pop. 8,893.

Helensville. Town of New Zealand, in Auckland prov. On the Kaipara river, it is 38 m. by rly. N. of Auckland. Steamers ply from here to various places on Kaipara Harbour and Wairoa river. Pheasant and duck shooting and fishing are available. Near are hot springs with great curative properties. Pop. 960.

Helenus. In Greek legend, son of Priam, king of Troy, noted for his powers of prophecy. Taken prisoner by the Greeks, to whom he declared that Troy could never be taken without the help of Pyrrhus (Neoptolemus) and Philoctetes, after the capture of the city he was allotted to Pyrrhus as part of the spoils. He afterwards accompanied Pyrrhus to Epirus and married Andromache, the widow of Hector, becoming king of the country after the death of Pyrrhus.

Helford. River of Cornwall, England. Rising 4 m. W. of Penryn, it flows 10 m. S. and E., to enter the English Channel between Rosemullion Head and Nare Point. There is a ferry across the river, which is visited by oyster fishers and yachtsmen.

Helfrich, CONRAD EMILE LAMBERT (b. 1886). Dutch sailor. He was born Oct. 11, 1886, and educated at the naval academy, Den Helder. He commanded a training squadron, 1934-35, and was director of the naval war college at The Hague, 1938-39. Helfrich had command of Netherlands naval forces in the East from 1939 to 1942, when he became supreme commander of Allied naval forces in the S.W. Pacific and c-in-c. of all Netherlands and N.E.I. land, air, and sea forces. In 1945 he was appointed c-in-c. of Netherlands naval forces and represented his country at the San Francisco conference.

Helical Rising. Of a star, the time at which it rises with the sun. At a given place this will occur once a year, on the date at which the sun in its annual passage round the zodiac passes near the star. The ancient Greeks and Egyptians used successive heliacal risings of bright zodiacal stars to determine the length of the year.

Helicon (Gr. *hēlikōn*). Name sometimes given to the circular bombardon (*q.v.*). The first meaning of the Greek original is the thread spun from the distaff to the spindle, then a nine-stringed instrument.

Helicon (mod. Zagará). Mt. in the S.W. of Boeotia, ancient Greece. Its beautiful scenery caused it to be popularly regarded as the home of the Muses, to whom there was a temple and in whose honour games were celebrated. The well of Aganippē at its foot, and the fountain of Hippocrēnē were also sacred to them. Remains of the temple, of a theatre, and of a colonnade have been discovered. See *Mythology*.

Helicopter (Gr. *helix*, spiral; *pteron*, wing). Direct-lift flying machine on which the wing and propeller of the orthodox aeroplane are replaced by a power-driven rotor or rotors revolving in a horizontal plane. The advantage is that it does not require, an initial run along the ground to become airborne, but can take off or land vertically.

Leonardo da Vinci first evolved the theory of the helicopter and made detailed drawings of a projected machine, but the first successful attempt to solve the problem of vertical flight was not made until 1923, when a Frenchman, Oehmichen, built a machine that succeeded in hovering for five minutes. This consisted of an oblong, semi-rigid balloon from

which was suspended a framework with two cross arms, at the ends of which were four horizontal power-driven rotors. There were seven other air-screws to assist manoeuvrability and stability.

In 1924 the marquis of Pescara designed and flew a helicopter with two superimposed horizontal rotors revolving in opposite directions and driven by a 180 h.p. Hispano-Suiza engine. The longest flight made lasted half an hour. Another helicopter that achieved some success was built by an Austrian, Asboth; it was lifted by two rotors and controlled by a series of flaps.

In 1930 an Italian, D'Ascanio, built a helicopter fitted with two twin-blade rotors 39 ft. in diameter and powered by a 95 h.p. Fiat engine. The machine set up a helicopter record by flying in a closed circuit of one mile for ten minutes. In 1933 a helicopter called the Florine remained in the air 9 mins. 58 secs. The rotors, 24 ft. in diameter, were mounted one at each end of the fuselage and driven by a 200 h.p. engine.

Following the success of Juan de la Cierva's Autogiro (*q.v.*), development of the helicopter was temporarily suspended. During the

Helicopter. The Westland-Sikorsky S 51 demonstrating its ability to land in a car park, June 11, 1947

Second Great War experiments with true helicopters were revived, particularly in the U.S.A., with a view to building a military machine that would be independent of airfields and able to hover for artillery spotting. The U.S. navy used helicopters for coastguard rescue work and to a limited extent for war. Postal authorities in the U.S.A. use them for mail deliveries between city post offices. The first helicopter mail service in Great Britain was inaugurated on Aug. 12, 1947, when two helicopters flew the King's mail from Dyce airport, near Aberdeen, to Balmoral castle. The world's first helicopter passenger service (Liverpool-Cardiff) was opened 1950.

Heligoland OR HELGOLAND. Island in the North Sea. Formerly included in the Prussian prov. of Schleswig-Holstein, it is about 44 m. N.W. of the mouths of the Weser

and Elbe. Rocky and with an elevation of about 190 ft, it has an area of $\frac{1}{2}$ sq. m.; its circumference is about 3 m., having been steadily reduced by erosion from 120 m. in 800 and 45 m. in 1300. Limestone and sandstone cliffs rise sheer from the ocean on all sides except the S.E., where there is a flat bank of sand called the Unterland. It was much visited for its sea-bathing facilities, and supported a pop. of Frisian fisher-folk and pilots.

Great Britain took Heligoland, which means holy land, from Holstein in 1807. In 1890 she ceded Heligoland to Germany in exchange for recognition of rights in Zanzibar. Germany converted the island into a strategic strong point of her coastal defence system. Artificial cliffs were constructed to prevent further erosion and the area of the island increased by deposits of material obtained from dredging the Elbe. A naval harbour was built, Zeppelin sheds erected, and batteries of heavy coastal artillery installed.

With Sylt and Borkum, Heligoland formed an almost impregnable defence line across Heligoland Bight and provided cover for the ports of Emden, Wilhelmshaven, Cuxhaven, and Hamburg and the Kiel Canal. By the treaty of Versailles, Germany was compelled to demilitarise Heligoland, which again became a pleasure resort. It had always been noted for migrating birds, and in 1926 a marine ornithological station was built in the lower town and a bird-watching station established above the upper town. When

Heligoland. Drawing showing how Germany had converted the island into an elaborate fortress. There were over 8 miles of tunnels, used as storage depots, hospitals, etc. During the raids preceding Germany's surrender, both upper and lower towns were obliterated by R.A.F. bombs. All fortifications and armaments were totally demolished April, 1947

Drawing by E. G. Lambert, courtesy of "The Sphere"

Hitler assumed power, these ornithological activities were used as a screen for the rearmament of the island.

By 1939 it had been completely refortified and from the outbreak of war was used as a base for sea and air minelayers, and for air attacks on Great Britain and her shipping. During the Second Great War, some 14 m. of concrete-lined tunnels were built for storage, massive concrete U-boat pens were erected, batteries of 12-in. and 18-in. guns installed, an underground hospital built, and a radar station set up. Although an aerodrome was laid out, the prevailing winds limited the island's usefulness as an air-base, and it had to depend for defence upon the fighter stations on Borkum and Sylt.

The German fleet in Heligoland Bight was bombed by the R.A.F. on Sept. 29, 1939; and on Dec. 3 direct hits were made on warships off Heligoland. After numerous attacks in this area on German warships and submarines, in 1944 the civil population was removed by the German authorities. Heligoland was attacked by nearly 1,000 bombers on April 18, 1945, a second heavy assault being carried out on the 19th. British troops landed on May 14, when the garrison surrendered. The town of Heligoland had been completely destroyed and an area of the Oberland a mile long and half a mile wide had been flattened. The U-boat pens and gun emplacements of re-inforced concrete had suffered only slight damage.

On April 18, 1947, fortifications, tunnels, U-boat pens, and gun emplacements were destroyed in a single explosion by the Royal Navy, over 6,700 tons of explosives being used. It was the largest explosion since the atomic bomb detonated at Bikini, and was registered on over 100 seismographs in different parts of Europe. Apart from destroying the fortress, this explosion served as a useful artificial earthquake for scientific investigation. At Kew Observatory, records from the instruments showed distinct movements which allowed of the exact calculation of the travel times of waves set up in the earth's crust. The first wave arrived at Kew after 1 min. 23 secs. while Paris reported the first wave as arriving 1 min. 40 secs. after the explosion.

Heligoland, BATTLE OF. Naval engagement of the First Great War, between ships of the British and German fleets, in the Heligo-

land Bight, Aug. 28, 1914. Commodore Tyrwhitt, in command of the British light cruisers *Arethusa* and *Fearless* and 33 destroyers, and Commodore R. Keyes, commanding eight British submarines,

sunk by her crew to avoid capture. Further German light cruisers, making six in all, made an effort to cut off the British and closed in; and for an hour or so Tyrwhitt and Keyes were hard pressed.

The ships of the first light cruiser squadron, under Commodore Goodenough, now entered the fight; and shortly afterwards five British battle cruisers of Sir David Beatty's squadron—*Lion*, *Queen Mary*, *Princess Royal*, *Invincible*, and *New Zealand*—also intervened, sinking the German light cruisers *Mainz*, *Köln*, and *Ariadne*. Each of the last two was sunk by two salvoes from *Lion*. All but one of the crew of *Köln* perished. The total German losses were three light cruisers and one destroyer, with 712 killed, 149 wounded, 379 captured. The British casualties were 31 killed, 52 wounded, with *Arethusa* much damaged but soon repaired. The German official history, while criticising British dispositions, admitted that this reverse produced a bad moral effect in the German navy. *Consult* Naval Operations, Sir J. Corbett, vol. 1, 1920.

Heliodorus. Greek writer of romance. Born at Emesa in Syria, he was the author of *Aethiopica*, a long love story in ten books, the beginning and the end of which are laid in Ethiopia. Dealing with the adventures of Theagenes and Chariclea, in plot and characterisation it is the best of its kind and commendably free from indecencies. Erroneously attributed to Heliodorus, bishop of Trioca in Thessaly (c. 490), it is probably the work of a sophist who lived at the end of the 3rd century A.D.

Heliogabalus. An alternative spelling of the name of Elagabalus (q.v.), Roman emperor.

Heliograph (Gr. *helios*, sun; *grapho*, I write). Instrument consisting of a mirror capable of revolution, and so of reflecting the rays of the sun or of some artificial source of light over considerable distances. It is used principally for military signalling, especially in mountainous districts, and its messages are conveyed by long and short flashes in the Morse code.

Heliograph signalling has been carried out at a distance of 70 m.;

it is practically secret and extremely rapid in operation. A heliograph cannot be read by anyone more than a few yards off the exact alignment. *See* Signalling.

Heliometer. Telescope used for accurately measuring small angular distances, e.g. the separation of the components of a double star, or the angular diameter of the sun. The lens of the telescope is split

Heliograph. Cavalry type with 8-inch mirrors
Courtesy of J. H. Steward

Heliometer at the Radcliffe Observatory, Oxford, for making accurate astronomical measurements
By courtesy of the Clarendon Press

along a diameter, and the two halves are movable along this diameter by means of a micrometer screw. Two images of any celestial object are thus produced with a separation which can be adjusted for making the measurement. Heliometers were used for the early measurements of stellar distances, but since the introduction of photography they are used less

Heliopolis (Gr. City of the Sun). Town of ancient Egypt, the chief seat of religious learning, formerly containing a famous university for the education of the priests. The On of the Bible (Gen. 41, v. 45), it was known to the Egyptians as Annu. Portions of the great temple of the sun still remain, as well as one of the obelisks of red granite, 66 ft. in height. Cleopatra's needle formerly stood

Heliopolis, Egypt. Mosque in the New Town. Top right, granite obelisk erected c. 2433 B.C.

here, with its fellow, now in New York. Heliopolis stands just N. of Cairo.

Helios. In Greek mythology, god of the sun, identified in later times with Apollo, and sometimes called Hyperion. He crossed the sky day by day from east to west in a chariot drawn by four horses. See Apollo.

Helio-stat (Gr. *hēlios*, sun; *statos*, fixed). Mirror mounted on an axis parallel to the axis of the earth and moved by clockwork so that it rotates with the same angular velocity as the sun, the image of which it reflects. In short, it follows the sun, and in consequence the rays of the sun when reflected from it pass always in a fixed direction. Foucault's helio-stat reflects the sun's rays horizontally. Heliostats are used in spectroscopy (q.v.).

Heliotrope (*Heliotropium peruvianum*). Perennial plant with shrubby stem, of the family Boraginaceae. It is a native of Peru.

It has broad lance-shaped wrinkled and hairy leaves, and clusters of fragrant lilac or dark-blue salver-shaped flowers.

Heliotrope (Gr. *hēlios*, sun; *tropos*, turn). Instrument for making long distance geodetic surveys by means of reflected sunlight. It consists of a mirror provided with a clockwork motion which enables it to follow the sun's apparent motion; so that at a particular hour of the day, arranged beforehand, the light of the sun is reflected from the mirror directly to the distant point where the surveyor is taking his sights. By graduated scales on the sighting base it is possible to fix from the reflection heights and distances. The heliotrope was developed from the heliograph (q.v.).

Heliotropin OR **PIPERONAL** ($C_9H_8O_3$). White crystalline substance, with the odour of heliotrope, used as a perfume for soaps and toilet preparations. It is made by oxidising oil of sassafras. Chemically it is the methylene ether of pyrocatechic aldehyde. The crystals dissolve in spirit, and it is this solution which is employed as a perfume. Heliotropin is also used in medicine.

Heliotropism (Gr. *hēlios*, sun; *trepein*, to turn). The bending of part of a plant in relation to the light incident upon it. Most shoots are positively heliotropic (bend towards light). This may be easily seen in the plants on the edge of a thick wood, under a hedgerow, or the pot-plants grown in a window. Few roots are sensitive to light. The effect of unequal illumination around a shoot is to reduce the auxin concentration in the part most brilliantly illuminated and so to depress the rate of growth of that side, with the result that the shoot makes a growth curvature towards the light.

Helium. Colourless gas with a characteristic spectrum. Known to exist in the sun long before deposits were found on the earth, it was first discovered in 1868 when Janssen detected a new line in the spectrum of the sun's chromosphere during an eclipse, and Frankland and Lockyer concluded it must belong to a new element. The spectrum of helium is characterised by five lines, one each in the red, yellow, blue-green, blue, and violet. The particularly brilliant yellow line

was the one by which its presence in the sun's chromosphere and in many fixed stars was detected. Its atomic number is 2; atomic weight, 4.003.

Helium was not known to occur in terrestrial matter until in 1895 Ramsay, searching for argon in certain minerals, obtained the helium spectrum. It was also found in other minerals, chiefly those which contain uranium, such as bröggerite, fergusonite, and monazite. Helium was afterwards detected in the atmosphere in which it exists to the extent of five parts in a million. It is contained in a certain number of natural gas supplies, also in many mineral springs.

The density of helium is 1.98, and next to hydrogen it is the lightest gas known. Attempts to produce chemical combinations have failed, and it is therefore classed as inert. Helium long resisted all attempts at liquefaction, but in 1908 Onnes of Amsterdam, working on methods devised by Dewar, succeeded. The boiling point of this liquid is just above absolute zero, about -269°C . By boiling liquid helium under reduced pressure, the lowest temperature ever attained was reached—about 2.5° on the absolute scale. Onnes's investigations show that electrical resistance nearly disappears at that temperature. The alpha particle emitted by many radio-active elements is a helium nucleus; i.e. an atom of helium minus its two external electrons.

Largest Deposits in U.S.A.

Although small deposits of the gas have been found in Canada and Brazil, only in the U.S.A. are helium-containing earth gases found in sufficient quantities to be of practical value. The richest helium-containing earth gases are in Kansas, with smaller deposits in Texas and Oklahoma. Helium is produced on a large scale according to the Linde system. The earth gas, led by pipe to the refinery, is brought to a low temperature and into a liquid state by compression followed by relaxation and counter-current cooling, this leading to the eventual separation of a gas containing 93–95 p.c. helium. Further low temperature processing frees the helium from the remaining carburetted hydrogen gas.

Helium was first used for filling low temperature gas thermometers and electric light bulbs. During the First Great War it was discovered that a mixture of 15 p.c. hydrogen and 85 p.c. helium constituted a non-inflammable gas of

Heliotrope. Flower clusters of the sweet-scented herb

exceptional buoyancy, and it became the ideal inflator for balloons and airships. As a result, the U.S. government took over control of all helium production, reserving to itself the gas as a munition of war. Not until 1937, when the development of heavier-than-air machines appeared to render airships obsolete as offensive weapons, did congress pass legislation permitting the sale of surplus helium to any U.S. industry requiring it. Export abroad remained prohibited.

Following the destruction by fire of the Zeppelin Hindenburg (*q.v.*) at Lakehurst, N.J., in 1937, the German government requested permission to purchase helium for inflating airships. This was refused on the grounds that the gas might be used for military experiment. Efforts were then made to find alternate sources of supply. In 1938 traces were found in São Paulo, Brazil, but despite the expenditure of German capital and the assistance of German scientists, the deposits did not justify their being worked. Other deposits occur in Alberta and Ontario, the gas being extracted by a refrigeration process developed from Claudet's liquid oxygen producing apparatus.

Helium is essential in the welding of light metals derived from magnesium. By projecting a nozzle spray of helium when welding steel, the oxygen is absorbed and oxidation prevented. Helium mixed with the oxygen breathed by divers while working under water dissolves the minute bubbles liberated in the blood stream which cause "bends." Until helium-oxygen mixtures were used, divers could not operate at a greater depth than 300 ft., but they can now go to 600 ft. A mixture of helium and oxygen is used in the treatment of asthma, and the gas has been invaluable in relieving pneumonia, and in aiding infants whose lungs fail to expand normally at birth. Helium gives the yellow colour to neon signs. *See* Radium.

Helix (Gr., spiral). Genus of land gastropodous molluscs. The common snail (*H. aspersa*) is a familiar example. All snails of this genus have conical, globular, or depressed shells. The genus includes over 4,000 species, distributed all over the world. *See* Snail.

Hell. In modern English, place or condition of punishment for impenitent sinners after death or after the final judgement. In the Authorised Version of the Bible it

had the wider meaning of the place of the departed. The R.V. has distinguished between Hell and Hades. It should be noticed that the clause in the Apostles' Creed, "He descended into Hell," should be "He descended into Hades" or the realm of departed spirits.

The idea of a place of punishment for the wicked after death is an obvious corollary of the belief in a future reward for the righteous, and is found in most religions which have developed beyond the primitive stage. In some, however, the belief in retribution takes the form of the idea that the wicked are reborn in a lower grade of life. The word Hell in the Bible is equivalent to Gehenna, which is itself derived from Hinnom, the name of a valley near Jerusalem associated with heathen rites. It became a place where refuse was deposited and constant fires were kept burning. Hence the name was adopted for the place of torment for the wicked. The idea of retribution for the individual after death is not prominent in the O.T. The Apocalyptic writings, of which Daniel is an example, were the first to lay great stress on a final judgement and retribution.

At the time when Jesus began to teach, the belief was widespread. There can be no doubt that Jesus and the N.T. in general teach that impenitent sinners are punished in the future life. Considerable controversy, however, has taken place on the question whether this punishment is eternal. Many theologians, feeling that such a doctrine would contradict the thought of God as a loving Father, maintain that Jesus meant not an eternal punishment but an "age long" punishment. Others interpret literally S. Paul's words, like Drummond in *Natural Law in The Spiritual World*, "the wages of sin is death," and have argued that the fate of sinners who are finally impenitent is annihilation.

The Roman Catholic Church still holds to the doctrine of Hell developed by the medieval church which was greatly influenced by Augustine. According to this even unbaptized infants and virtuous pagans are in Hell. The severity of this view is, however, greatly mitigated by the belief that there are different regions in Hell, that of "Limbo," which is assigned to unbaptized infants, not being a place of

torment. Among other Christians the doctrine of Hell has fallen into the background.

This is largely due to a change in our conception of the purpose of punishment. The older view, that retribution is an end in itself, is giving way to the view that the object of punishment should be reform and prevention. For this reason it would be true to say that among many modern Christians the idea of Hell is being transformed into that of a state of further probation and purification, *i.e.* Purgatory. Whatever modifications the idea of Hell may undergo in the light of modern thought, the belief in a future punishment of the wicked corresponds to a demand of the conscience and emphasises the vital importance of the struggle against evil. It cannot therefore be safely eliminated from the Christian faith. *See* Gehenna; Purgatory; Sin; Theology.

W. B. Matthews, K.C.V.O., D.D.

Hellanicus (c. 480-405 B.C.). Greek logographer. Like his predecessor Hecataeus (*q.v.*) a great traveller, he was the author of works on genealogy and chronology, and on the history of various countries, including a brief sketch of political events. The most important were *Attis*, a history of Attica down to the Peloponnesian war, and lists of the priestesses of Hera at Argos and of the victors in the games at the Spartan festival Carnea, both valuable for chronology.

Hellas. Originally a small district of Thessaly inhabited by Hellenes, the supposed descendants of the legendary king Hellen, son of Deucalion. The name afterwards came to be applied by the Greeks to all places inhabited by those of their race. Hellas thus included not only Greece proper, but the Greek cities of Asia Minor and Sicily, and even distant colonies such as Massilia (Marseilles), and those on the Pontus Euxinus. *See* Greece.

Hellebore (*Helleborus*). Genus of perennial herbs, members of the family Ranunculaceae. They are natives of Europe and N. and W.

Asia. They have large leaves deeply cut into lobes which are arranged finger-fashion. The showy parts of the flowers are the sepals, which are coloured, whilst the petals are converted into small nectar-tubes. Owing to their stimulating,

Hellebore. Flowers and leaves of *H. foetidus*

cathartic, and narcotic properties they were formerly used in medicine. *H. niger* is the so-called Christmas rose; *H. foetidus*, stinking hellebore or setterwort; and *H. viridis*, the bear's-foot.

Helle Fjord. Inlet of the Atlantic Ocean, on the coast of Norway, between Bergen and Trondhjem. On the night of Jan. 6-7, 1942, light British naval forces entered Helle Fjord, sinking a German supply vessel and two trawlers which were alongside a German canning factory, the latter also being damaged.

Hellenic Studies, SOCIETY FOR THE PROMOTION OF. Founded in 1879 by a number of scholars interested in the subject. Its object is to promote the study of everything connected with the language, literature, and art of ancient and modern Greece, particularly the results of modern research and excavations. The Journal of Hellenic Studies, issued by the society, contains an account of the researches and matters concerning Greek life. Its offices are at 50, Bedford Square, London, W.C.1.

Hellenism. Term applied to the school of culture which sought models of artistic expression in the art of ancient Greece. Its chief characteristics in the best period, both in art proper and in literature, were restraint and a sense of proportion and harmony. See Classical Education; Greek Art; Greek Language and Literature.

Hellenist (Gr. *hellenistes*). Term meaning literally one who speaks or writes pure Greek, then one who affects the use of Greek manners, modes of thought, or language. It was specially applied to those Jews who adopted Greek as their language, and afterwards to any non-Greek who did the same.

Heller (originally Haller). Once widely circulated Continental coin which took its name from Hall, in Swabia, where it was minted with locally mined silver in the 13th century. Reduced later to the value of about a halfpenny, it became a copper coin in Germany, Austria, Hungary, and Switzerland in the 19th century. It was given up in Germany, 1873; Switzerland, 1850; Austria, 1924. Renewed in Hungary as $\frac{1}{100}$ of a pengo, and in Czecho-Slovakia from 1921 as $\frac{1}{100}$ of a crown, it was the smallest coin in both countries until after the Second Great War.

Heller, STEPHEN (1814-88). A Hungarian pianist and composer. Born at Pest, May 15, 1814, he studied with Halm in Vienna, and

early made his début as a pianist. He lived in Paris from 1838, where he became known as teacher and composer. His first publication was a set of variations in 1829, and his last three *feuillets d'album*, about 1884. He wrote piano studies, preludes, a popular tarantella, and *pensées fugitives* for piano and violin. He visited England in 1850 and 1862, and died in Paris, on Jan. 14, 1883.

Stephen Heller,
Hungarian pianist

Helles, CAPE, OR HELLES BURN. A promontory at the south extremity of the peninsula of Gallipoli, Turkey, near the entrance to the Dardanelles. The beaches adjacent were utilised as landing places for troops at the beginning of the Gallipoli campaign in 1915. There is a lighthouse on the point. A memorial has been erected to 20,752 missing troops of the First Great War. See Gallipoli, Campaign in.

Hellespont (mod. Dardanelles). In ancient geography, strait separating the Thracian Chersonese from Asia. It was supposed to have derived its Greek name Hellespontos (sea of Hellē) from Hellē, daughter of Athamas, who in her flight from her stepmother, Ino, on the ram with the golden fleece, fell into the sea and was drowned. Its width varies from 6 m. to less than 1 m., its narrowest part being between Sestos and Abydos (*q.v.*). Hellespontos was also the name of a province, consisting of N. Mysia, in the reign of Diocletian. See Dardanelles; Leander.

Helleu, PAUL CÉSAR (1859-1927). French painter and etcher. Born at Vannes, Dec. 17, 1859, and taught by Gérôme, he began by painting old churches and landscapes. A Study of Versailles is in the Luxembourg. Later he turned to portraits in dry-point of fashionable women: the duchess of Marlborough, the countess of Warwick, and the duchess de Noailles. Delicate and graceful, these tinted etchings aroused much attention at the International Society's exhibitions and elsewhere. Helleu died in Paris, March 24, 1927.

Hellevoetsluis. Seaport and fortress of the Netherlands. It lies in the prov. of S. Holland, on the S. coast of the island of Voorne, on the Haringvliet, an arm of the Ems estuary, about 18 m. S.W. of Rotterdam, with which it is con-

nected by steam tramway, and also by the Voorne canal. It is an important base of the Dutch navy, with extensive docks, arsenals, engineering shops, etc., but the town has little other interest. Here William III embarked for England in 1688. Pop. 2,000.

Hell-Fire Club. Name given to a society of profligates founded by Sir Francis Dashwood (1708-81) and including Lord Sandwich, Lord Orford, and John Wilkes. They indulged in riotous orgies at the old Cistercian abbey of Medmenham, Bucks. The club was dissolved in 1763 after Wilkes had endangered Orford's sanity by releasing, during a prayer to the devil, a baboon dressed as Satan.

Hell Fire Corner. Landmark one mile from Ypres, Belgium, on the road to Menin. It was so named because British troops in the First Great War, going up from Ypres to the advanced trenches, were continually shelled by the Germans at this point.

The same name was applied to Dover from 1940 on account of the Germans' cross-Channel shelling of that port.

Hell Fire Pass. Name given by men of the British 8th army to Halfaya (*q.v.*).

Hell Gate. Narrow channel in the East River, New York, which has menaced vessels sailing S. from Long Island Sound to New York harbour because of its rocks and the difference in the river's two tides running turbulently at this point. Operations to remove the rocks began with unsuccessful surface blasting in 1851 and proceeded with steam drilling, blasting, and dredging, until the removal of Flood Rock in 1885 doubled the channel's navigable capacity, making it 200 ft. wide at its narrowest and giving Hell Gate a depth of 26 ft. In the days of sailing vessels, one out of every 50 that ventured through Hell Gate was seriously damaged.

Over Hell Gate are two bridges: a unit of the Triborough bridge which connects Manhattan, Bronx, and Queens, constructed 1935, and the New York connecting railroad bridge, 1917, which allows the only continuous direct rly. route from New England to the S. and W. The name is derived from Dutch *Hellegat* (beautiful pass), once applied to the whole river. Hell Gate pilots' association keeps watch for foreign vessels from its station at Belden Point on City Island, and when one is sighted coming down the Sound, a pilot goes aboard and guides her through.

Hellin. Town of Spain, in the prov. of Albacete. It stands near the river Mundo, on the Murcia-Albacete rly., 34 m. S.S.E. of Albacete. It has ruins of a Roman fort, and a church noted for its fine vaulting and marble pavement. It manufactures woollen and leather goods, pottery, etc., and trades in wine, oil, and saffron. At Minas del Mundo, 12 m. S., are famous sulphur mines (now state property), once worked by the Romans, and in the vicinity, at Azaraque, are mineral springs. Pop. 20,329.

Helluland. Name given by the Norse voyagers of the 11th century to a district in N. America visited by them. It means the land of flat stones. Various opinions have been expressed by scholars as to its exact whereabouts, but it was probably Newfoundland.

Helm (Ger. handle). Apparatus by which a ship is steered, and which in the 13th century replaced the single oar hitherto used. Although the term helm refers to the actual rudder alone, it is frequently used for the rudder, wheel, or tiller. On large vessels, such as liners or warships, the helm is power-operated from the wheelhouse. (See Ship.)

The term is used in heraldry for a helmet (*q.v.*).

Helmand. River of Afghanistan. It rises in the Hindu Kush, some 140 m. W. of Kabul. After a course of about 700 m., it falls, by several mouths, into Lake Helmet, in S.W. Afghanistan.

Helmet. Defence for the head in fighting. The helmet of the Greeks was usually open in front; some examples show a fixed plate pierced for eyes and nose which by tilting the whole helmet forward could be brought into position, but this was at best a cumbersome contrivance. The Greeks favoured a high crest of horsehair, but the Romans, while adopting the general lines of the Greek head-piece, were content with a much smaller crest, frequently a mere button or knob. Assyrian, Egyptian, and Etruscan helmets were planned on the same general principles though differing in design, and, like the Greek, were frequently ornamented with rich decoration.

After the fall of the Roman Empire, the helmets of Central Europe were cruder in manufacture, frequently mere caps of toughened leather, or of plates of bronze or iron riveted to a ring. The pointed helmet of the Normans was of this nature, but it was

generally provided with a strong nasal or nose guard, of large proportions, attached to the base of the ring. From this time the design of the helmet progressed; sometimes it was a small, close cap of steel, and sometimes a broad-brimmed defence. The great helm of the 13th century was of barrel form, with a flat top which was impractical as providing no glancing surface to the opposing weapon. At the end of the century we find the more practical sugar loaf helmet.

The 14th century helmet had a rounded top with a projecting face plate and a narrow vision slit. In jousting helmets this slit was so placed that the wearer could see out of it only when bent forward with lance in rest ready for his course. The popular type was known as the bascinet, a light pointed helmet, sometimes with a visor pivoted to the sides, and generally attached to the camil or coif of mail by staples and laces. In the 15th century we find the salade commonly in use; this was similar in design to the modern sou'-wester, with fixed or pivoted visor, and adjustable beaver, or chin piece. From this latter was evolved the armet or close helmet, which completely encased the

head, and had movable pieces to cover eyes and mouth. From this was evolved the simpler burgonet.

When full armour was discarded, light open helmets came into favour. Those of the 15th and 16th centuries were bolted to the cuirass back and front, presenting a smooth surface to any weapon.

With the introduction of gunpowder and the increased penetrating power of firearms, helmets fell into disuse. They were not worn by infantry in action after the Civil War in England. They were, however, retained by cavalry, who were more likely to be engaged in sword fighting. In the 18th century a type based somewhat on the ancient Greek form was adopted for heavy cavalry by most European armies, and this later gave place to the plain helmet worn by dragoons. The spiked helmet introduced into the Prussian army in 1860 was eventually adopted by the British as full dress headgear for line infantry regiments; and in a modified form by the British police. A variation of the crested cuirassier helmet worn by British fire brigades early in the 19th century was replaced by the military shrapnel helmet during the Second Great War.

The British shrapnel helmet introduced into the army in 1916 to reduce the number of casualties from head wounds was based on a 15th century model. It was copied by the U.S. army. The French casque or shrapnel helmet was a compromise between the morion and cabasset, while the German version was practically a direct copy of the salade, but without visor or chin piece. Shrapnel helmets underwent little change during the Second Great War, except that the American approximated more to the salade type, and some British and Canadian units were provided with a narrow-brimmed close-fitting cap-type helmet.

In heraldry, the helmet is generally called a helm, sometimes spelt heaume and the

Helmet. 1. Ancient Greek helmet. 2. Roman gladiator's helmet. 3. Norman helmet, 11th cent. 4. Heaume and crest of the Black Prince, 14th cent. 5. Visored bascinet, and camail, French, c. 1400. 6. Salade, German, second half of 15th cent. 7. Tilting heaume, German, c. 1485. 8. Comb morion, English, 16th cent. 9. Helmet of trooper of Life Guards, 1815. 10. British helmet of the two Great Wars

first type represented was cylindrical, with square or flat top; then came the round. In early art

Helmet. The heraldic helmet

the helmet was always represented disproportionately large as compared with the shield, and was placed indifferently full face or in profile. Gradually rules were introduced, the open visored helmet being reserved for princes and nobles and the closed for lesser folk. Modern practice enjoins that the sovereign and princes of the blood should have a helm of gold, with seven-barred visor (grilles), placed full face, or affrontée.

A peer has a silver helmet, with five golden bars, in profile to dexter; baronets and knights a steel helmet, represented in painting by light blue or grey, full faced, with open visor; esquires and gentlemen of coat armour, a steel helmet in profile, with closed visor. No woman, except a sovereign, is entitled to the helmet. *See* Armour; Casque; Celt, col. plate; Crest; Heraldry; Mantling.

Helmet Shell. Popular name for the shells of the genus *Cassia*, which includes numerous marine gastropodous molluscs found in the tropical seas. The shells are massive and ventricose, with a narrow aperture. There are about 50 species, many of which attain a large size and are handsomely coloured. From these shells the best shell cameos are cut.

Helmet Shell. Specimen of *Cassia* Madagascarensis

Helmholtz, HERMAN LUDWIG FERDINAND VON (1821-94). German physicist. Born at Potsdam, Aug. 31, 1821, Helmholtz was a descendant of the Quaker William Penn. He made a study of medicine, and during 1843-47 served as a surgeon in the Prussian army. He held the chair of physiology at Königsberg, Bonn, and Heidelberg universities, 1849-71, and then finally became professor of physics at Berlin. His most important post was that of director

of the physico-technical institution of Charlottenburg, to which he was appointed in 1887. At Charlottenburg he died, Sept. 8, 1894.

Helmholtz was responsible for many advances in the study of the eye and the nervous system. The invention of the ophthalmoscope is due to him, one of the most remarkable of all instruments used by the oculist. In 1856-66 was published his work *Physiological Optics*, one of the greatest advances in the theory of vision, etc., of the 19th century. His work on hearing, entitled *Sensations of Tone*, published in 1863, holds a corresponding position in acoustics. The great physicist was one of the founders with Lord Kelvin of the theory of the conservation of energy; to him is due the theory of colour depending on the three fundamental sensations of red, green, and blue or violet; the study of the electromagnetic theory of light; of vortex motion; and the problems of electro-dynamics. Also a philosopher of the empirical school, he must rank with Kelvin as the foremost physicist of his time. *Consult* Lives, J. G. McKendrick, 1899; L. Königsberger, Eng. trans. 1906.

Helminthology. The study of worms and agricultural parasites. *See* Worm.

Helmond. Town of the Netherlands. It stands on the Aa, in the province of N. Brabant, 28 m. S.E. of 'sHertogenbosch. The chief building is the castle, finished about 1400. There is also a fine church dedicated to S. Lambert, and a town hall. The town is served by railway, canal, and tramway, and its industries are chiefly connected with the making of cotton and silk goods. There are also engineering plant and works for making soap, tobacco, and beer. It suffered little damage in the Second Great War, being liberated from the Germans by British troops Sept. 19, 1944. Pop. 32,311.

Helmont, JEAN BAPTISTE VAN (1577-1644). Belgian alchemist. Born at Brussels and educated at Louvain, his outstanding discovery was carbonic acid gas, which he named *gas sylvestre*. This was rediscovered by Black in the 18th century, and called fixed air. Helmont died at Vilvorde, Dec. 30, 1644. *See* Alchemy.

Helmsley. Town of the N. Riding of Yorkshire, England. An old stone-built town on the river Rye, 20 m. N. of York, it is referred to in some ancient

records as Helmsley Blackamoor. Castle ruins, dating from the Norman and E.E. periods, are within the grounds of Duncombe Park; in the 16th century this was the property of the dukes of Buckingham. Near by is Rievaulx Abbey. The town trades in linen and in sheep. There are an old stone cross and a church of the Transitional period, much restored. Helmsley has a railway station. Pop. 1,238.

Helmstedt. Town of Lower Saxony, Germany. It lies 29 m. W.N.W. of Magdeburg. It was once famous for its university, founded in 1576 and suppressed in 1810, and as a spa. The old building of the university is constructed in the Renaissance style, dating from 1592, and has a tower 164 ft. high. The abbey of S. Ludgerus, founded in the 9th century, and now put to secular use, recalls the fact that the first Saxons were baptized here by the saint. The abbey church, originally built in the 11th century, and a chapel of Carolingian origin, show traces of the old construction. S. Stephen's church (13th century) contains fine tombs and carved work. There are several good examples of 16th century domestic architecture. Helmstedt, once a member of the Hanseatic League, has manufactures of agricultural machinery, earthenware, soap, tobacco, etc. Pop. 17,166.

Helm Wind. Name given to a strong cold N.E. wind which occasionally blows down the W. slopes of the Cross Fell range, Cumberland. It is most common in late winter and spring. The features of the wind are the formation of a heavy bank of cloud, known as the helm, along or just above the range, and a stationary roll of whirling cloud, the helm bar, parallel to the former and 1-2 m. from the foot of the Cross Fell. The cold wind blowing down the mountain becomes markedly gusty and ceases abruptly just short of the bar. In dry weather the sky between the helm and the bar is usually clear, although the remainder may be quite cloudy. The name has been applied to similar phenomena observed elsewhere. *See* Wind.

Heloderm (Gr. *hēlos*, nail; *derma*, skin). Venomous lizard, the only one known to science. There are two species, found in Central America, Mexico, and Arizona. *See* Gila Monster.

Héloïse (c. 1101-64). French abbess, famous for her early relations with her tutor Abélard (q.v.).

Helots (Gr. *heilōtes*). Lowest section of the community in ancient Sparta. The descendants of a pre-Dorian population, their position was analogous to that of the medieval villein in England and of the Russian serf before his emancipation, though they belonged to the state, and not to any individuals, and could not be removed from the land. The ruling class of Spartans employed them to cultivate their farms, and helots had to hand over a fixed quantity of the produce of the farm each year, being allowed to keep any surplus. Their lot was hard, and they were often treated with great cruelty, though by good service and conduct it was possible for them to obtain freedom.

In war they served as light-armed infantry, and sometimes as oarsmen. The helots, as a class, cherished a most bitter hatred of their Spartan rulers, and in 464 B.C. there was an actual revolt, which was suppressed with great difficulty. A special band of young Spartans, the *Crypteia* or secret police, was charged with the duty of watching the helot population, and any individual who seemed likely to cause trouble was put out of the way.

Helpmakaar. Village of Natal, S. Africa. It is 25 m. by motor road S.S.E. of Dundee, and about 10 m. to the N.E. is Rorke's Drift on the Buffalo river, noted for the heroic defence put up by a small party of British against Zulu hordes in 1879, after the defeat at Isandhlwana.

Helpmann, ROBERT MURRAY (b. 1911). An Australian dancer, choreographer, and actor. Born

Robert Helpmann,
Australian dancer

April 9, 1911, at Mount Gambier, he was educated at Adelaide, and first appeared on the stage of its Theatre Royal in 1923 as solo dancer. He made his London debut at Sadler's Wells in 1931 as Satan in the ballet *Job*, and during 1932-39 was premier danseur of the company there. As choreographer he was responsible for *Comus*, *Hamlet*, *The Birds*, and *Miracle in the Gorbals*. He acted as Oberon at the Old Vic in 1937; as *Hamlet* in 1944; and as *Flamino* in *The White Devil*, 1947. A study by G. Anthony was published in 1947. See *Ballet*.

Helps, SIR ARTHUR (1813-75). A British essayist and historian. Born at Streatham, July 10, 1813, and educated at Eton and Trinity College, Cambridge, in 1860 he became clerk to the privy council, a post which he held until his death, March 7, 1875. In this capacity he came much into

Sir Arthur Helps,
British essayist
After Williams

contact with Queen Victoria, and at her request edited *Prince Albert's Speeches and Addresses*, and *Leaves from a Journal of Our Life in the Highlands*. He was made K.C.B. in 1872.

Among his original works are *Thoughts in the Cloister and the Crowd*, 1835; *Friends in Council*, 1847-59; *The Spanish Conquest in America, 1855-61*; biographies of Columbus, Cortes, and Pizarro; the tragedies *Catherine Douglas* and *Henry II*, both 1843; and a novel, *Realmah*, 1868. Helps was an earnest writer, whose style won the praise of Ruskin.

Helsingborg or HÄLSINGBORG. City and seaport of Sweden, in the län or govt. of Malmö. It stands at the narrowest part of the Sound, opposite Elsinore (2½ m.) in Denmark, 33 m. N. of Malmö. It has remains of a castle and a fort, mentioned in the 12th century; also mineral springs and sea baths. The artificial harbour is being extended. The exports are timber, iron ore, and cattle; the imports coal, fertilisers, wheat, tobacco, and sugar.

A thriving manufacturing town, Helsingborg has copper and rubber works, sugar refineries, breweries, etc. Long occupied by Denmark, it was often besieged, becoming Swedish in 1710, when Stenbock here defeated the Danes. In the vicinity is the only coal-field in Sweden. Pop. 66,537.

Helsingfors. The capital of Finland is now known as Helsinki (*v.i.*).

Helsingör. Danish name for the port better known to the English as Elsinore, under which name it is described here.

Helsinki. Capital of Finland. It stands on the Gulf of Finland, 250 m. by rly. W. of Leningrad,

Helsinki arms

is the seat of the national diet, and has an observatory, botanical garden, and other institutions. The university, founded at Åbo (Turku) in 1640, was moved to the capital in 1827 when Åbo was burned down. The port consists of three harbours and a roadstead with a good anchorage. Considerable export trade is carried on with Russia, Sweden, and England, in timber, paper, cellulose, and butter; the chief industries are sugar-refining, brewing, machinery and carpet making, distilling, and tobacco dressing. The city has many new buildings of individual architecture.

Helsinki is protected by the island defences. The coast rly. goes W. to Hango and Åbo, and a second line runs N. to connect with the line from Vasa round the region of the lakes to Viborg and Leningrad. Founded by Gustavus I about 5 m. to the N.E. in 1550, the town was removed by Queen Christina in 1642; taken by the Russians in 1808, it later became the capital of the grand duchy, and of the republic.

In the Russo-Finnish War of 1939, Helsinki was heavily bombed by Russian aircraft on Nov. 30

Helsinki. Plan of the Finnish capital, showing its principal public buildings

Helsinki, Finland. 1. South harbour, which runs right into the heart of the city; the domed building is the church of S. Nicholas. 2. Diet House, completed in 1881, built of Finnish granite. 3. The railway station, also of granite

and during Dec. Finland joined Germany in her attack on Russia, June 22, 1941, and Helsinki was bombed repeatedly by the Russians until the armistice, Sept. 19, 1944. Pop. 327,627. See Finland.

Helst, BARTHOLOMAEUS VAN DER (c. 1613-70). Dutch painter. Born at Haarlem, he studied probably under Frans Hals, whose style he followed. He lived chiefly at Amsterdam, where he helped to found the painters' guild in 1653, and where he died. There are many portraits of burghesses and soldiers and groups by him in the Rijks Museum, and others at The Hague, Rotterdam, etc. His pictures are solidly painted, but a little lifeless in colour.

Helston. Mun. bor. and market town of Cornwall, England. Standing on the Cober, 12 m. W.S.W. of Falmouth, the terminus of a branch rly., it has since 1934 included Porthleven, a fishing village. Helston is an agricultural centre with a large cattle market on Mon., other markets being held on Wed. and Sat. The 18th century church is dedicated to S. Michael, in whose honour there has been held from time immemorial on May 8 a celebration known as the Furry (or Flora) Dance. King John granted Helston its first

charter in 1203 and during the Middle Ages the burghesses obtained the right to hold markets and fairs. Helston was one of the stannary towns, copper and tin being extensively worked. It retains its mayor and corporation. It is a good centre for visiting the Lizard, and close by is Looe Pool. Pop. 5,000. See Flora Day.

Helve. Powerful form of hammer at one time extensively used for the "shingling" of iron blooms. This is an operation by which the spongy mass of iron is consolidated and any liquid slag it contains squeezed out. In its usual form the helve consisted of a horizontal beam having at one end a double "knife edge" forming a fulcrum on which it could oscillate, and at the other a massive head, removable for repair or renewal, a fulcrum stand, an anvil, and a cam wheel.

The latter was, in the old days, usually driven by a water wheel, and in revolving lifted the hammer end of the beam a certain distance and then released it so that the hammer fell on the mass of iron on the anvil. The hammer blow would represent sometimes a weight of 10 tons falling 18 ins., the rate of striking being 60 blows a minute. See Steam Hammer.

Helvella. Genus of fungi of the family Ascomycetes. They are all edible, the best known being the white helvella (*H. crispa*) with ribbed, hollow, and inflated stem, and a thin cap broken into lobes which are folded and wrinkled. In the black helvella (*H. lacunosa*) the head is more inflated, less wrinkled, and entirely black.

Helvellyn. Mountain of the Lake District of England. It is on the borders of Cumberland and Westmorland overlooking Ullswater. Its height is 3,118 ft., being exceeded only by Scafell Pikes. It is best ascended from Patterdale, the way passing along Striding Edge, but there are other ascents. See Lake District and illus. below.

Helvetic Republic. Government set up by the French directory in Switzerland. The republic was proclaimed March 29, 1798, as the "Helvetic republic, one and indivisible," a central government, consisting of a senate and great council, for the Swiss cantons being set up at Lucerne. The constitution of the republic was a great step forward in combining the various districts of Switzerland, but quarrels arose and the constitution was abolished by Napoleon, Feb., 1803.

Helvetii. Ancient people inhabiting the western portion of what is now Switzerland. Their chief town was Aventicum (mod. Avenches). They first come into history as allies of the Cimbri and Teutones when those nations attempted to invade Italy at the end of the 2nd century B.C. In 58 B.C., under pressure from the German tribes, they invaded Gaul, but were driven back by Caesar.

Helvellyn, showing Striding Edge, one of the paths of ascent

Helvétius, CLAUDE ADRIEN (1715–71). A French philosopher. Born in Paris, he was the son of the

Claude A. Helvétius,
French philosopher

queen's physician. As farmer-general of taxes (1738–51), he amassed a large fortune. He spent the rest of his life on his estate near Paris, devoting himself to charitable works

and philosophy. He died Dec. 26, 1771. One of the chief representatives of the French Illuminati (*q.v.*), and intimate with the Encyclopédistes (*q.v.*), Helvétius was a hedonist and utilitarian. His book *De l'Esprit* (On the Mind), 1758, was banned and publicly burnt. All intelligences, he teaches, are born equal, differences being the result of education. Man is a hedonistic creature, whose only object is to secure pleasure and avoid pain; personal interest is the motive of all his actions. Virtue and vice are relative terms; really virtuous actions are such as promote the general welfare. *Pron.* El-vay-si-use.

Hely-Hutchinson, JOHN (1724–94). Irish politician. The son of Francis Hely, a landowner in Cork, he was educated at Trinity College, Dublin, and became a barrister. In 1751 he married an heiress, and took the additional name of Hutchinson. In 1759 he entered the Irish house of commons as M.P. for Lanesborough, and retained a seat there as representative of three successive constituencies until his death, Sept. 4, 1794. The gift that had brought him success as an advocate distinguished him in the political arena, and in 1777 he was made a secretary of state. He was also provost of Trinity College. Although rapacious for office and emoluments, Hely-Hutchinson was liberal enough to advocate relief to Roman Catholics, parliamentary reform, and free trade; a policy he preached in his *Commercial Restraints of Ireland*, 1779. His widow was created Baroness Donoughmore, and the present earl of Donoughmore is his descendant.

Hemans, FELICIA DOROTHEA (1793–1835). English poet. Born at Liverpool, Sept. 25, 1793, she was the daughter of George Browne, a merchant. In 1812 she married Captain Alfred Hemans, but they separated. As a child she had shown precocity, and a

volume of her poems was published when she was 14. Her chief works are *The Siege of Valencia*, 1823, an unacted play; *Lays of Many Lands*, 1825; *The Forest Sanctuary*, 1825; her own favourite *Songs of the Affections*, 1830; *Hymns for Childhood*, 1834. Though without depth, her poems are full of grace and permeated with a love of the

chivalrous. A few like *Casabianca*, *The Better Land*, and *The Homes of England*, have stood the test of time.

Mrs. Hemans died in Dublin, May 16, 1835. A complete edition of her works with a memoir by her sister was issued in 1839.

Hemel Hempstead. Mun. bor., parish, and market town of Herts, England. The old town is on the river Gade, 24 m. N.W. of London, and near the Grand Union Canal, with a rly. station on the branch line from Harpenden. Green Line buses connect with London. In the High Street are fine houses and old inns, with Gadebridge Park on the W. The bor. includes Marlowes and Heath Park, and stretches 1½ m. to Boxmoor, Two Waters, and Apsley End. Settlements in the district date from pre-Roman times.

Above Boxmoor, where a Roman villa has been brought to light, is a growing residential area, on the Feldon estate, with golf links. The ancient church of S. Mary, partly rebuilt in 1846 and restored in 1863, has 14th and 15th century roofing and interesting monuments. The old building known as the

Bury once belonged to a monastery at Ashridge. Industries include paper making, apron, blouse, and brush making, iron founding, brewing, and tanning. The growing of watercress for the London market is an important activity. There is a trade in timber. Mentioned in Domesday, Hemel Hempstead gives its name to a co. div. returning one M.P. It was selected as a site under the New Towns Act, 1946, to provide accommodation for a pop. of 60,000, with complementary industry, under the Greater London plan prepared by Sir P. Abercrombie; building started 1949. Market day, Thurs. Pop. 21,400.

Hemichorda. Term used in zoology for a group of animals, the principal genus of which is *Balanoglossus*. The term was used by W. Bates to indicate those particular forms from which vertebrates are supposed to have been derived. They possess certain characters of vertebrates, e.g. gill slits and a modified form of notochord.

Hemimorphite. Ore mineral of zinc; hydrated zinc silicate ($2\text{ZnO} \cdot \text{SiO}_2 \cdot \text{H}_2\text{O}$), containing, when pure, 54 p.c. zinc. It crystallises in the orthorhombic-hemimorphic system as whitish tabular or prismatic crystals, also massive, granular, fibrous, or encrusting. Hemimorphite occurs in veins or beds in calcareous rocks, generally accompanied by the zinc carbonate, smithsonite, and associated with sulphides of zinc, iron, and lead. Usually a product of the oxidation of primary zinc sulphide (sphalerite) ore, it forms rich deposits in the upper levels of zinc deposits in hot dry climates. Calamine was the name given to this mineral in America. *See* Zinc Ores.

Felicia Hemans
After W. E. West

Hemel Hempstead, Herts. Air view of the town and its surroundings, destined for expansion under the New Towns Act, 1946

Heming OR **HEMMINGE**, JOHN (c. 1556-1630). English actor. Born at Shottery, he became a member of the lord chamberlain's or king's company, and held shares in the Globe and Blackfriars theatres. He seems to have appeared in King Henry IV, part 1, possibly as Falstaff, and in several plays by Jonson, including Every Man in His Humour, Every Man Out of His Humour, Sejanus, Volpone, and The Alchemist. Shakespeare left him 26s. 8d. for the purchase of a ring. With his fellow-actor Condell, he published in 1623 in a single folio volume the first collected edition of Shakespeare's works. He died at Aldermanbury, Oct. 10, 1630.

Hemingway, ERNEST (b. 1898). American novelist. Born at Oak Park, Ill., July 21, 1898, he was educated in Europe and lived in Paris, where he became a member of a group of writers that included Gertrude Stein. He made a reputation as one of the most virile young novelists.

Ernest Hemingway,
American novelist

In *The Sun Also Rises*, 1926; *Men Without Women*, 1927; and *A Farewell to Arms*, 1929 (filmed 1933), he expressed the disillusion induced by the First Great War, and his characterisation, terse and deliberately simple, matched his flat, uncompromising style. Later novels included *Death in the Afternoon*, 1932; and probably his finest work, *For Whom the Bell Tolls*, 1940 (filmed 1944), dealing with the Spanish Civil War.

Hemiplegia (Gr. *hēmi*, half; *plēgē*, blow, stroke). Paralysis affecting one side of the body. It is most often due to haemorrhage into the brain on the opposite side, or to a blood clot in the cerebral vessels. See Paralysis.

Hemiptera (Gr. *hēmi*, half; *ptera*, wings). Name applied to an order of insects otherwise known as Rhynchota or beaked insects. These include the bugs, plant lice, and water scorpions. They vary greatly in size and form, some being beautiful and others the reverse. The mouth parts are modified to form a rostrum or beak which is used for piercing and sucking; none of them passes through a quiescent pupal stage. As a general rule they have four wings, the fore ones often more or less horny. See Insect.

Hemisphere (Gr. *hēmi*, half; *sphaira*, a globe). Half of the globe. All great circles divide the world into hemispheres, but maps in common use depict hemispheres in only two ways. The equator divides the world into the N. and S. hemispheres. The world is also divided into the E. and W. hemispheres, the latter containing N. and S. America, the former the other continents. The great circle made of the meridians 20° W. and 160° E. is usually taken as the boundary line between the hemispheres. See Earth; Equator.

Hemlock (*Conium maculatum*). Biennial herb of the family Umbelliferae. A native of Europe, N. Africa, N. and W. Asia, it has a stout, furrowed stem, spotted with purple and is 2 ft. to 4 ft. high. The leaves are wedge-shaped, finely divided, fern-like; flowers small, white, in compound umbels. All parts of the plant, but especially the fruits, contain an oily, poisonous fluid, the active principle of which is alkaloid coniine.

Cases of poisoning by coniine have occurred from mistaking the leaves for parsley. The symptoms are weakness and paralysis of the muscles, the lower limbs being first affected, and the action of the poison gradually extending upwards. Eventually paralysis of respiration occurs, and death ensues from asphyxia. This sequence of events is described in the well-known account of the death of Socrates, who was condemned to drink hemlock. The treatment is to wash out the stomach, administer stimulants, and perform artificial respiration if necessary.

Hemlock Spruce (*Tsuga canadensis*). Evergreen tree of the family Coniferae. A native of N.E. America, it attains a height

Hemlock Spruce. Leaves and cones
of this N. American evergreen tree

of 60 ft. to 80 ft. The short narrow leaves are green above and white beneath, solitary, in two irregular ranks; the cones small and oval, hanging down from the tips of the branches, with semi-circular scales. It is a timber tree, and the bark is used for tanning.

Hémon, LOUIS (1880-1913.) French novelist. He was born at Brest, Oct. 12, 1880, and died in Canada, July 8, 1913. His great French Canadian novel, *Maria Chapdelaine*, published just before his death, an intimate and moving story of a farming community in the early 19th century, was translated into most languages.

He left two posthumous novels, *Collin-Maillard*, 1924, and *Battling Malone*, 1925.

Hemp. Commercially, a general name for textile fibres produced by a number of unrelated plants, but originally restricted to those obtained from the annual herb hemp. (See *Cannabis*.) African bow-string hemp is

yielded by *Sansevieria guineensis*; Indian bow-string hemp by *Calotropis gigantea*; Bengal, Bombay, Madras, Brown, and Sunn hems by *Crotalaria juncea*; Jubbulpore hemp by *Crotalaria tenuifolia*; Indian hemp by *Apocynum cannabinum*; brown Indian hemp by *Hibiscus cannabinus*. Manila, also known as abaca (*Musa textilis*), sisal (*Agave sisalana*), and phormium (*Phormium tenax*) are referred to as hems, but unjustifiably.

True hemp (*Cannabis sativa*) has been cultivated in nearly all countries of the temperate zones, with Russia and Italy the greatest producers. The best quality is Italian. Although hemp is stronger than jute and endures heat, moisture, and friction with less injury than any other soft fibre except flax, it has been continuously displaced by other fibres. Its use is now mostly for twines. The tow, i.e. the broken and short fibres removed during separation processes, is employed for packings.

Hemp is used as a drug or intoxicant under the names of bhang, ganja, and charas. Hashish is the Arabic name given to a preparation of the leaves. The plant has valuable medicinal properties, and has been widely used in the East.

To discourage branching and produce the maximum length of

fibre, the plants are grown like timber and corn, in close rows. When the ripe stems are pulled they are made into bundles and subjected to processes of retting, bleaching, and scutching, such as are applied to flax (*q.v.*). It is a hardier plant than flax, and needs less attention. Hemp grows best in cool climates, and prefers a moist, rich, well-drained loam. Where both seed and fibre are required, from 2 to 2½ bushels of seed are drilled to the acre, which yields from 20 to 25 bushels of seed and 2 to 3 tons of stems equal to 6 to 8 cwts. of fibre. Male plants are pulled as soon as the flowers wither, but the females are left, of course, until the seeds are ripe. The name, in A.S. *henep*, is connected with Gr. and Lat. *cannabis*. See *Cannabis*; *Rope*.

Hemp Agrimony or **BLACK ELDER** (*Eupatorium cannabinum*). Perennial herb of the family

Hemp Agrimony
or Black Elder

Compositae. It is a native of Europe, N. Africa, and N. and W. Asia. It has a branching stem about 4 ft. high, and the leaves are divided into three or five lance-shaped toothed

leaflets. It is one of the simplest of the Composite flowers, each head consisting of five or six pale purple florets, but the heads are gathered into large clusters. The florets are all tubular. A reputedly tonic tea is made of the leaves.

Hemp Nettle (*Galeopsis tetrahit*). Annual herb of the family Labiatae. It is a native of Europe and N. and W. Asia. It has a bristly stem, with swollen joints, and oval-lance-shaped leaves with coarsely toothed edges. The rosy or white flowers are in whorls just above the pairs of leaves. *G. speciosa*, by some regarded as a form of *G. tetrahit*, has larger yellow flowers blotched with purple.

Hemsworth. Parish and village of Yorkshire (W.R.), England. It is 8 m. by railway S.E. of Wakefield. Stone quarrying and mining are the chief industries, and there is trade in linen and cotton. The 15th century church of S. Helen has been extensively restored: The hospital and the free grammar school were both founded by Robert Holgate, archbishop of York, in the 16th century. Hemsworth gives its name to a co. div. returning one M.P. Pop. 13,000.

Henbane (*Hyoscyamus niger*). A biennial herb of the family Solanaceae. It is a native of Europe, N. Africa, and N. and W. Asia. The leaves are oval, lobed or toothed, the upper ones clasping the stem; the flowers are large, funnel-shaped, and dull yellow, veined with purple. The fruit is a many-sided capsule which has a distinct lid.

Henbane, a medicinal herb

The dried leaves are used in medicine. The active principles are poisonous alkaloids called hyoscyamine and hyoscyne. Preparations of hyoscyamus are used with purgatives to diminish griping, and are also given to relieve spasmodic coughing in asthma and spasms of the bladder associated with cystitis or inflammation of the prostate gland. Hyoscyne is used as a sedative in acute mania. In conjunction with morphine it cuts off the pains of labour, producing the condition popularly known as twilight sleep. For this purpose the drug should only be used by skilled hands, and the patient must be continuously under observation. See *Corolla illus.*

Hendaye. Frontier town and small seaport of France, in Basses-Pyrénées dept., on the Bidassoa opposite Irun in Spain. It is the terminus of Route Nationale 10 from Paris. German troops occupied Hendaye on June 27, 1940, and it was recovered by the F.F.I. on Aug. 21, 1944.

Henderson, ALEXANDER (c. 1583-1646). Scottish divine. Born at Crieche, Fife, he was educated

Alex. Henderson,
Scottish divine
From an engraving

at St. Andrews, where he became professor of rhetoric and philosophy. He was appointed about Christmas, 1613, to the incumbency of Leuchars, but soon afterwards became a Presbyterian, and strongly opposed the attempt to introduce a liturgy. In 1638 he was moderator to the general assembly, and in 1639 minister of High Kirk,

Edinburgh. In 1641 he was made chaplain to Charles I in Scotland.

Henderson drafted the Solemn League and Covenant of 1643, and attended the Uxbridge conference of 1645. Valuing above all the alliance of Scottish and English Presbyterianism, he strove to prevent Montrose taking up arms on the Royalist side, but avoided a personal quarrel. Conciliatory, diplomatic, scholarly, tireless despite ill-health, Henderson ranks after Knox as the founder of the Reformed Church of Scotland and her greatest non-Catholic churchman. He died at Edinburgh, Aug. 19, 1646. Aiton's *Life and Times*, 1836, is the standard authority.

Henderson, ARTHUR (1863-1935). British statesman. Born in Glasgow, Sept. 13, 1863, he was apprenticed as a moulder at Newcastle. Here he came in touch with the trade union movement, and was soon made an official of his society. He was elected as Labour member to the city council, and later to that of Darlington, where he was mayor in 1903. At a by-election in 1903 he was returned as Labour M.P. for Barnard Castle, and was chairman of the parliamentary Labour party, 1908-10 and 1914-17. He represented Barnard Castle until 1918, sitting subsequently for Widnes, 1919-22; Newcastle, 1923; and Burnley, 1924-31.

Arthur Henderson,
British statesman

In May, 1915, he joined the Coalition government as president of the board of Education, and in Dec., 1916, became postmaster-general and adviser on labour to Lloyd George. After a visit to Russia, differences arose between him and the prime minister, resulting in Henderson's resignation, in Aug., 1917.

Henderson was Home secretary in the first Labour cabinet, 1924. In the second, 1929, he was made foreign secretary, an office in which he showed outstanding ability and gained international respect. Unable to follow Ramsay MacDonald into the National government in 1931, he became leader of the opposition, but lost his seat at the general election. In 1932 he became president of the disarmament conference at Geneva, his work there earning for him the Nobel peace prize for 1934. He returned to the commons after a

by-election at Clay Cross in 1934, but died Oct. 20, 1935. *Consult Life*, M. A. Hamilton, 1939; *From Foundry to Foreign Office*, E. A. Jenkins, 1933.

Of Henderson's two sons, William Watson (b. Aug. 8, 1891), became 1st Baron Henderson in 1945. He was a political journalist, edited the *Labour Magazine*, and sat as M.P. for Enfield, 1923-24 and 1929-31. Arthur (b. Aug. 27, 1893) was Labour M.P. for N. Cardiff, 1923-24 and 1929-31, for Kingswinford 1935-50, and for Rowley Regis and Tipton from 1950. He was joint parliamentary under-secretary for war, 1942-43; financial secretary to the war office, 1943-45; parliamentary under-secretary for India and Burma, 1945-47; minister of state for commonwealth affairs, Aug., 1947; air minister, Oct., 1947. He was made K.C., 1939, and P.C., 1947.

Henderson, GEORGE FRANCIS ROBERT (1854-1903). British soldier and historian. Born at St. Helier, Jersey, June 2, 1854, he was educated at Leeds grammar school and S. John's College, Oxford. He went to Sandhurst, and in 1878 entered the York and Lancaster regiment. In 1882 he served in Egypt, distinguishing himself at Tel-el-Kebir.

In 1889 he joined the teaching staff at Sandhurst, and during 1892-99 was professor of military history at the staff college. He was just beginning the official history of the S. African War when he died in Egypt, March 5, 1903. Regarded as the first military historian of his day, Henderson's great work was *Stonewall Jackson and the American Civil War*, 1898. His lectures and papers were published under the title of *The Science of War* in 1905.

Henderson, SIR NEVILLE MEYRICK (1882-1942). British diplomatist. Born June 10, 1882, he was educated at Eton, and entered the diplomatic service in 1905. In 1928 he was appointed to the Paris embassy as envoy extraordinary and minister plenipotentiary, and in 1935 was promoted ambassador to Argentina and minister to Paraguay. Transferred to Berlin in 1937, he strove sincerely to bring about an understanding between Great Britain

Sir Neville Henderson, British diplomatist

Hendon Aerodrome. Inaugurated privately in 1910, this well-known metropolitan airfield later became a training station for R.A.F. pilots and the scene of their annual displays, during one of which this air picture was taken

and Germany, and when war became inevitable he was bitterly disappointed. It was he who conveyed the British ultimatum to Hitler, Sept. 2, 1939. In 1940 Sir Neville published some of the inside story in *Failure of a Mission*. He became a group commander in the Home Guard in 1941 and died Dec. 29, 1942. A book of lighter reminiscences, *Water Under the Bridges*, appeared in 1945.

Hendon. Municipal borough of Middlesex, England. It stands on high ground, near the river Brent, 8 m. N.W. of London; it is served by railways and the Northern line, and has bus connexion with the City and West End. The borough includes Edgware, Mill Hill, and Golders Green, and has within its borders the Welsh Harp or Brent Reservoir and Hendon Aerodrome. The district has grown rapidly to achieve an est. pop. of 134,500.

On a summit N. of the old village is the old Perp. church of S. Mary, partly rebuilt in 1827, and notable for its battlemented tower, ancient roof, glass, and monuments, which include an effigy of Sir William Rawlinson (d. 1703). In the churchyard, which commands fine views towards Harrow, Stanmore, and Totteridge, are the graves of Woolner the sculptor and Emily, first wife of Coventry Patmore. The manor house was the occasional residence of the abbots of Westminster. Hendon Hall was the home of Garrick, who owned the manor. Hendon derived its name from Heandune or Highdown, and is mentioned as Handone in Domesday. It returns two M.P.s. There are almshouses. The newspaper section of the British Museum is here.

Hendon Aerodrome. Airfield adjoining the rly. at Hendon, Middlesex, England. The first airman to fly from Hendon was the French-

man Paulhan, at the start of the historic London-Manchester race of 1910. Claude Grahame-White (q.v.) purchased the field later that year, and established a flying school. To mark the coronation of George V in 1911, Hamel flew the first official air mail from Hendon to Windsor. Later, regular weekly flying meetings were held at what was by then known as London Aerodrome, displays being given by aces such as Hamel and Hucks.

During the First Great War an aircraft factory was established at Hendon, and the Grahame-White school became a training station for pilots of the R.F.C. The aerodrome was eventually purchased by the government as an R.A.F. station. The R.A.F. held an air display here annually, 1920-37. Hendon remained on the list of R.A.F. stations in the Second Great War, as a transport base.

Hendren, ELIAS (b. 1889). English cricketer. He was born at Chiswick, Feb. 5, 1889, and played football as wing forward with Brentford. Once a match-card boy at Lord's, he played cricket for Middlesex at 17, and eventually made more runs than all contemporaries except Hobbs and Mead. Hendren had an aggregate of 3,311 in 1928; an innings of 301 not out in 1933; 13 centuries in three separate seasons. Touring the West Indies in 1926, he averaged 126. He thrice visited Australia and played in test matches in England at 45. "Patsy" was a splendid fieldsmen in the deep, and a comedian during play. There was a demonstration at Lord's when in his last

Elias Hendren, English cricketer

county match, Aug. 30, 1937, he made his 170th century. He became coach at Harrow.

Hengelo. Town of the Netherlands, in the prov. of Overijssel. It stands on a small stream, 27 m. E. of Deventer, and is an important rly. junction of several lines. The principal industry is the manufacture of textiles. Pop. 45,030.

Hengist. Anglo-Saxon chief, reputed the leader of the first Anglo-Saxon invaders of England. The story is that the British king Vortigern invited the Anglo-Saxons, or some people of kindred race, to come over and help him against his enemies. Under Hengist and his brother Horsa, they landed about 450 at Ebbsfleet in Kent. They settled in Thanet, becoming little kings; but they soon quarrelled with the British, and in a fight near Aylesford in 455, Horsa was killed. Hengist reigned until 488, leaving a son Oisc. It has been conjectured that the two names Hengist and Horsa should be applied to one person, *Hengst* being modern German for a stallion.

Hengler's Circus. Amphitheatre, formerly in Argyll Street, Regent Street, London, W. It was built by Frederick Charles Hengler in 1871, and rebuilt, 1884, on the site of Argyll House, a residence of the ducal family of Argyll and later of the 4th earl of Aberdeen. The site of Hengler's Circus, which combined equestrian displays with spectacular performances by children, is now occupied by the Palladium music-hall.

Henie, SONJA. (b. 1913). Norwegian-born skater and film actress. Born in Oslo, April 8, 1913, she went to ballet school, but soon revealed an exceptional aptitude for skating. She won the world's championship for figure skating on ten occasions, and was also Olympic champion in 1928, 1932, and 1936. Turning professional, she accepted a Hollywood offer, and was starred in her first film, *One in a Million*, 1937, and many others.

Hénin. Village and hill in France. The village, known as Hénin-sur-Cojeul, is in the dept. of Pas-de-Calais, E. of the Arras-Bapaume road, 5 m. S.E. of Arras. It was captured by the British on April 3, 1917. Here in March, 1918, the British 3rd division made a great stand against the German offensive towards Arras. Hénin was yielded after a stiff resistance, but was recaptured by the 52nd division, Aug. 24. Hénin Hill, near by, taken by the Germans, March 22, 1918, was the scene of

a fine stand. Hénin-Liétard, a town in Pas-de-Calais, is 16 m. E.S.E. of Béthune, and has coal mines. Pop. 22,572. See Arras, Battles of; Somme, Battles of the.

Henlein, KONRAD (1898-1945). German politician. Educated at a commercial academy, after a period as a bank clerk he became a gymnastics instructor, and during 1923-33 was head of the German sports organization in the Sudeten area of Czecho-Slovakia. With Hitler's accession to power in Germany, Henlein began to agitate for autonomy for the Sudeten Germans. He led a revolt of his followers in 1938, and, when this was suppressed by martial law, changed his demands to reunion of Sudetenland with Germany. After the Munich agreement he was rewarded with the post of Reich Commissioner for the newly acquired territory. On the German invasion of Czecho-Slovakia, March, 1939, he was made *Gauleiter* of Sudetenland, later becoming civil administrator of Bohemia. Captured by the U.S. 7th army on May 9, 1945, Henlein committed suicide next day by taking poison.

Henley, WALTER DE. Medieval writer of the 13th century. His reputation rests entirely on his book on husbandry. Written in French, this was long regarded as the standard book of the kind, a fact attested by the many existing manuscripts and by its translation into English, Welsh, and Latin. There is a modern translation published by the Royal Historical Society. Henley was probably a Dominican monk. See Agriculture.

Henley, WILLIAM ERNEST (1849-1903). British poet and author. Born at Gloucester, on

Sonja Henie giving an exhibition of figure skating

W. E. Henley,
British poet
Elliott & Fry

1873 he went to Edinburgh to be treated by Lister. The limb was saved after 20 months in hospital, during which time he was visited by Stevenson, who became his close friend. A cripple all his life, Henley suffered much pain.

After leaving hospital, Henley settled in London in 1877. He edited successively the weekly paper *London*, the *Magazine of Art*, the *Scots* (afterwards the *National Observer*), and the *New Review*; and was a frequent contributor, chiefly of critical articles, to papers and magazines.

Meantime he obtained recognition as poet with *A Book of Verses*, 1888, which included those he had written on his Edinburgh sick-bed; *The Song of the Sword*, 1892; *For England's Sake*, 1900, a product of patriotic feeling during the S. African War. He edited, with T. F. Henderson, the *Centenary Burns*, 1896-97, to which he contributed a noteworthy appreciation of the poet; also *Lyra Heroica*, 1891, a book of verse for boys. With Stevenson he collaborated in four plays, including *Deacon Brodie*.

Henley was a great talker, a brilliant critic, and an outstanding if at times tempestuous personality. His most famous poem, *Invictus*, justly describes himself. Other well-known verses are those with the refrain, *England, My England*; and the free verse stanzas beginning, *A late lark*. He died at Woking, July 11, 1903. There are studies by L. C. Cornford, 1913; J. H. Buckley, 1947.

Henley-in-Arden. Market town of Warwickshire, England, 8 m. N. of Stratford-upon-Avon. With its picturesque half-timbered houses it has been described as a museum of domestic architecture; the White Swan inn dates from 1358, the Guild House from 1448. There is a railway station. Market day, Wed. Pop. 1,100. Consult H.-in-A.: an Ancient Market Town, W. Cooper, 1946.

Henley-on-Thames. Municipal bor. and market town of Oxfordshire, England. It stands on

Aug. 23, 1849, he was educated at the Crypt grammar school of that town, where T. E. Brown was one of his masters. Tuberculous disease threatening him with the loss of a leg in

Henley-on-Thames. View of the town and river in regatta week; the tower is that of the church of S. Mary

the N. side of the Thames, 36 m. by rly. W. of London. It is a co. constituency. Its beauty is enhanced by its situation beneath the Chilterns. Brewing and malting are carried on, but it is chiefly known as a boating centre. A fine bridge crosses the river here; built in 1786, it replaced one of great age. The church of S. Mary, with a lofty tower, is an old building; there is a school dating from the early 17th century; also a town hall. Here also is a business administration college. The royal regatta is held annually at Henley, which was chosen as venue for the rowing events in the Olympic Games, 1948. It was made a corporate town in 1570. Market day, Thurs. Pop. 10,000.

Henley Royal Regatta. Sporting event, with rowing and sculling races for amateurs. Attended by representatives of all the leading English rowing clubs, and admitting foreign competitors, it was inaugurated in 1839. It takes place annually in July on the Thames at Henley.

The following are the different races and the year of their foundation: Grand Challenge Cup, for eight oars, 1839; Stewards' Challenge Cup, for four oars, 1840; Diamond Challenge Sculls, for single scullers, 1844; Silver Goblets (and Nickalls Challenge Cup), for pair oars, 1845; Ladies' Challenge Plate, for eight oars, 1845; Visitors' Challenge Cup, for four oars, 1847; Wyfold Challenge Cup, for four oars, 1855; Thames Challenge Cup, for eight oars, 1868; Princess Elizabeth Cup, for school eights, 1946; Double Sculls, 1946. The regatta is held under the rules of the Amateur Rowing Association.

Henna. Powdered dried leaves of the Egyptian privet, *Lawsonia*

alba or *inermis*, a plant indigenous to Arabia, but cultivated in N. Africa, India, and Ceylon. It is used for dyeing the hair a reddish-brown colour, or may be employed in conjunction with other dyes (compound hennas). The henna powder, about 5 oz. for a head, is made into a paste with hot water, applied to the hair, and allowed to remain until the dye has acted, careful timing being important. The dyeing properties of henna are due to the presence of lawsone (2-hydroxy-1:4-naphthaquinone).

Henny-Feathered Cock. In a number of breeds of poultry there are relatively inconspicuous differences, either in colour or in shape, between the feathers of the cock and those of the hen. In both they closely resemble the condition usually found in hens. Such breeds are often referred to as henny-feathered. They provide a critical test for theories of the hormonal control of plumage.

Usually in poultry the male hormone has little or no effect on plumage; the feathers of the male castrate resemble those of the normal male. But the female hormone often has considerable effect, so that the hen differs from the cock or the male castrate. The female castrate usually resembles the male castrate. Two alternative explanations are given of henny-featheredness. There may have been a real, genetically determined, reversal of the reactivity of the feathers, so that in these breeds they react to male hormones as in other breeds they react to female hormones. Or perhaps the plumage is abnormally sensitive to the latter. It is probable that both types of hormone are in fact produced by the gonad of each sex. It should

be emphasised that the castrated henny-feathered cock assumes the normal castrate or male plumage, a fact which has long puzzled poultry-keepers.

Henrietta (1644-70). British princess and duchess of Orleans. Fifth daughter of Charles I and Henrietta Maria, she was born at Exeter, June 16, 1644. Her childhood was passed mostly at the French court, where on March 30, 1661, she married Philip (1640-1701), duke of Orleans and brother of Louis XIV. The duchess, who quarrelled constantly with her husband, became a leader of fashion, but was also chief agent of intercourse with the English court, being devoted to her brother Charles II. In May, 1670, she came to Dover to negotiate the secret treaty between Charles and Louis. Back at Versailles she fell ill and on June 30 died, declaring she had been poisoned. Henrietta is the chief character in M. Irwin's novel, *Royal Flush*, 1932.

Henrietta Maria (1609-69). Queen of Charles I. The youngest daughter of Henry IV of France, she was born in Paris, Nov. 25, 1609. Betrothed to Charles in 1624, she was married by proxy in May, 1625, just after Charles's accession. The queen was fond of gaiety and extravagant, but her partiality for the Roman Catholics governed almost all she did in English politics. She gave countenance and more to her co-religionists, and just before the Civil War her activities did much to fan the flames of discontent. Early in the war she returned from a visit to France with money and stores, and collected a party of royalists, who marched to her husband's aid. In 1644, however, she left England and never saw Charles again, although she was always scheming in his interests and those of their children. During the Commonwealth the queen remained in France, but she returned to England in 1660, living for some time at Somerset House. She died at Colombes, Aug. 31, 1669. There are Lives by I. A. Taylor, 1905; Carola Oman, 1936; J. Mackay, 1939.

Henry. The practical unit of electro-magnetic inductance. It is named after the American

Henrietta Maria, Queen of Charles I After Van Dyck

physicist, Joseph Henry, who discovered electro-magnetic induction simultaneously with, but independently of, Faraday. If the current in a self-inductance of one henry is changing at the rate of 1 ampere per second, a self-induced E.M.F. of 1 volt will be produced between the ends of the coil. Also if the mutual inductance between two coils is one henry, a current changing at the above rate in one coil will induce an E.M.F. of 1 volt between the ends of the other coil. On Jan. 1, 1948, the National Physical Laboratory adopted a new unit known as the absolute henry, to replace the "international henry." The latter is equivalent to 1.00049 absolute henries. See International Units.

Henry. Masculine Christian name. Its meaning, prince of the house, is seen best in its German form, Heinrich. Extensively used in Germany and France, it has always been popular in England, but less so in Scotland. Harry is the true English form. The French form is Henri, the Spanish Enrique. Henrietta, Henriette, and Harriet are feminine derivatives.

Henry I (1068-1135). King of England. Born at Selby, Yorkshire, he was the third surviving son of William the Conqueror, the only one born in England after the Conquest. On the death of William II he promptly secured the throne in the absence of his

Henry I,
King of England

elder brother Robert of Normandy. He was shrewd enough to realize the advantage of establishing a firm and just government, conciliating his English subjects, and acquiring a thorough mastery over the turbulent Norman baronage. The claims of his brother Robert, a convenient figurehead for the barons, compelled him to fight for his crown, and to make himself master of Robert's duchy of Normandy as well as of England.

In the course of his reign of thirty-five years (1100-1135) he won for himself the name of the lion of justice, laying the foundations of the work which was carried out by his grandson, Henry II; especially by his organization of the Curia Regis as the royal court of law administered by trained lawyers, and of the itinerant justices whose courts periodically supervised the administration of justice

in the provinces. In 1103 he became involved in a dispute with Anselm on the investiture question. Henry's only son, William, was drowned in the White Ship. He left his throne to his daughter, Matilda or Maud, widow of the emperor Henry V, and wife of Geoffrey of Anjou; but on his death, Dec. 1, 1135, the crown was successfully claimed by his nephew Stephen. See Investiture.

Henry II (1133-89). King of England, the first of the Plantagenets. He was born at Le Mans, March 5, 1133, the son of Geoffrey, count of Anjou, who was the second husband of the Empress Matilda or Maud, daughter of Henry I of England. Maud was dispossessed of

Henry II,
King of England

the English throne by her cousin Stephen of Boulogne, whose nineteen years' reign was a nightmare of civil war and feudal anarchy. Young Henry succeeded his father as count of Anjou, received his mother's duchy of Normandy which Stephen had not seized, and married Eleanor, duchess of Aquitaine, in 1152, thereby becoming, in effect, lord of the western half of France. In 1154 he succeeded Stephen on the English throne in place of his mother, who still survived.

Though now only twenty-one he had proved himself to be extraordinarily prompt, energetic, self-willed, and capable. In France, though a feudatory, his power at least rivalled that of the king, and his ambitions were European rather than English. But he realized that his kingdom should provide the real basis of power; and though he spent more than half his reign in France, he devoted himself to the establishment in England of a powerful monarchy.

Without delay, he cleared the country of the mercenaries and adventurers who had swarmed into it under Stephen, pulled down some thousands of the castles which the barons had built, and stamped out all resistance by the rapidity of his movements. The country was weary of anarchy, and the great majority of the barons were now in favour of restoring law and order. In the struggle with his archbishop, Thomas Becket (*q.v.*), he strove with only partial success to subject the clergy to the ordinary law, and to assert the royal supremacy over the clerical organi-

zation. By scutage, the partial substitution of money payments for military services, and by a revival of the old English *fyrð* or militia, he strengthened the military ascendancy of the crown over the baronage. He reorganized the administration of justice and finance on lines suggested by Henry I.

He sanctioned the intervention in Ireland of his barons, and then compelled both them and the native chiefs to recognize him as overlord, Ireland being thus annexed to the English crown. His later years were vexed by the turbulent disobedience of his sons, and he died at Chinon, July 6, 1189, in the course of a struggle with his son and successor, Richard, who had joined in arms with the French king. Henry, Geoffrey, and John were other sons. See *Avranches*; *consult Lives*, Mrs. J. R. Green, 1888; L. F. Salzman, 1914.

Henry III (1207-72). King of England. Born at Winchester, Oct. 1, 1207, he succeeded his father,

Henry III,
King of England

King John, in 1216, while the struggle with the barons was still in progress. The general recognition of the young king was, however, soon procured by the veteran, William Marshal, earl of Pembroke. During the years of his minority the country was well governed, first by Pembroke and then by Hubert de Burgh.

In 1227 Henry's personal reign began. Unfortunately he was one of the most incompetent of English kings. With more cultivated tastes than most of his contemporaries, personally brave and virtuous, and a devoted son of the Church, he lacked any conception of his duties as a king. First he fell wholly under the influence of his mother's Poitevin connexions, who filled all the offices of state. The pressure of the irritated barons removed the Poitevins, but on Henry's marriage with Eleanor of Provence, in 1236, a new flood of foreigners usurped all positions of importance, and under their influence the provisions of Magna Carta extorted by the barons from his father were persistently ignored. Matters came to a head when Henry, in obedience to the pope, accepted the crown of Sicily for his son Edmund, and endeavoured to procure from the country the money necessary to secure it.

The Great Council of barons, now headed by Simon de Montfort, assembled in arms at Oxford in 1258, and compelled the king to accept the Provisions of Oxford, which instituted an elaborate machinery of baronial committees to organize the government of the realm. The barons themselves were so little of one mind that Henry, supported by the arbitration of Louis IX of France, was enabled to repudiate the Provisions, and Montfort's party prepared to resist. The section of the barons whose chief aim was to secure their own independence supported the king. Montfort defeated the royalists at the battle of Lewes, May 14, 1264, and virtually assumed the functions of a dictator.

But Montfort's dictatorship was resented; the royalists rose in arms and Montfort was killed at the battle of Evesham, Aug. 4, 1265. The king was now dominated by the personality of his extremely able son, who was presently to succeed him as Edward I, and to him Henry now resigned the real control of the state. Order was restored and Edward himself began to enforce the very principles for which Montfort had died. Henry died Nov. 1, 1272.

Henry IV (1367-1413). King of England. Henry of Bolingbroke, known successively as earl of Here-

L. 22.

ford, earl of Derby, duke of Lancaster, and Henry IV of England, was born near Spilsby, Lincolnshire, April 3, 1367. He was the son of John of Gaunt, duke of Lancaster, grandson of Edward III, and cousin of Richard II. During Richard's reign he was one of the lords appellant who opposed the king's early policy. In 1398 he was sent into exile. On his father's death he returned to England in 1399, nominally to claim his estates, actually to depose Richard and set himself on the throne, his title being derived from parliament, which acknowledged him as the lawful heir, disregarding the superior claims of his infant cousin, Edmund Mortimer.

With him began the rule of the house of Lancaster, in circumstances which compelled the Lancastrian kings to yield unprecedented submission to the will of parliament. Henry's need for the alliance of the Church produced

the first enactment for the burning of heretics and the suppression of Lollardy. A revolt in Wales, headed by Owen Glendower, was followed by a still more serious revolt of the Percys, which was ended by the battle of Shrewsbury, July 21, 1403. In 1405 there was another insurrection prompted by the exiled Percy of Northumberland and headed by Mowbray and Archbishop Scrope, and another in 1408. After this, Henry was much troubled by the antagonism of his council, headed by the prince of Wales, afterwards Henry V. He died March 20, 1413. Other sons were John (Bedford); Thomas (Clarence); Humphrey (Gloucester).

Henry V (1387-1422). King of England. Henry of Monmouth, born Aug. 9, 1387, succeeded his

H. 5.

father, Henry IV, in 1413. The legends concerning "M a d o a p H a l" are hardly to be trusted. It is quite certain that, as prince of Wales, Henry acquired very serious training as a soldier in the campaign against the Percys and in Wales, and that he played an active part at the council table during his father's last years. Certainly he exhibited on his accession a character and a high sense of responsibility not generally anticipated. Something of a religious zealot, as king he persecuted heresy sternly, persuading himself that his secular ambitions were justified because he was an instrument in the hands of the Almighty for the regeneration of a corrupt and demoralized France.

At the beginning of his reign his power of swift decision and rapid action were displayed in the prompt and crushing suppression of a Lollard insurrection at its outset. He then at once turned his mind to the popular project of reviving the quite untenable claim of the English kings to the French crown, France at the time being distracted by the rival factions of Burgundians and Armagnacs. In 1415 an expedition set sail for Normandy, laid siege to Harfleur, and captured it. Leaving a garrison there, Henry, with a small available force of efficient, not more than 8,000 men, made an ostentatious march through Normandy to Calais. This at last brought down upon him the hosts

of the French, who had temporarily adjusted their differences, and over them his little army won the victory of Agincourt, Oct. 25, 1415.

The next two years he devoted to serious preparations for an organized conquest. In 1417 he again landed in Normandy and set about its systematic reduction, taking city after city and establishing a regular government as he advanced. In Jan., 1419, Rouen fell. The assassination of John of Burgundy drove his son Philip into the arms of the English. The Burgundian faction held possession of the person of the crazy king Charles VI, and on May 21, 1420, the treaty of Troyes was signed which recognized Henry as heir to Charles and regent during his life, while it gave him the hand of the princess Catherine in marriage. The greater part of France, however, repudiated the treaty. It was still necessary to continue the process of systematic conquest, and before even the whole of the N. had been brought into subjection, Henry died of dysentery at Vincennes, Aug. 31, 1422. See Agincourt; consult Henry V, A. J. Church, 1889; Henry V, C. L. Kingsford, 1901; The Reign of Henry V, J. H. Wylie, 1914-19.

Henry VI (1421-71). King of England. Henry of Windsor, born Dec. 6, 1421, son of Henry V, suc-

Henry

ceeded to the English throne Aug. 31, 1422. During his childhood the government was in the hands of a council, while his uncle, the duke of Bedford, acted as regent in France. Before Bedford's death, in 1435, it had become virtually certain that the French conquests of Henry V would not be retained. Joan of Arc (q.v.) had revived the French national spirit, and the tide of English victories was turned.

The second definitely marked section of the reign extends from 1435 to 1453. It witnessed the gradual expulsion of the English not only from northern France, conquered by Henry V, but even from Guienne, which had never been entirely separated from the English crown for 300 years. Only the Calais Pale was left. After Bedford's death the party of the Beauforts and Poles was dominant, the Beauforts being legitimated descendants of John of Gaunt, who

hoped to secure the succession for themselves, as they ultimately did in the person of Henry VII. The opposition to them was headed by the king's uncle, Humphrey, duke of Gloucester, and, after his death in 1447, by Richard of York, the grandson of Edmund Mortimer. In 1445 Henry married Margaret of Anjou, who allied herself with the Beauforts.

After Gloucester's death, Richard was the nearest prince of the blood and the heir presumptive to the throne until the birth of a prince of Wales in 1453. The basis of the strife between the Yorkist and Beaufort factions was the fact that the king was very nearly an imbecile and occasionally quite insane, so that York claimed the right to exercise the authority of the heir.
